1. See that the AC lead along back chassis flange is dressed along the edge of the chasis flange, as far away from the bottom end of the I. F. transformer and associated leads as possible.
2. See that the audio coupling condenser connected to center lug on the volume control is separated as much as possible from the output transformer leads, and the black molded 2 watt, 82 ohm resistor, R10.
3. See that the output transformer leads are not behind the speaker near the 1U5 tube.

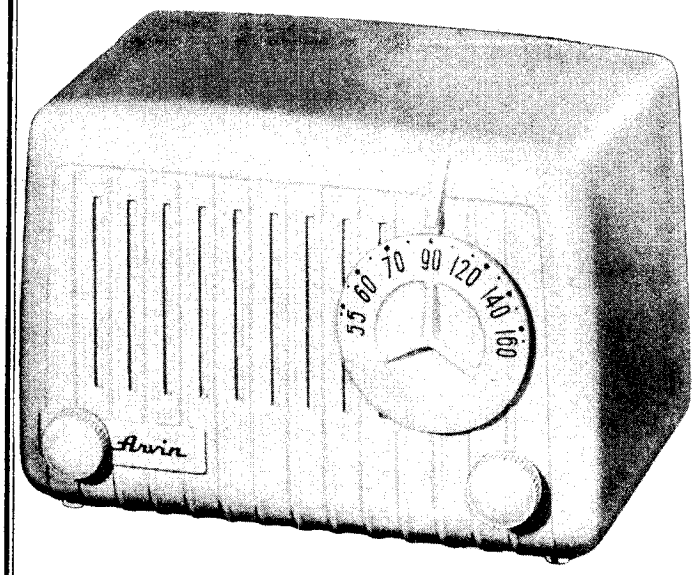
MODELS 356T, 357T;
Ch. RE-273



SPECIFICATIONS

FREQUENCY RANGE

Broadcast	540-1600 kc
IF	455 kc

TUBES AND FUNCTIONS

12SA7	Mixer-oscillator
12SK7	IF amp.
12SQ7	DET-AVC AF Amp.
50L6GT/G	Output
35Z5GT/G	Rectifier

LOUD SPEAKER

Type: Permanent magnet
Size: 4 Inch
Voice coil impedance ---------- 3.2 Ohms

CHASSIS FEATURES

Automatic Volume Control
Built-in Loop

OPERATING CONTROLS

1. Left knob ---------- ON-OFF Sw and Volume
2. Right knob ---------- Tuning

PHYSICAL DIMENSIONS

Length	8¾ inches
Height	6 inches
Depth	5¾ inches

POWER SUPPLY

105-125 Volts, AC-DC, 35 Watts

POWER OUTPUT

Undistorted	1.2 Watts
Maximum	3 Watts
Plate load	2000 Ohms

Models 356T & 357T are identical except for Color, 356T is Sandalwood, 357T is Willow Green.

POSITION OF POWER CORD PLUG

On AC, the power cord plug should be tried in both its possible positions in the receptacle, and left in the position that gives least hum. On DC, the receiver will work in only one position of the plug in its receptacle.

THE ANTENNA

This receiver has a built-in loop which gives satisfactory reception in most locations. If the receiver is located some distance from a broadcasting station, or where the electrical interference is high, an outside antenna connected to the pickup lead on the loop, will improve reception.

This receiver is designed to operate without a ground connection and no attempt should be made to use one.

ALIGNMENT PROCEDURE

A. Connect to 117 V., AC line and turn set on with volume control at full volume.

B. Connect signal generator high side through .05 uf or larger condenser to 12SA7 grid. Connect low side of signal generator to Chassis. Connect output meter across speaker voice coil.

C. Open variable condenser.

D. With signal generator set at 455 Kc, increase output of generator until output is heard in speaker. Adjust IF trimmers A1, A2 & A3 until maximum output meter reading is obtained, reducing signal generator output as adjustment progresses so that final adjustment is made with lowest input consistent with good signal to noise ratio.

E. With signal generator connected to a radiating loop and set to 1620 Kc, adjust oscillator trimmer A4 on variable condenser until output is maximum. Variable Condenser is to be fully opened during this adjustment.

F. Set signal generator to 1400 Kc and rotate variable condenser until output is maximum. Adjust R. F. trimmer A5 on variable, condenser until output increases to a new maximum. Rotate variable condenser slightly to obtain another maximum output. Re-adjust trimmers until output is again a maximum. Repeat this cycle until no further increase in output can be obtained. Final adjustment to be made with the signal generator output at lowest level consistent with good signal to noise ratio.

G. Set signal generator to 1000 Kc and tune radio to maximum output. Adjust variable condenser plates for maximum output.

H. Set signal generator to 600 Kc and proceed as in G above.

I. Set signal generator to 540 Kc and make sure that radio will tune to maximum output slightly before variable condenser is fully closed.

J. Recheck alignment and calibration at 1400, 1000, and 600 Kc, making any necessary readjustments.

K. Tune the variable condenser through its entire range to make sure it is not shorted at any point.

Models 360TFM is in a walnut cabinet. Model 361TFM is in a Willow Green cabinet. The Chassis is the same in both models.

ALIGNMENT PROCEDURE

AM

1. Plug set into 117 V. power source, turn volume control full on and band switch to AM, (left).
2. Connect output meter across speaker voice coil.
3. Connect signal generator high side through .05 mfd. condenser to converter grid and generator ground lead to receiver floating ground. Open tuning condenser. ator to test loop. Set signal generator to 1650 Kc. Tune trimmer A5 on oscillator section of tuning condenser for maximum output.
4. Close tuning condenser and set pointer at end mark of dial. Open tuning condenser. Connect signal generator to 1650 Kc. Tune trimmer A5 on oscillator section of tuning condenser for maximum output.
5. Set signal generator to 1400 Kc. Adjust tuning shaft until maximum output is obtained. Tune antenna trimmer A6 on tuning condenser for greatest output. Reset tuning shaft until output is again a maximum. Retune antenna trimmer. Repeat this cycle of operations at 1400 Kc until no further increase of output can be obtained. Keep generator output at a low value to prevent detuning by A. V. C. action.
6. Set signal generator to 600 Kc. Adjust tuning shaft for maximum output. Adjust tuning condenser plates for maximum output.
7. Check sensitivity at 1000 Kc. If sensitivity is too low, tuning condenser plates can be adjusted for tracking at this frequency. If this adjustment is made, tracking at 600 Kc must be readjusted.
8. Check coverage and calibration after alignment. Coverage should include 535 and 1650 Kc. Calibration should be such that pointer covers some part of calibration mark. If coverage and/or calibration are not correct, plates of tuning condenser can be adjusted. Calibration check points are 1400, 1000 600 and 540 Kc. If oscillator plates are adjusted, tracking of antenna section must be rechecked and corrected if necessary.
9. Check setting of trimmers on tuning condenser. Trimmer adjustments must not be extremely tight nor so loose as to be noisy or vibrate.
10. After alignment, check for noise due to condenser plates touching or pointer touching dial as tuning shaft is turned through the full tuning range.
11. The sensitivity of this set should be approximately 500 uv/m with 400 cycles, 30% modulation and 200 milliwatts, (.8 volt output.

FM

1. Turn band switch to FM, (right).
2. Connect (FM) I.F. generator to the second 12BA6 I.F. amp. grid, (lug #1) through the .01 uf mica dummy. Connect oscilloscope across volume control. With 150 Kc deviation 10.7 on the I. F. generator and the same audio voltage used as horizontal sweep on the scope, adjust the ratio detector transformer slugs A7-A8 for the characteristic "S" curve (See Fig. 1), with maximum vertical height on the scope. After this adjustment the top slug of the ratio detector should not be moved during the rest of the alignment.
3. Connect I.F. generator to mixer grid through .01 mica dummy. Using 23 Kc deviation 10.7 Mc adjust 10.7 Mc I. F. transformer slugs A9, A10, A11 and A12 for maximum output. Maximum output may be indicated by maximum vertical height on the scope or maximum voltage on a standard output meter across the voice coil of the receiver. After the two I.F. transformers have been aligned the bottom slug A8 of the ratio detector should also be peaked.
   The characteristic "S" curve of the complete I.F. channel should be checked by applying a 10.7 Mc signal with 150 Kc deviation to the mixer grid and observing the "S" curve on the scoke. It should not be very much different from that observed in step 2.
4. Connect R.F. (FM) generator (88 to 108 Mc) to the antenna terminals through the standard 300 ohm dummy (150 ohm in each side of generator leads). Use R.F.generator with 23 Kc deviation. With the variable condenser completely open and S.G. tuned to 108.5 Mc adjust oscillator trimmer A13 small ceramic trimmer) for maximum reading on output meter.
   Then tune receiver to low end of band (variable completely closed) and S.G. to 87.5 Mc. If the receiver does not tune to this frequency the FM oscillator coil L4 will either have to be squeezed together or lengthened to cover the band, (squeezing lowers and lengthening raises the frequency). Any change in the coil will have to be compensated by the trimmer at the high end of the band.
5. With the same S.G. connections as per paragraph 4 tune S.G. and set to 105 Mc. Tune R.F. trimmer A14 for maximum output at the same time rock variable back and forth through the frequency. (Rocking is necessary because slight oscillator pulling causes erroneous maximum readings).
   Tune S.G. and set the 90 Mc. Adjust R.F. coil L3 length for maximum output by squeezing or lengthening. Any change in the coil will have to be compensated at 105 Mc by the R.F. trimmer A14.
6. After steps 4 and 5 are finished check calibration and band coverage. Steps 4 and 5 may have to be repeated if set is off calibration. Band coverage should be 87.5 Mc to 108.5 Mc. Sensitivity should be approximately 200 uv at 105 Mc, 98 Mc and 90 Mc.

MODELS 664, 664A;
Ch. RE 206-1

Addition of Suffix -1 to Chassis No.; addition of 12SQ7 tube, and deletion of 14R7 tube; addition of hum bucking circuit in output.

CHANGES COVERED IN THIS SUPPLEMENT

1. Tube Complement.
2. Parts List.
3. Tube Layout Drawing.
4. Location of Parts under Chassis.
5. Schematic Diagram.

TUBES & FUNCTIONS

12SK7	RF Amp.
12SA7	Mixer-oscillator
12SK7	IF Amp.
12SQ7	DET-AVC-AF Amp.
35L6	Output
35Z5GT	Rectifier

NOTE: Some of the RE-206-1 Chassis use the same Tone Control Circuit as the RE-206 (A 20,000 ohm Control and .1 mfd. Condenser in the plate circuit of the output tube, with a 470,000 ohm fixed resistor in the grid circuit). For information on these sets refer to the Schematic & Parts Layout drawings in the original RE-206 Bulletin. The Reference Numbers on the Parts List and all drawings have been rearranged in this supplement, so that each number is used only once on the Schematic drawing. Therefore C-13 and R-13 in this supplement are C-14 & R-14 in the original bulletin. The 470,000 ohm grid resistor is designed as R-11 in both the original bulletin and this supplement.

NOTE: The AC hum on many of the sets now in the field can be decreased by making the above resistor and condenser change.

REF. NO.	PART NO.	DESCRIPTION
R1	C20060-103	Resistor, 10,000 ohm ½ W

Subject:
Revision of the hum bucking circuit to reduce AC hum.

Changes covered in this supplement:

Capacity of C12 condenser connected from B+ to cathode of the 35L6 tube is changed from .1 mfd. to .03 mfd. Resistance of R12 resistor connected from B+ to cathode of the 35L6 tube is changed from 12,000 ohms to 15,000 ohms.

Changes in Parts List:

Delete:

Ref. No.	Part No.	Description
R12	C20070-123	Resistor 12,000 ohms, 1 Watt
C12	C20068-104	Condenser, 1 mfd., 400 V.P.T.

Add:

35Z5/GT	Rectifier

GENERAL INFORMATION

Models 5D8, 581 & 100 are superheterodyne receivers employing four tubes plus one rectifier. These models are for operation on AC or DC current. All three models employ a four inch permanent magnet speaker and are virtually identical from an electrical standpoint. The model 100 does not utilize the Stationized Dial. Models 5D8 and 100 are enclosed in a plastic cabinet of ivory or walnut, while the 581 is housed in a wood cabinet of walnut or natural design.

SPECIAL SERVICE INFORMATION

Stage Gain Measurements:
Measurements taken with volume control maximum – AVC shorted out.

Standard Output.....50 milliwatts
Dummy Antenna.....200 Mmf.

Converter Grid to 1st I-F Grid.....71X at 1000 KC
Converter Grid to 1st I-F Grid.....78X at 455 KC
1st I-F Grid to 2nd Detector.....77X at 455 KC
Overall Audio Gain...0.8 volts at Volume Control for 0.5 watts output at 400 cycles.

Oscillator Grid Voltages:
At 117 volts AC line. Measurements made with an AC vacuum tube voltmeter, input loading above 10 megohms.
600 KC.....15 volts AC 1500 KC.....20 volts AC

D.C. Resistance Measurements:

1st I-F Coil	
Primary....17.5 ohms	Secondary.....17.5 ohms
2nd I-F Coil	
Primary....14.5 ohms	Secondary.....14.5 ohms
Oscillator Coil	
Primary.... 1.2 ohms	Secondary..... 4.5 ohms

NOTE: Due to the variation in winding methods, the D.C. resistance on all coils is subject to a 20% tolerance.

ALIGNMENT PROCEDURE

Alignment Procedure consists of the four steps outlined in the Alignment Precedure Chart.

For step No. 1, I-F Alignment, connect the leads of a test oscillator to the mixer grid and ground buss through an .01 Mfd. capacitor (dummy load). Upon completion of this step, "rock" the variable condenser to assure that the I-F's have been aligned to the correct frequency. Output should remain constant at any setting of the variable condenser.

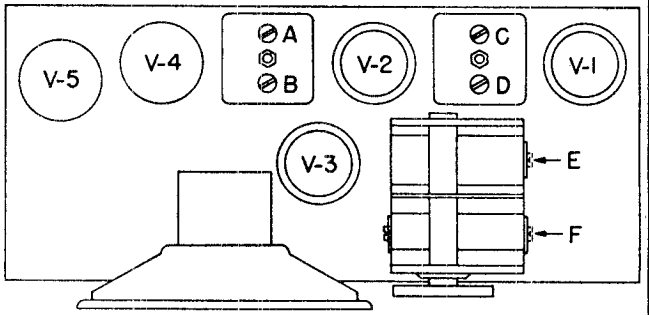
Steps 2 & 3 employ a Hazeltine Standard Test Loop No. 1150 or a reasonable substitute. Connect the test oscillator leads across this loop and place it in a vertical position about two feet from the receiver loop.

IMPORTANT NOTICE: Make certain that each step is done with a minimum input signal.

ALIGNMENT CHART

STEP	CONNECT TEST OSC. TO	TEST OSC. SETTING	POINTER SETTING	ADJUST FOR MAX. OUTPUT
1	Mixer Grid & Grd. (.01 Mfd. Cap)	455 KC	540 KC	Trimmers A, B, C & D
2	Standard Test Loop*	1600 KC	1600 KC	Trimmer E to 1600 KC
3	Standard Test Loop*	1500 KC	1500 KC	Trimmer F
4	Check Stationizing. Adjust pointer if stations are uniformly off in one direction.			

*NOTE: Hazeltine Standard Test Loop No. 1150 or a reasonable Substitute.



Trimmer Location

Socket Voltages:
All D.C. voltages measured with a vacuum tube voltmeter from socket contacts to ground buss. A.C. voltages measured with a 1000 ohms per volt A.C. meter from socket contacts to ground buss.* Volume Control maximum. No signal. 117 volts A.C. line. All voltages shown are positive D.C. unless otherwise noted.

*NOTE: Filament voltages should be measured across the filament of the tube.

GENERAL INFORMATION

Model 791 is a PhonOcord console employing six tubes plus a rectifier and a ten inch permanent magnet speaker.

Listed below are some of the features incorporated in this model.

1. Standard Broadcast Superheterodyne receiver.
2. Automatic Home Recording with Public Address System.
3. Phonograph with automatic record changer.

To service tubes, remove back. For tube location refer to tube layout diagram.

For service information concerning the automatic record changer and recorder, refer to service instructions, Automatic Record Changer – Recorder Combination (Packard-Bell Part No. 58004-B).

SPECIAL SERVICE INFORMATION

Stage Gain Measurements:

Measurements taken with volume and tone controls maximum. Selector Switch in Radio Receive position. AVC shorted out.

Standard Output . . . . 50 milliwatts
Dummy Antenna . . . . 200 Mmf.

Antenna to Converter Grid	4.25X at 1000 KC
Converter Grid to 1st I-F Grid	62X at 1000 KC
Converter Grid to 1st I-F Grid	71X at 455 KC
1st I-F Grid to 2nd Detector	69X at 455 KC
Overall Audio Gain . 260X at .5 watts	400 cycles

Oscillator Cathode Voltages:

Measured at 117 volts AC line with AC vacuum tube voltmeter, input loading above 10 megohms.

1600 KC . . . . . 2.15 volts AC
1000 KC . . . . . 2.0 volts AC
600 KC . . . . . 2.2 volts AC

D.C. RESISTANCE MEASUREMENTS

1st and 2nd I-F Coils:
Primary . . . . . 17 ohms
Secondary . . . . . 17 ohms*

*NOTE: To obtain the true reading of the secondary of the 2nd I-F Coil it must be removed from the can. This is because of the 47K resistor inside the can.

Oscillator Coil:
Start to Finish . . . . 8 ohms
Start to Tap . . . . . 7 ohms

NOTE: Due to variation in winding methods, the D. C. resistance on all coils is subject to a 20% tolerance.

HOW TO CHECK COMPRESSION VOLTAGE

Turn the Selector Switch to Radio Record position. Feed a 1 volt (RMS) 1000 cycle signal into the diode return of the 2nd I. F. (brown lead). Connect the leads of a vacuum tube voltmeter to point "A" (see Schematic Diagram) and ground. The voltage at this point should be approximately a minus 2.25 volts.

BRIEF DESCRIPTION OF COMPRESSION CIRCUIT

One diode section of the 6H6 serves as the compressor rectifier. The compressor system is automatic and is in the circuit on both record positions. A portion of the output voltage is rectified by the 6H6 and varies the grid bias of the first audio, 6SF7.

RECORDING HEAD PRESSURE

The proper recording head pressure is 1¼ Oz. Adjustment of this pressure is made by turning the small screw on the top of the recording arm. This adjustment is very critical and should be made in quarter turns. TURN THE SCREW CLOCKWISE TO INCREASE THE CUTTING DEPTH and COUNTERCLOCKWISE TO DECREASE THE CUTTING DEPTH.

This adjustment is made at the factory with an ordinary pocket postal scale, consequently, field adjustments should be made in a like manner.

ALIGNMENT PROCEDURE

Alignment Procedure consists of the four steps outlined in the Alignment Procedure Chart.

Connect the test oscillator leads to the mixer grid and ground in series with an .01 Mfd. capacitor (dummy load) for step No. 1, I-F Alignment. Upon completion of this step, "Rock" the variable condenser to assure that the I-F's have been aligned to the proper frequency. Output should remain constant for any setting of the variable condenser.

Use the Hazeltine Test Loop No. 1150 or a reasonable substitute for the balance of the alignment. Place the test loop about two feet from the receiver loop in a vertical position.

IMPORTANT NOTICE: Make certain that each alignment step is done with a minimum input signal.

ALIGNMENT CHART

STEP	CONNECT TEST OSC. TO	TEST OSC. SETTING	POINTER SETTING	ADJUST FOR MAX. OUTPUT
1	Mixer Grid & Grd. (.01 Mfd. Cap.)	455 KC	540 KC	Trimmers A, B, C, & D
2	Standard Test Loop*	1620 KC	1620 KC	Trimmer F to 1620 KC
3	Standard Test Loop*	1500 KC	1500 KC	Trimmer E
4	Check stationizing. Slide pointer on string if stations are uniformly off in one direction.			

*NOTE: Hazeltine Test Loop No. 1150 (or a reasonable substitute).

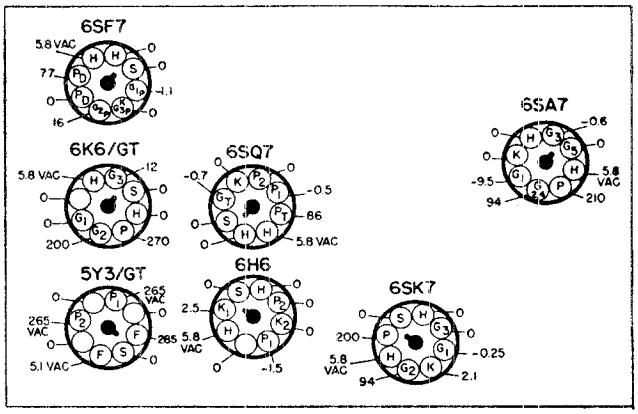

FIGURE 3 – SOCKET VOLTAGES

SOCKET VOLTAGES

All D.C. Voltages measured with a vacuum tube voltmeter from socket contacts to chassis. A.C. Voltages measured with a 1000 ohms per volt A.C. meter from socket contacts to chassis. Volume and tone controls maximum. Switch in Radio position. No signal. 117 volts A.C. line. All voltages shown are positive D.C. unless otherwise noted.

TABLE OF REPLACEABLE PARTS

Part No.	Ref. Symbol	Description
21077		Cabinet
23514	C1A,B	Capacitor, variable
23915	C2	Capacitor, ceramic, 220 Mmf. 20%
23017	C3	Capacitor, tubular, .05 Mf. 200 V.
23912	C4	Capacitor, ceramic, 47 Mmf. 20%
23004	C5-1 to 2	Capacitor, tubular, .005 Mf. 600 V.
23019	C6	Capacitor, tubular, .1 Mf. 200 V.
23020	C7-1 to 2	Capacitor, tubular, .2 Mf. 400 V.
23009	C8	Capacitor, tubular, .05 Mf. 400 V.
23007	C9-1 to 2	Capacitor, tubular, .02 Mf. 600 V.
23001	C10	Capacitor, tubular, .001 Mf. 600 V.
23023	C11	Capacitor, tubular, .01 Mf. 500 V.
24006	C12	Capacitor, electrolytic, 25 Mf. 25 V.
24003	C13-1 to 2	Capacitor, electrolytic, 20 Mf. 350 V.
29325	L-1	Coil, loop
29004	L-2	Coil, 1st. I-F Transformer
29007	L-3	Coil, 2nd I-F Transformer
29202	L-4	Coil, oscillator
32007-1		Cord, A.C. 8'
32011		Cord, A.C. 6'
36024		Cartridge, cutter (magnetic) 3.2ohms
38107		Dial, scale stationized
38108		Dial, Export and East
52037BG		Knob
54001		Lamp, dial, T-44, 0.250 Amp.
57010		Microphone, with cable (crystal)
57010-1		Microphone, base CB
58004E		Changer (RC-130L)
66004		Plug, pin
66013		Plug, mike
67031		Pointer, assembly
68029		Cartridge, phono pick-up (Shure P-30S) crystal
69001		Pulley
69003C		Pulley
69006A		Pulley
73165	R1-1 to 2	Resistor, 2.2 megohm ½W. 20%
73041	R2	Resistor, 22K ohm, ½W. 10%
73437	R3	Resistor, 10,000 ohm, 2W. 10%
73045	R4-1 to 2	Resistor, 47,000 ohm, ½W. 10%
73169	R5-1 to 5	Resistor, 4.7 megohm, ½W. 20%
73157	R6-1 to 2	Resistor, 470,000 ohms, ½W. 20%
73008	R7	Resistor, 39 ohm, ½W. 10%
73163	R8	Resistor, 1.5 megohm, ½W. 20%
73153	R9-1 to 4	Resistor, 220,000 ohm, ½W. 20%
73022	R10	Resistor, 560 ohm, ½W. 10%
73016	R11	Resistor, 180 ohm, ½W. 10%
73161	R12-1 to 2	Resistor, 1 megohm, ½W. 20%
73043	R13	Resistor, 33,000 ohm, ½W. 10%
25506C	R14	Control, tone
25010B	R15	Control, volume (tap @ 20K ohms
73221	R16	Resistor, 470 ohm, 1W. 10%
73601	R17	Resistor, ½ ohm, 1W. W.W.
73430	R18	Resistor, 2,700 ohm, 2W. 10%
77016B		Shaft, dial
78008		Shield, mike plug
79002		Socket, tube
79004		Socket, mike
79005		Socket, pickup
79007		Socket, A.C.
79010B		Socket, lamp
83705		Speaker
86009B		Switch, phono, etc.
89016B	T-1	Transformer, power
89402	T-2	Transformer, output 8000/3.2 ohms

MODELS 1181, 1181A

SPECIFICATIONS

Overall Dimensions:

	1181	1181A		1181	1181A
Height	33½"	25¼"	Depth	17"	30¼"
Width	36"	17¾"	Weight	109 lbs.	85 lbs.

Electrical Rating:

Line Voltage . . . . . 110-120 volts, A.C. 50,60 C.P.S.
Power Consumption . . 110 watts including phonograph

Tuning Frequency Range:

Standard Broadcast . . . . 540 to 1620 KC
Frequency Modulation . . . . 87.5 to 108.5 MC

Intermediate Frequency:

AM . . . . . 455 KC
FM . . . . . 10.7 MC

Electrical Output:

Undistorted . . . . . 4.0 watts
Maximum . . . . . 6.0 watts

Loudspeaker:

Type . . . . . Permanent Magnet
Outside Cone Diameter . . . . 10"
Voice Coil Impedance . . . . . 3.2 ohms at 400 C.P.S.
Magnet Rating . . . . . 4.6 Oz. Alnico V

Tubes:

Tube	No.	Function
6BA6	V-1	R-F Amplifier
6BA6	V-2	Mixer
6BA6	V-3	I-F Amplifier
6BA6	V-4	Driver
6AL5	V-5	FM Detector
6H6	V-6	AM Detector–AVC–Compressor
6SQ7	V-7	1st Audio Amplifier
6SK7	V-8	2nd Audio Amplifier
6AU6	V-9	Oscillator
6V6-GT	V-10	Output
5Y3-GT	V-11	Rectifier
6U5-6G5	V-12	Tuning Eye

GENERAL INFORMATION

These Models utilize a 2 band PhonOcord chassis. The Model 1181 is housed in a console cabinet, and the Model 1181A in an Armchair type cabinet. Both Models employ ten tubes plus rectifier and tuning eye and a 10 inch permanent magnet speaker. Listed below are some of the features included in these Models.

1. Standard Broadcast from 540 to 1620 KC.
2. Frequency Modulation from 87.5 to 108.5 MC.
3. Tuning Eye for accurate tuning of stations.
4. Automatic Home Recording combined with Automatic Record Changer.

For information concerning the Home Recording, Automatic Record Changer unit, refer to Service Instructions, Automatic Record Changer–Recorder Combination (Packard-Bell Part No. 58004-B).

RECORDING HEAD PRESSURE

The proper recording head pressure is 1¼ Oz. Adjustment of this pressure is made by turning the small screw on the top of the Recording Arm. This adjustment is very critical and should be made in quarter turns. TURN THE SCREW CLOCKWISE TO INCREASE CUTTING DEPTH, and COUNTER - CLOCKWISE TO DECREASE CUTTING DEPTH.

This adjustment is made at the factory with an ordinary pocket type postal scale, consequently, field adjustments should be made in a like manner.

BRIEF DESCRIPTION OF COMPRESSION CIRCUIT

One diode section of the 6H6 serves as the compressor rectifier. The compression system is automatic, and is in the circuit on both record positions. A portion of the output voltage is rectified by the 6H6 and varies the grid bias of the 2nd Audio, 6SK7.

HOW TO CHECK COMPRESSION VOLTAGE

Turn the Selector Switch to Radio Record position. Feed a 2 volt (RMS) 1000 cycle signal into the diode return of the 2nd I-F (point K, schematic). Connect the leads of a vacuum tube type voltmeter to point L (schematic) and ground. The voltage at this point should be approximately minus 2.5 volts.

SPECIAL SERVICE INFORMATION

Stage Gain Measurements, AM

Measurements taken with volume and tone controls maximum. Band Switch in Standard Broadcast position. AVC shorted out.

Standard Output . . . . 50 milliwatts
Dummy Antenna . . . . 200 Mmf.
Antenna Post to R-F Grid . . . . . 12X at 1000 KC
R-F Grid to Converter Grid . . . . . 9X at 1000 KC
Converter Grid to 1st I-F Grid . . . . 20X at 455 KC
1st I-F Grid to 2nd Detector . . . . . 40X at 455 KC
Overall Audio Gain . 30 millivolts to produce 50 milliwatts at 1000 cycles.

Stage Gain Measurements, FM

Measurements taken with volume and tone controls maximum. Band Switch in Frequency Modulation position. AVC shorted out.

Dummy Antenna . . . . 270 ohms
Dipole Terminal to R-F Grid . . . . . 0.9X at 98 MC
Converter Grid to 1st I-F Grid . . . . 12X at 10.7 MC
1st I-F Grid to Driver Grid . . . . . 45X at 10.7 MC

Oscillator Cathode Voltages

Measured at 117 volts AC line with an AC vacuum tube voltmeter, input loading above 10 megohms.

1620 KC . . . . . 8.5 volts AC
1200 KC . . . . . 8.2 volts AC
800 KC . . . . . 5.5 volts AC
540 KC . . . . . 2.5 volts AC

Oscillator Grid Current, FM

Measured at 117 volts AC line, with a DC microammeter connected in series with ground end of the 22,000 ohm grid resistor.

108 MC . . . . . 190 microamps
98 MC . . . . . 200 microamps
88 MC . . . . . 220 microamps

D.C. RESISTANCE MEASUREMENTS

I-F Coils:

Type	Primary	Secondary
1st AM	7.5	7.5
2nd AM	8.0	8.0
1st FM	0.75	0.75
2nd FM	1.5	0.5
Ratio Detector	1.5	0.1*

*Either side to tertiary, 0.25 ohms

Oscillator Coil:
Primary . . . . . 1 ohm
Secondary . . . . . 6 ohms
Antenna Coil:
Start to Finish . . . . 12.2 ohms
Start to Tap . . . . . 10.5 ohms
R-F Coil:
Primary . . . . . 5.8 ohms
Secondary . . . . . 4.2 ohms

NOTE: Due to the variation in winding methods, the D.C. resistance on all coils is subject to a 20% tolerance.

ALIGNMENT PROCEDURE—AM

Alignment procedure consists of the steps outlined in the Alignment Chart. Make certain that each step is done with a minimum input signal. Connect voltmeter to AVC (point J on schematic).

ALIGNMENT CHART—AM

STEP	CONNECT TEST OSC. TO	TEST OSC. SETTING	POINTER SETTING	ADJUST FOR MAX. OUTPUT
1	Mixer Grid & Ground	455 KC	540 KC	S7, 8, 9, 10
2	R-F Grid & Ground	1500 KC	1500 KC	Trimmers F & G
3	R-F Grid & Ground	600 KC	600 KC	Trimmer B
4	Repeat Step No. 2			
5	Standard Test Loop	1500 KC	1500 KC	Trimmer A
6	Check stationizing. Slide pointer on string if stations are uniformly off in one direction.			

Equipment Required for FM Alignment

1—Signal Generator to cover FM band (88 to 108 MC).

2—Vacuum Tube Type Voltmeter similar to "Voltohmyst" or "Polymeter."

ALIGNMENT CHART – FM

STEP	CONNECT TEST OSC. TO	TEST OSC. SETTING	POINTER SETTING	CONNECT VOLTMETER TO	ADJUST FOR MAX. OUTPUT
1	R-F Grid & Ground	10.7 MC	88 MC	Point I	S12, 6, 5, 4, 3
2	Adjust S11 for zero center			Point H	
3	Repeat Steps 1 and 2.				
4	Doublet Terminals thru 270 ohms	108 MC	108 MC	Point I	Trimmers D, C, E
5	Doublet Terminals thru 270 ohms	88 MC	88 MC	Point I	S1, 2
6	Repeat Step No. 4.				

Note: Rock variable condenser for Step No. 4.

SOCKET VOLTAGES

All D.C. voltages measured with a vacuum tube voltmeter from socket contacts to chassis. A.C. voltage measured with a 1000 ohms per volt A.C. meter from socket contacts to chassis. Volume and tone controls maximum. Switch in Radio position. No signal. 117 volts A.C. line. All voltages shown are positive D.C. unless otherwise noted.

MODEL CR-10

SPECIFICATIONS

CIRCUIT ..... 6-tube superheterodyne

FREQUENCY RANGES
- Broadcast (BC) ..... 540 1600 kc.
- Short Wave 1 (SW1) ..... 2.7—5.2 mc.
- Short Wave 2 (SW2) ..... 5 - 7.1 mc.
- Short Wave 3 (SW3) ..... 7—10.1 mc.
- Short Wave 4 (SW4) ..... 9.2 -14 mc.
- Short Wave 5 (SW5) ..... 13.8—18 mc.

AUDIO OUTPUT ..... 3 watts

PUSH BUTTONS ..... 6 (used for band switching)

POWER INPUT ..... 7 amperes at 6.6 volts, d.c., with p-m speaker; 8 amperes at 6.6 volts, d.c., with electro-dynamic speaker

INTERMEDIATE FREQUENCY ..... 455 kc.

AERIAL ..... Any Philco Auto-Radio Aerial

PHILCO TUBES (6) 6BA6 (2), 6BE6, 6AV6, 6X4, 7C5

Circuit Description

Philco Auto Radio Model CR-10 is a six-tube superheterodyne, providing reception on the standard broadcast band and five short-wave ranges between 2.7 mc. and 18.0 mc. The radio is of the universal-mounting type; the speaker and control head are mounted separately.

The circuit employs a 6BA6 r-f amplifier, a 6BE6 converter, a 6BA6 i-f amplifier, a 6AV6 detector-a.v.c.—1st audio, and a 7C5 output amplifier. The power supply includes a non-synchronous vibrator and a 6X4 rectifier tube.

A ganged variable condenser tunes the aerial, r-f, and oscillator circuits. The i-f transformers are permeability tuned.

S100	Switch, off-on (in control head)	Part of R202
S101	Switch, muting (in control head)	Part of Z101
S102	Switch, push-button, PB1 (in control head)	Part of Z101
S103	Switch, push-button, PB2 (in control head)	Part of Z101
S104	Switch, push-button, PB3 (in control head)	Part of Z101
S105	Switch, push-button, PB4 (in control head)	Part of Z101
S106	Switch, push-button, PB5 (in control head)	Part of Z101
S107	Swtich, push-button, PB6 (in control head)	Part of Z101
S108	Switch, solenoid	Part of Z100
T100	Transformer, power	32-8313
VB100	Vibrator	83-0026
WS-1 (F)	Switch-wafer section (homing)	Part of Z100

Band switching is accomplished by the solenoid-actuated wafer switch, which is operated by the push buttons on the control head. The pilot-lamp arrangement is such that the push button of the band in use is illuminated.

TROUBLE-SHOOTING *Procedure*

For rapid trouble shooting, the radio circuit is divided into four sections, with test points specified for each section; these sections and test points are indicated in the schematic diagram. The trouble-shooting procedure given for each section includes a simplified test chart and a bottom view of the chassis showing the locations of the test points and the components of that section.

In each chart, the first step is a master check for determining whether trouble exists in that section, without going through the entire chart.

Failure to obtain the "NORMAL INDICATION" in any given step indicates trouble within the circuit under test.

After isolating the trouble to a single stage, the defect is located by: first, testing the tube; second, measuring tube electrode voltages; third, measuring circuit resistances; fourth, substituting condensers. The trouble revealed should be corrected before testing further.

Preliminary Checks

To avoid possible damage to the radio, the following preliminary checks should be made before connecting the radio to a source of power.

1. Inspect both the top and bottom of the chassis. Make sure that all tubes are secure in the proper sockets, and look for any broken or shorted connections, burned resistors, or other obvious indications of trouble.

2. Measure the resistance between B+ (pin 7 of the 6X4 rectifier tube) and the radio chassis. When the ohmmeter test leads are connected in the proper polarity, the highest resistance reading will be obtained. If the reading is lower than 2800 ohms, check condensers C106A and C106B for leakage or shorts.

The resistance value above, which is much lower than normal, does not represent a quality check of these condensers; the value given is the lowest at which the rectifier will operate safely while the voltage checks of Section 1 (power supply) are performed.

Socket, control-head plug	27-6234
Speaker cable	41-3801

CONTROL UNITS

Parts for control units are listed in CONTROL UNITS FOR PHILCO UNIVERSAL (CR-MODEL) AUTO RADIOS, PR-1508, with the following exceptions:

Chrysler

Dial	27-5986
Pointer	56-4362FCP

Ford

Dial	27-5987
Pointer	56-4362FCP

Chevrolet

Dial	54-5004
Pointer	56-4362FCP

Universal

Dial	27-5985
Pointer	56-4362FCP

DIAL CORDS

The details of drive-cord installations are illustrated in CONTROL UNITS FOR PHILCO UNIVERSAL (CR-MODEL) AUTO RADIOS, PR-1508. Use drive cord Part No. 45-8750 (25-ft. spool); lengths and loop sizes are given below.

CONTROL UNIT	CORD LENGTH	LOOP DIAMETER
Underdash	15-3/4"	5/16"
Ford	19"	5/16"
Chevrolet	18"	5/16"
Chrysler	14-3/4"	1/8"

TROUBLE SHOOTING

Section 1

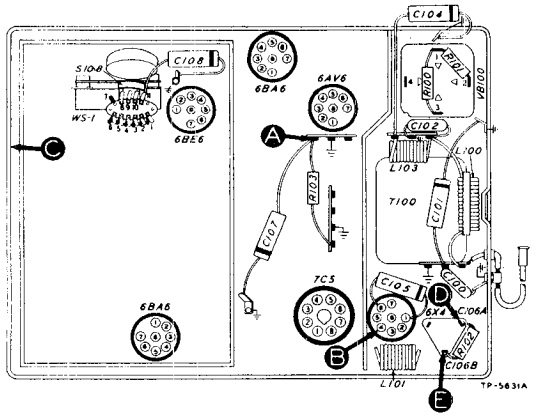
POWER SUPPLY

Make the tests for this section with a d-c voltmeter; connect the leads between the chassis, test point C, and the test points indicated in the chart.

The voltage readings given were taken with a 20,000-ohms-per-volt meter at an input voltage of 6.6 volts, d.c.

Set the volume control to minimum, and the tone control fully clockwise. Depress the BC push button.

Follow the steps in the order given. If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 2 (audio circuits); if not, isolate and correct the trouble in this section.



Bottom View, Showing Section 1 Test Points

STEP	TEST POINT	NORMAL INDICATION	ABNORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	168v		Trouble in this section. Isolate by the following tests.
2	B	6.6v	No voltage	Open: L100, L103, S100, F100. Shorted: C100, C101, C102, C103, C104.
			Low voltage	Leaky: C100, C101, C102, C103, C104. Defective battery.
3	D	245v	No voltage	Defective: 6X4, VB100. Open: T100. Shorted: C105, C106A. Leaky: C106B, C107.
			Low voltage	Defective: 6X4, VB100. Leaky: C106A. Shorted: C106B, C107.
			High voltage	Open: T200*, R206*.
4	E	230v	No voltage	Open: R102. Shorted: C106B.
			Low voltage	Increased resistance: R102. Leaky: C106B.
			High voltage	Shorted: C206*.
5	A	168v	No voltage	Open: R103. Shorted: C107, C419*.
			Low voltage	Increased resistance: R103. Leaky: C107.
Listening test: Abnormal hum may be caused by open or leaky: C105, C106A, C106B, C107.				

*This part, located in another section, may cause an abnormal indication in this section.

TROUBLE SHOOTING

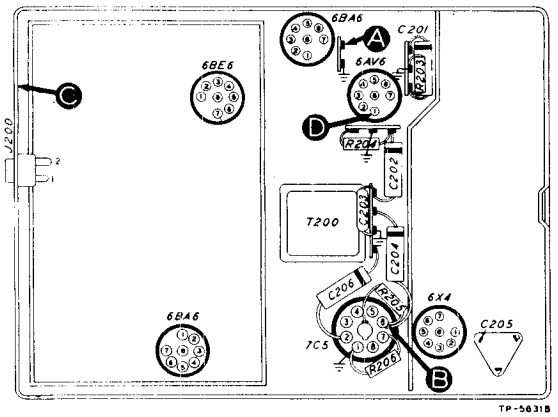
Section 2

AUDIO CIRCUITS

For the tests in this section, use an audio-frequency signal generator. Connect the generator ground lead to the chassis, test point C; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Set the volume control to maximum, and the tone control counterclockwise.

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 3 (i-f, detector, and a-v-c circuits); if not, isolate and correct the trouble in this section.



Bottom View, Showing Section 2 Test Points

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	Loud, clear speaker output with moderate generator input.	Trouble in this section. Isolate by the following tests.
2	B	Clear output with strong input.	Defective: 7C5, LS200. Open: R206, R205, T200, C205. Shorted: C204, C205, C206.
3	D	Loud, clear output with moderate input.	Defective: 6AV6. Open: C204, R203, R204. Shorted: C203, C202 (rotate through range), S101*.
4	A	Loud, clear output with moderate input.	Open: R200 (rotate through range), C201. Open or shorted: J100, PL100.
Listening test: Distortion may be caused by leaky C201 or C204.			

*This part, located in another section, may cause an abnormal indication in this section.

© John F. Rider

TROUBLE SHOOTING

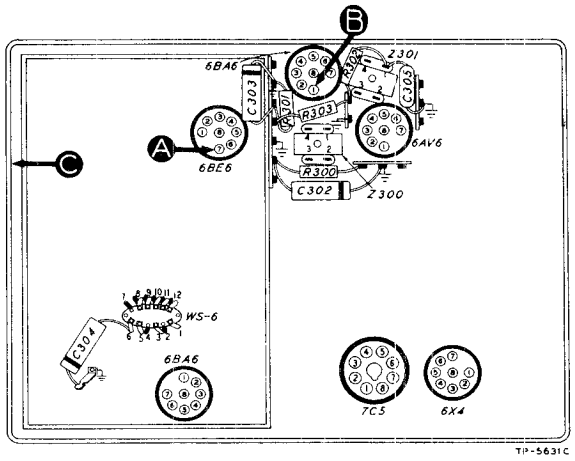
Section 3

I-F, DETECTOR, AND A-V-C CIRCUITS

For the tests in this section, use an r-f signal generator, with modulated output, set at 455 kc. Connect the generator ground lead to the chassis, test point C; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Set the volume control to maximum, and the tone control fully counterclockwise. Depress the BC push button, and set the radio tuning to the low-frequency end of the dial.

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 4 (r-f and converter circuits); if not, isolate and correct the trouble in this section.



Bottom View, Showing Section 3 Test Points (location of test point A shown in figure 4)

To provide a complete i-f amplifier check, test point A for this section is placed at the grid of the mixer, in Section 4; therefore, the effectiveness of step 1 as a master check is dependent upon the condition of certain parts in Section 4; these parts are listed below under "POSSIBLE CAUSE OF ABNORMAL INDICATION."

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	Loud, clear speaker output with weak generator input.	Trouble in this section. Isolate by the following tests.
2	B	Loud, clear output with moderate input.	Defective: 6BA6. Misaligned: Z301. Open: R300, R301, R302, C301A, C301B, L301A, L301B. Shorted: C300B, C301A, C301B, C302, C303, C305, L300B, L301A, L301B.
3	A	Loud, clear output with weak input.	Defective: 6BE6*. Misaligned: Z300. Open: C300A, C300B, L300A, L300B. Shorted: C300A, L300A, L300B, C411*.

*This part, located in another section, may cause an abnormal indication in this section.

TROUBLE SHOOTING

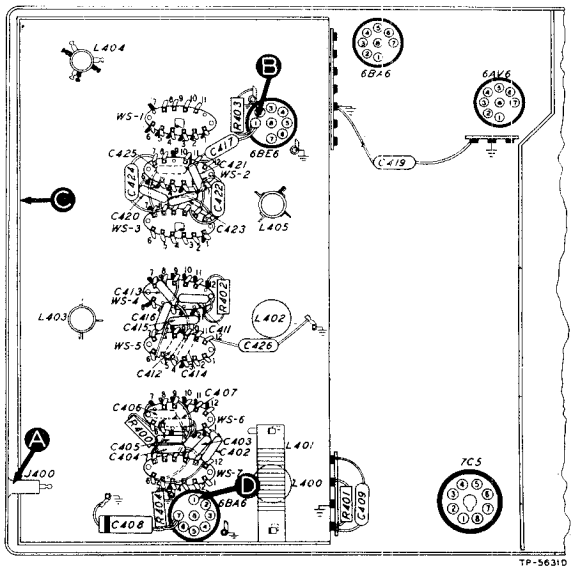
Section 4

R-F AND CONVERTER CIRCUITS

For the tests in this section, with the exception of the oscillator tests, use an r-f signal generator, with modulated output. Connect the generator ground lead to the chassis, test point C; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Set the volume control to maximum, and the tone control fully counterclockwise.

Set the band push-button, tuning control, and signal-generator frequency as indicated in the chart.
OSCILLATOR TESTS: Connect the positive lead of a high-resistance d-c voltmeter to the chassis, test point C; connect the prod end of the negative lead through a 100,000-ohm isolating resistor to the 6BE6 oscillator grid (pin 1), test point B. Use a suitable meter range, such as 0—10 volts. Proper operation of the oscillator is indicated by negative voltages of approximately the values given in the chart (measured with 20,000-ohms-per-volt meter), throughout the tuning range.



Bottom View, Showing Section 4 Test Points (location of C419 shown in figure 3)

If the "NORMAL INDICATION" is obtained in steps 1, 5, 9, 13, 17, and 21, further tests should be unnecessary; if not, isolate and correct the trouble in this section. If the trouble is not revealed by the tests for this section, check the alignment.

Section 4 (Cont.)

BC CIRCUITS

STEP	TEST POINT	SIG. GEN. FREQ.	BAND PUSH BUTTON	RADIO TUNING	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	1000 kc.	BC	Tune to signal.	Loud, clear output with very low generator input.	Trouble in BC circuits. Isolate by steps 2, 3, and 4.
2	B		BC	Tune through range.	-2.2v to -3.6v	Defective: 6BE6, WS-3 (F), WS-3 (R), WS-2 (F), WS-2 (R). Open: R403, C417, C420. Shorted: C417, L404A, C418A, C420, C400C.
3	D	1000 kc.	BC	Tune to signal.	Same as step 1.	Defective: 6BA6, 6BE6, WS-4 (F), WS-5 (F), WS-5 (R). Open: R404, R401, L402A, R402, C411, C409. Shorted: C409, C400B, C411.
4	A	1000 kc.	BC	Tune to signal.	Same as step 1.	Defective: WS-7 (F), WS-7 (R), WS-6 (F). Open: C401A, L400A, C407, R400, J400. Shorted: C400A, C401A, C407, L400A.

SW1 CIRCUITS

5	A	4.0 mc.	SW1	Tune to signal.	Same as step 1.	Trouble in SW1 circuits. Isolate by steps, 6, 7, and 8.
6	B		SW1	Tune through range.	-2.5v to -3.5v	Defective: WS-3 (F), WS-3 (R), WS-2 (F), WS-2 (R). Open: C418B, L404B, C421. Shorted: C418B, L404B, C421, C418C.
7	D	4.0 mc.	SW1	Tune to signal.	Same as step 1.	Defective: WS-5 (F), WS-5 (R), WS-4 (F), WS-4 (R). Open: L402B, C410B, C416. Shorted: L402B C410B, C416, C426.
8	A	4.0 mc.	SW1	Tune to signal.	Same as step 1.	Defective: WS-7 (F), WS-7 (R), WS-6 (F). Open: L400B, C401B, C406. Shorted: L400B, C401B, C406.

SW2 CIRCUITS

9	A	6.0 mc.	SW2	Tune to signal.	Same as step 1.	Trouble in SW2 circuits. Isolate by steps 10, 11, and 12.
10	B		SW2	Tune through range.	-3.7v to -4.2v	Defective: WS-3 (F), WS-3 (R), WS-2 (F), WS-2 (R). Open: C418C, C422, L404B. Shorted: C418C, C422, L404B.
11	D	6.0 mc.	SW2	Tune to signal.	Same as step 1.	Defective: WS-5 (F), WS-5 (R), WS-4 (F), WS-4 (R). Open: C415, L402B. Shorted: C415, L402B.
12	A	6.0 mc.	SW2	Tune to signal.	Same as step 1.	Defective: WS-7 (F), WS-7 (R), WS-6 (F), WS-6 (R). Open: C405, L400B. Shorted: C405, L400B.

SW3 CIRCUITS

13	A	9.0 mc.	SW3	Tune to signal.	Same as step 1.	Trouble in SW3 circuits. Isolate by steps 14, 15, and 16.
14	B		SW3	Tune through range.	-2.7v to -3.1v	Defective: WS-3 (F), WS-3 (R), WS-2 (F), WS-2 (R). Open: C418D, L405, C423, C418F. Shorted: C418F, C418D, L405, C423.
15	D	9.0 mc.	SW3	Tune to signal.	Same as step 1.	Defective: WS-5 (F), WS-5 (R), WS-4 (F), WS-4 (R). Open: L403, C410C, C414. Shorted: L403, C410C, C414.
16	A	9.0 mc.	SW3	Tune to signal.	Same as step 1.	Defective: WS-7 (F), WS-7 (R), WS-6 (F), WS-6 (R). Open: L401, C404, C401C. Shorted: L401, C401C, C404.

SW4 CIRCUITS

STEP	TEST POINT	SIG. GEN. FREQ.	BAND PUSH BUTTON	RADIO TUNING	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
17	A	12.0 mc.	SW4	Tune to signal.	Same as step 1.	Trouble in SW4 circuits. Isolate by steps 18, 19, and 20.
18	B		SW4	Tune through range.	-3.3v to -3.6v	Defective: WS-3 (F), WS-3 (R), WS-2 (F), WS-2 (R). Open: C418E, C424, L405. Shorted: C418E, C424, L405.
19	D	12.0 mc.	SW4	Tune to signal.	Same as step 1.	Defective: WS-5 (F), WS-5 (R), WS-4 (F), WS-4 (R). Open: C413, L403. Shorted: C413, L403.
20	A	12.0 mc.	SW4	Tune to signal.	Same as step 1.	Defective: WS-7 (F), WS-7 (R), WS-6 (F), WS-6 (R). Open: C403, L401. Shorted: C403, L401.

SW5 CIRCUITS

21	A	15.0 mc.	SW5	Tune to signal.	Same as step 1.	Trouble in SW5 circuits. Isolate by steps 22, 23, and 24.
22	B		SW5	Tune through range.	-3.9v to -4.0v	Defective: WS-3 (F), WS-3 (R), WS-2 (F), WS-2 (R). Open: C425, L405. Shorted: C425, L405.
23	D	15.0 mc.	SW5	Tune to signal.	Same as step 1.	Defective: WS-5 (F), WS-5 (R), WS-4 (F), WS-4 (R). Open: C412, L403. Shorted: C412, L403.
24	A	15.0 mc.	SW5	Tune to signal.	Same as step 1.	Defective: WS-7 (F), WS-7 (R), WS-6 (F), WS-6 (R). Open: C402, L401. Shorted: C402, L401.

ALIGNMENT PROCEDURE

NOTE: THE CONTROL UNIT SHOULD BE PLUGGED INTO THE RADIO

DIAL POINTER: With tuning cable disengaged, set tuning gang to full-mesh position; turn tuning control to low-frequency end until pointer stops, then engage cable.

OUTPUT METER: Connect across voice-coil terminals.

SIGNAL GENERATOR: Connect ground lead to chassis; connect output lead as indicated in chart. Use modulated output.

RADIO CONTROLS: Turn volume control to maximum, and tone control fully counterclockwise. Set dial as indicated in chart.

OUTPUT LEVEL: During alignment, signal generator must be attenuated to hold output-meter indication below 1 volt.

STEP	SIGNAL GENERATOR		RADIO			ADJUST
	CONNECTION TO RADIO	DIAL SETTING	BAND PUSH BUTTON	DIAL SETTING	SPECIAL INSTRUCTIONS	
1	Through .05-mf. condenser to aerial receptacle.	455 kc.	BC	1600 kc.	Adjust, in order given, for maximum output.	TC301B—2nd i-f sec. TC301A—2nd i-f pri. TC300B—1st i-f sec. TC300A—1st i-f pri.
2	Dummy aerial (see note below).	1600 kc.	BC	1600 kc.	Adjust for maximum.	C418A—BC osc. (shunt)
3	Same as step 2.	1520 kc.	BC	1520 kc.	Adjust for maximum.	C410A—BC r.f. C401A—BC aerial
4	Same as step 2.	580 kc.	BC	580 kc.	Adjust for maximum while rocking tuning control.	TC400—BC osc. (padding)
5	Same as step 2.	18.0 mc.	SW5	18.0 mc.	Adjust for maximum.	C418F—SW5 osc.

MODEL CR-12

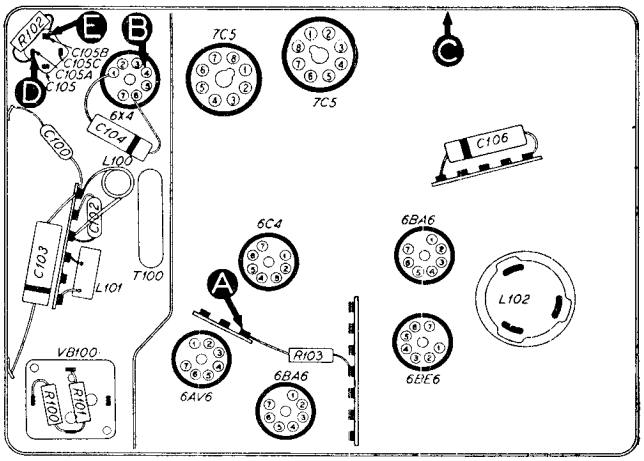
TROUBLE SHOOTING

Section 1

Make the tests for this section with a d-c voltmeter, connecting the leads between the chassis (test point C) and the test points indicated in the chart. The voltage readings given were taken with a 20,000-ohms-per-volt meter.

Turn on the power and depress the manual-tuning button. Turn the volume control to minimum, and the tone control fully counterclockwise.

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 2; if not, isolate and correct the trouble in this section.



Bottom View, Showing Section 1 Test Points

STEP	TEST POINT	NORMAL INDICATION	ABNORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A B	192v 6.6v		Trouble in this section. Isolate by the following tests.
2	B	6.6v	No voltage Low voltage	Open: F100, S100, L100, L101. Weak battery. Leaky: C100, C101, C102, C103.
3	D	250v	No voltage Low voltage High voltage	Open: T100. Shorted: T100, C104, C105A. Defective: VB100, 6X4. Leaky: C105A. Defective: 6X4, VB100. Shorted: C105B, T100. Open: C105A, T100. Open: R102, R210*, T200*.
4	E	237v	No voltage Low voltage High voltage	Open: R102. Shorted: C105B. Leaky: C105B. Changed resistance: R102. Shorted: C207*. Open: R103, R210*.
5	A	192v	No voltage Low voltage	Open: R103. Shorted: C105C. Leaky: C105C. Changed resistance: R103.
Listening Test: Abnormal hum or hash may be caused by open C105B or C105C.				

* This part, located in another section, may cause abnormal indication in this section.

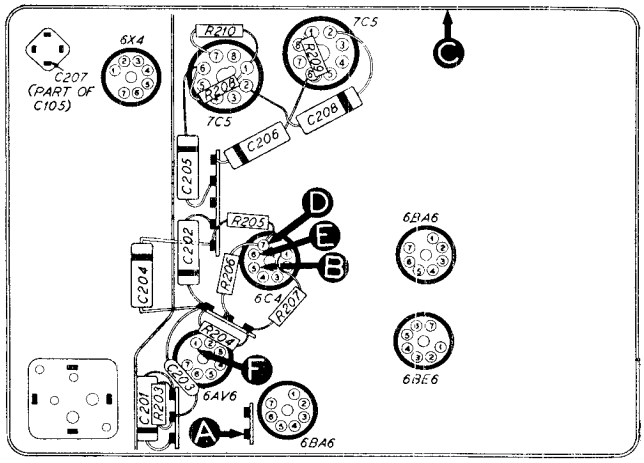
TROUBLE SHOOTING

Section 2

For the tests in this section, use an audio-frequency signal generator. Connect the generator ground lead to the chassis, test point C; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Depress the manual-tuning button. Turn the volume control to maximum, and the tone control fully counterclockwise. Adjust the signal-generator output as required for each step.

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 3; if not, isolate and correct the trouble in this section.



Bottom View, Showing Section 2 Test Points

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	Loud, clear signal with weak signal input.	Trouble in this section. Isolate by the following tests.
2	B (Remove 6C4)	Loud, clear signal with strong signal input.	Defective: 7C5, LS200. Open: L200, R209, R210, T200. Leaky: C206. Shorted: C206, C207.
3	D (6C4 removed)	Same as step 2.	Defective: 7C5. Shorted: C205. Open: C205, R208. Leaky: C205.
4	E (Replace 6C4)	Loud, clear signal with moderate signal input.	Defective: 6C4. Open: R205, R206, R207. Leaky: C204. Shorted: C204, C203, C202 (rotate through range).
5	F	Same as step 1.	Open: R203, R204, C204. Defective: 6AV6.
6	A	Same as step 1.	Open: R200 (rotate through range), C201, R201. Defective: PL100*, J100*, or cable.
Listening Test: Distortion may be caused by leaky or shorted C201, or by open R203.			

* This part, located in another section, may cause abnormal indication in this section.

© John F. Rider

TROUBLE SHOOTING

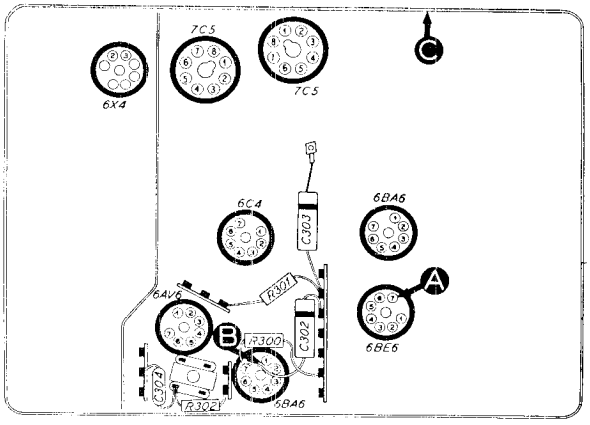
Section 3

For the tests in this section, use an r-f signal generator, with modulated output, set at 455 kc. Connect the generator ground lead to the chassis, test point C; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Depress the manual-tuning button. Turn the volume control to maximum, and the tone control fully counterclockwise.

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 4; if not, isolate and correct the trouble in this section.

Since the circuit location of test point A for this section is the same as that of test point B for Section 4, the effectiveness of step 1 as a master check is dependent upon the condition of certain parts in Section 4; these parts are listed below under "POSSIBLE CAUSE OF ABNORMAL INDICATION."



Bottom View, Showing Section 3 Test Points

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	Loud, clear signal with weak signal input.	Trouble in this section. Isolate by the following tests.
2	B	Loud, clear signal with moderate signal input.	Open, shorted, or misaligned: Z301. Defective: 6BA6, 6AV6 (diode section). Open: R300, R301, R302. Shorted: C302, C303, C304.
3	A	Loud, clear signal with weak signal input.	Defective: 6BE6*. Open, shorted, or misaligned: Z300. Open: R403*, L403*.

* This part, located in another section, may cause abnormal indication in this section.

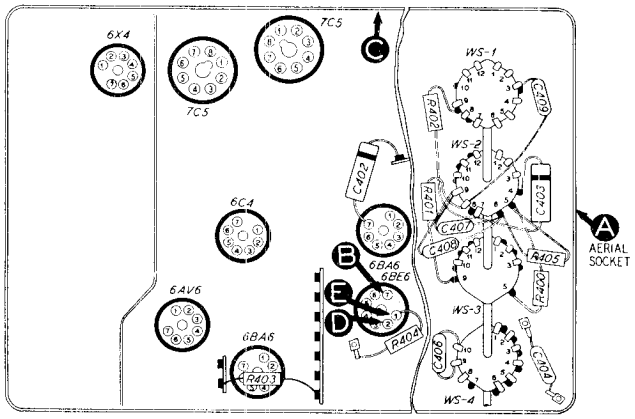
TROUBLE SHOOTING

Section 4

For the tests in this section, with the exception of the oscillator tests, use an r-f signal generator, with modulated output. Connect the generator ground lead to the chassis, test point C; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Turn the volume control to maximum, and the tone control fully counterclockwise.

If the "NORMAL INDICATION" is not obtained in step 1(a), isolate and correct the trouble before making the test in step 1(b).



Bottom View, Showing Section 4 Test Points

STEP	TEST POINT	SIG. GEN. FREQ.	RADIO TUNING	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1(a)	A	1000 kc.	Manual. Tune to signal.	Loud, clear signal with weak signal input.	Trouble in manual-tuning circuits; isolate by steps 2, 3, and 4, and correct trouble before proceeding.
1(b)	A	Tune to frequency of each push button.	Push button. Depress each button.	Loud, clear signal with weak signal input.	Trouble in push-button-tuning circuits; isolate by steps 5, 6, and 7.
			MANUAL-TUNING TESTS		
2	B	1000 kc.	Manual. Tune to signal.	Loud, clear signal with moderate signal input.	Defective: 6BE6. Trouble in oscillator circuit (step 3).
3	E to D (Osc. test: see note, page 5.)		Manual. Tune through range.	Negative 2 to 4 volts	Defective: 6BE6, WS2(F). Open: L403, L402C, C406, C407, C408, R404. Shorted or leaky: C406, C407, C408. Shorted: L403, L402C.
4	A	1000 kc.	Manual. Tune to signal.	Loud, clear signal with weak signal input.	Defective: 6BA6, WS3(R), WS3(F), WS1(F), WS1(R), WS2(R). Open: L404, L402B, L402A, R400, R401, R402, R403, R405, C404, C409. Shorted or leaky: C409, C405, C404, C401.
			PUSH-BUTTON-TUNING TESTS		
5	B	Tune to frequency of each button.	Push button. Depress each button.	Loud, clear signal with moderate signal input.	Defective: WS1(F), WS1(R). Trouble in oscillator circuit (step 6).

MODEL CR-12

PUSH-BUTTON-TUNING TESTS

STEP	TEST POINT	SIG. GEN. FREQ.	RADIO TUNING	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
6	E to D (Osc. test: see note below.)		Push button. Depress each button.	Negative 2 to 4 volts.	Open: WS2(F). Open or shorted: L401F, L401G, L401H, L401I, L401J.
7	A	Tune to frequency of each button.	Push button. Depress each button.	Loud, clear signal with weak signal input.	Defective: WS3(R), WS3(F), WS1(F), WS1(R), WS2(R). Open: L401A, L401B, L401C, L401D, L401E. Open or shorted: Z400.

OSCILLATOR TESTS (steps 3 and 6): Connect positive lead of high-resistance voltmeter to test point D (pin 2, cathode of 6BE6); connect prod end of negative lead through 100,000-ohm isolating resistor to test point E (pin 1, oscillator grid, of 6BE6). Use suitable meter range, such as 0—10 volts. Proper operation of oscillator is indicated by negative voltage, 2 to 4 volts (measured with 20,000-ohms-per-volt meter), throughout range of manual tuning, step 3, and of push-button tuning, step 6.

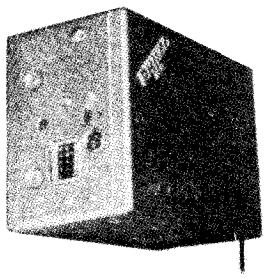
Philco Auto Radio Model CR-12,



SPECIFICATIONS

CIRCUIT	Eight-tube superheterodyne
FREQUENCY RANGE	535—1600 kc.
INTERMEDIATE FREQUENCY	455 kc.
AUDIO OUTPUT	6 watts
POWER INPUT	8.6 amperes at 6.6 volts, d.c.
PUSH BUTTONS	Six: five station selectors and one manual-tuning selector
AERIAL	Any Philco auto-radio aerial
PHILCO TUBES (8)	6BA6 (2), 6BE6, 6AV6, 6C4, 7C5 (2), 6X4

Circuit Description

Philco Auto Radio Model CR-12 is an eight-tube superheterodyne of the universal-mounting type, designed for separate mounting of the speaker and control head.

Sectionalized Schematic Diagram, Showing Test Points

e aerial input circuit is designed for maximum re-
on of interference without loss of signal strength.
eability tuning is used for all main circuits. Of the
ish buttons, located on the control head, five are
for automatic station selection, and one selects
al tuning. The pilot lamps are connected through
witch wafers in a series-parallel circuit; the wiring
arranged that the lamp which glows above the
button in use is in series with the parallel combina-
of the other five lamps.

oot switch and cable assembly (Foot Control Kit,
No. 45-1545) is available for automatic tuning of
is by foot control; the switch cable is connected
ugging it into pin jack J101.

A tuned-r-f-amplifier stage, incorporating a 6BA6 pentode, provides good sensitivity and selectivity. The 6BE6 converter works into a 6BA6 i-f amplifier, which operates at 455 kc.

The 6AV6 duo-diode, triode tube provides detection and a-v-c voltage in the diode section; the triode section functions as the first audio amplifier. The first-audio stage is coupled to the 6C4 inverter, which drives the two 7C5 output tubes in push-pull. Approximately six watts of audio power is supplied to the electrodynamic speaker.

The power supply includes a non-synchronous vibrator and a type 6X4 rectifier.

ALIGNMENT

DIAL POINTER—With tuning cable disengaged, set tuning-core gang to full-mesh position; turn dial of tuning control to low-frequency end until pointer stops, then engage tuning cable.

OUTPUT METER—Connect across voice-coil terminals.

SIGNAL GENERATOR — Connect ground lead to chassis; connect output lead as indicated in chart. Use modulated output.

STEP	SIGNAL GENERATOR		RADIO		ADJUS
	CONNECTIONS TO RADIO	FREQUENCY	TUNING	SPECIAL INSTRUCTIONS	
1	Through .05-mf. condenser to aerial receptacle.	455 kc.	Manual. 1600 kc.	Adjust, in order given, for maximum output. (TC301B and TC300B are reached through holes in bottom of i-f transformers.)	TC301 TC301 TC300 TC300
2	Same as step 1.	455 kc.	Any push button except manual tuning.	Adjust for minimum output.	TC40(
3	Dummy aerial (see note below).	580 kc.	Manual. 580 kc.	Adjust for maximum output while rocking tuning control.	TC40:
4	Same as **step 3.**	1500 kc.	Manual. Tune to signal.	**Adjust,** in order given, for maximum output.	C4 C4
5	Same as **step 3.**	1400 kc.	Manual. Tune to signal.	Re-engage tuning cable for correct calibration.	
6	Repeat steps 3, 4, and 5 until no further improvement is obtained.				
7	After reinstalling radio in car, adjust C401 (manual tuning only) for maximum output while tuned to weak static 1400 kc. Re-engage tuning control for correct dial calibration.				

DUMMY AERIAL: Connect generator output lead through 30-mmf. condenser to aerial receptacle; connect another 30-mmf. co between aerial receptacle and chassis.

SETTING PUSH BUTTONS

Each adjusting rod controls ganged tuning cores for both aerial and oscillator circuits, so that only a single adjustment is required for a given frequency. The ganged tuning cores are adjusted by turning the bakelite knobs, numbered 1, 2, 3, 4, and 5, located on the front of the radio.

1. Use an r-f signal generator to furnish test signals at the approximate frequencies of the desired stations. Connect the generator ground lead to the chassis. Connect the output lead through a 30-mmf. condenser to the aerial receptacle; connect another 30-mmf. condenser between the aerial receptacle and the chassis.

2. Turn on the power, set the volume control to maximum, and turn the tone control fully counterclockwise.

3. Starting with the lowest frequency desired, set the signal generator, depress push button No. 1 on the control head, and adjust knob No. 1 on the radio for maximum output. Repeat the procedure for buttons 2, 3, 4, and 5.

4. After the radio is installed in the car, and the aerial connected, allow a fifteen-minute warm-up period, then readjust the tuning for each button while listening to the station for which the adjustment is being made.

TROUBLE - SHOO

For rapid trouble shooting, the into four sections, with test poi section; these sections and test p the schematic diagram. The trou given for each section includes and a bottom view of the chassis of the test points and the compo

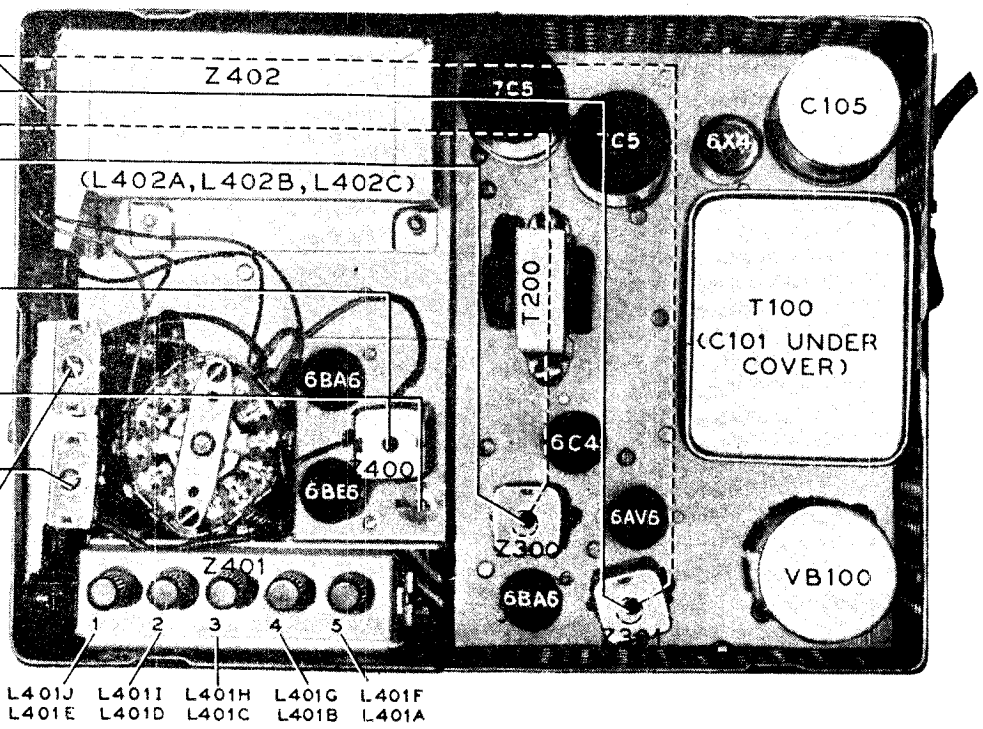
PROCEDURE

RADIO CONTROLS—Turn volume control to maximum, and tone control fully counterclockwise; use push buttons as directed in chart.

OUTPUT LEVEL—During alignment, adjust signal-generator output to maintain output-meter indication below 1 volt.



Top View, Showing Trimmer and Tuning-Core Locations

Preliminary Checks

To avoid possible damage to the radio, the following preliminary checks should be made before turning on the power:

1. Inspect both the top and the bottom of the chassis. Make sure that all tubes are secure in the proper sockets, and look for any broken or shorted connections, burned resistors, or other obvious sources of trouble.

2. Measure the resistance between B+ (pin 7 of the 6X4 rectifier) and the radio chassis (test point C), with the ohmmeter polarity such that the highest resistance reading is obtained. If the reading is lower than 5000 ohms, check condensers C105A and C105B for leakage or shorts.

The resistance value above, which is much lower than normal, is not intended as a quality check of these condensers; the value given is the lowest at which the rectifier will operate safely while the voltage tests of Section 1 are performed.

3. If a fuse is blown, check the vibrator before installing a new fuse.

4. If the vibrator is defective, check C104 before installing a new vibrator.

MODEL 49-906

Circuit Description

Philco Radio Model 49-906 is an eight-tube superheterodyne which provides reception on the standard-broadcast band and on the FM band. A built-in high-impedance loop is used as the aerial on the broadcast band and the line cord is used as the aerial on the FM band. These aerials normally provide adequate signal pickup; if additional pickup is required, Philco Dipole Aerial, Part No. 45-1462, may be used. When connecting the dipole aerial, disconnect the black lead from terminal 2 of TB400, and attach it to pin 1 of the dipole-aerial plug which fits into J400. No additional coupler is required.

To eliminate complicated switching and to provide greater stability and gain on both bands, separate converter tubes are used for broadcast and FM reception. A 12AU6 high-gain pentode is used as a tuned r-f amplifier on the FM band. The output of this stage is fed to a 14F8 dual triode which functions as the converter for the FM signal. A 12AU7 dual triode is used as the converter for the broadcast signal. Band switching is accomplished by means of a single-wafer switch, which connects the B+ voltage to the proper mixer plate.

6BJ6 type tubes are used in the two i-f-amplifier stages. Two sets of i-f transformers are used; one set is tuned to 455 kc. for standard broadcast, and the other set is tuned to 9.1 mc. for FM. The use of two sets of transformers makes better shielding possible, so that undesirable beat signals and interaction between transformers are eliminated.

Two diode sections of the 19T8 triple-diode-triode are used in a ratio detector circuit for detection of FM signals. The other diode section is used in a half-wave rectifier circuit for detection of standard-broadcast signals and to provide a-v-c voltage.

The triode section of the 19T8 is employed as the first audio amplifier, and is resistance-coupled to the 50A5 output tube, which supplies an audio output of approximately one watt to the permanent-magnet dynamic speaker.

Philco TROUBLE-SHOOTING Procedure

For rapid trouble shooting, the radio circuit is divided into four sections, as follows:

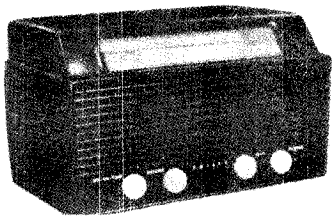
Section 1—the power supply
Section 2—the audio circuits
Section 3—the i-f, detector, and a-v-c circuits
Section 4—the r-f and converter circuits

Test points are specified for each section, and are indicated in the sectionalized schematic diagram. The trouble-shooting procedure given for each section includes a simplified test chart and a bottom view of the chassis showing the locations of the test points and the components of that section.

In each chart, the first step is a master check for determining whether trouble exists in that section, without going through the entire chart.

Failure to obtain the "NORMAL INDICATION" in any given step indicates trouble within the circuit under test.

After isolating the trouble to a single stage, the defect is located by: first, testing the tube; second, measuring tube electrode voltages; third, measuring circuit resistances; fourth, substituting condensers. The trouble revealed should be corrected before testing further.



SPECIFICATIONS

CABINET	Plastic
CIRCUIT	Eight-tube superheterodyne
FREQUENCY RANGES	
Broadcast	540—1620 kc.
FM	88—108 mc.
AUDIO OUTPUT	1 watt
OPERATING VOLTAGES	105—120 volts, a.c. or d.c.
POWER CONSUMPTION	40 watts
AERIALS	Built-in loop and FM line cord; provisions for connection of external aerial
INTERMEDIATE FREQUENCIES	
AM	455 kc.
FM	9.1 mc.
PHILCO TUBES (8)	12AU6, 12AU7, 14F8, 6BJ6-(2), 19T8, 50A5, 117Z3

REPLACEMENT PARTS LIST

NOTE: An asterisk (*) indicates a general replacement item. The part numbers of these items may not be identical with those on factory parts; also, the electrical values of some replacement items may differ from the values given in the schematic diagram and parts list. The values substituted in any case are so chosen that the operation of the radio will be either unchanged or improved. When ordering replacements, use only the "Service Part No."

Socket, 8-pin Loktal	27-6138*
Socket, 7-pin miniature	27-6226
Wave switch	42-1834-1

† 42-1834-1 is WS, wafer switch, single wafer (includes WS-A and WS-B).

Preliminary Checks

To avoid possible damage to the radio, the following preliminary checks should be made before turning on the power:

1. Inspect both the top and the bottom of the chassis. Make sure that all tubes are secure in the proper sockets, and look for any broken or shorted connections, burned resistors, or other obvious indications of trouble.

2. Measure the resistance between B+ (pin 6 of the 117Z3) and B–, test point B. When the ohmmeter leads are connected in the proper polarity, the highest resistance reading will be obtained. If the reading is lower than 1250 ohms, check condensers C102, C103A, C103B, and C103C for leakage or shorts. This resistance value, which is much lower than normal, does not represent a quality check of these condensers; it is the lowest value which will permit the rectifier to operate safely while the voltage checks of Section 1 (power supply) are performed.

3. If the 50A5 tube or the 6BJ6 (2nd i-f amplifier) tube is burned out, check condenser C314 for a short before installing a new tube.

Important!

To avoid altering FM operation, special care should be used in replacing any part. Replacement parts should be placed in the same physical positions as the original parts; connections should be of the same length, and should be soldered to the same points. The placement or length of leads should not be changed.

Section 1

TROUBLE SHOOTING

POWER SUPPLY

Make the tests for this section with a d-c voltmeter. Connect the negative lead to B–, test point B; connect the positive lead to the test points indicated in the chart. The voltage readings given were taken with a 20,000-ohms-per-volt meter, at a line voltage of 117 volts, a-c.

Set the volume control to minimum, turn the tone control fully clockwise, and set the band switch to the broadcast position.

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 2 (audio circuits); if not, isolate and correct the trouble in this section.

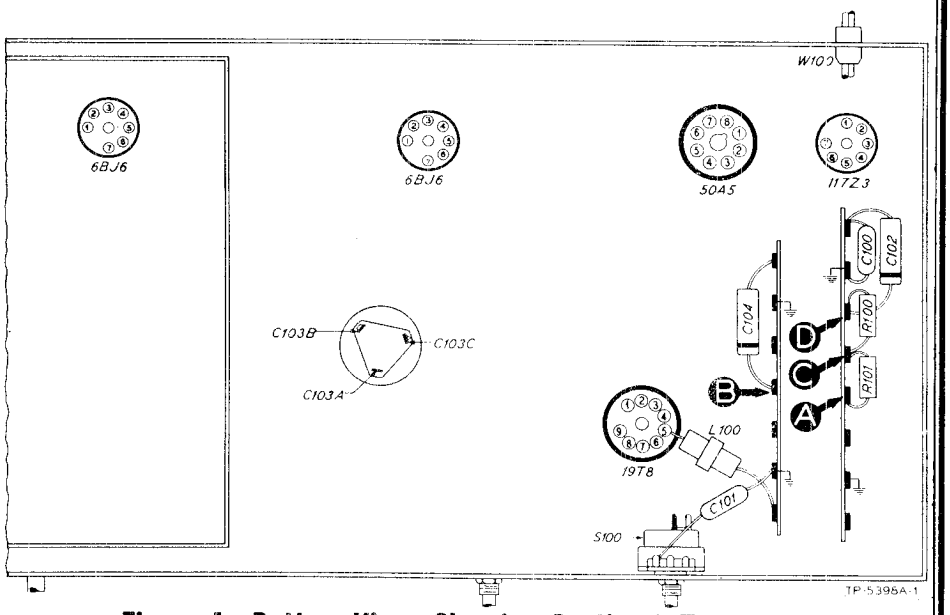

Figure 1. Bottom View, Showing Section 1 Test Points

STEP	TEST POINT	NORMAL INDICATION	ABNORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	95 volts		Trouble in this section. Isolate by the following tests.
2	C	100 volts	No voltage	Defective: 117Z3. Open: W100, S100. Shorted: C103A, C103B, C102.
			Low voltage	Defective: 117Z3. Leaky: C103A, C103B, C103C. Shorted: C103C.
			High voltage	Open: R100, R101, T200*, R204*.
3	D	118 volts	No voltage	Open: R100. Shorted: C103B.
			Low voltage	Increased value: R100. Leaky: C103B. Shorted: C103C.
			High voltage	Open: R101, T200*, R204*.
4	A	95 volts	No voltage	Open: R101. Shorted: C103C.
			Low voltage	Leaky: C103C. Increased value: R101. Shorted: C312*, C311*, C317*, C419*, C406*, C315*, C318*, C411*.

Listening Test: Abnormal hum may be caused by open C103A, C103B, or C103C.

* This part, located in another section, may cause abnormal indication in this section.

MODEL 49-906

Section 2 TROUBLE SHOOTING

AUDIO CIRCUITS

For the tests in this section, use an audio-frequency signal generator. Connect the generator ground lead to B–, test point B; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Set the volume control to maximum, and turn the tone control fully counterclockwise.

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 3 (i-f, detector, and a-v-c circuits); if not, isolate and correct the trouble in this section.

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	Loud, clear speaker output with moderate generator input.	Trouble in this section. Isolate by the following tests.
2	C	Loud, clear output with strong input.	Defective: 50A5. Shorted: LS200, T200. Open: R203, R204, C205, LS200, T200. Shorted or leaky: C202, C204, C205, C206, C207.
3	D	Loud, clear output with moderate input.	Defective: 19T8. Open: R205, R202, C202. Shorted or leaky: C202, C203 (rotate R201 through range).
4	A	Loud, clear output with moderate input.	Open: R200 (rotate through range), C200, C201. Shorted or leaky: C200, C201.
Listening Test: Distortion may be caused by leaky C200, C201, or C202.			

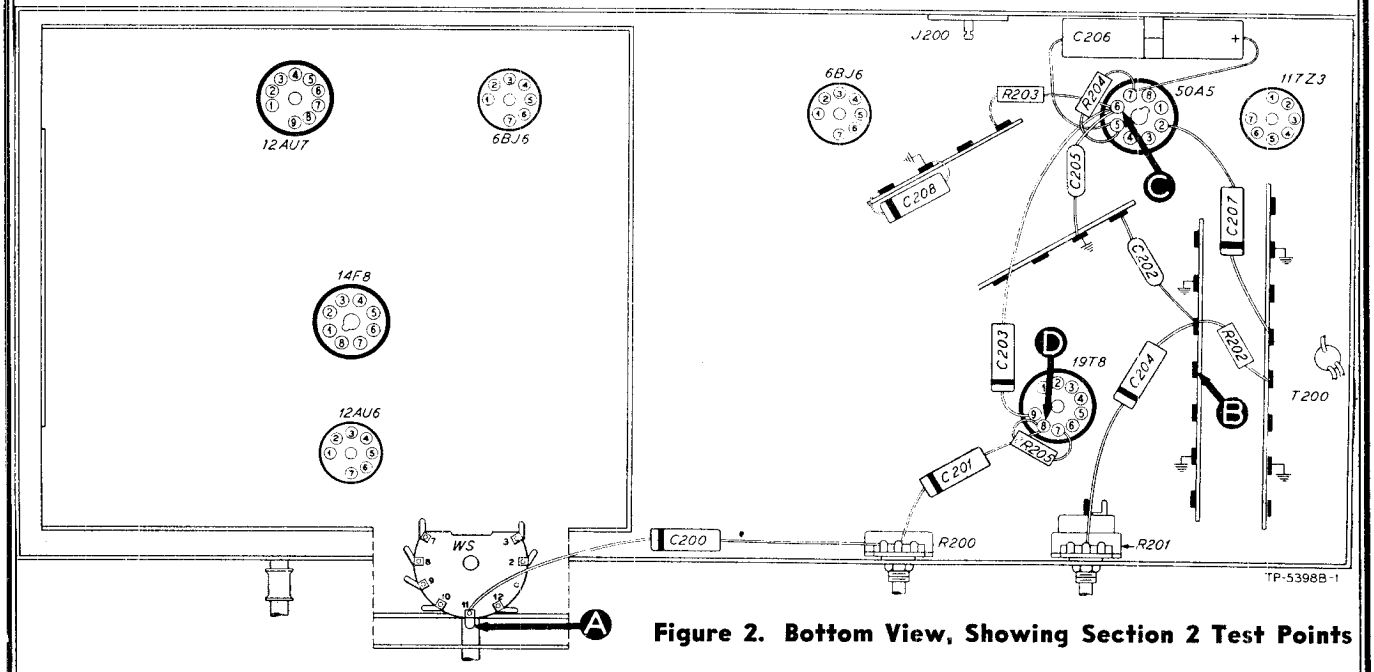

Figure 2. Bottom View, Showing Section 2 Test Points

Section 3 TROUBLE SHOOTING

I-F, DETECTOR, AND A-V-C CIRCUITS

AM Circuits

For the tests of the AM circuits, use an r-f signal generator, with modulated output, set at 455 kc. Connect the generator ground lead to B–, test point B; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Set the volume control to maximum, and turn the tone control fully counterclockwise. Set the band switch to the broadcast position, and rotate the tuning control until the tuning gang is fully meshed.

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for the FM circuits; if not, isolate and correct the trouble in the AM circuits.

Since test point A for the AM circuits is placed at the grid of the 12AU7 mixer in Section 4, the effectiveness of step 1 as a master check is dependent upon the condition of certain parts in Section 4. These parts are listed below under "POSSIBLE CAUSE OF ABNORMAL INDICATION."

© John F. Rider

Section 3—Cont. TROUBLE SHOOTING

AM Chart

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	Loud, clear speaker output with weak generator input.	Trouble in AM circuits. Isolate by the following tests.
2	D	Loud, clear output with moderately strong input.	Defective: 19T8, 6BJ6 (2nd i-f amplifier). Open: R307, R308, R309, R311, R312, L305B, C317, L305A, L304A, WS. Shorted or leaky: C316, C317, C315. Shorted: L305A, L305B, WS.
3	E	Loud, clear output with moderate input.	Defective: 6BJ6 (1st i-f amplifier). Open: R301, R302, R304, R305, R306, C311, C313, L302A, L302B, L303A, L303B. Shorted or leaky: C311, C313, C308. Shorted: L303A, L303B.
4	A	Loud, clear output with weak input.	Defective: 12AU7*. Open: R411*, R413*, R409*, L300A, L300B, L301A, L301B, WS. Shorted or leaky: C424*, C410*. Shorted: L301A, L301B, L301C, WS.

Listening Test: Hum and distortion may be caused by shorted or leaky C309, C310, C314, C321, C320, C323, C307, C420*, C421*, C422*, C423*, C100*, C101*.

* This part, located in another section, may cause abnormal indication in this section.

FM Circuits

For the tests of the FM circuits, use an AM r-f signal generator, set at 9.1 mc. Connect the generator ground lead to B–, test point B; connect the output lead through a .1-mf. condenser to the test points indicated in the chart. Detune the generator frequency to one side or the other until a satisfactory test signal is obtained.

Set the band switch to the FM position; set the other radio controls as directed under AM CIRCUITS.

The parts which were found to be satisfactory for AM operation, with the exception of those indicated in the chart, will usually be satisfactory for FM operation.

The best indication of satisfactory FM-detector operation is the ability of this circuit to take the alignment properly (see page 10).

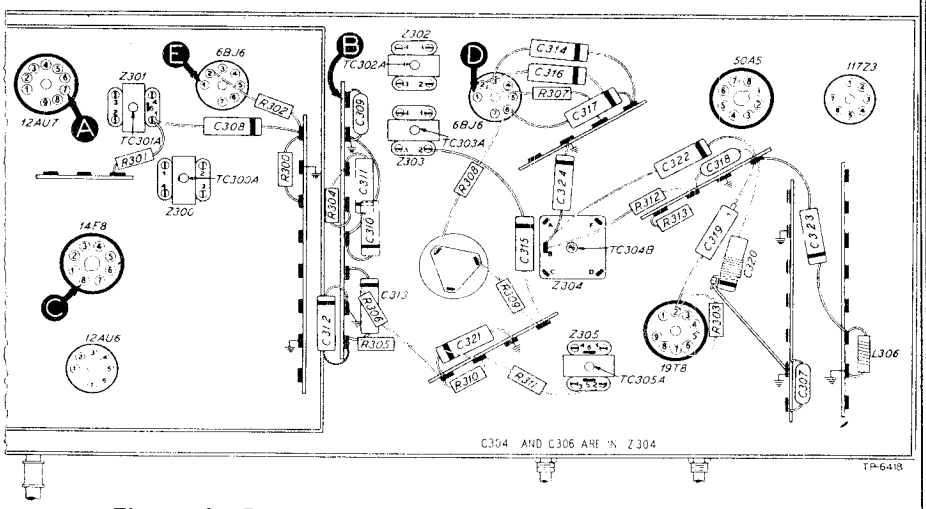

Figure 3. Bottom View, Showing Section 3 Test Points

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 4 (r-f and converter circuits); if not, isolate and correct the trouble in the FM circuits of this section.

Since test point C for the FM circuits is placed at the grid of the 14F8 mixer in Section 4, the effectiveness of step 1 as a master check is dependent upon the condition of certain parts in Section 4. These parts are listed below under "POSSIBLE CAUSE OF ABNORMAL INDICATION."

FM Chart

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	C	Loud, clear speaker output with weak generator input.	Trouble in FM circuits. Isolate by the following tests.
2	D	Loud, clear output with strong input.	Defective: 6BJ6 (2nd i-f amplifier), Z304, 19T8, WS. Misaligned: Z304. Open: R312, R313, R314, C320, C319, C318, C304, C306, C323, L306. Shorted or leaky: C319, C320, C304, C306, C323.
3	E	Loud, clear output with moderate input.	Defective: 6BJ6 (1st i-f amplifier). Misaligned: Z302. Shorted: L302A, L302B.
4	C	Loud, clear output with weak input.	Defective: 14F8*. Open: R300, R406*, R407*, R405*, L404*, L300A, WS. Shorted or leaky: C418*, C419*. Shorted: L300A, L300B, WS.

* This part, located in another section, may cause abnormal indication in this section.

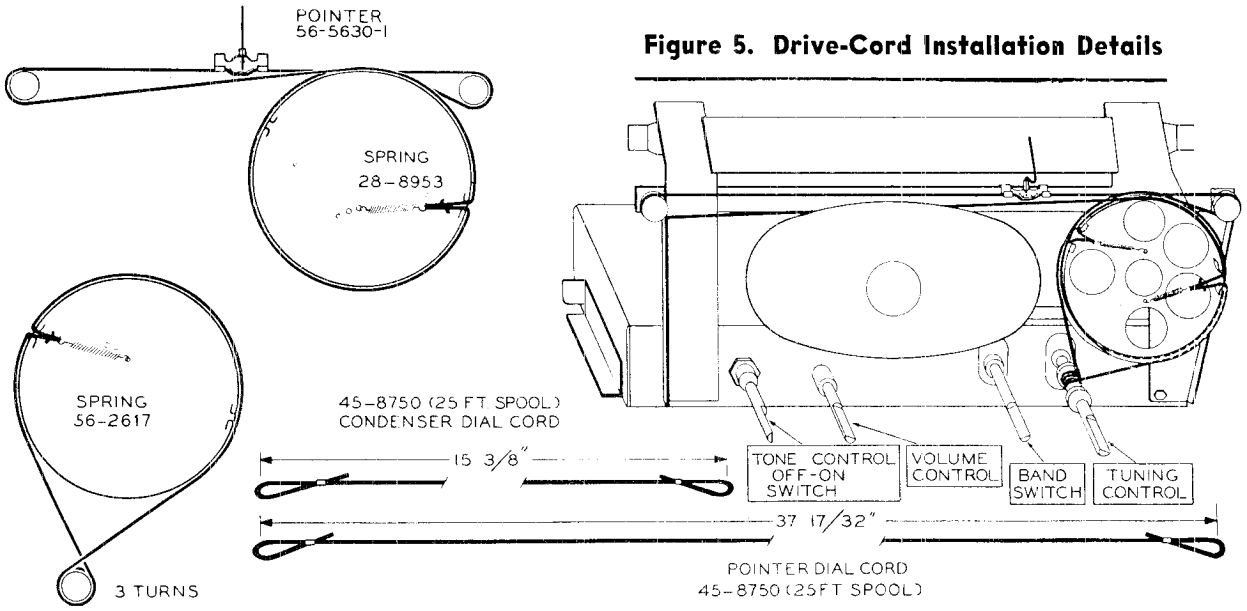

Figure 5. Drive-Cord Installation Details

ALIGNMENT OF AM CIRCUITS

Make alignment with loop aerial connected to radio. The AM alignment should be completed before the FM alignment is made.

DIAL POINTER—With tuning condenser fully meshed, adjust dial pointer to coincide with index mark at low-frequency end of dial. See "CALIBRATING DIAL BACKPLATE" for method of measuring backplate for index and calibration marks.

OUTPUT METER—Connect between terminal 3 (voice-coil connection) of aerial terminal panel TB400 and chassis.

AM SIGNAL GENERATOR—Connect as indicated in chart. Use modulated output.

OUTPUT LEVEL—During alignment, signal-generator output must be attenuated to maintain radio output below 1.25 volts, as read on output meter.

CONTROLS—Set volume control to maximum, turn tone control fully counterclockwise, and set band switch to broadcast position.

ALIGNMENT OF FM CIRCUITS

Align the AM Circuits first

OUTPUT METER—Connect between terminal 3 (voice-coil connection) of aerial terminal panel TB400 and chassis.

ALIGNMENT INDICATOR—Connect negative lead of a 20,000-ohms-per-volt, d-c voltmeter to pin 2 of 19T8 tube; connect positive lead to B—, test point B in Section 2. Use 10-volt range.

AM SIGNAL GENERATOR—Generator must have sufficient output to give a reading of at least 8.5 volts on alignment indicator. Connect generator ground lead to B—, test point B; connect output lead as indicated in chart. Use modulated output.

CONTROLS—Same as for alignment of AM circuits, except set band switch to FM position. Allow radio and signal generator to warm up for at least 15 minutes before making alignment.

NOTE: Check resonance of coils L401, L402, and L403 by inserting each end of a powdered-iron tuning core, such as Philco Part No. 56-6100, in the coils. If the signal strength increases when the iron end is inserted, compress the turns slightly. If the signal strength increases when the threaded brass end is inserted, spread the turns slightly. If the signal strength decreases when either the iron or the brass end is inserted, no further adjustment is necessary. Do not spread or compress turns of coil excessively; only a small change is required at these high frequencies.

CALIBRATING DIAL BACKPLATE

When the radio chassis has been removed from the cabinet, dial calibration and alignment points may be marked on the dial backplate below the pointer.

The method of measuring for these points is illustrated in figure 7. Hold a ruler against the dial backplate, with the start of the ruler at the reference line shown, and mark pencil dots at the proper points for the required frequency settings.

After installation of the chassis in the cabinet, the dial pointer should be moved to coincide with the index mark on the dial. Coincidence of the pointer and index mark should occur with the tuning condenser fully meshed.

SPECIFICATIONS

CIRCUIT .....Eight-tube, superheterodyne
FREQUENCY RANGE .....540 to 1600 kc.
INTERMEDIATE FREQUENCY .....265 kc.
POWER INPUT .....6.3 volts, 8.8 amperes, d.c.
PHILCO TUBES .....7A7(2), 7B8, 7B6, 7A4, 7C5(2), 7Y4
AERIAL.....Retractable-tip, Philco Part No. 91-0227

IMPORTANT

The aerial and aerial lead-in form part of the r-f tuning circuit. When testing or aligning this receiver on the bench it is important that an aerial dummy load of equal capacity be used.

CIRCUIT DESCRIPTION

The circuit of the P4635 consists of a 7A7 r-f amplifier, a 7B8 converter, a 7A7 i-f amplifier, a 7B6 second detector–first audio, and an audio power amplifier using two 7C5's in push-pull, driven by a 7A4 phase inverter. The power supply is of the six-volt non-synchronous vibrator type, using a 7Y4 rectifier.

The aerial input circuit is designed for maximum interference elimination, without sacrifice of signal strength. Permeability tuning, controlled by a pantograph tuning unit, is used for both the r-f and oscillator stages. This method of tuning assures maximum sensitivity, selectivity, and stability for this type of receiver. A sensitivity control is provided (identified in figure 9, page 6), which consists of a variable resistor in the common cathode circuit of the converter and i-f stages. This should be adjusted for lower sensitivity in areas where most reception is from local stations, in order to minimize noise pickup.

The P4635 uses an intermediate frequency of 265 kc.

Two features of the audio system are the tone control, which is an inverse feed-back circuit built around the first audio amplifier, and the push-pull output stage, which delivers a full five watts of audio power to the dynamic speaker.

TROUBLE-SHOOTING PROCEDURE

This service manual provides a trouble-shooting procedure for the P4635, which will facilitate the isolation of most of the faults that may be encountered. The circuit is divided into four sections, with a schematic and chassis layout, showing test points for each section. The trouble-shooting procedure for each section is outlined in a chart. Tests indicated by a large asterisk (*) provide sectional master checks, making it possible to eliminate each section as a source of trouble without going through its entire test chart.

Wherever trouble is found (indicated by failure to get a "Normal Indication" on any test) it should be isolated by voltage and resistance checks of the parts associated with the point under test, and remedied before testing further.

PRELIMINARY CHECKS

The following preliminary checks are recommended:

1. Carefully inspect both sides of the chassis. Make sure that all the tubes are secure, and look for bad connections, burned resistors, or other mechanical faults.

2. Check the fuse, and connect the receiver to a source of power (6.3 volts, d.c.). Look for unlighted tube filaments, overheated resistors (smoke, sweating, etc.), and listen for the hum of the vibrator.

3. Check the tubes and the vibrator. WARNING: If the 7Y4 is defective, check C107 for shorts before inserting a new tube. If the vibrator is defective, check C106 for a short before inserting a new vibrator.

© John F. Rider

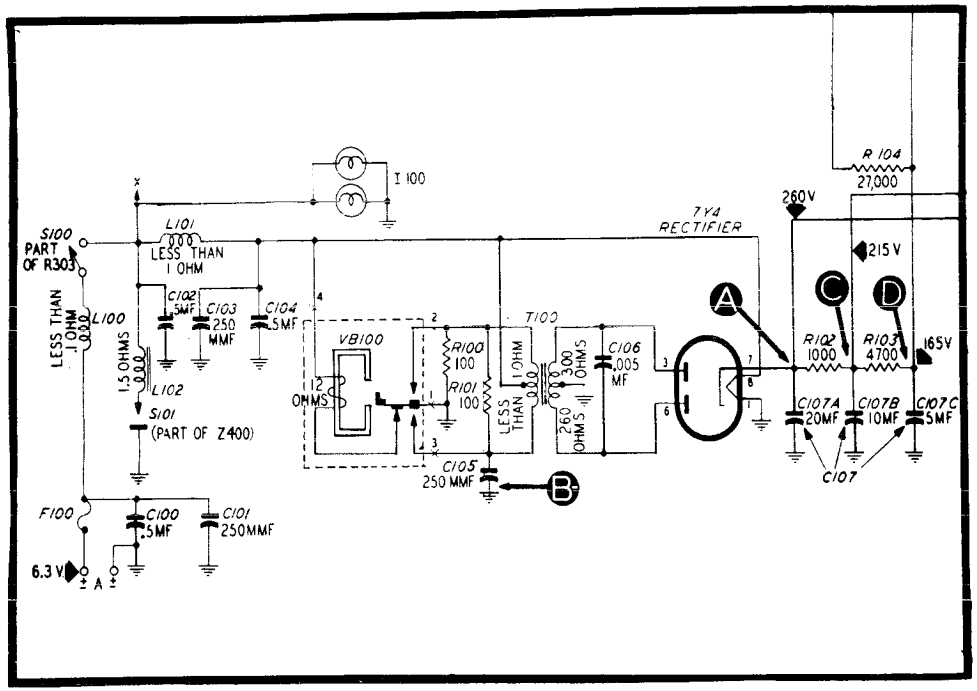
TESTS TO ISOLATE TROUBLE WITHIN SECTION 1

MAKE TEST ✱ FIRST
If the "NORMAL INDICATION" is obtained, proceed to the next section. If not, isolate and remedy the trouble in this section.

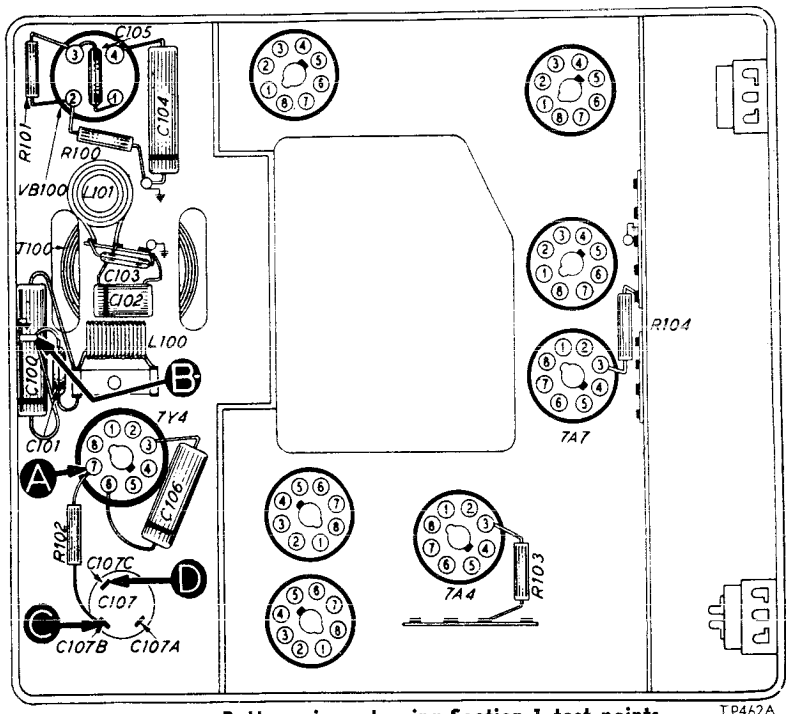
Make all measurements for this section with a volt-ohmmeter, using the applicable d-c range. All voltages given in this manual are average, and were taken with a 20,000 ohms-per-volt meter, with 6.3 volts d-c input; the volume control was set at minimum, and the tuning control at 540 kc.

WARNING: If the 7Y4 rectifier is found to be defective, check the main filter condenser, C107, for shorts before inserting a new tube. If the vibrator is found to be defective, check C106 for a short before inserting a new vibrator.

TEST POINTS	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
D to B–	165 volts	Trouble within Section 1. Isolate by following tests.
A to B–	260 volts	Defective 7Y4, VB100, T100, C105, C106, C107A, or C107B.
C to B–	215 volts	Defective R102, C107B or C107C.
D to B–	165 volts	Defective R103, C107C or C407 (see Section 4 for location).



Section 1 schematic. TP462E



Bottom view, showing Section 1 test points. TP462A

© John F. Rider

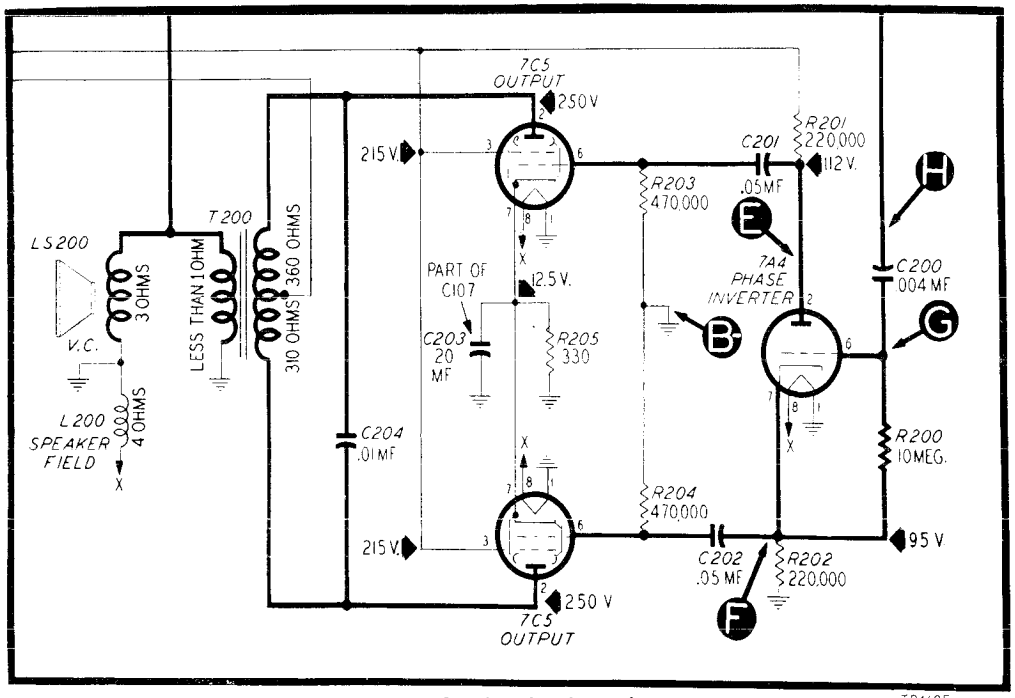
TESTS TO ISOLATE TROUBLE WITHIN SECTION 2

MAKE TEST ✱ FIRST
If the "NORMAL INDICATION" is obtained, proceed to the next section. If not, isolate and remedy the trouble in this section.

For all tests in this section, use an audio signal. Connect the generator output lead through a condenser (.01 to .25 mf.) to the test points indicated; connect the ground lead to the receiver chassis (B–).

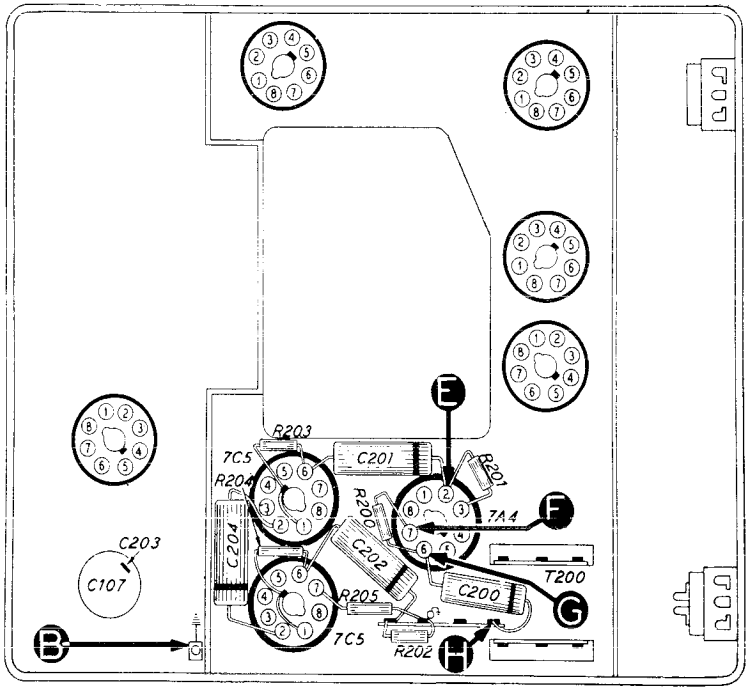
Set the receiver volume control at maximum, and adjust the signal-generator output for a loud, clear signal.

TEST POINTS	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
H to B–	Loud, clear signal.	Trouble within Section 2. Isolate by following tests.
E to B– (Remove 7A4)	Loud, clear signal.	Defective 7C5, T200, LS200, R203, R205, C201, C203, or C204.
F to B– (7A4 removed)	Loud, clear signal, same as preceding test.	Defective 7C5, T200, R204, or C202.
G to B– (Replace 7A4)	Clear signal, louder than preceding test.	Defective 7A4, R202, R201, R200, or C200.
H to B–	Loud, clear signal, same as preceding test.	Defective C200 or C308 (see Section 3 for location).



Section 2 schematic.

TP462F



Bottom view, showing Section 2 test points.

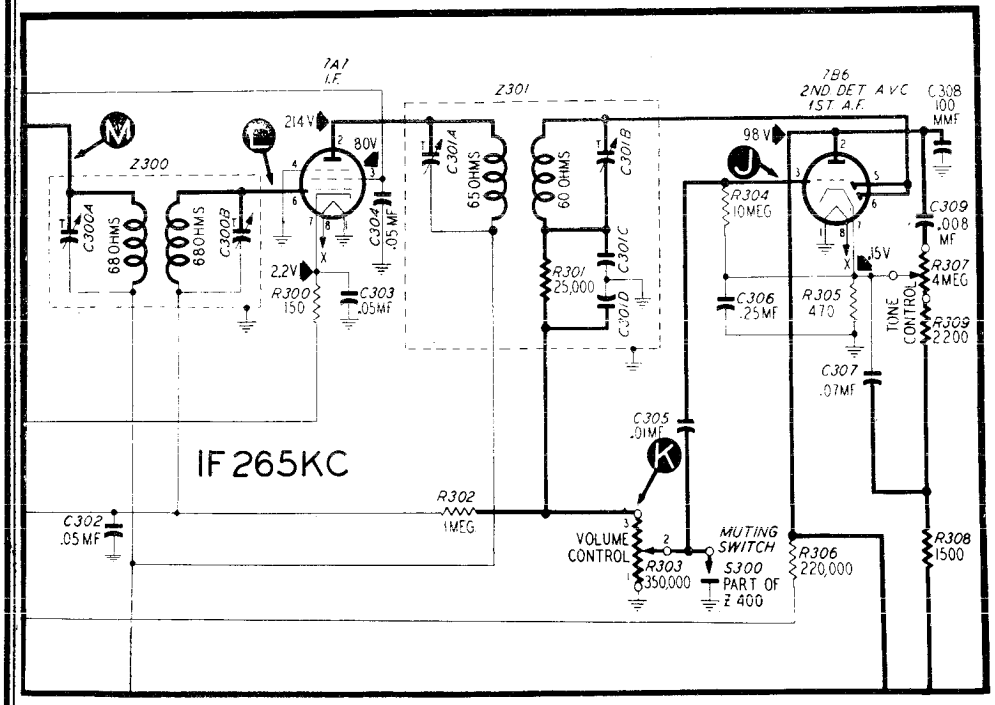
TESTS TO ISOLATE TROUBLE WITHIN SECTION 3

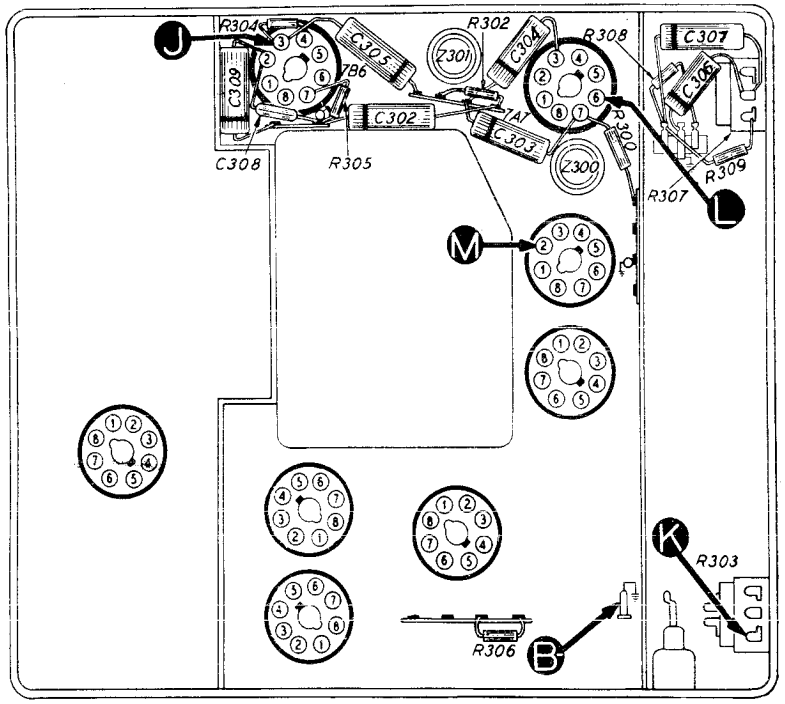
MAKE TEST ✻ FIRST
If the "NORMAL INDICATION" is obtained, proceed to the next section. If not, isolate and remedy the trouble in this section.

For the second and third tests in the chart for this section, use an audio signal. For the first, and the last two, use a modulated 265-kc. signal. Connect the signal-generator output lead through a condenser (.01 to .25 mf.) to the test points indicated; connect the ground lead to the receiver chassis (B–). Set the receiver volume control and sensitivity control at maximum, and adjust the signal-generator output for a loud, clear signal.

TEST POINTS	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
M to B– (265-kc. signal)	Loud, clear signal.	Trouble within Section 3. Isolate by following tests.
J to B– (audio signal)	Loud, clear signal.	Defective 7B6, R306, R305, R304, C306, C308, or C309.
K to B– (audio signal)	Loud, clear signal.	Defective C305, S300, or R303 (rotate R303 through its entire range for complete check).
L to B– (265-kc. signal)	Loud, clear signal.	Defective 7A7, C303, C304, C406, R104, R300, R404, Z301; shorted C301C or C301D.
M to B– (265-kc. signal)	Loud, clear signal.	Defective R302 or Z300.



Section 3 schematic.



Bottom view, showing Section 3 test points.

© John F. Rider

TESTS TO ISOLATE TROUBLE WITHIN SECTION 4

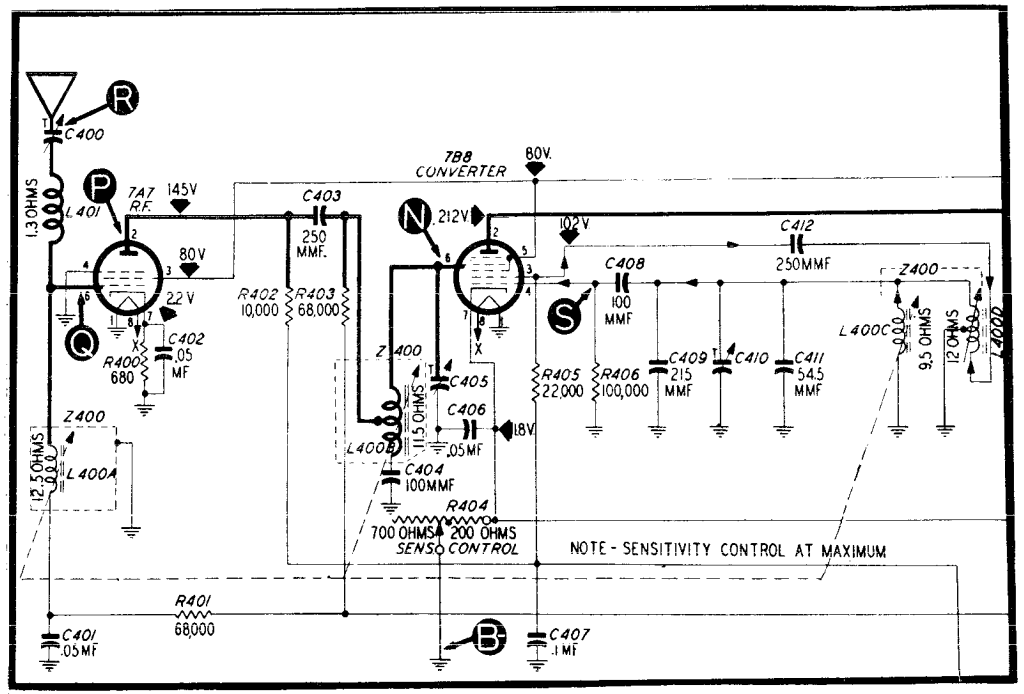
MAKE TEST ✱ FIRST

If the "NORMAL INDICATION" is not obtained, isolate and remedy the trouble in this section.

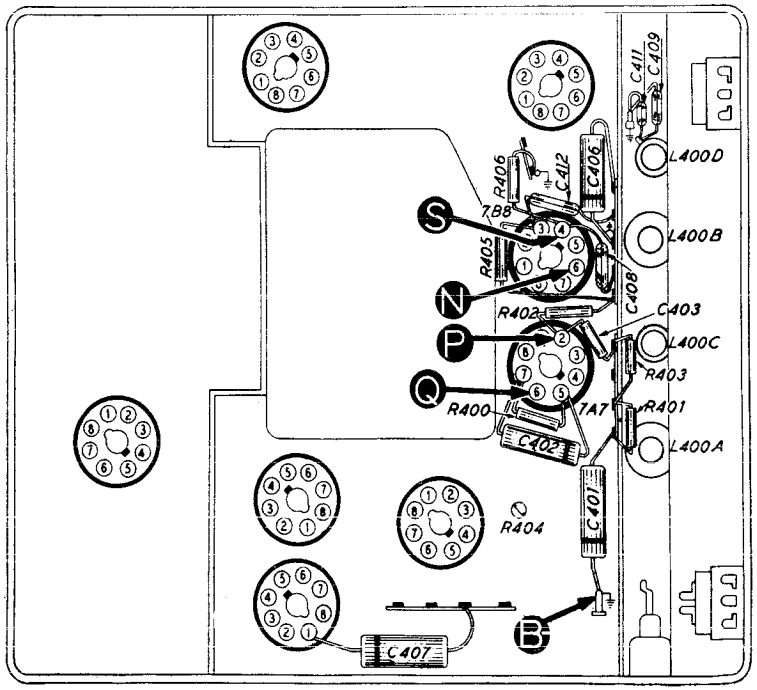
1. Attach the positive lead of a 20,000-ohms-per-volt meter (10-volt range) to the receiver chassis, and the prod end of the negative lead through 50,000 ohms to point S. Rotate the tuning control through its entire range; absence of voltage indicates that the oscillator is not functioning. If so, check the components listed in the second test below.

2. Connect the signal-generator output lead through a condenser (.01 to .25 mf.) to the test points indicated; connect the ground lead to the receiver chassis. Set the receiver volume control and sensitivity control at maximum, tune the signal generator and receiver to 1000 kc., and adjust the generator output for a loud, clear signal.

TEST POINTS	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
R to B—	Loud, clear signal.	Trouble within Section 4. Isolate by following tests.
N to B—	Loud, clear signal.	Defective 7B8, L400C, L400D, R404, R405, R406, C408, C409, C410, C411, or C412.
P to B—	Loud, clear signal.	Defective C403, C404, C405, R403, or L400B.
Q to B—	Loud, clear signal.	Defective 7A7, L400A, R400, R402, or C402.
R to B—	Loud, clear signal.	Defective L401, C400, or C401.

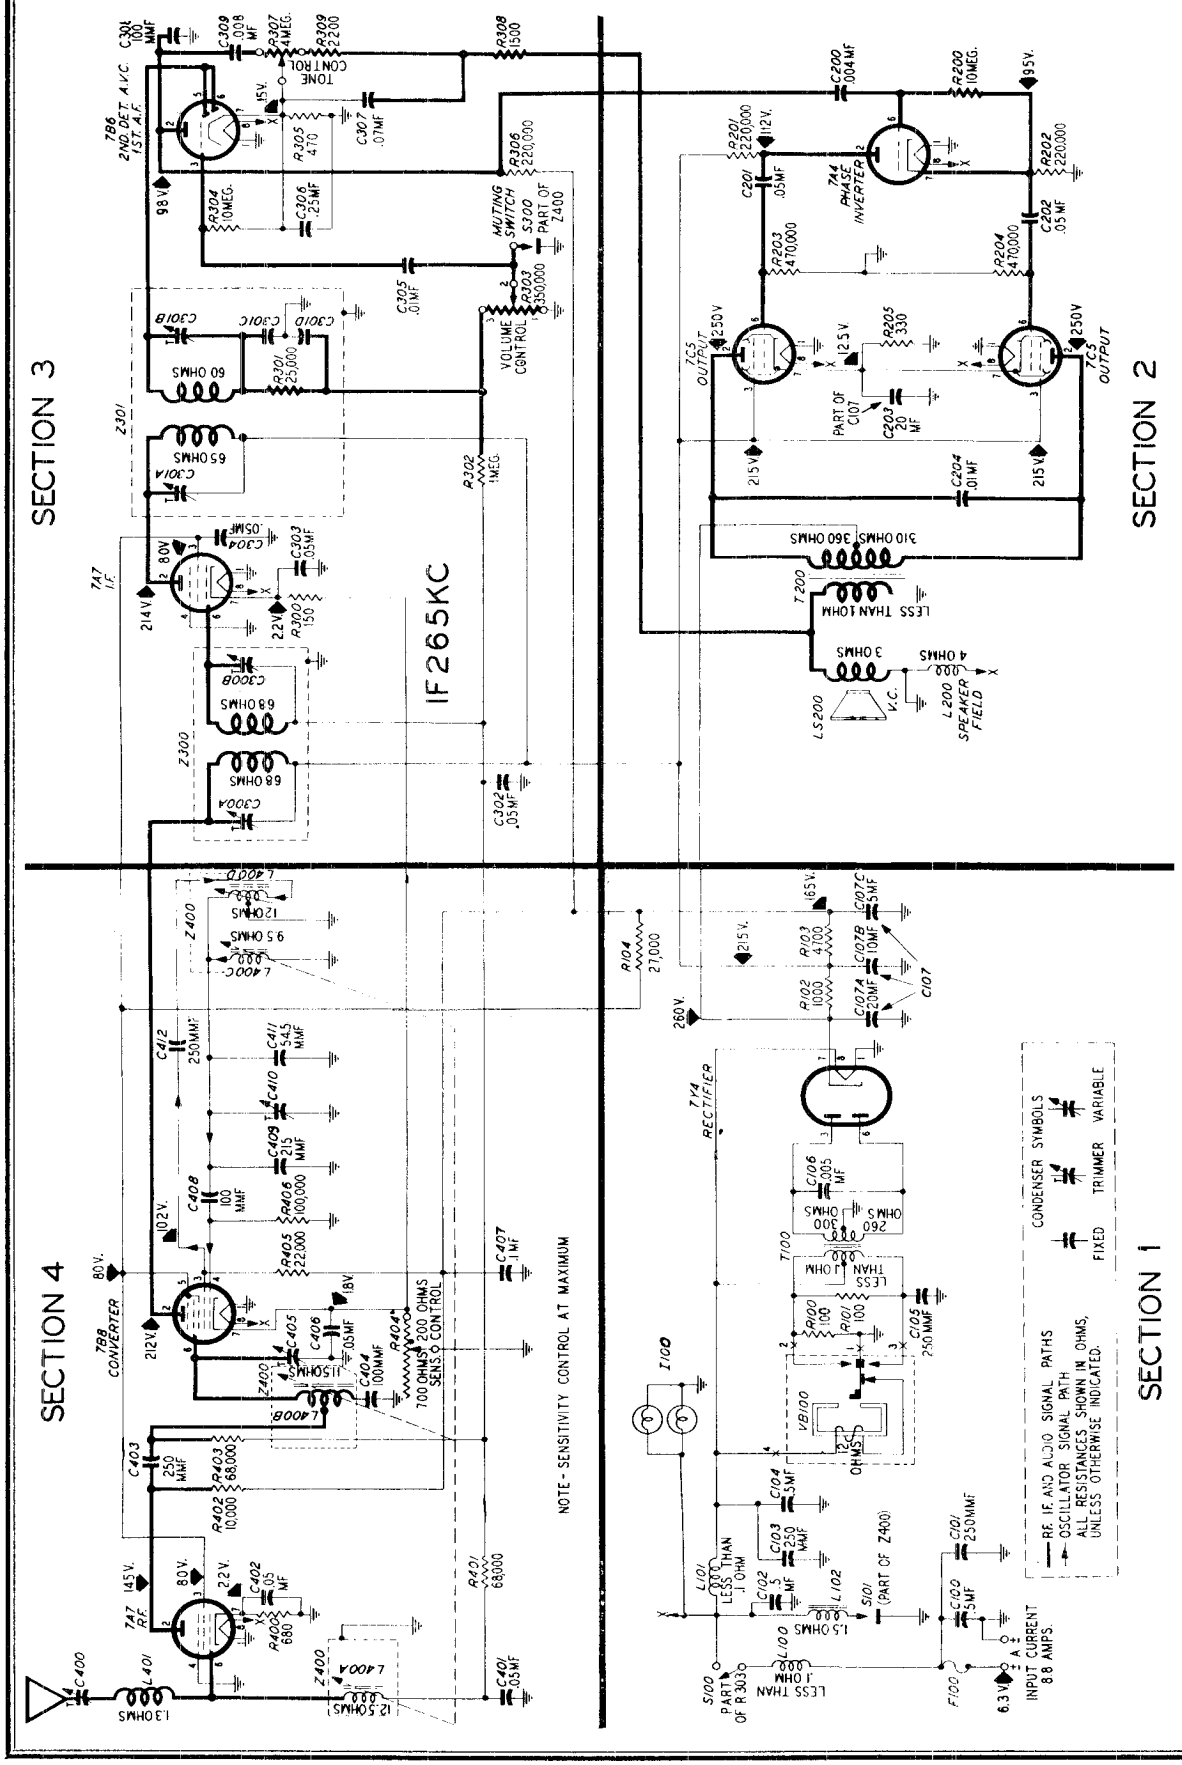


Section 4 schematic.



Bottom view, showing Section 4 test points.

MODEL P4635



NOTE: All voltage, capacity, and resistance values shown are average. The voltages were measured between the points indicated and the receiver chassis (B–), using a 20,000-ohms-per-volt meter, with 6.3 volts d-c input to the receiver power supply; the volume control was set at minimum, and the tuning control at 540 kc.

ALIGNMENT PROCEDURE

CONNECT THE SIGNAL-GENERATOR output lead as follows:

For the i-f alignment (the first step in the chart), connect through a .05-mf. condenser to the aerial connector.

For the r-f alignment (all steps after the first), inject the signal through a dummy aerial consisting of a 20-mmf. condenser in series with an aerial lead (Part No. 95-0181) plugged in to the antenna receptacle. If an aerial lead is not available, connect a 30-mmf. condenser from the antenna receptacle to ground, and inject the signal through the 20-mmf. condenser alone. **The foregoing instruction must be carefully followed if the receiver is to give its best performance after being reinstalled in the car.**

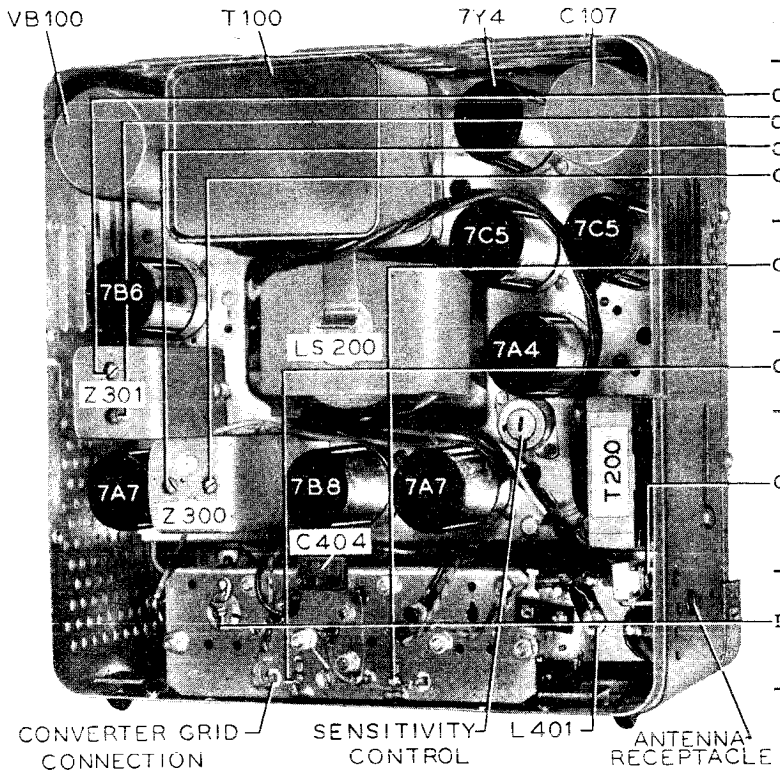
CONNECT THE OUTPUT METER between the voice-coil lug on the speaker and the receiver chassis.

ADJUST THE RECEIVER CONTROLS as follows:

Set the volume and sensitivity controls at maximum. Set the tone control for maximum signal output (approximately the center of its range).

ADJUST THE SIGNAL-GENERATOR OUTPUT as alignment progresses to keep the meter needle near center scale, using the lowest range on the output meter.

AFTER REINSTALLING THE RECEIVER in the car and connecting the aerial, make the following adjustments: Set the aerial trimmer for maximum signal strength on a weak station near 1400 kc. Set the sensitivity control for low sensitivity, if the receiver is to be used mainly for local-station reception, or higher sensitivity depending on the degree of distant-station reception desired. The lower the sensitivity can be set, the less will be the noise and interference pickup.



Chassis view, showing trimmer locations.

ADJUST IN ORDER	SPECIAL INSTRUCTIONS	DIAL SETTINGS SIG. GEN.	DIAL SETTINGS RECEIVER
C301B C301A C300B C300A	Ground pin 4 of the 7B8. Adjust for maximum in order as numbered and then repeat procedure.	265 kc.	1600 kc.
C410	Remove the ground from pin 4 of the 7B8. Adjust for maximum.	1600 kc.	1600 kc.
C405	Adjust for maximum.	1400 kc.	1400 kc.
C400	Adjust for maximum. Final adjustment to be made after installation in car, with antenna connected.	1400 kc.	1400 kc.
L400D	Adjust for maximum while rocking tuning control back and forth across signal.	580 kc.	580 kc.
	Repeat all steps after the first.		

MODEL P4635

REPLACEMENT PARTS LIST

NOTE: Parts marked with an asterisk (*) are general replacement items, and the part numbers will not be identical with those used on factory assemblies. Use only the "Service Part No." shown in the parts list when ordering replacements.

SECTION 1

Reference No.	Description	Service Part No.
C100	Condenser, .5 mf.	61-0137*
C101	Condenser, 250 mmf.	60-10245307*
C102	Condenser, .5 mf.	61-0137*
C103	Condenser, 250 mmf.	60-10245307*
C104	Condenser, .5 mf.	61-0137*
C105	Condenser, 250 mmf.	60-10245307*
C106	Condenser, .005 mf.	61-0153*
C107	Condenser, electrolytic	61-0150*
	C107A: condenser, 20 mf.	Part of C107
	C107B: condenser, 10 mf.	Part of C107
	C107C: condenser, 5 mf.	Part of C107
F100	Fuse	45-2559*
I100	Lamp, pilot	34-2064
L100	Choke, "A"	32-1644
L101	Choke, vibrator	65-0151
L102	Coil, solenoid	65-0360
R100	Resistor, 100 ohms	66-1104340*
R101	Resistor, 100 ohms	66-1104340*
R102	Resistor, 1,000 ohms	66-2104340*
R103	Resistor, 4,700 ohms	66-2474340*
R104	Resistor, 27,000 ohms	66-3274340*
S100	Switch, off-on	Part of R303
S101	Switch, solenoid (muter)	Part of Z400
T100	Transformer, power	65-0358*
VB100	Vibrator	83-0026*

SECTION 2

C200	Condenser, .004 mf.	61-0129*
C201	Condenser, .05 mf.	61-0170*
C202	Condenser, .05 mf.	61-0170*
C203	Condenser, 20 mf.	Part of C107
C204	Condenser, .01 mf.	61-0124*
L200	Field, speaker	Part of LS200
LS200	Speaker	73-0066*
R200	Resistor, 10 megs.	66-6103340*
R201	Resistor, 220,000 ohms	66-4223340*
R202	Resistor, 220,000 ohms	66-4223340*
R203	Resistor, 470,000 ohms	66-4473340*
R204	Resistor, 470,000 ohms	66-4473340*
R205	Resistor, 330 ohms	66-1334340*
T200	Transformer, output	65-0409*

SECTION 3

C302	Condenser, .05 mf.	61-0122*
C303	Condenser, .05 mf.	61-0122*
C304	Condenser, .05 mf.	61-0122*
C305	Condenser, .01 mf.	61-0124*
C306	Condenser, .25 mf.	61-012 *
C307	Condenser, .07 mf.	61-0152*
C308	Condenser, 100 mmf.	60-10105407*
C309	Condenser, .008 mf.	61-0174*
R300	Resistor, 150 ohms	66-1153340*
R302	Resistor, 1 meg.	66-5103340*
R303	Control, volume, 350,000 ohms	67-0052*
R304	Resistor, 10 megs.	66-6103340*
R305	Resistor, 470 ohms	66-1473340*
R306	Resistor, 220,000 ohms	66-4223340*
R307	Control, tone, 4 megs.	67-0051*
R308	Resistor, 1,500 ohms	66-2153340*
R309	Resistor, 2,200 ohms	66-2223340*
S300	Switch, muting (solenoid)	Part of Z400
Z300	Transformer, 1st i-f	65-0352
	C300A: condenser, trimmer	Part of Z300
	C300B: condenser, trimmer	Part of Z300
Z301	Transformer, 2nd i-f	65-0410
	C301A: condenser, trimmer	Part of Z301
	C301B: condenser, trimmer	Part of Z301
	C301C: condenser	Part of Z301
	C301D: condenser	Part of Z301
	R301: resistor, 25,000 ohms	Part of Z301

SECTION 4

Reference No.	Description	Service Part No.
C400	Condenser, trimmer	31-6472*
C401	Condenser, .05 mf.	61-0122*
C402	Condenser, .05 mf.	61-0122*
C403	Condenser, 250 mmf.	60-10245307*
C404	Condenser, 100 mmf.	60-10105407*
C405	Condenser, trimmer	Part of Z400*
C406	Condenser, .05 mf.	61-0122*
C407	Condenser, .1 mf.	61-0113*
C408	Condenser, 100 mmf.	60-10105407*
C409	Condenser, 215 mmf. (silver mica)	Part of Z400
C410	Condenser, trimmer	Part of Z400
C411	Condenser, 54.5 mmf. (silver mica)	Part of Z400
C412	Condenser, 250 mmf.	60-10245307*
L401	Choke, antenna	65-0378

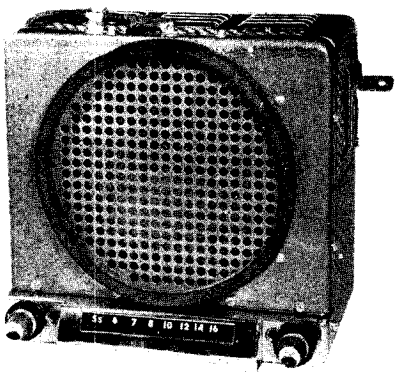
MODELS S4624, S4625



CIRCUIT DESCRIPTION

The circuit of the Model S4624 custom-built auto radio consists of a 7A7 r-f stage, a 7B8 converter, a 7A7 i-f stage, a 7B6 second detector and first audio, and a 7A5 beam-power audio amplifier. The power supply is of the 6-volt non-synchronous vibrator type, using a 7Y4 full-wave rectifier.

A high degree of selectivity, sensitivity, and stability is achieved by the use of permeability tuning in both the r-f and oscillator circuits.

An intermediate frequency of 455 kc. is generated in the converter stage, and is applied via a tuned transformer to the i-f amplifier. A second tuned transformer passes the amplified 455-kc. signal on to the second detector, (the diode section of the 7B6) where it is rectified and the audio-frequency modulation separated from it. Automatic volume control is provided by smoothing and filtering the rectified 455-kc. voltage, and applying it to the grids of the r-f amplifier and converter tubes.

The audio signal from the second detector is applied through the volume control to the first audio amplifier (the triode section of the 7B6). From the plate of the first audio, the signal is applied to the grid of the output power amplifier. The output transformer, which constitutes the plate load of the power amplifier, transmits the signal to the voice coil of the electro-dynamic speaker.

IMPORTANT

The aerial and aerial lead-in form part of the r-f tuning circuit. When testing or aligning this receiver on the bench it is important that an aerial dummy load of equal capacity be used.

TROUBLE-SHOOTING PROCEDURE

This service manual provides a logical trouble-shooting procedure for the S4624, which will facilitate the isolation of most of the faults that may be encountered. The circuit is divided into four sections, with a schematic and chassis layout, showing test points, for each section. The trouble-shooting procedure for each section is outlined in a chart. The first test in each chart is a sectional master check, making it possible to eliminate the section under test as a source of trouble without going through its entire chart procedure. The sections should be tested in their numerical order, as they are arranged in the manual.

The dial scale on the S-4625 is a fluorescent type to match the panel indicators of the 1947 cars. The dial pointer and cam assembly is different thus giving a new part number to the tuning assembly which otherwise is the same. The "A" lead is dressed to the left side of the radio case instead of the right side for convenience to the new position of the ignition switch. A clip is provided on the side of the case to hold the fuse holder and prevent it from rattling against the set. The receiver is mounted in the same position as in the 1946 car, but hook bolts of a new design are provided to fit the installation.

The suppression material is different and complete information on the suppression of ignition interference is given in the installation instructions with the radio.

PRELIMINARY CHECKS

Before starting the trouble-shooting procedure, the following steps are recommended:

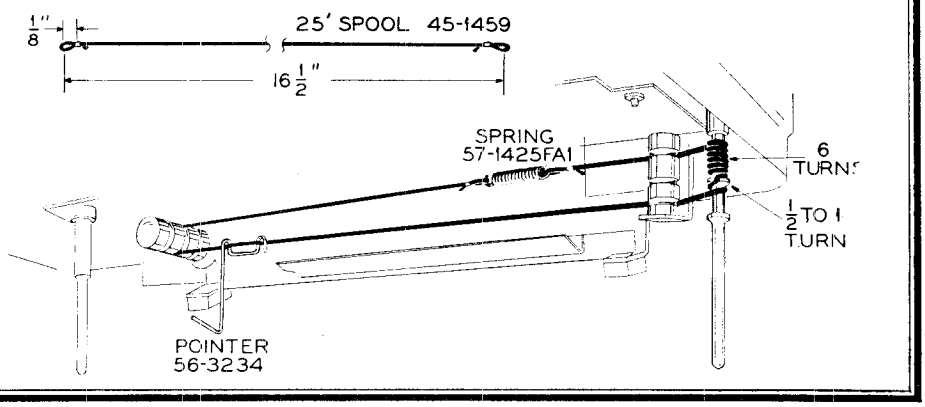
1. Carefully inspect both sides of the chassis. Make sure that all tubes are secure, and look for bad connections, burned resistors, or other mechanical faults.

2. Check the fuse, and connect the receiver to a source of power (6.3 volts, d.c.). Look for unlighted tube filaments, over-heated resistors (smoke, sweating, etc.), and listen for the hum of the vibrator.

3. Check the tubes and the vibrator. WARNING: If the 7Y4 is defective, check C105 for shorts before inserting a new tube. If the vibrator is defective, check C104 for a short before inserting a new vibrator.

SPECIFICATIONS

CIRCUIT	**Six-tube, superheterodyne**
FREQUENCY RANGE	**540 to 1600 kc.**
INTERMEDIATE FREQUENCY	**455 kc.**
PHILCO TUBES	**7A7(2), 7B8, 7B6, 7A5, 7Y4**
POWER INPUT	**6.3 volts, 6 amps, d.c.**
AERIAL	**Retractable-tip, Philco Part No. 91-0230**



Drive-cord installation details.

NOTE: Parts marked with an asterisk (*) are general replacement items, and the part numbers will not be identical with those used on factory assemblies. Use only the "Service Part No." shown in the parts list when ordering replacements.

MAKE TEST NO. 1 FIRST !

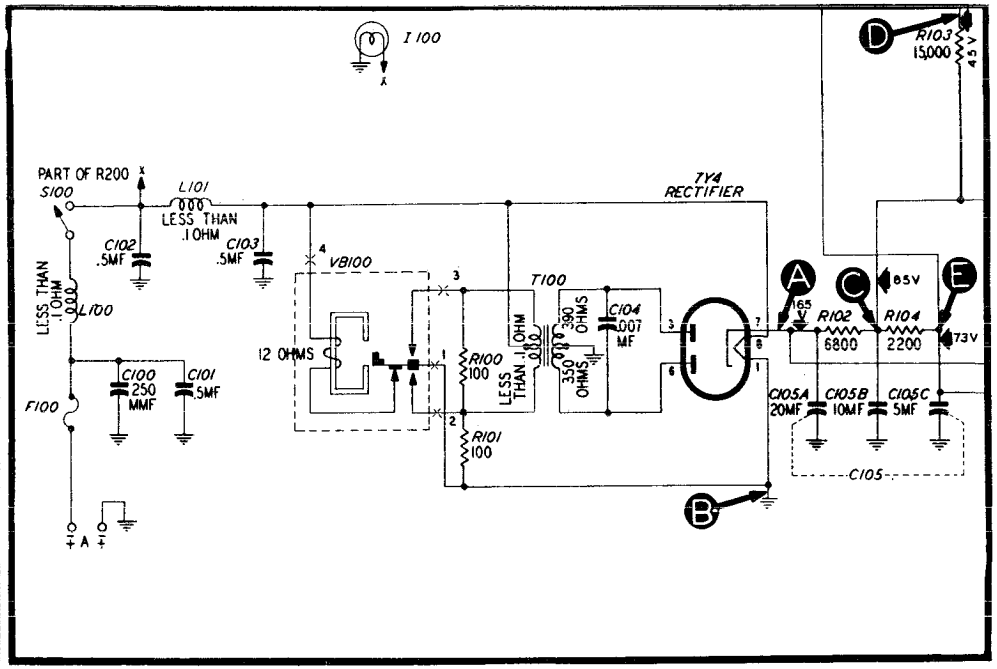
If the "NORMAL INDICATION" for this test is obtained, proceed to Test No. 1 in the next section. If not, continue through the chart to isolate and remedy the trouble in this section.

TESTS TO ISOLATE TROUBLE WITHIN SECTION 1

Make all measurements for this section with a volt-ohmmeter, using the applicable d-c range. All voltages given in this manual are average, and were taken with a 20,000 ohms-per-volt meter and with 6.3 volts d-c input; the volume control was set at minimum, and the tuning control at 540 kc.

WARNING: If the 7Y4 rectifier is found to be defective, check the main filter condenser, C105, for shorts before inserting a new tube. If the vibrator is found to be defective, check C104 for a short before inserting a new vibrator.

	TEST POINTS	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1.	D to B—	45 volts	Trouble within Section 1. Isolate by following tests.
2.	A to B—	165 volts	Defective 7Y4, VB100, T100, C104, or C105A.
3.	C to B—	85 volts	Defective R102, C105B, C105C, or C406 (shown in Section 4).
4.	D to B—	45 volts	Defective R103 or C303 (shown in Section 3).
5.	E to B—	73 volts	Defective R104, C105C, or C406 (shown in Section 4).



Section 1 schematic.

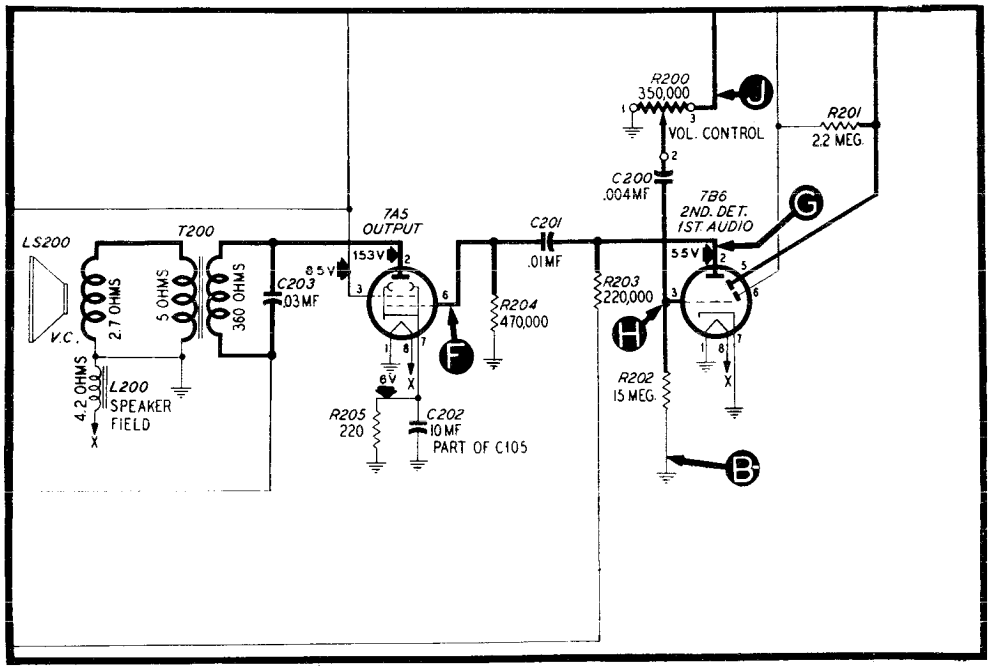
MAKE TEST NO. 1 FIRST !

If the "NORMAL INDICATION" for this test is obtained, proceed to Test No. 1 in the next section. If not, continue through the chart to isolate and remedy the trouble in this section.

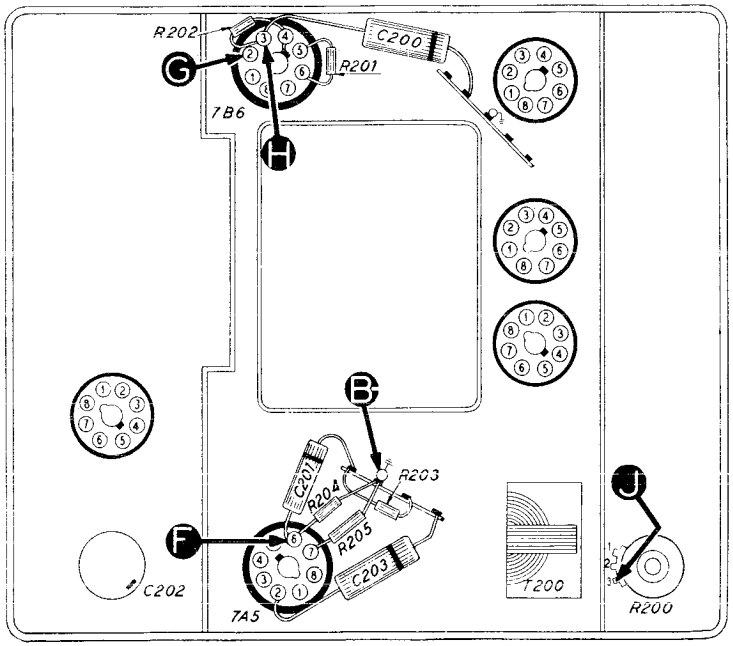
TESTS TO ISOLATE TROUBLE WITHIN SECTION 2

For all tests in this section, use an audio signal. Connect the generator output lead through a condenser (.01 to .25 mf.) to the test points indicated; connect the ground lead to the receiver chassis (B–). Set the receiver volume control at maximum, and start with the signal generator adjusted for low output.

	TEST POINTS	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1.	J to B–	Loud, clear signal.	Trouble within Section 2. Isolate by following tests.
2.	F to B–	Clear signal, using moderate generator output.	Defective 7A5, T200, LS200, R204, R205, C201, C202, or C203.
3.	G to B–	Same as above.	Open C201.
4.	H to B–	Clear signal, much louder than step 3.	Defective 7B6, R202, R203, C105C, or R104 (shown in Section 1).
5.	J to B–	Same as step 4.	Defective C200 or R200 (rotate R200 through its entire range for complete check).



Section 2 schematic.



Bottom view, showing Section 2 test points. TP461B

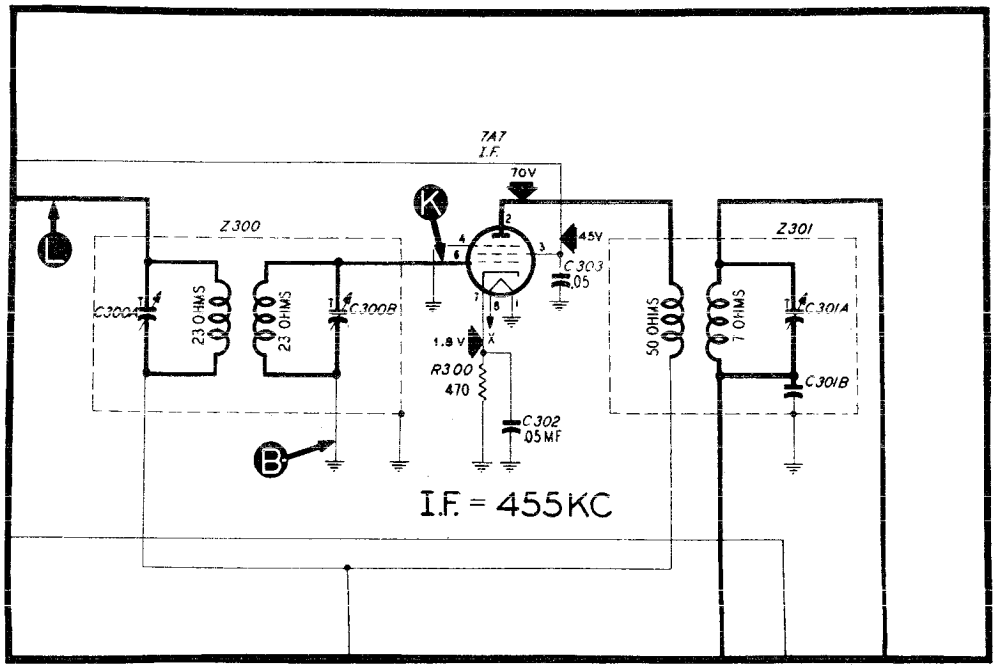
MAKE TEST NO. 1 FIRST !

If the "NORMAL INDICATION" for this test is obtained, proceed to Test No. 1 in the next section. If not, continue through the chart to isolate and remedy the trouble in this section.

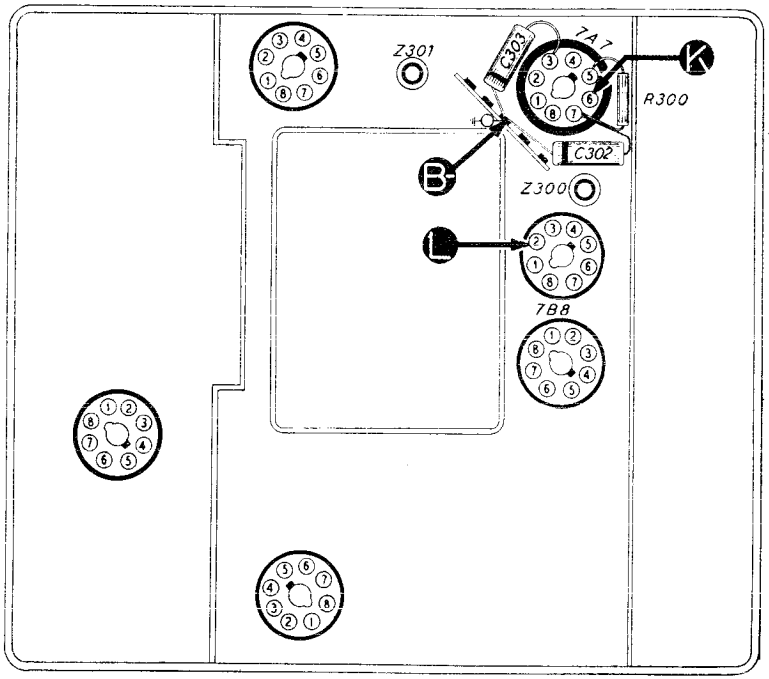
TESTS TO ISOLATE TROUBLE WITHIN SECTION 3

For all tests in this section, use a modulated 455-kc. signal. Connect the signal-generator output lead through a condenser (.01 to .25 mf.) to the test points indicated; connect the ground lead to the receiver chassis (B–). Set the receiver volume control at maximum, and adjust the signal-generator output for a loud, clear signal.

	TEST POINTS	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1.	L to B–	Loud, clear signal.	Trouble within Section 3. Isolate by following tests.
2.	K to B–	Loud, clear signal.	Defective 7A7, Z301, R300, C302, or C303.
3.	L to B–	Loud, clear signal.	Defective Z300.



Section 3 schematic.



Bottom view, showing Section 3 test points.

© John F. Rider

TESTS TO ISOLATE TROUBLE WITHIN SECTION 4

MAKE TEST NO. 1 FIRST !

If the "NORMAL INDICATION" for this test is not obtained, continue through the chart to isolate and remedy the trouble in this section.

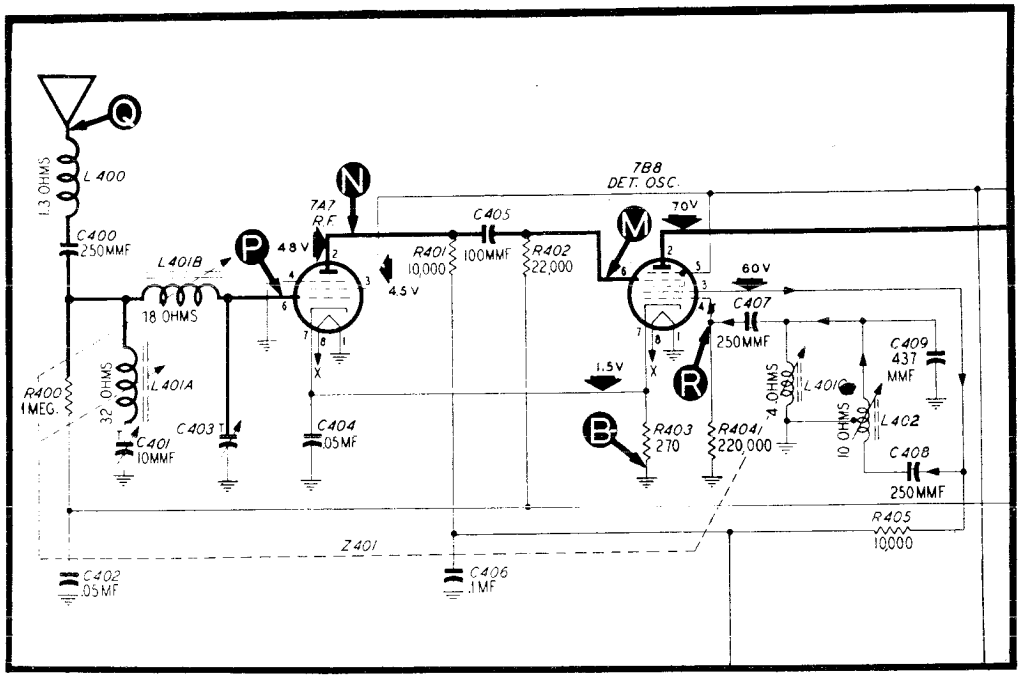
PRELIMINARY OSCILLATOR CHECK:

Attach the positive lead of a 20,000-ohms-per-volt meter (10-volt range) to the receiver chassis, and the prod end of the negative lead through 50,000 ohms to point R. Rotate the tuning control through its entire range; absence of voltage indicates that the oscillator is not functioning. If this is the case, check the components listed in the second test below.

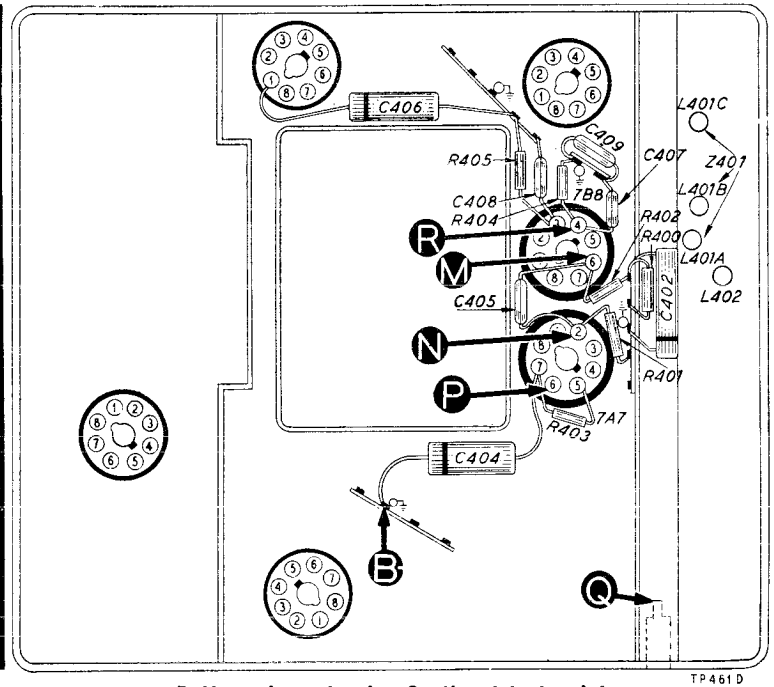
FOR CHART TESTS 1 - 5:

Connect the signal-generator output lead through a condenser (.01 to .25 mf.) to the test points indicated; connect the ground lead to the receiver chassis. Set the receiver volume control at maximum, tune the signal generator and receiver to 1000 kc., and start with the generator adjusted for low output.

	TEST POINTS	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1.	Q to B–	Loud, clear signal.	Trouble within Section 4. Isolate by following tests.
2.	M to B–	Clear signal, with moderate generator output.	Defective 7B8, C404, C405, C406, C408, C409, R402, R403, R404, R405, L401C, or L402.
3.	N to B–	Same as above.	Open C405.
4.	P to B–	Clear signal, louder than step 3.	Defective 7A7, R400, R401, C401, C402, or C403.
5.	Q to B–	Same as step 4.	Defective L400, C400, L401A, or L401B.

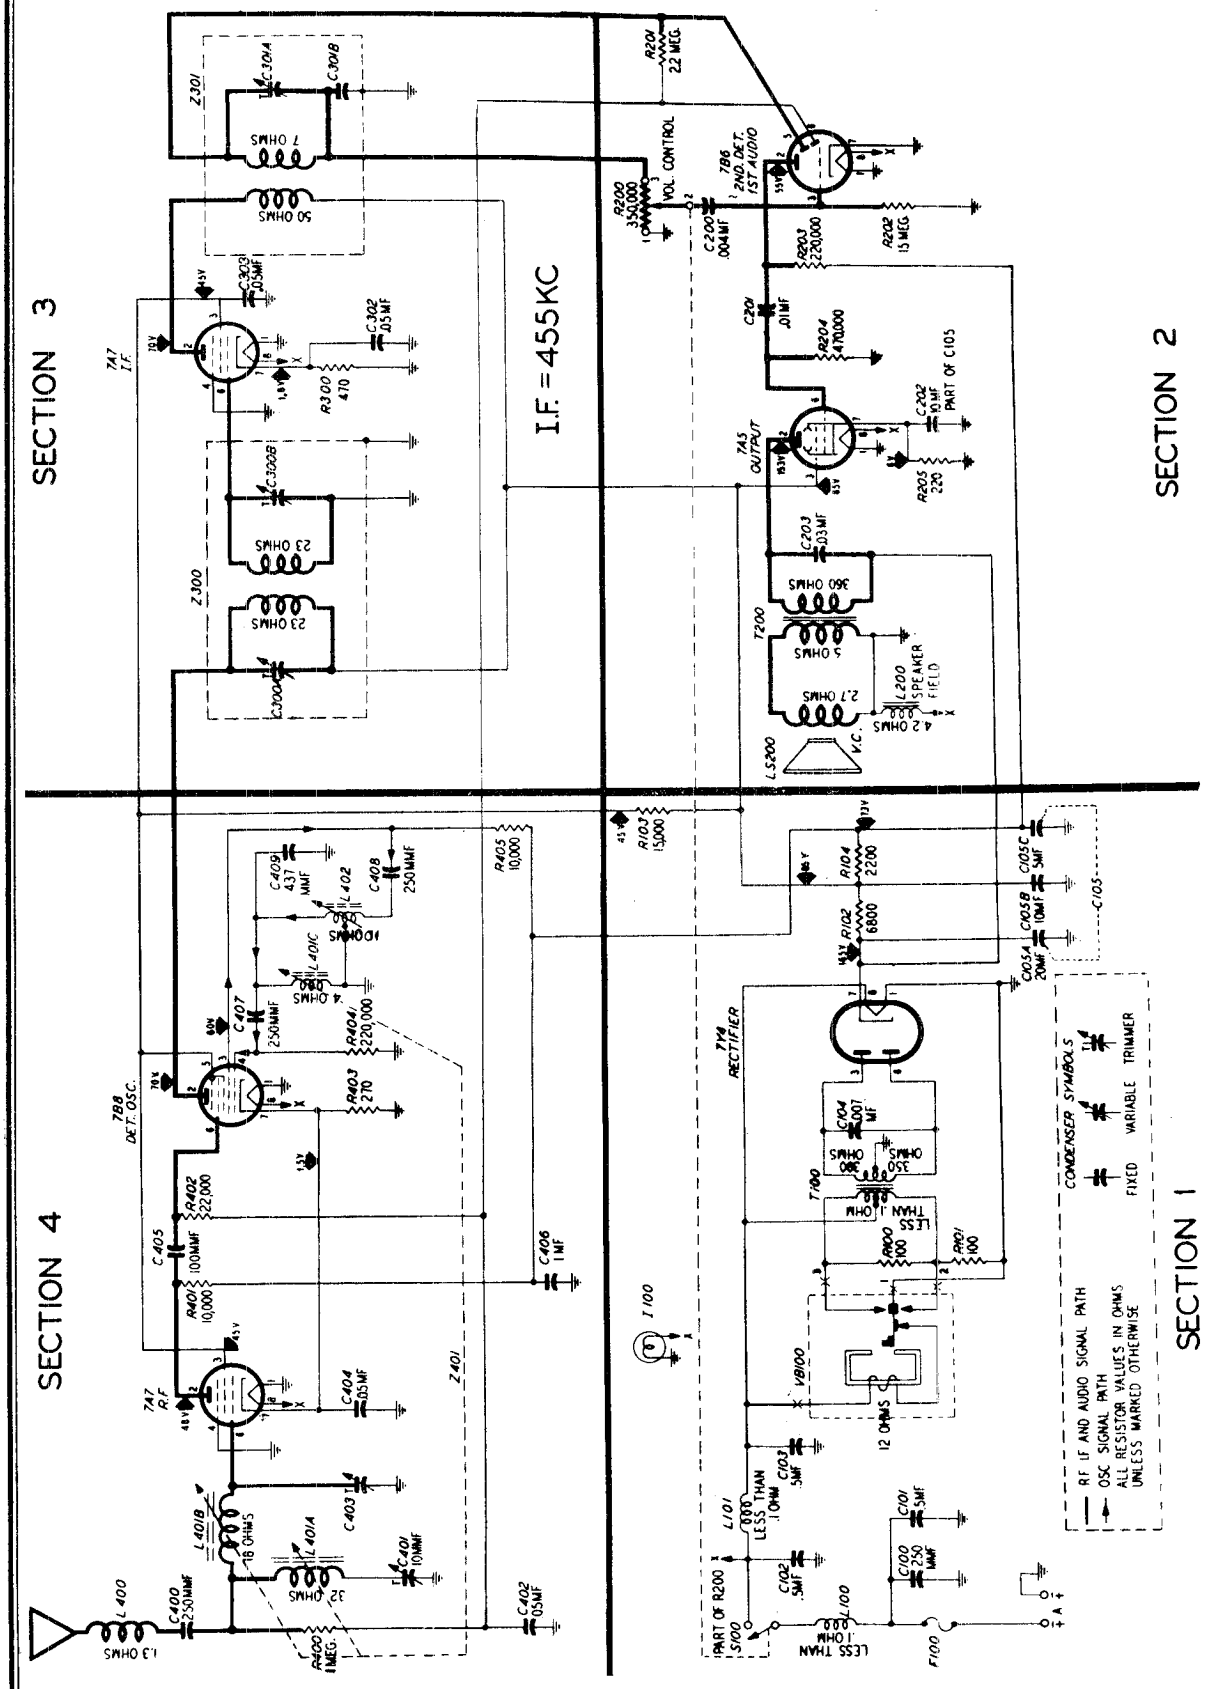


Section 4 schematic.



Bottom view, showing Section 4 test points.

MODELS S4624, S4625



NOTE: All voltage, capacity, and resistance values shown are average. The voltages were measured between the points indicated and the receiver chassis (B–), using a 20,000-ohms-per-volt meter, with 6.3 volts d-c input to the receiver power supply; the volume control was set at minimum, and the tuning control at 540 kc.

©John F. Rider

ALIGNMENT PROCEDURE

CONNECT THE SIGNAL-GENERATOR output lead as follows:

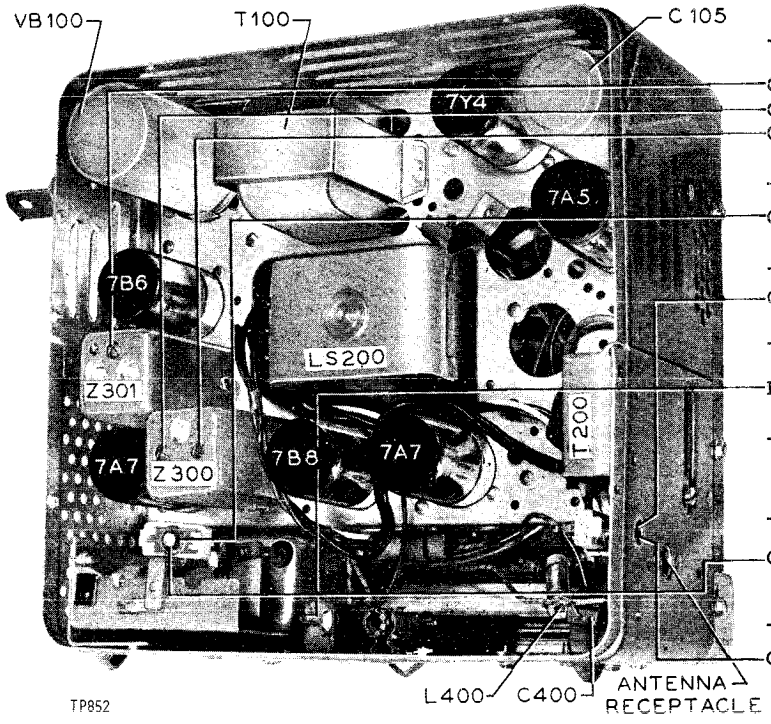
For the i-f alignment (the first step in the chart), connect through a .05-mf. condenser to the antenna receptacle.

For the r-f alignment (all steps after the first), connect through a dummy aerial consisting of a 20-mmf. condenser in series with an aerial lead (Part No. 95-0211) plugged into the antenna receptacle. If the aerial lead is not available, connect a 30-mmf. condenser from the aerial terminal to the receiver chassis, and inject the signal through the 20-mmf. condenser alone.

CONNECT THE OUTPUT METER across the speaker voice coil. Do not disconnect the speaker during alignment.

SET THE RECEIVER VOLUME CONTROL at maximum. Adjust the signal-generator output as alignment progresses to keep the meter needle near center scale, using the lowest range on the output meter.

AFTER REINSTALLING THE RECEIVER in the car, and connecting the antenna, adjust the antenna trimmer (C403) for maximum signal strength on a weak station near 1400 kc.



ADJUST IN ORDER	SPECIAL INSTRUCTIONS	DIAL SETTINGS SIG. GEN.	DIAL SETTINGS RECEIVER
C301A C300B C300A	1. Ground pin 4 of the 7B8 converter. Adjust the i-f trimmers for maximum in the order given, and then repeat the procedure.	455 kc.	1600 kc.
C401	2. Preset C401 to ½ turn from fully tight. Remove the ground from pin 4 of the 7B8.		
C403	3. Adjust for maximum.	1400 kc.	1400 kc.
L402	4. Adjust for maximum while rocking the tuning control.	580 kc.	580 kc.
	5. Tune in the 550-kc. signal with the receiver tuning control.	550 kc.	550 kc. (approx.)
C401	6. Adjust for minimum output.	1460 kc.	Do not alter from setting made in step 5.
C403	7. Adjust for maximum. Final adjustment to be made after the set has been reinstalled in the car, with the antenna connected.	1400 kc.	1400 kc.

R405	Resistor, 10,000 ohms	66-3103340*
Z401	Manual inductive tuning assembly	76-2197
	L401A: coil, image suppressor (Part of Z401)	65-0406
	L401B: coil, r-f grid tuning (Part of Z401)	65-0407
	L401C: coil, oscillator grid tuning (Part of Z401)	65-0405

New part numbers have been given to the following items and apply only to the Model S-4625.

Description	Service Part No.
Dial hardware	
Bezel and stud assembly	76-2155
Dial	27-5922
Pointer	76-2475
Knob, tone control and nut cover	76-2171
Knob, tuning and volume	77-1043
Pilot-lamp assembly	
Shield	76-2339-1
Set mounting hardware	
Bolt, hook	56-3740
Lock washer	1W35046FA1

The following additional parts are supplied with the Model S-4625:

Dial hardware	
Rubber pad	54-4314

MISCELLANEOUS

Description	Service Part No.
Dial hardware	
Background	55-1159
Bezel and stud assembly	76-2156
Bracket, stud, and screen assembly	76-2189
Cord, drive (25-foot spool)	45-1459
Dial	27-5900
Felt	54-4267
Pointer	56-3234
Spring, pointer	57-1425FA1
Spring, retaining	28-9007FA1
Housing parts	
Connector, antenna	57-0591FA3
Cover, tube side	57-1547FC59
Cover, wiring side	57-1548FC59
Gasket, speaker	55-1045
Housing assembly	77-1177FC59
Inductive tuning assembly	76-2197
Bracket (inductive tuning unit mounting)	57-1787FA3
Coil assembly, r-f	65-0407
Coil assembly, image trap	65-0406
Coil assembly, oscillator	65-0405
Condenser, image-suppressor trimmer	63-0071
Core, iron (r-f)	57-1702
Core, iron (oscillator)	57-1703
Core assembly, iron (image trap)	77-0677
Drive spiral assembly	76-2165
Nut, backlash	57-1706
Pin, hair	57-1868FA11
Shaft, core guide	57-1672FA3
Spring, retaining (phosphor bronze)	57-1398
Pilot lamp assembly	
Bracket	57-1404FA3
Shield	76-2339
Socket assembly	76-1679
Set mounting hardware	
Bolt, hook	97-0135FA3
Nut	97-0229FA3
Nut, wing	1W23750FA3
Socket, tube	27-6138*
Socket, vibrator	27-6153
Speaker-mounting hardware	
Bolt	W1582FA3
Lockwasher	1W24257FA1
Nut	1W19988FA3
Suppression parts	
Braid, copper (bonding)	95-0073
Condenser, generator	30-4632
Distributor choke assembly	77-0947
Ground strap	77-0336
Ground strap, fender	77-0966
Nipple, distributor suppressor	57-7159
Screw, ground strap	1W19828FA3
Suppressor, distributor (high-voltage)	33-1333
Washer, brass	2W54094

Description	Service Part No.
Speed nut	1W56913FE7
Moulding	56-3739
Speaker mounting hardware	
Gasket	55-1045
Suppression parts	
Bolt, heater-cable-clamp	1W10636FA3
Condenser, ignition-coil	30-4007-1
Ground strap, heater-cable	76-2505
Ground strap, battery-cable	76-2557
Ground strap, windshield-wiper-motor	76-2556
Nut, heater-cable-clamp	1W19988FA3

Suppression parts in the Model S-4624 list that are not used in Model S-4625 are:

Distributor filter assembly	77-0947
Ground strap, muffler	77-0336
Ground strap, fender	77-0966

ALIGNMENT PROCEDURE

OUTPUT METER — Connect across voice-coil terminals.

SIGNAL GENERATOR — Connect ground lead to chassis; connect output lead as indicated in chart. Use modulated output.

RADIO CONTROLS — Set volume control to maximum, and tone control fully counterclockwise.

OUTPUT LEVEL — During alignment, adjust signal-generator output to maintain output-meter indication below 1 volt.

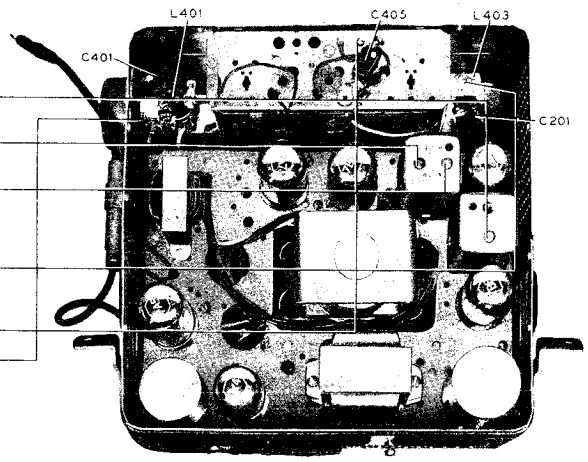
DUMMY AERIAL — For steps 2 and 3, connect generator output lead through 22-mmf. condenser to aerial receptacle; connect 30-mmf. condenser between receptacle and chassis.

IMPORTANT! The above instructions for the dummy aerial must be carefully followed if the radio is to perform at its best after being reinstalled in the car.

STEP	SIGNAL GENERATOR		RADIO		ADJUST
	CONNECTIONS TO RADIO	DIAL SETTING	DIAL SETTING	SPECIAL INSTRUCTIONS	
1	Through .05-mf. condenser to aerial receptacle.	455 kc.	1600 kc.	Adjust, in order given, for maximum output.	C301A — 2nd i-f sec. C300B — 1st i-f sec. C300A — 1st i-f pri.
2	Through dummy aerial.	580 kc.	580 kc.	Adjust for maximum while rocking tuning control. (See NOTE below.)	TC403 — Osc. padding
3	Same as step 2.	1400 kc.	1400 kc.	Adjust for maximum.	C406 — R.f. (shunt) C400 — Aerial (series)
4	Repeat steps 2 and 3 until no further improvement is obtained.				
5	After reinstalling radio in car, with aerial connected, adjust C400 for maximum output from weak station near 1400 kc.				

NOTE: If a satisfactory peak cannot be obtained, proceed to step 3

TOP VIEW, SHOWING TRIMMER AND TUNING-CORE LOCATIONS



SETTING PUSH BUTTONS

Any one of the four station push buttons may be set for any frequency within the broadcast band.

1. Turn on the power, and allow the radio to warm up for fifteen minutes.

2. Push the button in, and tune in the desired station by pulling out slightly on the knurled front end of the button and then turning; turning the knurled end causes the dial pointer to move, indicating the frequency to which the circuits are turned.

3. Repeat the adjustment for each button.

TROUBLE-SHOOTING *Procedure*

For rapid trouble shooting, the radio circuit is divided into four sections, as follows:

Section 1—the power supply
Section 2—the audio circuits
Section 3—the i-f, detector, and a-v-c circuits
Section 4—the r-f and converter circuits

Test points are specified for each section, and are indicated in the sectionalized schematic diagram. The trouble-shooting procedure given for each section includes a simplified test chart and a bottom view of the chassis showing the locations of the test points and the components of that section.

In each chart, the first step is a master check for determining whether trouble exists in that section, without going through the entire chart.

Failure to obtain the "NORMAL INDICATION" in any given step indicates trouble in the circuit under test.

After isolating the trouble to a single stage, the defect is located by: first, testing the tube; second, measuring tube electrode voltages; third, measuring circuit resistances; fourth, substituting condensers. The trouble revealed should be corrected before testing further.

Preliminary Checks

To avoid possible damage to the radio, the following preliminary checks should be made before connecting the radio to a source of power.

1. Inspect both the top and the bottom of the chassis. Make sure that all tubes and the vibrator are secure in the proper sockets, and look for any broken or shorted connections, burned resistors, a blown fuse, or other obvious indications of trouble.

2. Measure the resistance between B+ (pin 7 of 7Y4 rectifier tube) and the chassis. When the ohmmeter test leads are connected in the proper polarity, the highest resistance reading will be obtained. If the reading is lower than 2500 ohms, check condenser C105A for leakage or short.

NOTE: The resistance value above, which is much lower than normal, does not represent a quality check of this condenser; the value given is the lowest at which the rectifier will operate safely while the voltage tests of Section 1 (power supply) are performed.

3. If the fuse is blown, check the vibrator before installing a new fuse; if the vibrator is defective, check the buffer condenser, C104, before installing a new vibrator.

MODEL S4824,
Studebaker

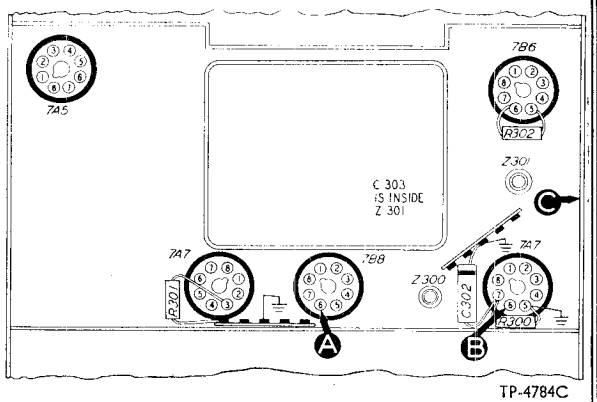
TROUBLE SHOOTING

Section 3 — I-F, DETECTOR, AND A-V-C CIRCUITS

For the tests in this section, use an r-f signal generator, with modulated output, set at 455 kc. Connect the generator ground lead to the chassis, test point C; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Set the volume control to maximum, and the tone control fully clockwise. Set the radio tuning control to the extreme low-frequency end of the dial.

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 4 (r-f and converter circuits); if not, isolate and correct the trouble in this section.



TP-4784C

BOTTOM VIEW, SHOWING SECTION 3 TEST POINTS

Since the circuit location of test point A for this section is in Section 4, the effectiveness of step one as a master check is dependent upon the condition of certain parts in Section 4; these parts are listed below under "POSSIBLE CAUSE OF ABNORMAL INDICATION."

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	Loud, clear signal ...with weak signal input.	Trouble in this section. Isolate by the following tests.
2	B	Loud, clear signal with strong signal input.	Defective: 7A7. Open: L301A, L301B, C301A, R300, R301. Shorted: C300B, L301A, L301B, C301A.
3	A	Same as step 1.	Defective: 7B8*. Open: C300A, C300B, L300A, L300B, R402*. Shorted: C300A, L300A, L300B, C404*, C406*.

*This part, located in another section, may cause abnormal indication in this section.

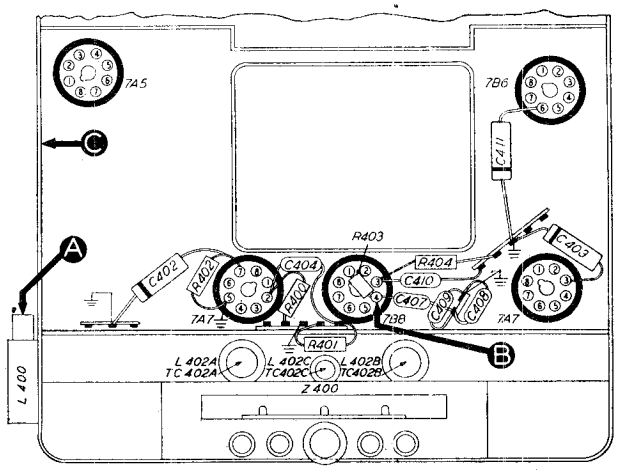
TROUBLE SHOOTING

Section 4 — R-F AND CONVERTER CIRCUITS

For the tests in this section, with the exception of the oscillator test, use an r-f signal generator, with modulated output. Connect the generator ground lead to the chassis, test point C; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Set the radio volume control to maximum, and the tone control fully clockwise. Set the radio tuning control and signal-generator frequency as indicated in the chart.

If the "NORMAL INDICATION" is not obtained in step 1, isolate the trouble by following the remaining steps.



TP-4784D

BOTTOM VIEW, SHOWING SECTION 4 TEST POINTS

STEP	TEST POINT	SIGNAL GEN. FREQUENCY	RADIO TUNING	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	1000 kc.	Tune to signal.	Loud, clear signal with weak signal input.	Trouble in this section. Isolate by the following tests.
2	B (Osc. test; see note below.)			Negative 1.6 to 6 volts.	Defective: 7B8. Open: R403, C407, L402C, L403, C410, R404. Shorted: C407, C408, C409, C410, L402C, L403.
3	A	1000 kc.	Tune to signal.	Same as step 1.	Defective: 7A7. Open: L400, C400, L401, L402A, R400, C404, L402B, C405. Shorted: C401.
Listening Test: Distortion may be caused by open R302, R401, or C411.					

OSCILLATOR TEST: Connect the positive lead of a high-resistance voltmeter to the chassis; connect the prod end of the negative lead through a 100,000-ohm isolating resistor to the oscillator grid (pin 4) of the 7B8, test point B. Proper operation of the oscillator is indicated by negative voltages of approximately the values given in the chart (measured with 20,000-ohms-per-volt meter) throughout the tuning range.

MODEL 5824, Studebaker

TROUBLE SHOOTING

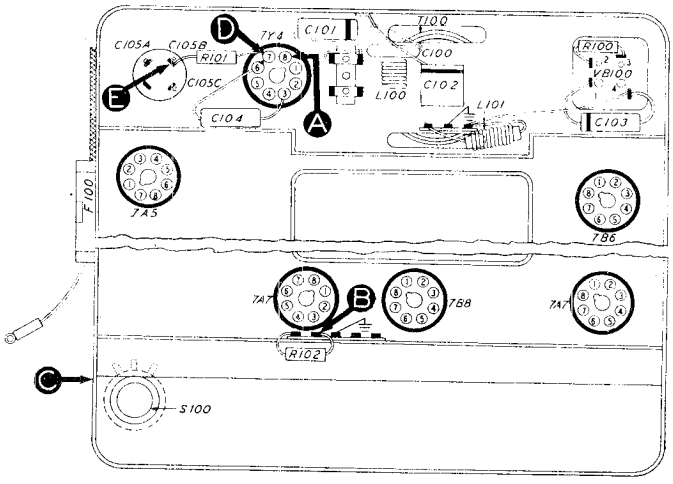
Section 1 — POWER SUPPLY

Make the tests for this section with a d-c voltmeter; connect the leads between the chassis, test point C, and the test points indicated in the chart.

The voltage readings given were taken with a 20,000-ohms-per-volt meter, with an input voltage of 6.6 volts, d.c.

Set the volume control to minimum, and the tone control fully clockwise.

Follow the steps in the order given. If the "NORMAL INDICATION" is obtained in step 1, (a) and (b), proceed with the tests for Section 2 (audio circuits); if not, isolate and correct the trouble in this section.



TP-4784A

BOTTOM VIEW, SHOWING SECTION 1 TEST POINTS

STEP	TEST POINT	NORMAL INDICATION	ABNORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1 (a) 1 (b)	A B	6.6v 82v		Trouble in this section. Isolate by the following tests.
2	A	6.6v	No voltage Low voltage	Open: FS100, L100, S100, L101. Shorted: C100, C101, C102, C103. Leaky: C100, C101, C102, C103.
3	D	165v	No voltage Low voltage High voltage	Defective: 7Y4, VB100. Open: T100. Defective: 7Y4. Open: C105A, T100. Leaky: C105A. Shorted or leaky: C105B, C105C. Open: R101, R205*.
4	E	85v	No voltage Low voltage High voltage	Open: R101. Shorted: C105B. Leaky: C105B, C105C. Changed resistance: R101. Open: R102, R205*, T200*.
5	B	82v	No voltage Low voltage	Open: R102. Shorted: C105C. Leaky: C105C. Changed resistance: R102.
Listening Test: Abnormal hum may be caused by open C105B or C105C.				

This part, located in another section, may cause abnormal indication in this section.

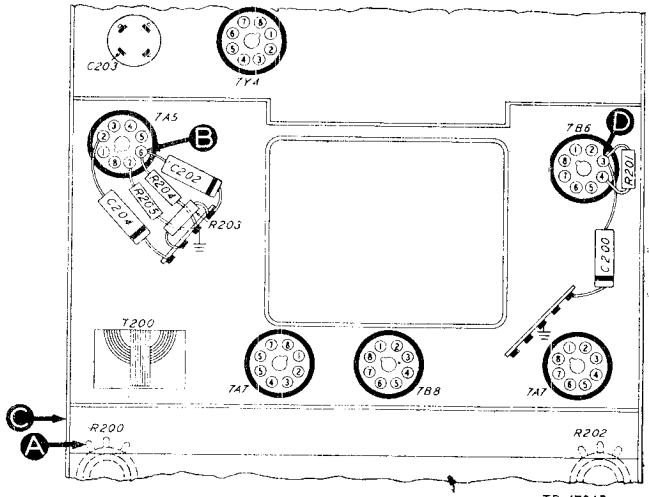
TROUBLE SHOOTING

Section 2 — AUDIO CIRCUITS

For the tests in this section, use an audio-frequency signal generator. Connect the generator ground lead to the chassis, test point C; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Set the volume control to maximum, and the tone control fully clockwise.

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 3 (i-f, detector, and a-v-c circuits); if not, isolate and correct the trouble in this section.



TP-4784B

BOTTOM VIEW, SHOWING SECTION 2 TEST POINTS

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	Loud, clear signal with weak signal input.	Trouble in this section. Isolate by the following tests.
2	B	Clear signal with strong signal input.	Defective: 7A5, LS200. Open: R205, T200, L200. Shorted: C202, C204, C201 (rotate R202 through range).
3	D	Same as step 1.	Defective: 7B6. Open: C202, R203. Shorted: C303*.
4	A	Same as step 1.	Open: R200 (rotate through range), C200.
Listening Test: Distortion may be caused by open R201, R204, or by shorted or leaky C200, C202.			

*This part, located in another section, may cause abnormal indication in this section.

MODEL S4824,
Studebaker

Circuit Description

Studebaker-Philco Model S4824, a custom-built auto radio, is a six-tube superheterodyne with self-contained speaker. Permeability tuning is used for all main circuits. Four push buttons provide mechanical automatic tuning by actuating the pantograph tuning mechanism.

The circuit includes a 7A7 r-f amplifier, a 7B8 converter, a 7A7 i-f amplifier, a 7B6 detector-a.v.c.-1st audio amplifier, and a 7A5 output amplifier. The power supply has a non-synchronous vibrator and a 7Y4 rectifier.

The lower section of L402B, together with C405 and incidental circuit constants, comprises a series-resonant circuit at image frequencies; since this circuit is directly across the output circuit of the r-f amplifier, the image-frequency component of the output is by-passed to ground. L402B as a whole, with its associated components, functions as an r-f autotransformer, of which the output side is resonant at signal frequencies.

SPECIFICATIONS

CABINET	Model 46-131 (Plastic, walnut finish)
CIRCUIT	Four-tube superheterodyne
FREQUENCY RANGE	540 to 1720 k.c.
POWER INPUT	90 volts at 6.5 to 7.5 milliamperes (plate supply) 1.5 volts at .2 ampere (filament supply) From battery pack—Type P-60B-6L
POWER CONSUMPTION	1 watt (total for both plate and filament supplies)
AERIAL	External, Philco Type 40-6383
INTERMEDIATE FREQUENCY	455 kc.
PHILCO TUBES USED	1LA6, 1LN5, 1LH4, 1A5GT/G

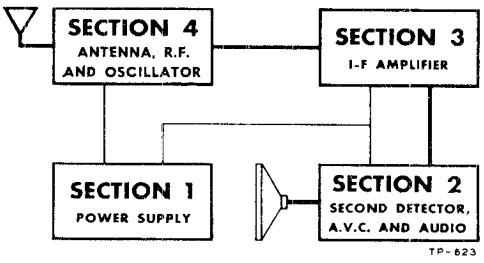

Figure 1. Block diagram (Heavy lines indicate signal path).

TROUBLE-SHOOTING PROCEDURE

In this manual, the receiver circuit is divided into four sections, as shown in figure 1. One test point is designated for each section, as shown in figure 2. Abnormal indications, secured when checking at these test points, localize trouble to the section under test. After localization, isolation of the faulty part is accomplished by testing in the order shown in the sectional test charts. A high-quality signal generator and volt-ohmmeter are required. Voltage readings shown were taken with a 20,000-ohms-per-volt meter. To localize trouble, proceed in the order given in the following chart. When applying a signal, connect the signal-generator output lead through a condenser (.01 to .25 mf.). Remedy any defect encountered before proceeding to the next check.

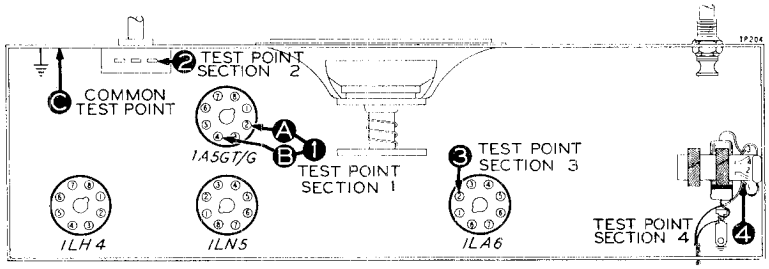

Figure 2. Bottom view, showing test points.

TESTS TO LOCALIZE TROUBLE TO ONE SECTION

SECTION	TEST	NORMAL RESULTS
Preliminary resistance check	Measure resistance between points 1B and C before connecting battery to receiver. If resistance is low, check condensers C100 and C203 for leakage or shorts.	100,000 ohms or higher
1	Measure voltage between points 1A and C (chassis). Measure voltage between points 1B and C.	1.2 to 1.4 volts 63 to 79 volts
2	Apply audio signal between points 2 and C.	Loud, clear signal
3	Apply weak, modulated signal (455 kc.) between points 3 and C.	Loud, clear signal
4	Apply weak, modulated signal (frequency to which set is tuned) between points 4 and C.	Loud, clear signal

MODEL 46-131

TESTS TO ISOLATE TROUBLE WITHIN SECTION 1

Make all tests for this section with a volt-ohmmeter, using the 0-250v. d-c range. Voltages given were taken with the set operating and drawing normal current from battery. See figures 3 and 4 for location of test points.

Test Points	Normal Reading	Possible Cause of Abnormal Reading
B to C (chassis)	79 volts	No voltage indicates open battery cable, defective switch S100, open resistor R100, shorted condenser C100. Low voltage indicates nearly dead battery, defective resistor R100, leaky condenser C100, or excessive plate or screen current by one or more tubes.
A to C	1.4 volts	No voltage indicates open battery cable or defective switch S100.
D to C	6 volts	Deviation in this voltage indicates change in value of resistor R100, or abnormal current flow because of defective parts in sections 2, 3, or 4.

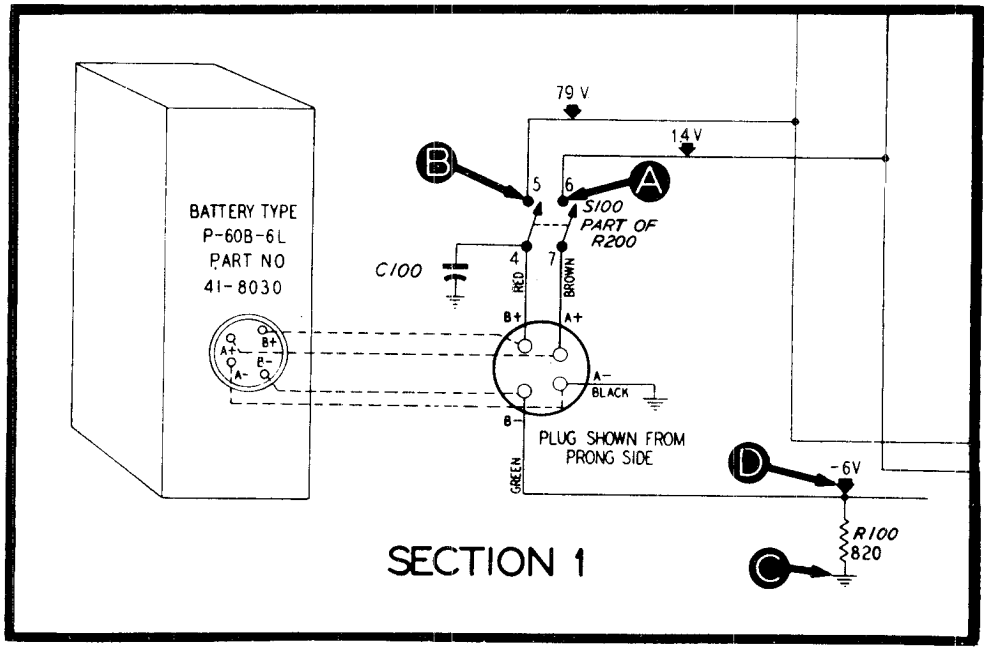

Figure 3. Section 1 schematic.

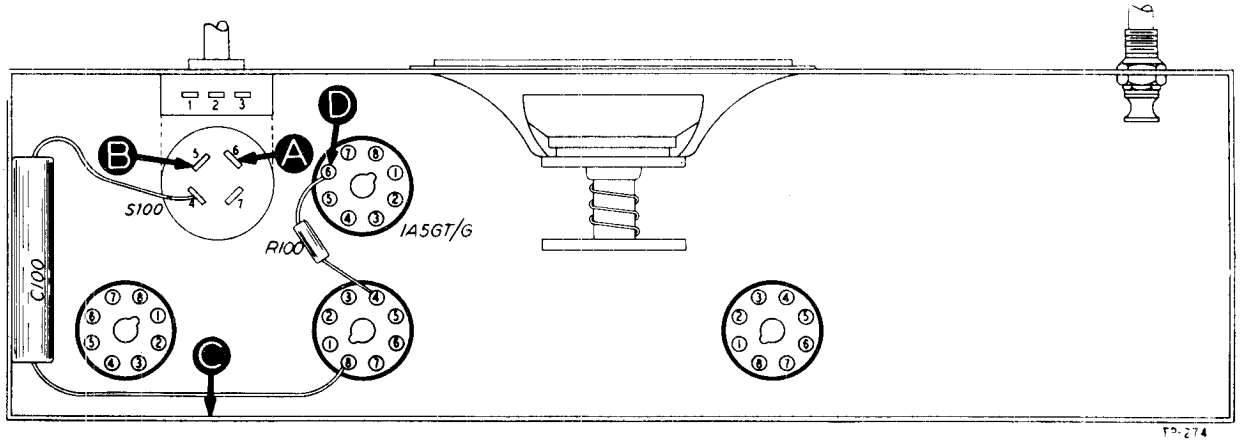

Figure 4. Bottom view, showing section 1 test points.

©John F. Rider

TESTS TO ISOLATE TROUBLE WITHIN SECTION 2

For all tests in this section use the audio range of the signal generator. Connect the generator output lead through a condenser (.01 to .25 mf.) to points indicated; connect the ground lead to receiver chassis. Adjust signal generator output for clear, audible signal.

Test Points	Normal Indication	Possible Cause of Abnormal Indication
E to C (chassis)	Clear, audible signal from speaker (receiver volume control at approximately three-fourths maximum).	No signal indicates defective 1A5GT/G, defective output transformer T200 or speaker LS200. Low and greatly distorted signal indicates leakage in condensers C202 or C203.
F to C	Clear, audible signal, same as preceding test.	No signal indicates open condenser C202, or shorted condenser C201; distortion indicates leakage in condenser C202, or open resistor R203.
G to C	Clear, audible signal with noticeable increase over that obtained in previous tests.	No signal indicates defective 1LH4, or open resistor R202. Distortion indicates defective 1LH4.
H to C	Clear, audible signal, same as preceding test.	No signal indicates open condenser C200; noisy or otherwise distorted signal indicates defective volume control R200. Rotate control through entire range for complete check.

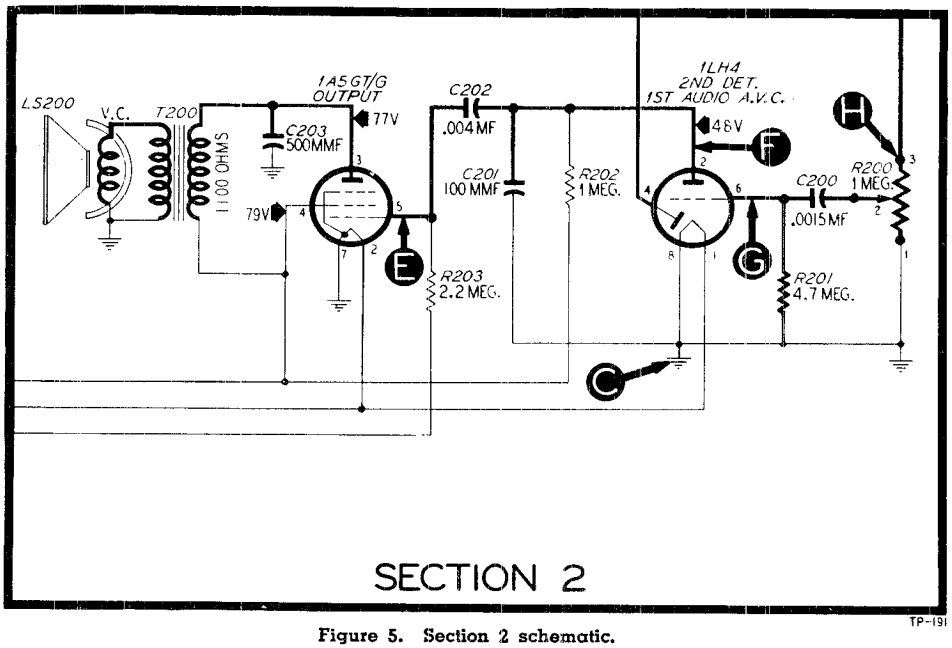

Figure 5. Section 2 schematic.

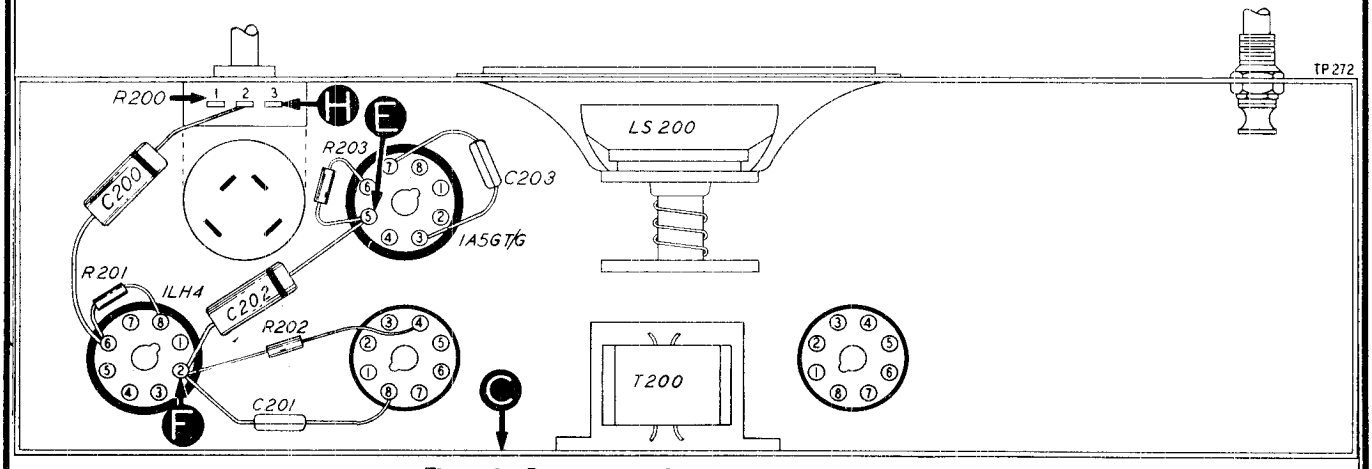

Figure 6. Bottom view, showing section 2 test points.

MODEL 46-131

TESTS TO ISOLATE TROUBLE WITHIN SECTION 3

For all tests in this section, set the signal generator to 455 kc., modulation on. Connect the generator output lead through a condenser (.01 to .25 mf.) to the points indicated; connect the ground lead to receiver chassis. Adjust signal generator output for clear, audible signal.

Test Points	Normal Indication	Possible Cause of Abnormal Indication
J to C (chassis)	Audible signal from speaker.	No signal, or very weak signal, indicates defective 1LN5 tube, defective or misaligned i-f transformer assembly Z301, or defective diode section of 1LH4 tube.
K to C	Audible signal from speaker.	No signal indicates defective or misaligned i-f transformer assembly Z300.

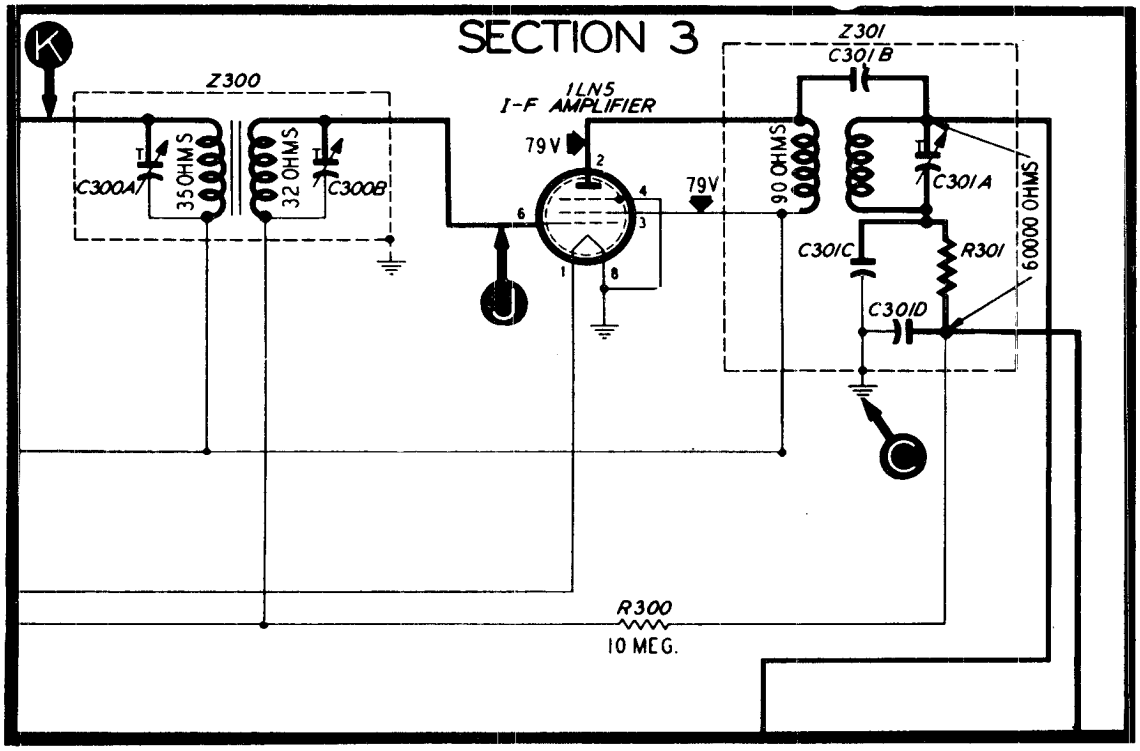

Figure 7. Section 3 schematic.

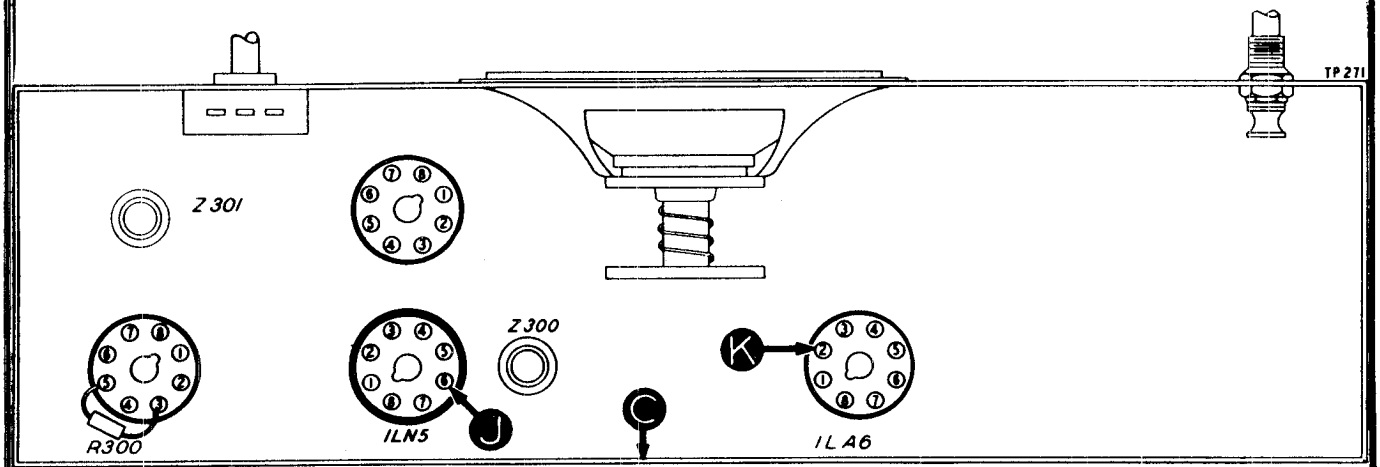

Figure 8. Bottom view, showing section 3 test points.

© John F. Rider

TESTS TO ISOLATE TROUBLE WITHIN SECTION 4

IMPORTANT: Before applying a test signal to this section, make a preliminary check by rotating the tuning control through its entire range. Any scraping noise heard in the speaker indicates bent tuning condenser plates, dirty wiper contacts or dirt between the condenser plates. These conditions should be remedied before proceeding with the tests. Then connect the signal-generator output lead through a condenser (.01 to .25 mf.) to indicated test points and the generator ground lead to "C" (receiver chassis). For best results, check operation first at 540 kc. and then at 1700 kc.

Test Points	Normal Indication	Possible Cause of Abnormal Indication
L to C (chassis)	Audible signal from speaker.	No signal indicates defective 1LA6 tube, defective oscillator transformer T401, shorted plates in oscillator section of condenser C401, shorted condenser C405, or defective resistor R401 or R402.
M to C	Audible signal from speaker.	No signal indicates defective antenna transformer T400, or shorted plates in antenna section of condenser C401.

OSCILLATOR GRID BIAS VOLTAGE. Ground test point "L", connect a voltmeter (20,000-ohms-per-volt, 10-volt scale) between "N" (—) and "C" (+), and rotate the tuning control throughout its entire range. The voltage reading should not fall below 1.5 volts throughout. Insufficient voltage indicates malfunctioning, and the components listed in the first test in the above chart should be checked in the order given.

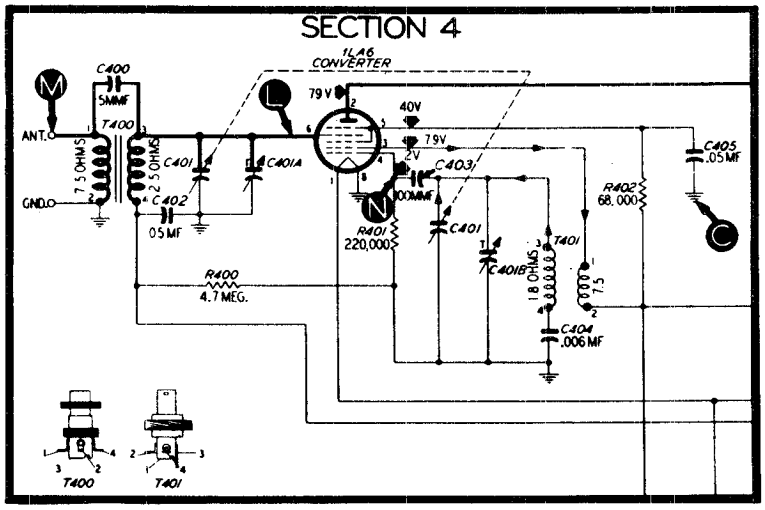

Figure 9. Section 4 schematic.

MODEL 46-131

CONNECTING ALIGNING EQUIPMENT

OUTPUT METER. Connect to voice coil lugs on rear of speaker, as shown in figure 11.

SIGNAL GENERATOR. Use a 100-mmf. condenser to couple the signal-generator output lead to the receiver. Adjust the output of the signal generator to give a signal strength sufficient to cause a readable deflection of the output meter, using the range on the meter which best indicates small variations in output. Reduce the output of the signal generator if the pointer of the output meter goes off scale as alignment progresses.

PROCEDURE. Turn receiver volume control to three-fourths maximum and adjust all trimmers, in the order listed, for maximum output.

ALIGNMENT CHART

SIGNAL GENERATOR		RECEIVER		
Connections to Receiver	Dial Setting (kc.)	Dial Setting (kc.)	Special Instructions	Adjust Trimmers in Given Order
Stator plate terminal, antenna section of tuning condenser, and chassis.	455	540	Turn C300B fully clockwise. Turn tuning condenser plates to fully meshed position. Make sure that dial pointer is set to the left index mark (the first small hole stamped 3¾ inches from left end of scale plate reflector). This setting corresponds to a dial setting of 540 kc.	C301A C300A C300B
Antenna lead and chassis.	1700	1700	Turn tuning condenser until dial pointer is on the first index mark (the first small hole 4⅛ inches from right end of the scale plate reflector).	C401B
Antenna lead and chassis.	1500	1500 (approx.)	Turn tuning condenser to position providing maximum reading on output meter.	C401A

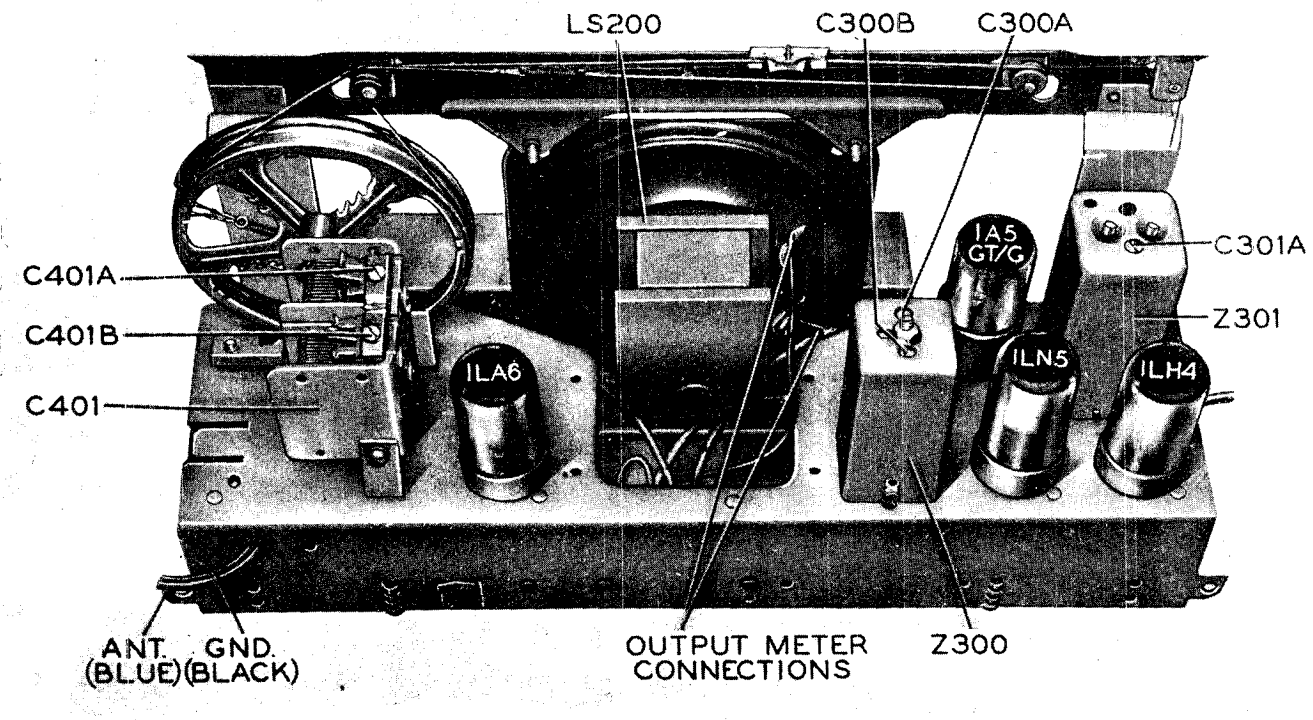

Figure 11. Top view, showing trimmer-condenser locations.

SPECIFICATIONS

CABINET	Model 46-132 (wood, walnut finish)
CIRCUIT	Five-tube superheterodyne
FREQUENCY RANGE	540 to 1720 kc.
POWER INPUT	90 volts at 8 to 10 milliamperes (plate supply) 1.5 volts at .25 ampere (filament supply) From battery pack—Type P-60D-11L
POWER CONSUMPTION	1.3 watts (total for both plate and filament supply)
AERIAL	External, Philco Type 40-6383
INTERMEDIATE FREQUENCY	455 kc.
PHILCO TUBES USED	1LA6, 1LN5, 1LH4, 1A5GT/G—(2)

PHILCO TROUBLE-SHOOTING PROCEDURE

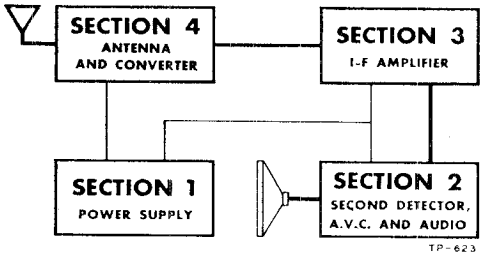

Figure 1. Block diagram (Heavy lines indicate signal path).

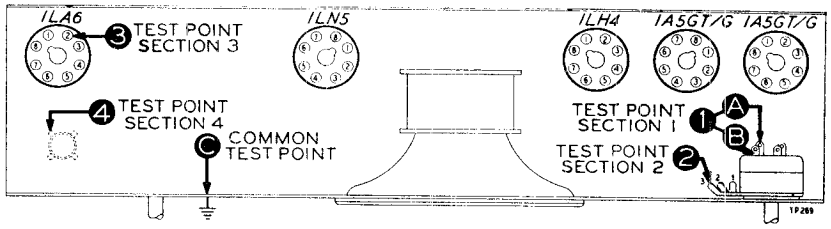

Figure 2. Bottom view showing test points.

In this manual, the receiver circuit is divided into four sections, as shown in figure 1. One test point is designated for each section, as shown in figure 2. Abnormal indications, secured when checking at these test points, localize trouble to the section under test. After localization, isolation of the faulty part is accomplished by testing in the order shown in the sectional test charts. A high-quality signal generator and a volt-ohmmeter are required. Voltage readings shown were ta sn with a 20,000-ohms-per-volt meter. To localize trouble, turn receiver volume control full on; proceed in the order given in the following chart. When applying a signal, connect the signal-generator output lead through a condenser (.01 to .25 mf.). Remedy any defect encountered before proceeding to the next check.

TESTS TO LOCALIZE TROUBLE TO ONE SECTION

SECTION	TEST	NORMAL RESULTS
Preliminary resistance check	Measure resistance between points 1B and C with battery disconnected from receiver. If resistance is low, check condensers C302 and C202 for leakage or shorts.	100,000 ohms or higher
1	Measure voltage betwee point 1A and C (chassis) Measure voltage between point 1B and C (chassis)	1.2 to 1.4 volts 69 to 79 volts
2	Apply audio signal between point 2 and C (chassis)	Loud, clear signal
3	Apply weak, modulated signal (455 kc.) between point 3 and C (chassis)	Loud, clear signal
4	Apply weak, modulated signal (frequency to which set is tuned) between point 4 and C (chassis)	Loud, clear signal

MODEL 46-132

TESTS TO ISOLATE TROUBLE WITHIN SECTION 1

NOTE: Make all tests for this section with a volt-ohmmeter, using the 0-250 V d-c range. Voltages given were taken with the set operating and drawing normal current from battery. See figures 3 and 4 for location of test points.

TEST POINTS	NORMAL READING	POSSIBLE CAUSE OF ABNORMAL READING
B to C (chassis)	79 volts	No voltage indicates open battery cable, defective switch S100, open resistor R100, shorted condenser C302 (see section 3). Low voltage indicates nearly dead battery, defective resistor R100, leaky condenser C302, or excessive plate or screen current by one or more tubes.
A to C	1.35 volts	No voltage indicates open battery cable or defective switch S100.
D to C	6 volts	Deviation in this voltage change of value by resistor R100, or abnormal current flow because of defective parts in the sections 2, 3, or 4.

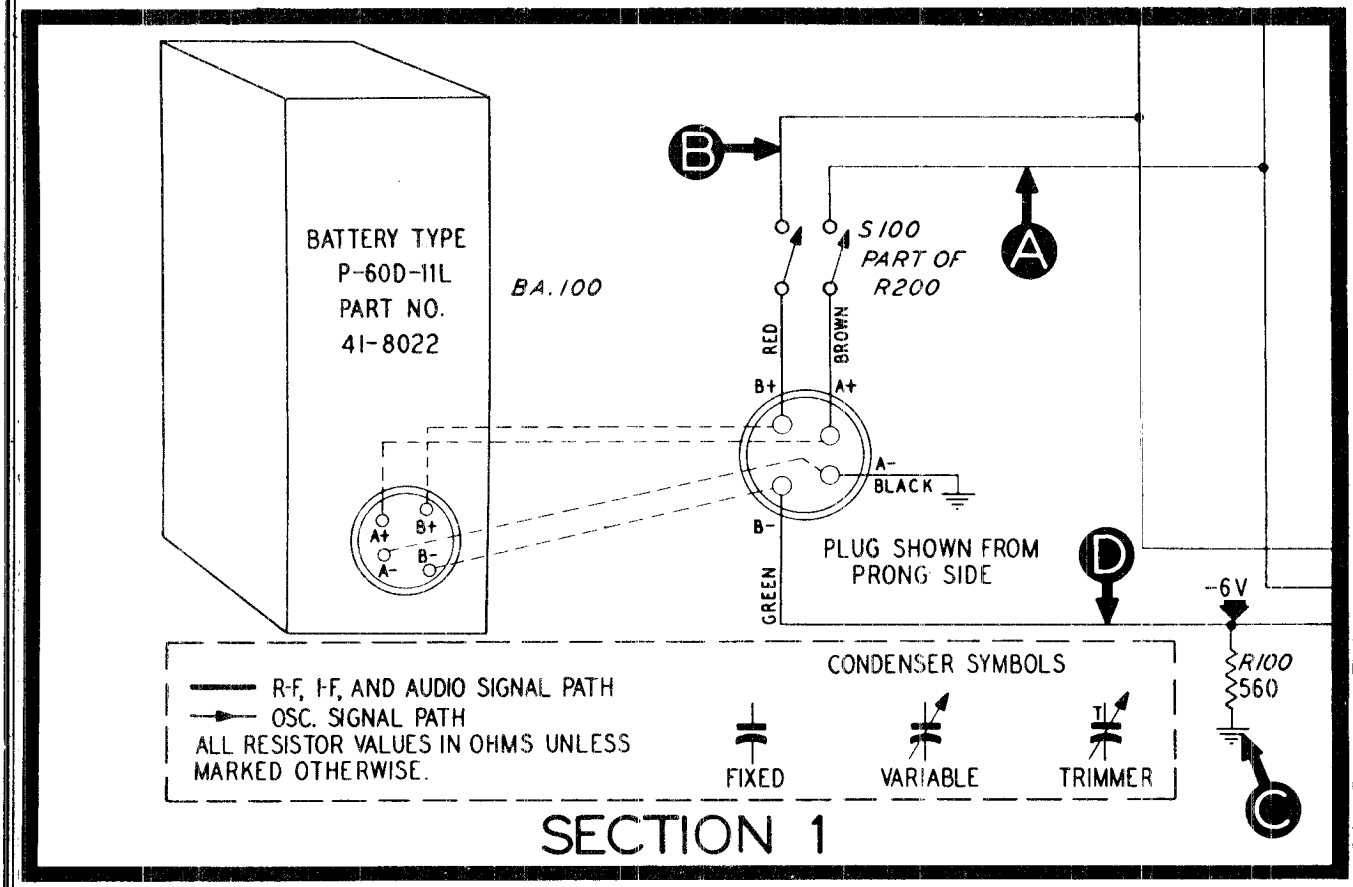

Figure 3. Section 1 schematic.

MODEL 46-132

TESTS TO ISOLATE TROUBLE WITHIN SECTION 2

For all tests in this section, use the audio range of the signal generator. Connect the generator output lead through a condenser (.01 to .25 mf.) to points indicated, and connect the ground lead to receiver chassis. Adjust signal-generator output for clear, audible signal.

TEST POINTS	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
E to C (chassis)	Clear, audible signal from speaker (receiver volume control at approximately three-fourths maximum).	No signal indicates defective 1A5GT/G tube (into which the signal is fed), defective output transformer T200 or speaker LS200. Low and greatly distorted signal indicates leakage in condensers C203 or C204.
F to C	Clear, audible signal, as in preceding test.	No signal indicates open condenser C203 or shorted condenser C202; distortion indicates leakage in condenser C203.
G to C	Clear, audible signal with noticeable increase over that obtained in previous tests.	No signal indicates defective 1LH4 tube or open resistor R203. Distortion indicates defective 1LH4 tube.
H to C	Clear, audible signal, same as preceding test.	No signal indicates open condenser C201; noisy or otherwise distorted signal indicates defective volume control R200. Rotate control through entire range for complete check.

MODEL 46-132

TESTS TO ISOLATE TROUBLE WITHIN SECTION 4

IMPORTANT: Before applying a test signal to this section, make a preliminary check by rotating the tuning control throughout its entire range. Any scraping noise heard in the speaker indicates bent tuning condenser plates, dirty wiper contacts or dirt between the condenser plates, which conditions should be remedied before proceeding with the tests. Then connect the signal-generator output lead through a condenser (.01 to .25 mf.) to indicated test point and the generator ground lead to "C" (receiver chassis). For best results, check operation first at 540 kc. and then at 1700 kc.

TEST POINTS	NORMAL INDICATION	POSSIBLE CAUSE FOR ABNORMAL INDICATION
L to C (chassis)	Audible signal from speaker.	No signal indicates defective 1LA6 tube; defective oscillator transformer T401, shorted plates in oscillator section of condenser C401, shorted condenser C404 or defective resistor R401 or R402.
M to C	Audible signal from speaker.	No signal indicates defective antenna transformer T400, or shorted plates in antenna section of condenser C401.

OSCILLATOR GRID BIAS VOLTAGE. Ground test point "L"; connect a voltmeter (20,000 ohms-per-volt, 10-volt scale) through 50,000 ohm isolating resistor, between "N" (—) and "C" (+). Rotate the tuning control throughout its entire range. The voltage reading should not fall below 1.5 volts throughout. Insufficient voltage indicates malfunctioning, and the components listed in the first test in the above chart should be checked in the order given.

Circuit Description

The Philco Models 47-204 and 47-205 are 5-tube, table-model superheterodyne radios, providing reception in the standard broadcast band. The two models are identical, except for cabinet and dial parts, as indicated in the parts list.

The high-impedance loop aerial normally provides adequate signal pick-up. An external aerial may be connected, if desired, by detaching the aerial lead (shown in figure 6) from the chassis, and connecting the lead to an external aerial lead-in. Do not use a ground.

The loop is coupled to the 7A8 converter tube. Variable-condenser tuning is employed, the oscillator rotor-section plates being shaped to obtain tracking, thus eliminating the necessity for a series padding condenser.

The 7A8 is transformer coupled to the 14A7 i-f amplifier, which is also transformer coupled to the diodes of the 14B6 second detector—first audio-frequency amplifier. A-v-c voltage is applied to the control grids of both the i-f and converter tubes.

The triode section of the 14B6 is the first audio stage, and is resistance coupled to the 50L6GT output tube. The output tube is transformer coupled to a permanent-magnet dynamic speaker.

D-c operating voltages are obtained from a 35Y4 half-wave rectifier, the output of which is filtered by a two-section resistor—condenser filter.

The choke, part of C304, and the condenser C304 in Section 3, figure 3, form a series-tuned circuit, resonant at the intermediate frequency. This combination offers less impedance than a condenser alone, at this frequency, thus reducing any tendency toward oscillation. This choke—condenser combination acts as a condenser for audio frequencies. By-passing at broadcast frequencies is made adequate by connecting the tuning-condenser gang to the chassis.

The 150,000-ohm resistor, R100, in Section 1, prevents hum which might otherwise occur under conditions of high humidity.

Philco TROUBLE-SHOOTING Procedure

In this manual, the schematic diagram is divided into four sections, with a chassis layout for each section, showing components and test points for each section. The test points are also indicated on the schematic diagram in the corresponding section. A simplified trouble-shooting procedure is given in a chart for each section. The first step in each chart is a master check, indicating whether trouble exists in that section. Failure to secure the "NORMAL INDICATION" in a given step indicates trouble, which should be located by voltage, resistance, or capacitance checks of parts indicated in the step, and remedied before testing further.

Preliminary Checks

The following preliminary checks are recommended before turning on the radio:

1. Carefully inspect both top and bottom of the chassis. Make sure that all tubes are secure in their proper sockets (see figure 6), and look for bad connections, burnt resistors, or other obvious sources of trouble.

2. Measure the resistance between B plus and B minus (test points C and B— in figure 1), using the ohmmeter polarity giving the highest resistance reading; if the reading is lower than 50,000 ohms, check C101A, C101B, and C101C, for leakage or shorts.

MODELS 47-204, 47-205

TROUBLE SHOOTING — Section 1

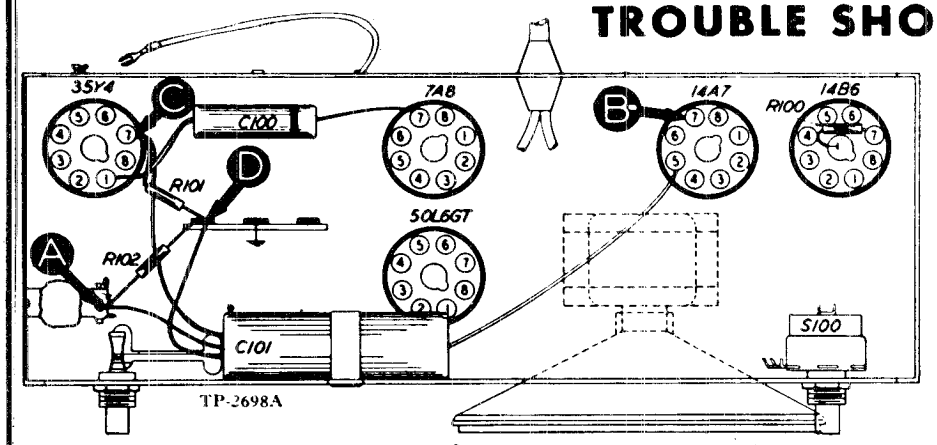

Figure 1. Bottom View, Showing Section 1 Test Points

Make the tests for this section with a d-c voltmeter, connecting the leads to the test points indicated in the chart. The voltages shown were taken with a 20,000-ohms-per-volt meter at a line voltage of 117 volts, 60 cycles.

Turn the volume control to minimum, and set the dial pointer at 540 kc.

Follow steps in sequence. If "NORMAL INDICATION" is obtained in step 1, proceed with tests for Section 2; if not, isolate and correct the trouble within this section.

STEP	TEST POINTS	NORMAL INDICATION	ABNORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A to B—	90v		Trouble within this section; isolate by the following tests.
2	C to B—	115v	No voltage	Defective 35Y4 tube. Shorted C101A.
			Low voltage	Defective 35Y4 tube. Open C101A or I100. Leaky C101A.
			High voltage	Open R101.
3	D to B—	105v	No voltage	Shorted C101B.
			Low voltage	Open C101B. Leaky C101B or C203.
			High voltage	Open R102, T200, or R204.
4	A to B—	90v	No voltage	Shorted C101C.
			Low voltage	Leaky C101C.
			High voltage	Open R204.

Listening Test: Abnormal hum may be caused by open C101A, C101B, or C101C.

TROUBLE SHOOTING — Section 2

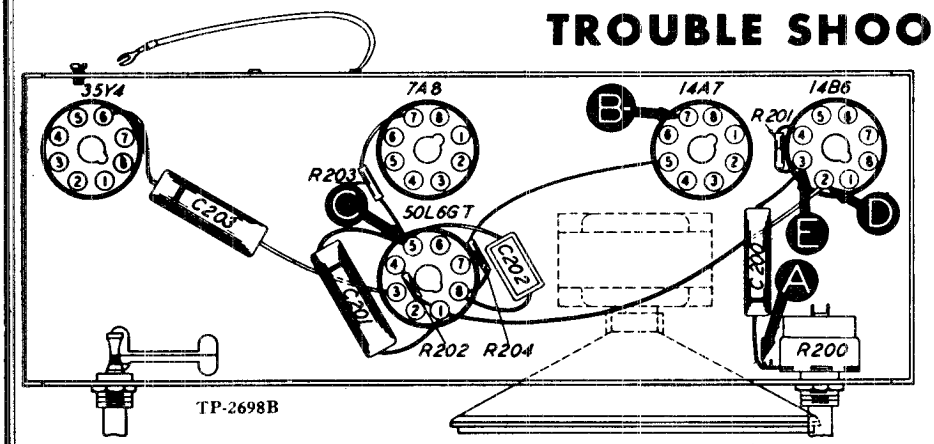

Figure 2. Bottom View, Showing Section 2 Test Points

Make tests for this section by using an audio signal. Connect ground lead of signal generator to B—; connect output lead through a .1-mf condenser to the test points indicated in the chart. Set the volume control at maximum. If "NORMAL INDICATION" is obtained in step 1, proceed with tests for Section 3; if not, isolate and correct the trouble within this section.

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	Loud, clear signal with low signal-generator output	Trouble within this section; isolate by the following tests.
2	C	Clear signal with high signal-generator output	No signal: Open or shorted LS200 or T200. Shorted C203. Open R204. Defective 50L6GT tube. Weak or distorted signal: Defective 50L6GT tube, or LS200. Leaky C202 or C201. Open R203. Shorted R204.
3	D	Same as step 2	No signal: Open C201. Weak or distorted signal: Leaky C201.
4	E	Same as step 1	No signal: Open R202. Defective 14B6 tube. Weak or distorted signal: Shorted C200. Open R201. Defective 14B6 tube.
5	A	Same as step 1 Note: Rotate R200 through range	No signal: Open C200. Shorted C300D. Weak or distorted signal: Defective R200.

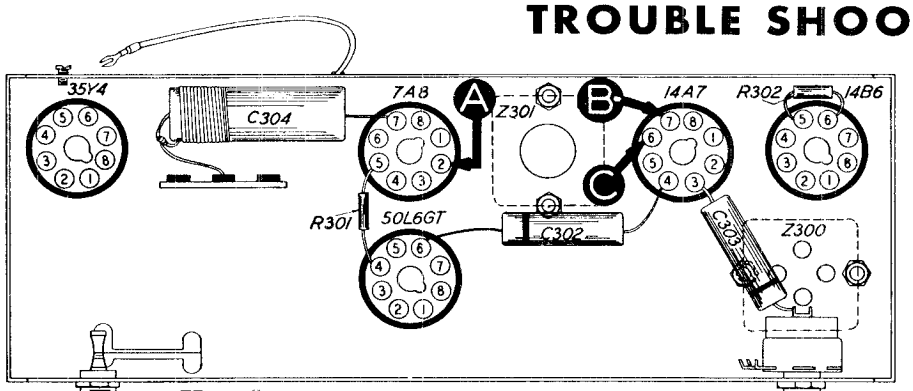
TROUBLE SHOOTING — Section 3



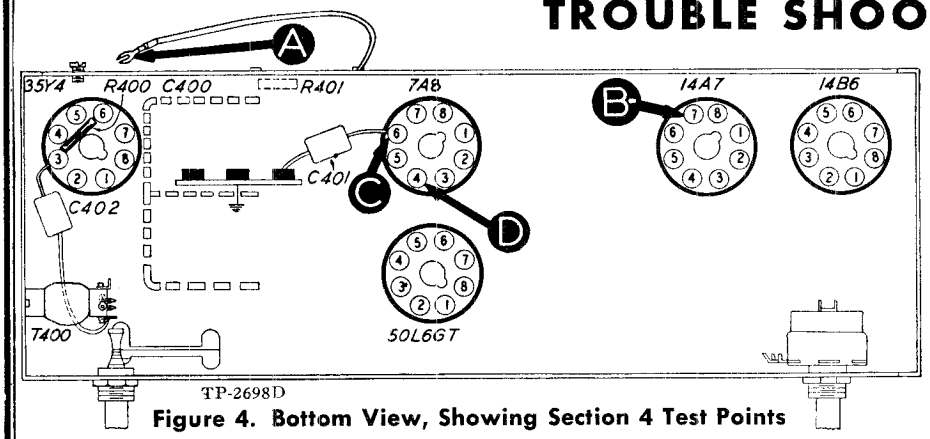
TP-2698C

Figure 3. Bottom View, Showing Section 3 Test Points

Make tests for this section by using an r-f signal generator with modulated output. Set generator frequency to 455 kc. Connect ground lead of signal generator to B—; connect output lead through a .1-mf condenser to the test points indicated in the chart. Set the volume control at maximum. If "NORMAL INDICATION" is obtained in step 1, proceed with tests for Section 4; if not, isolate and correct the trouble within this section.

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	Clear signal with low signal-generator output	Trouble within this section; isolate by the following tests.
2	C	Same as step 1	No signal: Open or shorted Z300. Defective 14B6 or 14A7 tube. Open R301. Shorted C303. Weak or distorted signal: Leaky C303. Open C303 or C304. Defective 14B6 or 14A7 tube. Misaligned Z300. Leaky or open C302.
3	A	Same as step 1	No signal: Open or shorted Z301. Weak or distorted signal: Misaligned Z301.

TROUBLE SHOOTING — Section 4



TP-2698D

Figure 4. Bottom View, Showing Section 4 Test Points

Make tests for this section by using an r-f signal generator with modulated output. Set frequency as noted in chart. Connect generator ground lead to B—; connect output lead through a .1-mf condenser to the test points indicated in the chart.

Inspect tuning condensers for bent plates, dirt, or poor wiper contacts; any or all of these will cause noise. If "NORMAL INDICATION" is not obtained in step 1, isolate trouble by following the remaining steps.

STEP	TEST POINT	DIAL SETTINGS		NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
		SIG. GEN.	RADIO		
1	A	540 kc	540 kc	Clear signal with low signal-generator output	Trouble within this section; isolate by the following tests.
2	Osc. Test (see Note below)		540 to 1620 kc	Negative voltage	Open or shorted T400, C402, or R400. Shorted C400 or C400B. Defective 7A8 tube.
3	C	540 kc	540 kc	Same as step 1	No signal: Open or shorted Z301. Shorted C400 or C400A. Defective 7A8 tube. Weak or distorted signal: Shorted or open LA400. Defective 7A8 tube.
4	A	540 kc	540 kc	Same as step 1	Weak signal: Open C401.

NOTE: Oscillator test.—Connect positive lead of a 20,000-ohms-per-volt meter to B—; prod end of negative lead through a 100,000-ohm isolating resistor to test point D. Proper operation of oscillator is indicated by a negative voltage of 9 to 12 volts throughout range of tuning condenser.

SYMBOLIZATION AND TERMINOLOGY

All components in the radio circuits are symbolized and located as follows:

C—condenser	LA—loop aerial	S—switch
I—pilot lamp	LS—loudspeaker	T—transformer
L—choke or coil	R—resistor	Z—electrical assembly

100-series components are in Section 1, the power supply.

200-series components are in Section 2, the second detector, a.v.c. and audio.

300-series components are in Section 3, the i-f amplifier.

400-series components are in Section 4, the aerial, r.f. and oscillator.

MODEL 48-1284

Circuit Description

Philco Model 48-1284 is a console-model radio-phonograph combination consisting of a seven-tube superheterodyne and a Philco Model M-8 Automatic Record Changer, operating on a.c. only. The tuning ranges are 540 to 1650 kc. and 9.3 to 15.7 mc. The built-in low-impedance loop normally provides adequate signal pickup; where greater pickup is required, an external aerial may be connected, using Philco Aerial Coupler Part No. 76-2353.

A 7AF7 dual triode is employed in a converter circuit designed for high signal-to-noise ratio and high conversion efficiency. A 7A7 pentode is used in the first i-f stage and the pentode section of a 7R7 dual-diode-pentode is used in the second i-f stage. The midget-type i-f transformers have permeability tuning for greater stability and efficiency. One diode section of the 7R7 is used as the detector, and the other is used to supply a-v-c voltage to the converter and the first i-f stage. A 7F7 dual triode functions as the first audio amplifier and phase inverter to drive two 6K6GT output tubes in push-pull.

More uniform frequency response and decreased harmonic distortion is obtained by the use of inverse feedback. Voltage from the secondary of the output transformer is fed back through a voltage divider, R209 and R210, over three stages to the first audio amplifier. Full control of bass and treble is made possible by a variable tone control, R201. Excellent frequency response at any volume level is provided by a 12-inch electrodynamic speaker.

Philco TROUBLE-SHOOTING Procedure

For rapid trouble shooting, the radio circuit is divided into four sections, as follows:

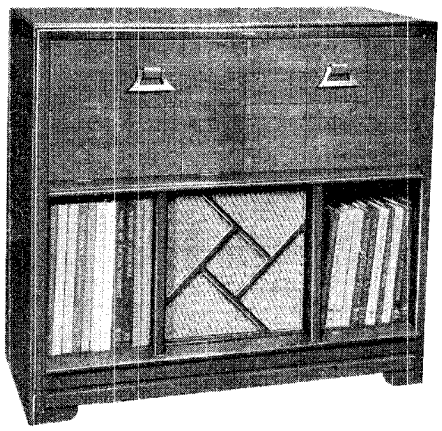
Section 1—the power supply
Section 2—the audio circuits
Section 3—the i-f, detector, and a-v-c circuits
Section 4—the r-f and converter circuits

Test points are specified for each section, and are indicated in the sectionalized schematic diagram. The trouble-shooting procedure given for each section includes a simplified test chart and a bottom view of the chassis showing the locations of the test points and the components of that section.

In each chart, the first step is a master check for determining whether trouble exists in that section, without going through the entire test procedure.

Failure to obtain the "NORMAL INDICATION" in any given step indicates trouble within the circuit under test.

After isolating the trouble to a single stage, the defect is located by: first, testing the tube; second, measuring tube electrode voltages; third, measuring circuit resistances; fourth, substituting condensers. Any trouble revealed should be corrected before testing further.



MODEL 48-1284

SPECIFICATIONS

CABINET	Wood console, walnut finish
RADIO CIRCUIT	Seven-tube superheterodyne
FREQUENCY RANGES	
Broadcast	540—1650 kc.
Short Wave	9.3—15.7 mc.
AUDIO OUTPUT	6 watts
OPERATING VOLTAGE	105—120 volts, 60 cycles, a.c.
POWER CONSUMPTION	
Radio	75 watts
Record Changer	20 watts
AERIAL	Built-in low-impedance loop; terminal provided for external aerial
INTERMEDIATE FREQUENCY	455 kc.
PHILCO TUBES (7)	7AF7, 7A7, 7R7, 7F7, 6K6GT (2), 7Z4
PHONOGRAPH	Philco Automatic Record Changer Model M-8 (for service information see manual PR-1478)

Preliminary Checks

To avoid possible damage to the radio, the following preliminary checks should be made before turning on the power:

1. Inspect both the top and the bottom of the chassis. Make sure that all tubes are secure in the proper sockets, and look for any broken or shorted connections, burned resistors, or other obvious indications of trouble.

2. Measure the resistance between B+ (pin 7 of 7Z4 rectifier) and B–, test point B. When the ohmmeter leads are connected in the proper polarity, the highest resistance reading will be obtained. If the reading is lower than 3000 ohms, check condensers C102, C103B, C311, and C306 for leakage or shorts. This resistance value, which is much lower than normal, does not represent a quality check of these condensers; it is the lowest value which will permit the rectifier to operate safely while the voltage tests of Section 1 (power supply) are performed.

MODEL 48-1284

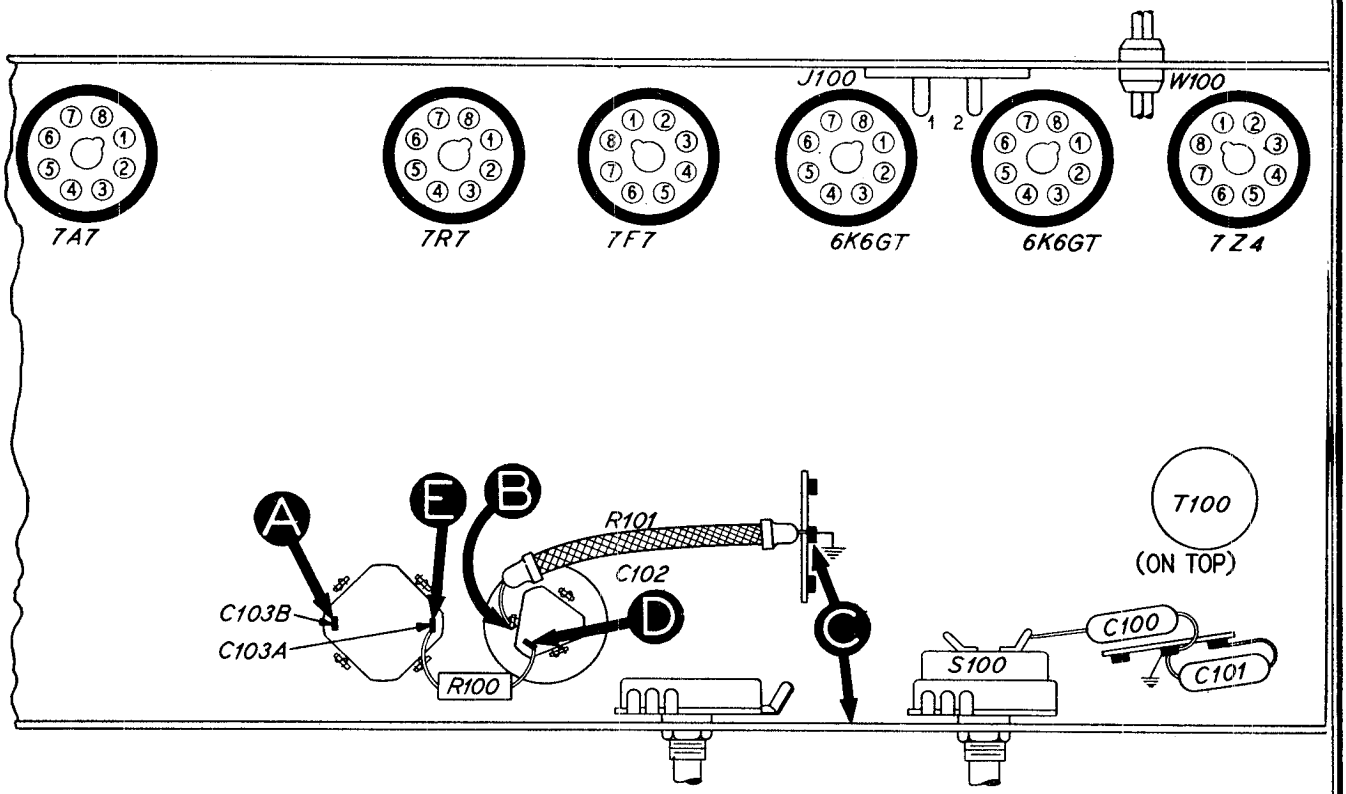

FIGURE 2. BOTTOM VIEW, SHOWING SECTION 1 TEST POINTS TP-5356-A

Section 1 TROUBLE SHOOTING

POWER SUPPLY

CAUTION: Do not turn on the power with the speaker disconnected, or the radio may be damaged.

Make the tests for this section with a d-c voltmeter; connect the leads between the test points indicated in the chart. The voltage readings given were taken with a 20,000-ohms-per-volt meter at a line voltage of 117 volts.

Set the band switch to the broadcast position. Set the volume control to minimum and turn the tone control fully clockwise.

Follow the steps in the order given. If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 2 (audio circuits); if not, isolate and correct the trouble in this section.

STEP	TEST POINT	NORMAL INDICATION	ABNORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A to C	255v		Trouble in this section. Isolate by the following tests.
2	D to B	300v	No voltage Low voltage High voltage	Defective: 7Z4. Open: T100, S100, W100. Shorted: C102, T200. Leaky: C102. Shorted or leaky: C103A, C103B, C306*, C311*, C210*, C211*. Open: L100, R100, R101, T200*.
3	B to C	−17v	High voltage	Open: R101.
4	E to C	205v	No voltage Low voltage	Open: R100. Shorted: C103A. Leaky: C103A. Increased resistance: R100.
5	A to C	255v	No voltage Low voltage High voltage	Open: L100, R101. Shorted: C103B. Leaky: C103B. Shorted: C210*, C211*. Open: T200*.
Listening Test: Abnormal hum may be caused by open C102, C103A, C103B, C100, or C101.				

*This part, located in another section, may cause abnormal indication in this section.

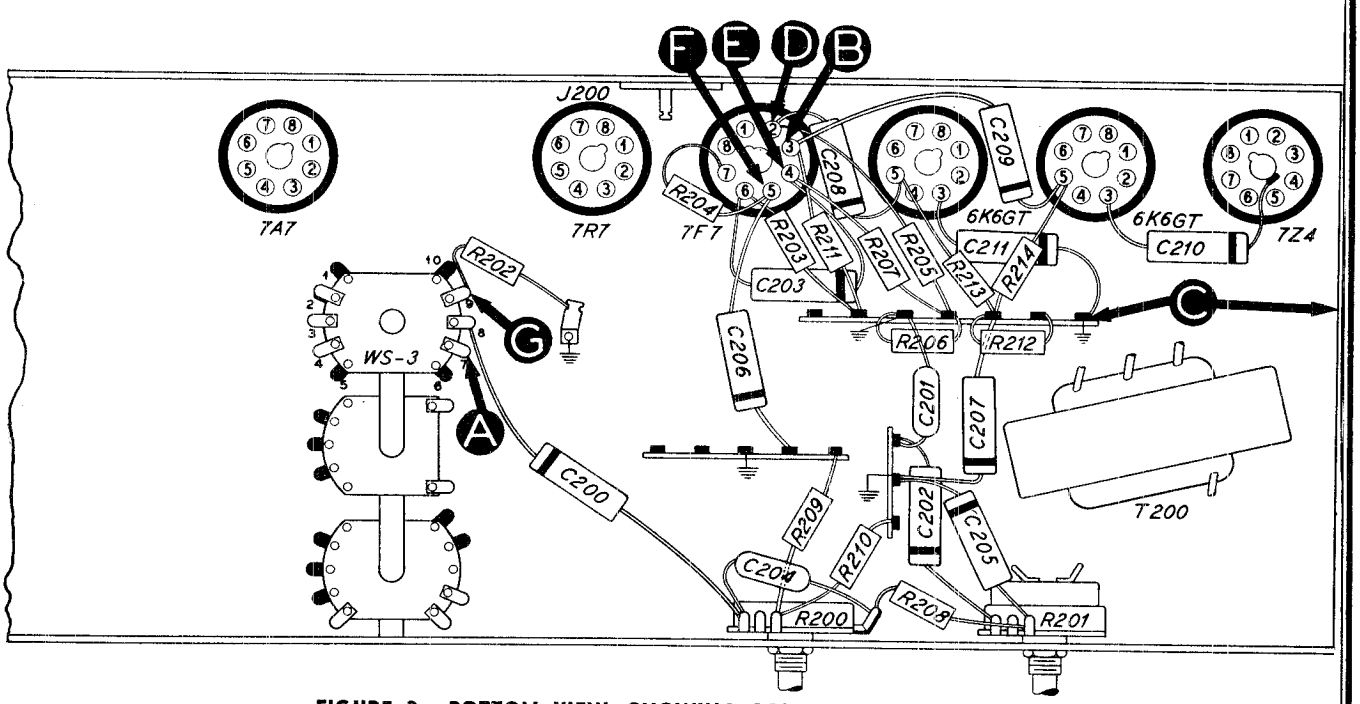

FIGURE 3. BOTTOM VIEW, SHOWING SECTION 2 TEST POINTS TP-5356-B

Section 2

TROUBLE SHOOTING

AUDIO CIRCUITS

For the tests in this section, use an audio-frequency signal generator. Connect the generator ground lead to the chassis, test point C; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Set the volume control to maximum, turn the tone control fully clockwise, and set the band switch to the broadcast position for all of the steps except step 7.

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 3 (i-f, detector, and a-v-c circuits); if not, isolate and correct the trouble in this section.

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	Loud, clear signal with weak signal input.	Trouble in this section. Isolate by the following tests.
2	B (Remove 7F7.)	Clear signal with strong signal input.	Defective: 6K6GT, T200. Shorted: C210, C209. Open: R214, R212, C209.
3	D (7F7 removed.)	Same as step 2.	Defective: 6K6GT, T200. Shorted: C208, C211. Open: R213, C208.
4	E (Replace 7F7.)	Loud, clear signal with moderate signal input.	Defective: 7F7. Shorted: C203. Open: R205, R206, R207, R211.
5	F	Same as step 1.	Defective: 7F7. Shorted: C201, C202. Open: C203, R203, R204.
6	A	Same as step 1.	Defective: R200 (rotate through range). Open: C200, C206, WS-3 (R), R209. Shorted: C302D*, C312*.
7	G (Set band switch to phono.)	Same as step 1.	Open: WS-3 (R).
Listening Test: Distortion may be caused by shorted or leaky C200, C206, C203, C208, or C209. Poor low-frequency response may be caused by open or shorted C205 or open R208.			

*This part, located in another section, may cause abnormal indication in this section.

MODEL 48-1284

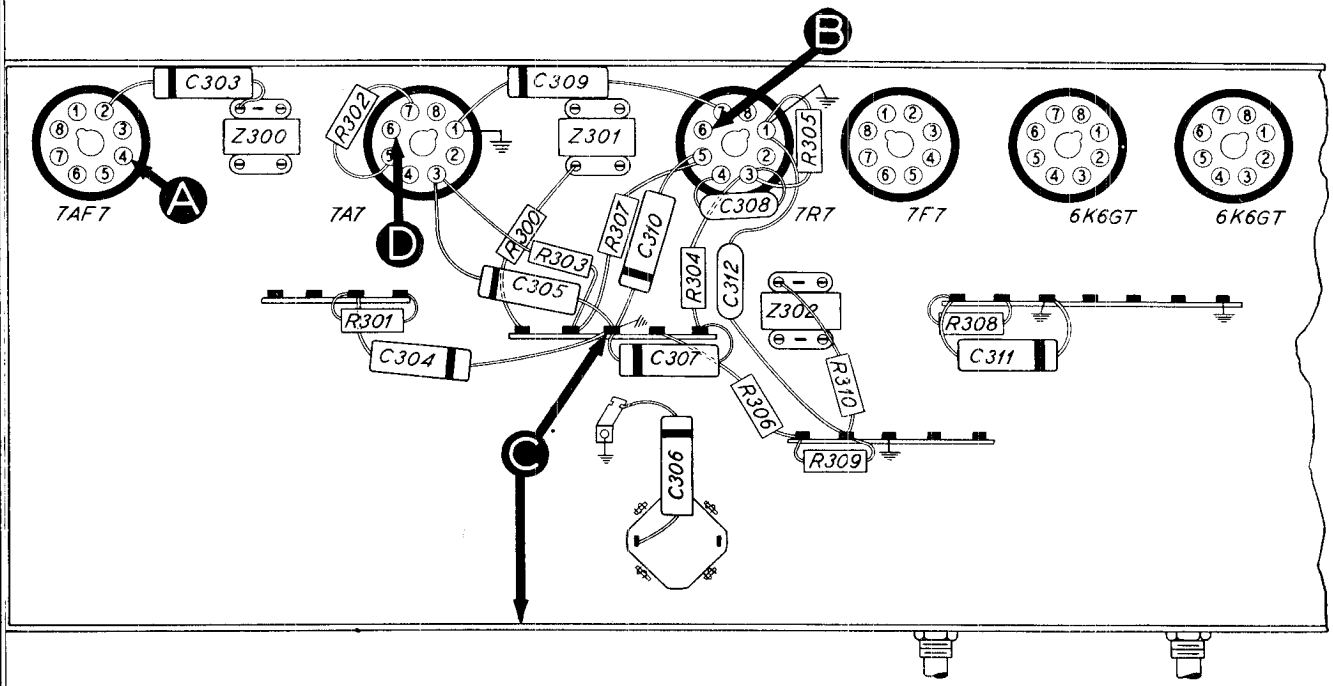

FIGURE 4. BOTTOM VIEW, SHOWING SECTION 3 TEST POINTS TP-5356-C

Section 3 TROUBLE SHOOTING

I-F, DETECTOR, AND A-V-C CIRCUITS

For the tests in this section, use an r-f signal generator, with modulated output, set at 455 kc. Connect the generator ground lead to the chassis, test point C; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Set the radio-phono switch to the radio position and the band switch to the broadcast position. Set the volume control to maximum and turn the tone control fully clockwise. Rotate the tuning control until the tuning condenser is fully meshed.

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 4 (r-f and converter circuits); if not, isolate and correct the trouble in this section.

To provide a complete i-f-amplifier check, test point A for this section is placed at the grid of the mixer in Section 4; therefore, the effectiveness of step 1 as a master check is dependent upon the condition of certain parts in the mixer circuit. These parts are listed below under "POSSIBLE CAUSE OF ABNORMAL INDICATION".

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	Loud, clear signal with weak signal input.	Trouble in this section. Isolate by the following tests.
2	B	Loud, clear signal with strong signal input.	Defective: 7R7. Open: L302A, L302B, R306, WS-2 (R), R309, R310, R308, R307, C302A, C302B. Shorted: L302A, L302B, C302A, C302B. Shorted or leaky: C310, C311, C302C. Misaligned: Z302.
3	D	Loud, clear signal with moderate signal input.	Defective: 7A7. Misaligned: Z301. Open: R302, R303, L301A, L301B, C301A, C301B. Shorted: C305, C301A, C301B, L301A, L301B.
4	A	Loud, clear signal with weak signal input.	Defective: 7AF7*. Misaligned: Z300. Open: R401*, R300, R301, L300A, L300B, L300C, C300A, C300B. Shorted: C303, C409*, C300A, C300B, L300A, L300B, L300C.

*This part, located in another section, may cause abnormal indication in this section.

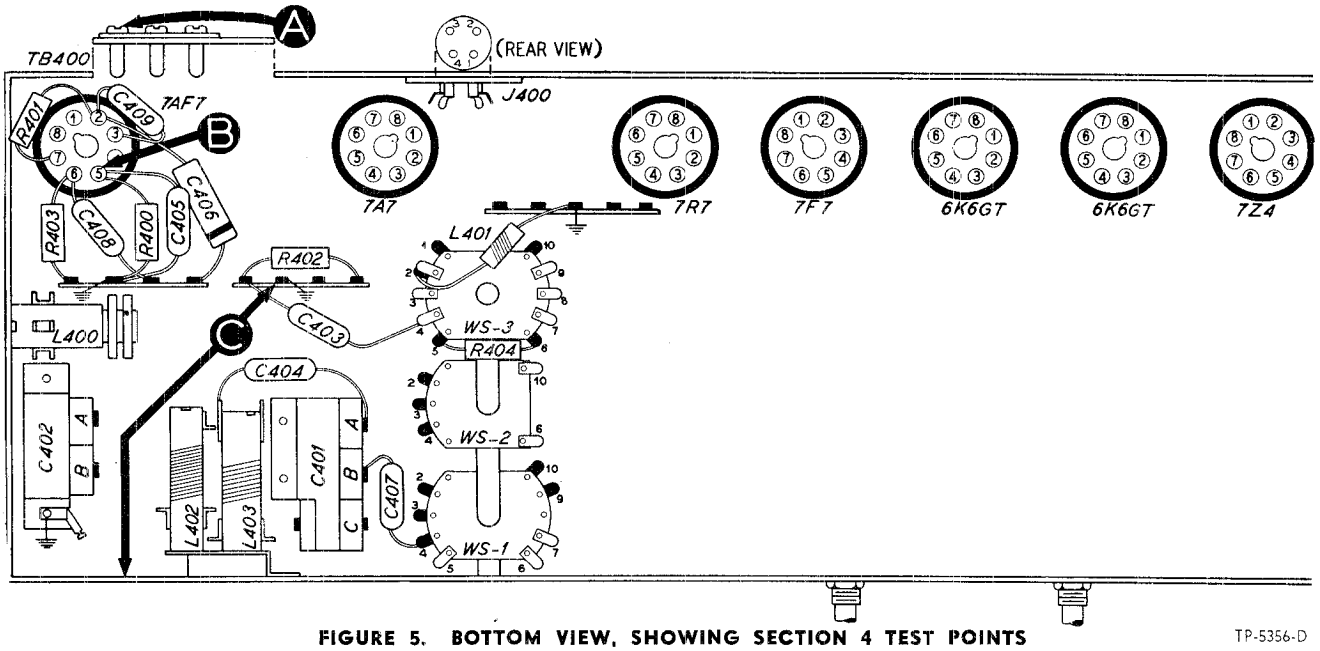

FIGURE 5. BOTTOM VIEW, SHOWING SECTION 4 TEST POINTS

TP-5356-D

Section 4

TROUBLE SHOOTING

R-F AND CONVERTER CIRCUITS

For the tests in this section, with the exception of the oscillator tests, use an r-f signal generator with modulated output. Connect the generator ground lead to the chassis, test point C; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Set the volume control to maximum and turn the tone control fully clockwise. Set the radio band switch, the tuning control, and the signal-generator frequency as indicated in the chart.

If the "NORMAL INDICATION" is not obtained in step 1, isolate and correct the trouble in this section. If the trouble is not revealed by the tests for this section, check the alignment.

STEP	TEST POINT	SIG. GEN. FREQ.	BAND SWITCH	RADIO TUNING	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1 (a)	A	1000 kc.	BC	1000 kc.	Loud, clear signal with weak signal input.	Trouble in broadcast band. Isolate by the tests in steps 2 and 3.
1 (b)	A	15 mc.	SW	15 mc.	Same as step 1 (a).	Trouble in short-wave band. Isolate by the tests in steps 4 and 5.
2	B (Osc. test; see note below.)		BC	Rotate through range.	Negative 1.5 to 2.0 volts.	Defective: 7AF7. Open: L402, WS-1 (F), WS-2 (F), WS-3 (F), R400, C408, R403, R404, C405. Shorted or leaky: C405, C408, C400A, C402B, C401C. Shorted: L402.
3	A	1000 kc.	BC	1000 kc.	Loud, clear signal with weak signal input.	Open: L400, WS-3 (F), WS-3 (R), C403, C406, R401. Shorted: C400B, C402A.
4	B (Osc. test; see note below.)		SW	Rotate through range.	Negative 1.5 to 2.0 volts.	Defective: 7AF7. Open: L403, WS-1 (F), WS-2 (F), WS-3 (F), C407. Shorted: C401B, C407.
5	A	15 mc.	SW	15 mc.	Loud, clear signal with weak signal input.	Open: WS-3 (F), WS-3 (R), L401. Shorted: C401A.

OSCILLATOR TEST: Connect the positive lead of a high-resistance voltmeter to the chassis, test point C; connect the prod end of the negative lead through a 100,000-ohm isolating resistor to the oscillator grid (pin 5 of the 7AF7), test point B. Use a suitable meter range, such as 0—10 volts. Proper operation of the oscillator is indicated by negative voltages of approximately the values given in the chart (measured with a 20,000-ohms-per-volt meter) throughout the tuning range.

MODEL 48-1284

CALIBRATING DIAL BACKPLATE

When the radio chassis has been removed from the cabinet, dial calibration and alignment points should be marked on the dial backplate below the pointer.

The method of measuring for these points is illustrated in figure 1. Hold a ruler against the scale backplate, with the start of the ruler at the reference line shown, and mark pencil dots at the proper points for the required frequency settings. When the ruler is correctly placed, the index mark is approximately 2 inches from the reference point indicated in figure 1.

With the tuning gang fully meshed, the pointer should be adjusted on the dial-drive cord to coincide with the index mark.

After installation of the chassis in the cabinet, the dial pointer should be moved to coincide with the index mark on the dial. Coincidence of the pointer and index mark should occur with the tuning condenser fully meshed.

ALIGNMENT PROCEDURE

DIAL—Calibration and pointer-index measurements are shown in figure 1. With tuning condenser fully meshed, set pointer to index mark.

OUTPUT METER—Connect one lead to chassis, and other lead to terminal 3 of TB400.

SIGNAL GENERATOR—Connect generator ground lead to chassis; connect output lead as indicated in chart. Use modulated output.

RADIO CONTROLS—Set volume control to maximum and turn tone control fully counterclockwise.

OUTPUT LEVEL—During alignment, adjust signal-generator output to maintain output-meter indication below 1.5 volts.

STEP	SIGNAL GENERATOR CONNECTION TO RADIO	SIGNAL GENERATOR DIAL SETTING	RADIO BAND SWITCH	RADIO DIAL SETTING	RADIO SPECIAL INSTRUCTIONS	ADJUST
1	Through .1-mi. condenser to terminal 1 of TB400.	455 kc.	BC	540 kc.	Adjust tuning cores, in order given, for maximum output.	TC302B—3rd i-f sec. TC302A—3rd i-f pri. TC301B—2nd i-f sec. TC301A—2nd i-f pri. TC300B—1st i-f sec. TC300A—1st i-f pri.
2	Radiating loop (see note below).	580 kc.	BC	580 kc.	Adjust trimmer for maximum output.	C401C—BC osc. (series)
3	Same as step 2.	1600 kc.	BC	1600 kc.	Adjust trimmer for maximum output.	C402B—BC osc. (shunt)
4	Same as step 2.	1500 kc.	BC	1500 kc.	Adjust trimmer for maximum output.	C402A—BC aerial
5	Same as step 2.	580 kc.	BC	580 kc.	Adjust trimmer for maximum output while rocking tuning condenser.	C401C—BC osc. (series)
6	Repeat steps 3, 4, 5, 3, and 4 until no further improvement is noted.					
7	Same as step 2.	15 mc.	SW	15 mc.	Adjust trimmer for maximum output on first peak from loose position. Check for image at 14.1 mc.	C401B—SW osc.
8	Same as step 2.	15 mc.	SW	15 mc.	Adjust trimmer for maximum output while rocking tuning condenser.	C401A—SW aerial

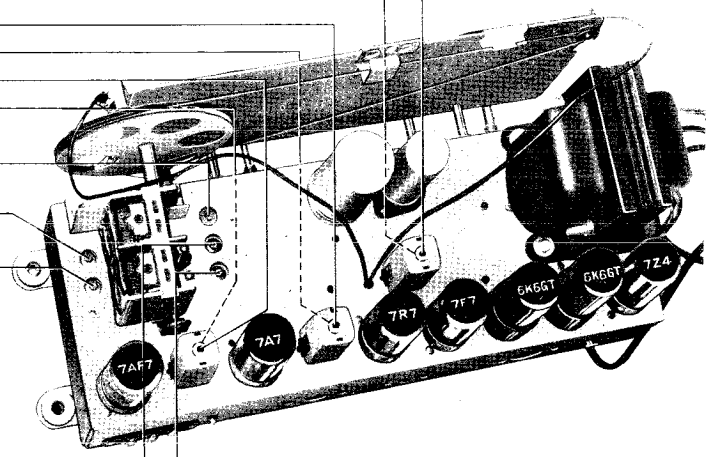

FIGURE 8. TOP VIEW, SHOWING TRIMMER LOCATIONS

RADIATING LOOP: Make up a 6—8-turn, 6-inch-diameter loop from insulated wire; connect to signal-generator leads and place near radio loop aerial. Make certain that radio loop aerial is connected to radio.

REPLACEMENT PARTS LIST

NOTE

Part numbers identified by an asterisk (*) indicate general replacement items. These numbers may not be identical with those on factory assemblies; also, the electrical values of some replacement items may differ from the values indicated in the schematic diagram and parts list. The values substituted in any case are so chosen that the operation of the radio will be either unchanged or improved. When ordering replacements, use only the "Service Part No."

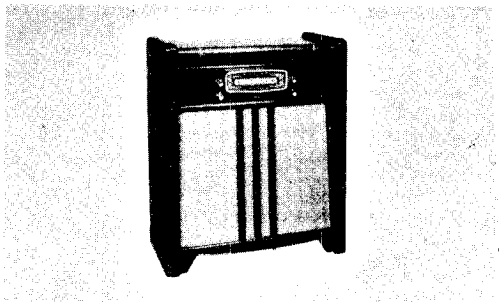
MODEL 49-1100

Circuit Description

Philco Radio Model 49-1100 is a six-tube superheterodyne, which provides reception in the standard-broadcast band. The circuit includes a 14AF7 converter, a 7B7 1st i-f amplifier, a 7B7 2nd i-f amplifier, a 7C6 detector, a.v.c., and 1st audio amplifier, and a 35L6GT output amplifier. The power supply employs a 50X6 rectifier in a voltage-doubling circuit.

A low-impedance loop aerial, located within the cabinet, normally provides adequate signal pickup. If greater signal pickup is required, the jumper should be disconnected from the terminal at the rear of the chassis and an external aerial connected to the terminal.

Two series-resonant circuits, consisting of condensers C302 and C303 together with the coils wound on these condensers, function as traps to prevent feedback of the intermediate frequency and the second harmonic of the intermediate frequency through the B– lead. One circuit is resonant at 455 kc., and the other at 910 kc. Each circuit offers a very low impedance to the resonant frequency, and, therefore, shunts it to the chassis.



SPECIFICATIONS

CABINET	Wood, mahogany
CIRCUIT	Six-tube superheterodyne
FREQUENCY RANGE	540—1620 kc.
INTERMEDIATE FREQUENCY	455 kc.
AUDIO OUTPUT	2.5 watts
OPERATING VOLTAGE	105—120 volts, 60 cycles, a.c.
POWER CONSUMPTION	40 watts
AERIAL	Built-in low-impedance loop; provisions for external aerial.
PHILCO TUBES (6)	14AF7, 7B7(2), 7C6, 35L6GT, 50X6

TP-4525

Philco TROUBLE-SHOOTING *Procedure*

For rapid trouble shooting, the radio circuit is divided into four sections, as follows:

Section 1—the power supply
Section 2—the audio circuits
Section 3—the i-f, detector, and a-v-c circuits
Section 4—the r-f and converter circuits

Test points are specified for each section, and are indicated in the sectionalized schematic diagram. The trouble-shooting procedure given for each section includes a simplified test chart and a bottom view of the chassis showing the locations of the test points and the components of that section.

In each chart, the first step is a master check for determining whether trouble exists in that section, without going through the entire test procedure.

Failure to obtain the "NORMAL INDICATION" in any given step indicates trouble within the circuit under test.

After isolating the trouble to a single stage, the defect is located by: first, testing the tube; second, measuring tube electrode voltages; third, measuring circuit resistances; fourth, substituting condensers. The trouble revealed should be corrected before testing further.

Preliminary Checks

To avoid possible damage to the radio, the following preliminary checks should be made before connecting the radio to a source of power.

1. Inspect both the top and the bottom of the chassis. Make sure that all tubes are secure in the proper sockets, and look for any broken or shorted connections, burned resistors, or other obvious indications of trouble.
2. Measure the resistance between B+ (pin 7 of 50X6 rectifier) and B–. When the ohmmeter leads are connected in the proper polarity, the highest reading will be obtained. If the reading is lower than 3000 ohms, check condensers C101, C102, C103A, and C207 for leakage or shorts.

NOTE: The resistance value above, which is much lower than normal, does not represent a quality check of these condensers; the value given is the lowest at which the rectifier will operate safely while the voltage tests of Section 1 (power supply) are performed.

©John F. Rider

TROUBLE SHOOTING

Section 1—Power Supply

Make the tests for this section with a d-c voltmeter; connect the leads between B–, test point B, and the test points indicated in the chart.

The voltage readings given were taken with a 20,000-ohms-per-volt meter, at a line voltage of 117 volts.

Set the volume control to minimum, and the tone control fully clockwise.

Follow the steps in the order given. If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 2 (audio circuits); if not, isolate and correct the trouble in this section.

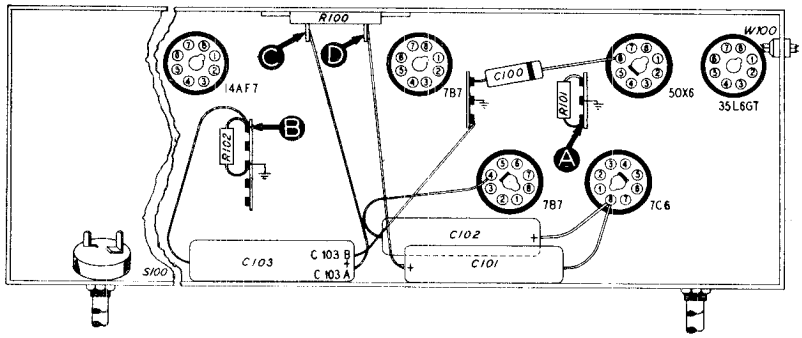


Figure 1. Bottom View, Showing Section 1 Test Points

STEP	TEST POINT	NORMAL INDICATION	ABNORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	107v		Trouble in this section. Isolate by the following tests.
2	D	225v	No voltage Low voltage High voltage	Defective: 50X6, S100, W100, PL100. Shorted: C101 and C102. Defective: 50X6. Open: C101, C102. Leaky: C101, C102, C103A, C103B. Open: R100, R101.
3	C	190v	No voltage Low voltage High voltage	Shorted: C103A. Open: R100. Changed resistance: R100. Shorted: C207*, C103B. Leaky: C103A. Open: R101, T200*, R207*.
4	A	107v	No voltage Low voltage High voltage	Shorted: C103B. Open: R101. Leaky: C103B. Open: R207*, T200*.
Listening Test: Abnormal hum may be caused by open C100, C103A, C103B, or R102.				

* This part, located in another section, may cause abnormal indication in this section.

TROUBLE SHOOTING

Section 2—Audio Circuits

For the tests in this section, use an audio-frequency signal generator. Connect the generator ground lead to B–, test point B; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Set the volume control to maximum, and the tone control fully clockwise.

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 3 (i-f, detector, and a-v-c circuits); if not, isolate and correct the trouble in this section.

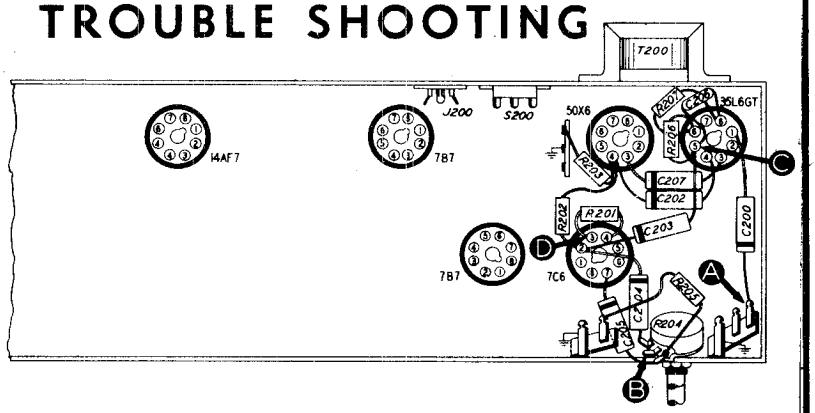

Figure 2. Bottom View, Showing Section 2 Test Points

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	Loud, clear signal with weak signal input.	Trouble in this section. Isolate by the following tests.
2	C	Clear signal with strong signal input.	Open: T200, R207. Shorted: C203, C206, C207, C205. Leaky: C203. Defective: 35L6GT, LS200.
3	D	Same as step 1.	Open: R202, R203, C203. Shorted: C202, C204. Defective: 7C6 (triode section).
4	A	Same as step 1.	Open: C200, C201, R200 (rotate through range). Shorted: C307* C301D*.
Listening Test: Distortion may be caused by open R201 or R206, or by shorted or leaky C200 or C201.			

* This part, located in another section, may cause abnormal indication in this section.

© John F. Rider

MODEL 49-1100

Section 3—I-F, Detector, and A-V-C Circuits

TROUBLE SHOOTING

For the tests in this section, use an r-f signal generator, with modulated output, set at 455 kc. Connect the generator ground lead to B–, test point B; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Set the volume control to maximum, and the tone control fully clockwise. Rotate the tuning control until the tuning condenser is fully meshed.

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 4 (r-f and converter circuits); if not, isolate and correct the trouble in this section.

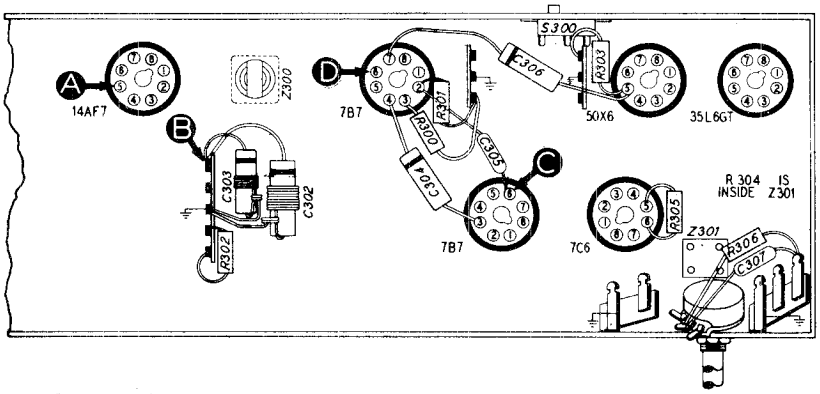

Figure 3. Bottom View, Showing Section 3 Test Points

Since the circuit location of test point A for this section is in Section 4, the effectiveness of step 1 as a master check is dependent upon the condition of certain parts in Section 4; these parts are listed below under "POSSIBLE CAUSE OF ABNORMAL INDICATION."

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	Loud, clear signal with weak signal input.	Trouble in this section. Isolate by the following tests.
2	C	Loud, clear signal with moderate signal input.	Defective: 7B7 (2nd i-f amplifier), 7C6 (diode section). Open: L301A, L301B, R306, R304, R303, R300. Shorted: C305, C301A, C301B, C306, C304, C301C, L301A, L301B. Leaky: C305.
3	D	Same as step 1.	Defective: 7B7 (1st i-f amplifier). Open: C305, R301, R302. Shorted: C300B, L300B.
4	A	Same as step 1.	Defective: 14AF7. Open: R402*, L401*, L300A, C300A, L300B. Shorted: C300A, L300A.

NOTE: Voltage on the chassis may be caused by shorted C302 or C303. Oscillation may be caused by open C302 or C303.

* This part, located in another section, may cause abnormal indication in this section.

Section 4—R-F and Converter Circuits

TROUBLE SHOOTING

For the tests in this section, with the exception of the oscillator test, use an r-f signal generator with modulated output. Connect the generator ground lead to B–, test point B; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Set the volume control to maximum, and the tone control fully clockwise. Set the radio tuning control and signal-generator frequency as indicated in the chart.

If the "NORMAL INDICATION" is not obtained in step 1, isolate and correct the trouble in this section.

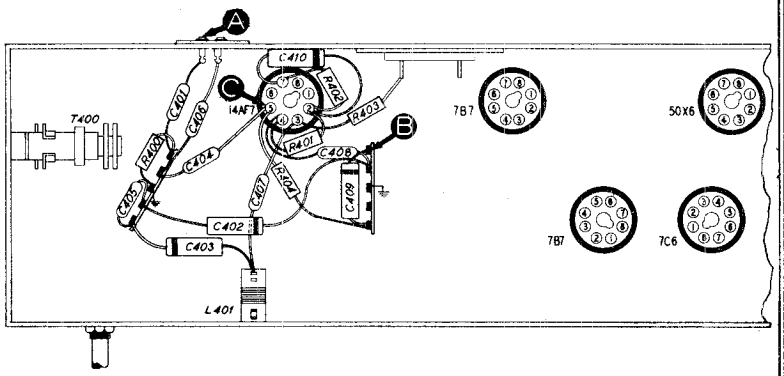

Figure 4. Bottom View, Showing Section 4 Test Points

STEP	TEST POINT	SIG. GEN. FREQ.	RADIO TUNING	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	1000 kc.	Tune to signal.	Loud, clear signal with weak signal input.	Trouble in this section. Isolate by the following tests.
2	C (Osc. test; see note below.)		Rotate through range.	Negative 3.5 to 5 volts.	Defective: 14AF7. Open C403, C407, C408, L401, R401. Shorted: C405, C400A, C400C, C408, C407. Leaky: C407, C408.
3	A	1000 kc.	Tune to signal.	Same as step 1.	Open: C401, C404, T400. Shorted: C400B, C400D, C406.

Listening Test: Distortion and hum may be caused by open C409 or R404.

OSCILLATOR TEST: Connect the positive lead of a high-resistance voltmeter to B–, test point B; connect the prod end of the negative lead through a 100,000-ohm isolating resistor to the oscillator grid (pin 4 of the 14AF7), test point C. Proper operation of the oscillator is indicated by negative voltages of approximately the values given in the chart (measured with 20,000-ohms-per-volt meter) throughout the tuning range.

ALIGNMENT PROCEDURE

DIAL—Calibration and pointer-index measurements are shown in figure 6. With tuning gang fully meshed, set pointer to index mark.

OUTPUT METER—Connect to voice-coil terminals.

SIGNAL GENERATOR—Connect as indicated in chart. Use modulated output.

RADIO CONTROLS—Set volume control to maximum, and tone control fully counterclockwise.

OUTPUT LEVEL—During alignment, adjust signal-generator output to maintain output-meter indication below 1.25 volts.

STEP	SIGNAL GENERATOR		RADIO		
	CONNECTIONS TO RADIO	DIAL SETTING	DIAL SETTING	SPECIAL INSTRUCTIONS	ADJUST
1				Turn trimmer fully tight.	C300B—1st i-f sec.
2	Through .1-mf. condenser to mixer grid (pin 5 of 14AF7).	455 kc.	Tuning gang fully meshed.	Adjust trimmers, in order given, for maximum output.	C301B—2nd i-f sec. C301A—2nd i-f pri. C300B—1st i-f sec. C300A—1st i-f pri.
3	Radiating loop (see note below).	1600 kc.	1600 kc.	Adjust trimmer for maximum output.	C400C—osc.
4	Same as step 3.	1500 kc.	1500 kc.	Adjust trimmer for maximum output.	C400D—aerial.

RADIATING-LOOP NOTE: Make up a 6—8 turn, 6-inch-diameter loop, using insulated wire; connect to signal-generator leads and place near radio loop aerial. Make certain that radio loop aerial is connected to radio.

REPLACEMENT PARTS LIST

NOTE: Part numbers marked with an asterisk (*) are general replacement items. These numbers may not be identical with those on factory assemblies; also, the electrical values of some replacement items may differ from the values indicated in the schematic diagram and parts list. The values substituted in any case are so chosen that the operation of the radio will be either unchanged or improved. When ordering replacements, use only the "Service Part No."

MODEL 49-1401

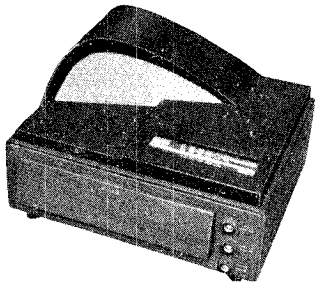
Circuit Description

Philco Model 49-1401 is a table-model radio-phonograph combination consisting of a 5-tube superheterodyne, which provides reception on the standard broadcast band, and a Philco Model M-7 Automatic Record Player. The built-in loop aerial normally provides adequate signal pickup. However, a terminal has been provided for connecting an external aerial, if required.

The loop works directly into a 12BE6 converter, where the incoming signal is converted to the 455-kc. intermediate frequency. The oscillator section of the tuning-condenser gang has a specially shaped rotor, to provide proper tracking without the use of a series padding condenser. The converter is transformer-coupled to a 12BA6 i-f amplifier, which, in turn, is transformer-coupled to the diode section of a 6AQ6. Both i-f transformers have permeability-tuned primary and secondary windings. The diode section of the 6AQ6 acts as a detector, and also provides a-v-c voltage, which is applied to the grids of the converter and the i-f amplifier. The triode section of the 6AQ6, the first audio amplifier, is resistance-coupled to a 35L6GT beam-power-output amplifier, which supplies approximately 2 watts of audio power to a p-m dynamic speaker.

The d-c operating voltages are furnished by a voltage-doubler circuit employing a 50Y6GT rectifier and a resistor-condenser filter. Resistor R103 is connected between B– and the chassis to prevent hum due to condenser leakage under high-humidity conditions.

MODEL 49-1401



SPECIFICATIONS

CABINET	Wood, mahogany finish with black plastic top
RADIO CIRCUIT	Five-tube superheterodyne
FREQUENCY RANGE	540—1600 kc.
AUDIO OUTPUT	2 watts
OPERATING VOLTAGES	105—120 volts, 60 cycles, a.c.
POWER CONSUMPTION	
Radio only	35 watts
Radio-phonograph	50 watts
AERIAL	Built-in loop; terminal also provided for external aerial
INTERMEDIATE FREQUENCY	455 kc.
PHILCO TUBES (5)	12BE6, 12BA6, 6AQ6, 35L6GT, 50Y6GT

Philco TROUBLE-SHOOTING Procedure

For rapid trouble shooting, the radio circuit is divided into four sections, as follows:

Section 1 — the power supply
Section 2 — the audio circuits
Section 3 — the i-f, detector, and a-v-c circuits
Section 4 — the r-f and converter circuits

Test points are specified for each section, and are indicated in the sectionalized schematic diagram. The trouble-shooting procedure given for each section includes a simplified test chart and a bottom view of the chassis showing the locations of the test points and the components of that section.

In each chart, the first step is a master check for determining whether trouble exists in that section, without going through the entire chart.

Failure to obtain the "NORMAL INDICATION" in any given step indicates trouble within the circuit under test.

After isolating the trouble to a single stage, the defect is located by: first, testing the tube; second, measuring tube electrode voltages; third, measuring circuit resistances; fourth, substituting condensers. The trouble revealed should be corrected before testing further.

Preliminary Checks

To avoid possible damage to the radio, the following preliminary checks should be made before turning on the power:

1. Inspect both the top and the bottom of the chassis. Make sure that all tubes are secure in the proper sockets, and look for any broken or shorted connections, burned resistors, or other obvious sources of trouble.

2. Measure the resistance between B+, pin 4 of the 50Y6GT, and B–, test point B. When the ohmmeter leads are connected in the proper polarity, the highest resistance reading will be obtained. If the reading is lower than 2000 ohms, check condenser C102A for leakage or a short. This resistance value, which is much lower than normal, does not represent a quality check of this condenser; it is the lowest value which will permit the rectifier to operate safely while the voltage checks of Section 1 (power supply) are performed.

© John F. Rider

Section 1 — Power Supply

TROUBLE SHOOTING

Make the tests for this section with a d-c voltmeter. Connect the negative lead to B–, test point B; connect the positive lead to the test points indicated in the chart. The voltage readings given were taken with a 20,000-ohms-per-volt meter, at a line voltage of 117 volts, a.c.

Set the volume control to minimum, and the radio-phono switch to the radio position.

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 2 (audio circuits); if not, isolate and correct the trouble in this section.

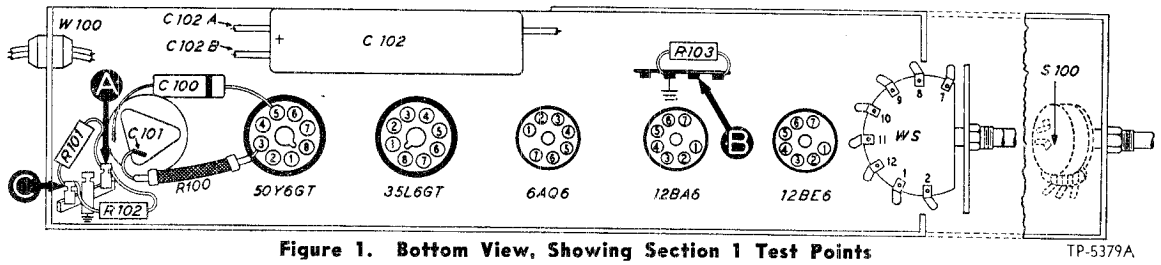


Figure 1. Bottom View, Showing Section 1 Test Points TP-5379A

STEP	TEST POINT	NORMAL INDICATION	ABNORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	110v		Trouble in this section. Isolate by the following tests.
2	C	200v	No voltage	Defective: 50Y6GT. Open: W100, S100, R100, C101. Shorted: C100.
			Low voltage	Defective: 50Y6GT. Open: C102A. Leaky: C102A, C101. Shorted: C101.
			High voltage	Open: R101, R102, C102B, R204*, T200*.
3	A	110v	No voltage	Shorted: C102B. Open: R101 and R102.
			Low voltage	Leaky: C102B. Shorted: C304. Open: R101, R102.
Listening Test: Abnormal hum may be caused by open or leaky C102A or C102B.				

*This part, located in another section, may cause abnormal indication in this section.

Section 2 — Audio Circuits

TROUBLE SHOOTING

For the tests in this section, use an audio-frequency signal generator. Connect the generator ground lead to B–, test point B; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Set the radio volume control to maximum, and the radio-phono switch as indicated in the chart.

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 3 (i-f, detector, and a-v-c circuits); if not, isolate and correct the trouble in this section.

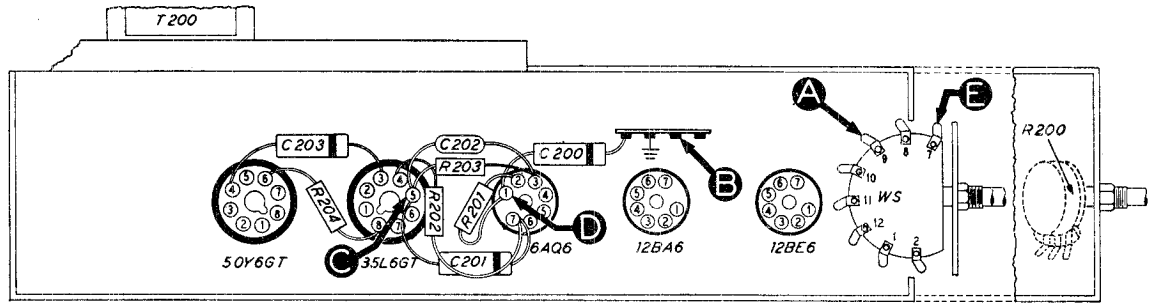

Figure 2. Bottom View, Showing Section 2 Test Points TP-5379B

STEP	TEST POINT	RADIO-PHONO SWITCH	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1 (a)	A	Radio	Loud, clear speaker output with moderate generator input.	Trouble in this section. Isolate by the following tests.
1 (b)	E	Phono		
2	C	Radio	Clear output with strong input.	Defective: LS200, 35L6GT. Shorted: T200, C203, C201, C202. Open: T200, R204, R203. Leaky: C203.
3	D	Radio	Loud, clear output with moderate input.	Defective: 6AQ6. Shorted: C200. Open: C201, R202, R201. Leaky: C201.
4	A	Radio	Loud, clear output with moderate input.	Open: R200 (rotate), C200, WS. Shorted: WS.
5	E	Phono	Same as step 4.	Open or shorted: WS.
Listening Test: Distortion may be caused by leaky C201. Distortion on strong signals may be caused by shorted or leaky C200.

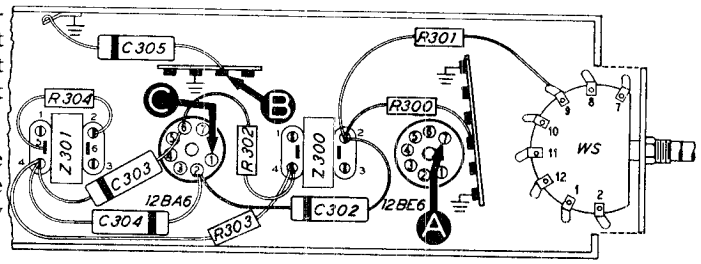
MODEL 49-1401

Section 3 — I-F, Detector, and A-V-C Circuits

TROUBLE SHOOTING

For the tests in this section, use an r-f signal generator, with modulated output, set at 455 kc. Connect the generator ground lead to B–, test point B; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Set the radio volume control to maximum, and the radio-phono switch to the radio position. Rotate the tuning control until the tuning condenser is fully meshed.



TP-5379C

Figure 3. Bottom View, Showing Section 3 Test Points

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 4 (r-f and converter circuits); if not, isolate and correct the trouble in this section.

To provide a complete i-f amplifier check, test point A for this section is placed at the grid of the converter in Section 4; therefore, the effectiveness of step 1 as a master check is dependent upon the condition of certain parts in the converter circuit. These parts are listed below under "POSSIBLE CAUSE OF ABNORMAL INDICATION."

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	Loud, clear speaker output with weak generator input.	Trouble in this section. Isolate by the following tests.
2	C	Loud, clear output with strong input.	Defective: 12BA6, 6AQ6. Shorted: C300B, C301A, C301B, C301C, C301D, C303, C304, WS, L300B, L301A, L301B. Open: R302, R303, R304, L300B, L301A, L301B, R301, C301A, C301B. Leaky: C303, C304. Misaligned: Z301.
3	A	Loud, clear output with weak input.	Defective: 12BE6*. Shorted: C400A*, C400B*, C300A, L300A, L300B, C302. Open: L300A, R300, C300A, C300B. Misaligned: Z300.

*This part, located in another section, may cause abnormal indication in this section.

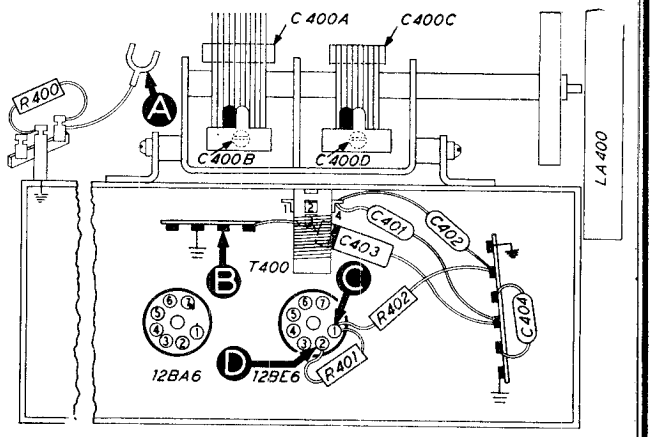
Section 4 — R-F and Converter Circuits

TROUBLE SHOOTING

For the tests in this section, with the exception of the oscillator test, use an r-f signal generator with modulated output. Connect the generator ground lead to B–, test point B; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Set the radio volume control to maximum, and the radio-phono switch to the radio position. Set the tuning control and signal-generator frequency as indicated in the chart.

If the "NORMAL INDICATION" is obtained in step 1, further tests should be unnecessary; if not, isolate and correct the trouble in this section. If the trouble is not revealed by the tests for this section, check the alignment.



TP-5379D

Figure 4. Bottom View, Showing Section 4 Test Points

STEP	TEST POINT	SIG. GEN. FREQ.	RADIO TUNING	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	1000 kc.	Tune to signal.	Loud, clear speaker output with weak generator input.	Trouble in this section. Isolate by the following tests.
2	C — D (Osc. test; see note below.)		Rotate through range.	Negative 4 to 5 volts.	Defective: 12BE6. Shorted: C400C, C400D, C402, C401, L400A, L400B. Open: C402, L400A, L400B, R401, R402.
3	A	1000 kc.	Tune to signal.	Same as step 1.	Shorted: LA400, C400A, C400B. Open: LA400, C404.

OSCILLATOR TEST: Connect the positive lead of a high-resistance voltmeter to the oscillator cathode (pin 2 of 12BE6), test point D; connect the prod end of the negative lead through a 100,000-ohm isolating resistor to the oscillator grid (pin 1 of 12BE6), test point C. Use a suitable meter range, such as 0—10 volts. Proper operation of the oscillator is indicated by negative voltage within the range given in the chart (measured with a 20,000-ohms-per-volt meter) throughout the tuning range.

ALIGNMENT PROCEDURE

DIAL — Calibration and pointer-index measurements are shown in figure 7. With tuning condenser fully meshed, set pointer to index mark.

RADIO CONTROLS — Set volume control to maximum, and radio-phono switch to radio position.

OUTPUT METER — Connect to terminals indicated in figure 6.

SIGNAL GENERATOR — Connect ground lead to B–, test point B in figure 4, and connect output lead as indicated in chart. Use modulated output.

OUTPUT LEVEL — During alignment, adjust signal-generator output to maintain output-meter indication below 1.25 volts.

STEP	SIGNAL GENERATOR		RADIO		ADJUST
	CONNECTION TO RADIO	DIAL SETTING	DIAL SETTING	SPECIAL INSTRUCTIONS	
1	Through .1-mf. condenser to external-aerial lead. Make sure that radio loop aerial is connected to radio.	455 kc.	Tuning condenser fully meshed.	Adjust, in order given, for maximum output.	TC301B—2nd i-f sec. TC301A—2nd i-f pri. TC300B—1st i-f sec. TC300A—1st i-f pri.
2	Radiating loop (see note below).	1600 kc.	1600 kc.	Adjust for maximum output.	C400D—osc.
3	Same as step 2.	1500 kc.	1500 kc.	Adjust for maximum output.	C400B—aerial

RADIATING LOOP: Make up a 6—8-turn, 6-inch-diameter loop, using insulated wire; connect to signal-generator leads and place near radio loop aerial. Make sure that radio loop aerial is connected to radio.

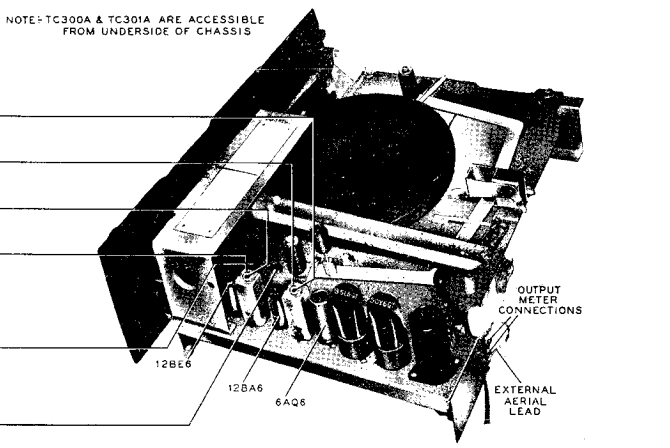

Figure 6. Top View, Showing Trimmer Locations

CALIBRATING DIAL BACKPLATE

When the radio chassis has been removed from the cabinet, dial-calibration and alignment points should be marked on the dial backplate, below the pointer.

The method of measuring for these points is illustrated in figure 7. Hold a ruler against the backplate, with the start of the ruler at the reference line shown, and mark pencil dots at the proper points for the required frequency settings. When the ruler is correctly placed, the index mark is approximately 2-3/8 inches from the reference point indicated in figure 7.

With the tuning gang fully meshed, the pointer should be adjusted on the dial-drive cord to coincide with the index mark.

After installing the chassis in the cabinet, the dial pointer should be moved to coincide with the index mark on the dial. Coincidence of the pointer and index mark should occur with the tuning condenser fully meshed.

MODEL 49-1401

SYMBOLIZATION

The components in the radio circuit are symbolized according to the types of parts and the sections of the radio in which the parts are located. The prefix letter of the symbol designates the type of part, as follows:

C —condenser	LA—loop aerial	S —switch	WS—wafer switch
I —pilot lamp	LS—loud-speaker	T —transformer	Z —electrical assembly
L —choke or coil	R —resistor	W —wire or cable	

The number of the symbol designates the section in which the part is located, as follows:

100-series components are in Section 1 — the power supply
200-series components are in Section 2 — the audio circuits
300-series components are in Section 3 — the i-f, detector, and a-v-c circuits
400-series components are in Section 4 — the r-f and converter circuits

REPLACEMENT PARTS LIST

NOTE: Parts marked with an asterisk (*) are general replacement items. These numbers may not be identical with those on factory assemblies; also, the electrical values of some replacement items may differ from the values indicated in the schematic diagram and replacement parts list. The values substituted in any case are so chosen that the operation of the radio will be either unchanged or improved. When ordering replacements, use only the "Service Part No."

SECTION 1
POWER SUPPLY

Reference Symbol	Description	Service Part No.
C100	Condenser, line filter, .05 mf.	61-0170*
C101	Condenser, filter, electrolytic, 20 mf., 200v	30-2568-22
C102	Condenser, electrolytic, two-section	30-2575-20
C102A	Condenser, filter, 75 mf., 250v	Part of C102
C102B	Condenser, filter, 20 mf., 250v	Part of C102
I100	Pilot lamp	32-2605*
R100	Resistor, current limiting, 25 ohms	33-1334-5

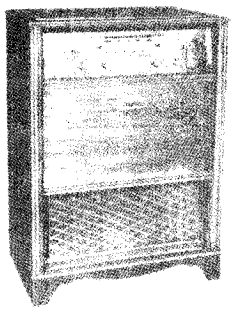
MODEL 49-1600



MODEL 49-1600

SPECIFICATIONS

CABINET	Modern classical, wood console, walnut finish.
CIRCUIT	Five-tube superhetrodyne
FREQUENCY RANGE	540—1620 kc.
AUDIO OUTPUT	3 watts
OPERATING VOLTAGE	117 volts, 60 cycles, a.c.
POWER CONSUMPTION	
Radio	35 watts
Phonograph	50 watts
AERIAL	High-impedance loop; also provision for external aerial.
INTERMEDIATE FREQUENCY	455 kc.
PHILCO TUBES (5)	14Q7, 12BA6, 7C6, 35L6GT, 50X6
RECORD PLAYER	Philco Automatic Record Changer Model M-9 (For service information refer to PR-1571.)

TP-5872

Circuit Description

Philco Model 49-1600 is a console radio-phonograph combination consisting of a five-tube superhetrodyne, which provides reception on the standard-broadcast band, and a Philco M9 Automatic Record Changer. The built-in loop aerial normally provides adequate signal pickup. However, provision has been made for connecting an external aerial, if required.

The loop works directly into a 14Q7 converter, where the incoming signal is converted to the 455-kc. intermediate frequency. The oscillator section of the tuning-condenser gang has a specially shaped rotor to provide proper tracking without the use of a series padding condenser. The converter is transformer-coupled to a 12BA6 i-f amplifier, which, in turn, is transformer-coupled to the diode section of a 7C6. Both i-f transformers have permeability-tuned primary and secondary windings. The diode section of the 7C6 acts as a detector, and also provides a-v-c voltage, which is applied to the grids of the converter and the i-f amplifier. The triode section of the 7C6, the first audio amplifier, is resistance-coupled to a 35L6GT beam-power-output amplifier, which supplies approximately three watts of audio power to a permanent-magnet dynamic speaker.

The d-c operating voltages are furnished by a voltage-doubler circuit employing a 50X6 rectifier and a resistor-condenser filter. Resistor R102 is connected between B– and the chassis to prevent hum due to condenser leakage under high-humidity conditions.

Philco TROUBLE-SHOOTING *Procedure*

For rapid trouble shooting, the radio circuit is divided into four sections, with test points specified for each section; these sections and test points are indicated in the schematic diagram. The trouble-shooting procedure given for each section includes a simplified test chart and a bottom view of the chassis, showing the locations of the test points and the components of that section.

In each chart, the first step is a master check for determining whether trouble exists in that section without going hrough the entire test procedure.

Failure to obtain the "NORMAL INDICATION" in any given step indicates trouble within the circuit under test.

After isolating the trouble to a single stage, the defect is located by: first, testing the tube; second, measuring tube electrode voltages; third, measuring circuit resistances; fourth, substituting condensers. The trouble revealed should be corrected before testing further.

Preliminary Checks

Before connecting the radio to a source of power, the following steps are recommended:

1. Inspect both the top and the bottom of the chassis. Make sure that all tubes are secure in the proper sockets, and look for any broken or shorted connections, burned resistors, or other obvious sources of trouble.
2. Measure the resistance between B+ (pin 2 of the 50X6 rectifier tube) and B–, test point B. When the ohmmeter test leads are connected in the proper polarity, the highest resistance reading will be obtained. If the reading is lower than 2700 ohms, check condensers C102A and C102B for leakage or shorts. The resistance value is much lower than normal, and is not intended as a quality check of these condensers; the value given is the lowest at which the rectifier will operate safely while the voltage checks of Section 1 (power supply) are performed.

©John F. Rider

TROUBLE SHOOTING

Section 1 - Power Supply

For the tests in this section, use a d-c voltmeter. Connect the negative lead to B–, test point B; connect the positive lead to the test points indicated in the chart. The voltage readings given were taken with a 20,000-ohms-per-volt meter at a line voltage of 117 volts, a.c.

Turn on the power, set the volume control to minimum, and set the radio-phono switch to the radio position.

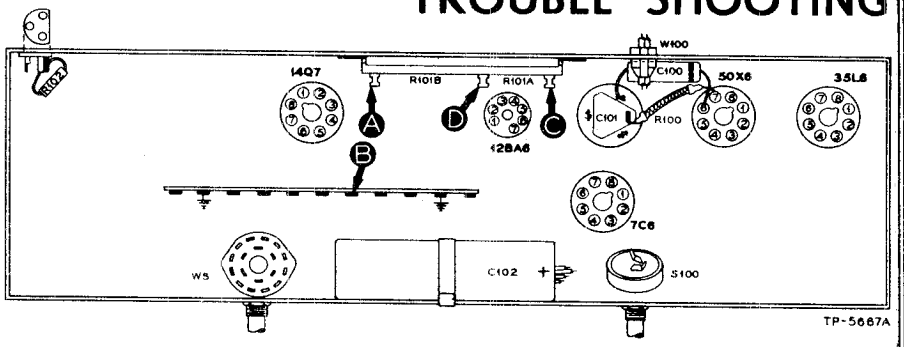


Figure 1. Bottom View, Showing Section 1 Test Points

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 2 (audio circuits); if not, isolate and correct the trouble in this section.

STEP	TEST POINT	NORMAL INDICATION	ABNORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	110v		Trouble in this section. Isolate by the following tests.
2	C	215v	No voltage	Defective: 50X6. Shorted: C100, C102A. Open: W100, S100, R100, C101.
			Low voltage	Defective: 50X6. Shorted: C101. Leaky: C101, C102A. Open: C102A.
3	D	205v	High voltage	Open: R101A.
			No voltage	Shorted: C102B. Open: R101A.
			Low voltage	Leaky: C102B. Open: C102B.
4	A	110v	High voltage	Open: R101B, T200*, R205*.
			No voltage	Open: R101B. Shorted: C102C.
			Low voltage	Leaky: C102C. Shorted: C303*.
Listening Test: Abnormal hum may be caused by open or leaky C102A, C102B, or C102C.				

* This part, located in another section, may cause abnormal indication in this section.

TROUBLE SHOOTING

Section 2 - Audio Circuits

For the tests in this section, use an audio-frequency signal generator. Connect the generator ground lead to B–, test point B; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Set the volume control to maximum.

Set the radio-phono switch to the radio position for test points A, C, and D, and to the phono position for test point E.

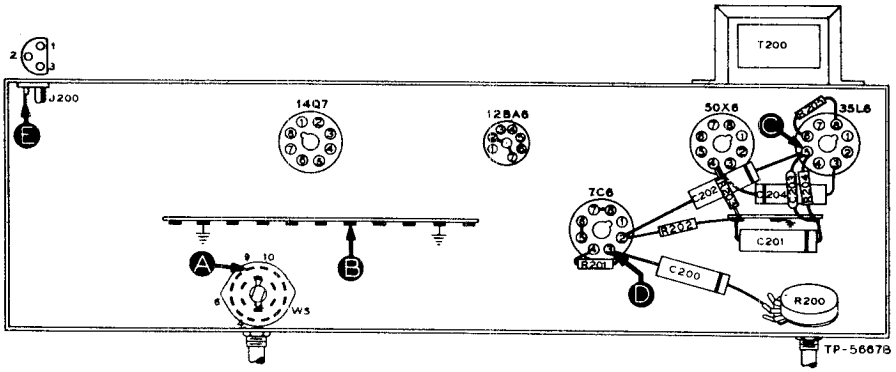

Figure 2. Bottom View, Showing Section 2 Test Points

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 3 (i-f detector, and a-v-c circuits); if not, isolate and correct the trouble in this section.

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A E	Loud, clear speaker output with moderate signal-generator input.	Trouble in this section. Isolate by the following tests.
2	C	Clear output with strong input.	Defective: 35L6GT, LS200. Shorted: T200, C202, C203, C204. Open: R204, R205, T200. Leaky: C204.
3	D	Loud, clear output with moderate input.	Defective: 7C6. Shorted: C200, C201. Open: C202, R201, R202, R203. Leaky: C202.
4	A	Same as step 1.	Open: R200 (rotate), C200, WS. Shorted: WS, C301*.
5	E	Same as step 1.	Open: WS. Shorted: WS.
Listening Test: Distortion may be caused by leaky C202. Distortion of strong signals may be caused by shorted or leaky C200.			

* This part, located in another section, may cause abnormal indication in this section.

MODEL 49-1600

Section 3—I-F, Detector, and A-V-C Circuits

TROUBLE SHOOTING

For the tests in this section, use an r-f signal generator, with modulated output, set at 455 kc. Connect the generator ground lead to B—, test point B; connect the output lead through a .1-mf. condenser to the test point indicated in the chart.

Set the volume control to maximum, and set the radio-phono switch to the radio position. Rotate the tuning control until the tuning condenser is fully meshed.

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 4 (r-f and converter circuits); if not, isolate and correct the trouble in this section.

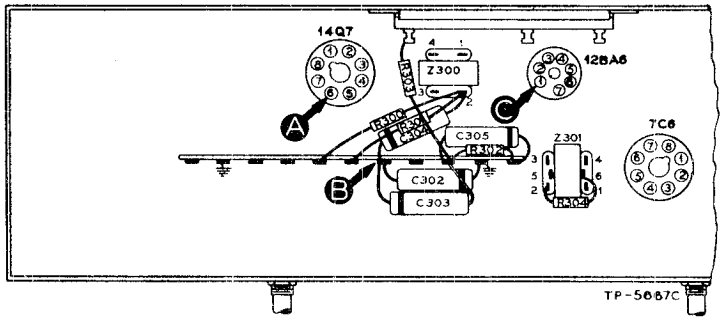

Figure 3. Bottom View, Showing Section 3 Test Points

To provide a complete i-f amplifier check, test point A for this section is placed at the grid of the mixer in Section 4; therefore, the effectiveness of step 1 as a master check is dependent upon the condition of certain parts in the mixer circuit. These parts are listed below under the "POSSIBLE CAUSE OF ABNORMAL INDICATION."

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	Loud, clear speaker output with weak signal-generator input.	Trouble in this section. Isolate by the following tests.
2	C	Loud, clear output with moderate input.	Defective: 12BA6, 7C6. Shorted: C300B, C301A, C301B, C301C, C301D, C303, C305, L300B, L301A, L301B, WS-B. Open: C301A, C301B, L300B, L301A, L301B, R301, R302, R303, R304, WS-B. Leaky: C303, C305. Misaligned: Z301.
3	A	Loud, clear output with weak input.	Defective: 14Q7*. Shorted: C300A, L300A. Open: C300A, C300B, L300A, R300. Misaligned: Z300.

* This part, located in another section, may cause abnormal indication in this section.

Section 4—R-F and Converter Circuits

TROUBLE SHOOTING

For the tests in this section, with the exception of the oscillator test, use an r-f signal generator with modulated output. Connect the generator ground lead to B—, test point B; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Set the volume control to maximum, and set the radio-phono switch to the radio position. Set the tuning control and the signal-generator frequency as indicated in the chart.

If the "NORMAL INDICATION" is not obtained in step 1, isolate and correct the trouble in this section. If the trouble is not revealed by the tests for this section, check the alignment.

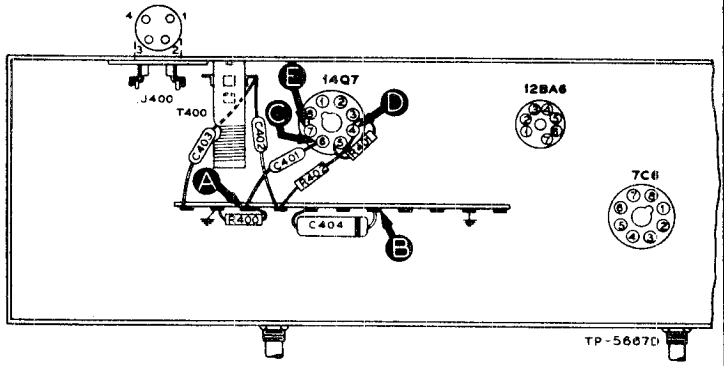

Figure 4. Bottom View, Showing Section 4 Test Points

STEP	TEST POINT	SIG. GEN. FREQ.	RADIO TUNING	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	1000 kc.	Tune to signal.	Loud, clear speaker output with weak signal-generator input.	Trouble in this section. Isolate by the following tests.
2	D—E (Osc. test; see note below.)		Rotate through range.	Negative 2 to 3 volts.	Defective: 14Q7. Shorted: C400 (osc. section), C400B, C402, C403, T400. Open: C402, R401, R402, T400.
3	C	1000 kc.	Tune to signal.	Same as step 1.	Defective: 14Q7. Shorted: C400 (aerial section), C400A, LA400. Open: LA400.
4	A	1000 kc.	Tune to signal.	Same as step 1.	Shorted: J400. Open: C401.

OSCILLATOR TEST: Connect the positive lead of a high-resistance voltmeter to the cathode of the 14Q7, test point E; connect the prod end of the negative lead through a 100,000-ohm isolating resistor to the oscillator grid (pin 4 of 14Q7), test point D. Use a suitable meter range, such as 0—10 volts. Proper operation of the oscillator is indicated by a negative voltage of approximately the volue given in the chart (measured with a 20,000 ohms-per-volt meter) throughout the tuning range

ALIGNMENT PROCEDURE

DIAL—Calibration and pointer-index measurements are shown in figure 7. With tuning condenser fully meshed, set pointer to index mark.

OUTPUT METER—Connect across voice coil.

SIGNAL GENERATOR—Connect as indicated in chart. Use modulated output.

RADIO CONTROLS—Set volume control to maximum, and radio-phono switch to radio position.

OUTPUT LEVEL—During alignment, adjust signal-generator output to maintain output-meter indication below 1.25 volts.

STEP	SIGNAL GENERATOR		RADIO		ADJUST
	CONNECTION TO RADIO	DIAL SETTING	DIAL SETTING	SPECIAL INSTRUCTIONS	
1	Ground lead to B−; output lead through .1-mf. condenser to external-aerial lead (loop aerial must be connected).	455 kc.	Tuning condenser fully meshed.	Adjust tuning cores, in order given, for maximum output.	TC301B—2nd i-f sec. TC301A—2nd i-f pri. TC300B—1st i-f sec. TC300A—1st i-f pri.
2	Radiating loop (see note below).	1600 kc.	1600 kc.	Adjust trimmer for maximum output.	C400B—osc.
3	Same as step 2.	1500 kc.	1500 kc.	Adjust trimmer for maximum output.	C400A—aerial

RADIATING LOOP: Make up a 6—8 turn, 6-inch-diameter loop from insulated wire; connect to signal-generator leads and place near radio loop aerial. The loop aerial must be connected.

SYMBOLIZATION

The components in the radio circuit are symbolized according to the types of parts and the sections of the radio in which the parts are located. The prefix letter of the symbol designates the type of part, as follows:

C—condenser
I—pilot lamp
L—choke or coil
LA—loop aerial
LS—Loud-speaker
R—resistor
S—switch
T—transformer
TC—tuning core
W—line-cord-and-plug assembly
WS—Wafer switch
Z—electrical assembly

The number of the symbol designates the section in which the part is located, as follows:

100-series components are in Section 1—the powersupply.
200-series components are in Section 2—the audio circuits.
300-series components are in Section 3—the i-f, detector, and a-v-c circuits.
400-series components are in Section 4—the r-f and converter circuits.

REPLACEMENT PARTS LIST

NOTE: Part numbers identified by an asterisk (*) indicate general replacement items. These numbers may not be identical with those on factory assemblies; also, the electrical values of some replacement items may differ from the values indicated in the schematic diagram and replacement parts list. The values substituted in any case are so chosen that the operation of the radio will be either unchanged or improved. When ordering replacements, use only the "Service Part No."

MODELS 49-1602, 49-1603, 49-1604, 49-1605

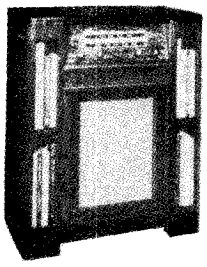
Circuit Description

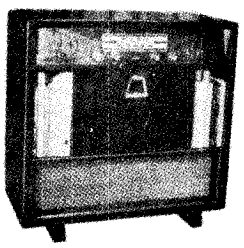
Philco Radio-Phonograph Models 49-1602 and 49-1604 are identical electrically. Each model includes a Philco Automatic Record Changer Model M-9 and a six-tube superheterodyne which provides reception in the standard broadcast band.

A semi-high-impedance loop aerial normally gives adequate signal pickup; if greater signal pickup is required, an external aerial may be connected.

The loop aerial feeds into a 14AF7 converter. The aerial and oscillator circuits are tuned by ganged, variable tuning condensers. The two i-f stages employ 7B7 pentode amplifier tubes. The new Philco high-gain transformers are used for coupling in the r-f and i-f circuits, to provide additional amplification and to give better reproduction of the received r-f signal. The diode section of the 7C6 dual-diode-triode provides detection and a-v-c action. The triode section of this tube functions as the first audio amplifier, and is resistance-coupled to the 35L6GT output tube. The loudspeaker is a permanent-magnet, dynamic type. The power supply employs a 50X6 full-wave, voltage-doubler rectifier and a resistor-condenser filter network.

A 150,000-ohm resistor, R103, is connected between B– and the chassis to prevent hum under conditions of high humidity. The combination of C305 and its associated r-f choke is a series-resonant circuit at 455 kc., and functions as a low-impedance by-pass for the intermediate frequency.





MODEL 49-1602 MODEL 49-1604
MODEL 49-1603 MODEL 49-1605

SPECIFICATIONS

CABINET	
Model 49-1602	Wood console, walnut finish
Model 49-1604	Wood console, mahogany finish
CIRCUIT	Six-tube superheterodyne
FREQUENCY RANGE	540—1620 kc.
AUDIO OUTPUT	3 watts
OPERATING VOLTAGE	105—120 volts, a.c.
POWER CONSUMPTION	
Radio	65 watts
Phonograph	30 watts
AERIAL	Built-in semi-high-impedance loop; also provision for connecting external aerial.
INTERMEDIATE FREQUENCY	455 kc.
PHILCO TUBES (6)	7B7(2), 7C6, 14AF7, 35L6GT, 50X6
PHONOGRAPH	Philco Automatic Record Changer Model M-9

TP-5870 & TP-5819A

Philco TROUBLE-SHOOTING Procedure

For rapid trouble shooting, the radio circuit is divided into four sections, with test points specified for each section; these sections and test points are indicated in the schematic diagram. The trouble-shooting procedure given for each section includes a simplified test chart and a bottom view of the chassis showing the locations of the test points and the components of that section.

In each chart, the first step is a master check for determining whether trouble exists in that section, without going through the entire test procedure.

Failure to obtain the "NORMAL INDICATION" in any given step indicates trouble within the circuit under test.

After isolating the trouble to a single stage, the defect is located by: first, testing the tube; second, measuring tube electrode voltages; third, measuring circuit resistances; fourth, substituting condensers. The trouble revealed should be corrected before testing further.

Preliminary Checks

To avoid possible damage to the radio, the following preliminary checks should be made before it is turned on:

1. Inspect both the top and the bottom of the chassis. Make sure that all tubes are secure in the proper sockets, and look for any broken or shorted connections, burned resistors, or other obvious sources of trouble.
2. Measure the resistance between B+ (pin 7 of 50X6 rectifier) and B–, test point B. When the ohmmeter test leads are connected in the proper polarity, the highest resistance reading will be obtained. If the reading is lower than 3000 ohms, check condensers C102A and C102B for leakage or shorts. The resistance value given is much lower than normal, and is not intended as a quality check of these condensers; the value given is the lowest at which the rectifier will operate safely while the voltage checks of Section 1 (power supply) are performed.

Model 49-1603 **GENERAL INFORMATION** Model 49-1605

The radio chassis of these two models are electrically and mechanically identical to that of Model 49-1602. The record changer used is a Model M-9C (see diagram below)

TROUBLE SHOOTING

Section 1 - Power Supply

For the tests in this section, use a d-c voltmeter. Connect the negative lead to B–, test point B; connect the positive lead to the test points indicated in the chart. The voltage readings given were taken with a 20,000-ohms-per-volt meter at a line voltage of 117 volts, a.c.

Turn on the power, and set the volume control to minimum. Turn the tone control fully clockwise, and set the radio-phono switch to the radio position.

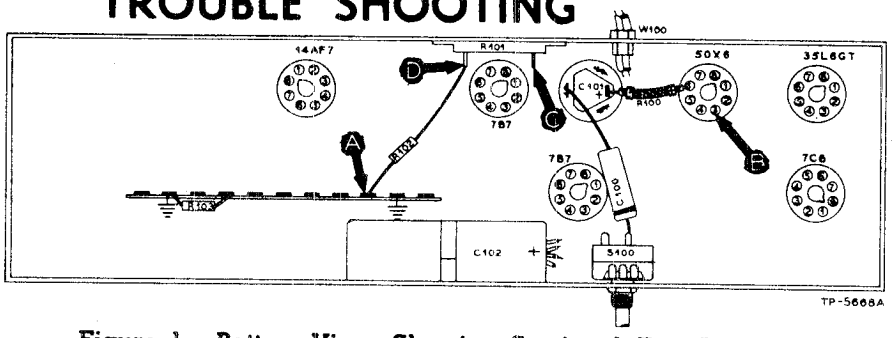

Figure 1. Bottom View, Showing Section 1 Test Points

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 2 (audio circuits); if not, isolate and correct the trouble in this section.

STEP	TEST POINT	NORMAL INDICATION	ABNORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	80v		Trouble within this section. Isolate by the following tests.
2	C	225v	No voltage	Defective: 50X6. Open: C101, R100, S100, W100. Shorted: C102A.
			Low voltage	Defective: 50X6. Open: C102A, Leaky: C102A, 102B. Shorted: C102C.
			High voltage	Open: R101, R207*, T200*.
3	D	195v	No voltage	Shorted: C102B.
			Low voltage	Open: C102B. Leaky: C102B.
			High voltage	Open: R102.
4	A	80v	No voltage	Shorted: C102C. Open: R102.
			Low voltage	Leaky: C102C.
Listening Test: Abnormal hum may be caused by open C102A, C102B, or C102C.				

* This part located in another section, may cause abnormal indication in this section.

Section 2 - Audio Circuits

For the tests in this section, use an audio-frequency signal generator. Connect the generator ground lead to B–, test point B; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Set the volume control to maximum, and turn the tone control fully counterclockwise. Set the radio-phono switch to the radio position for test points A, C, and D, and to the phono position for test point E.

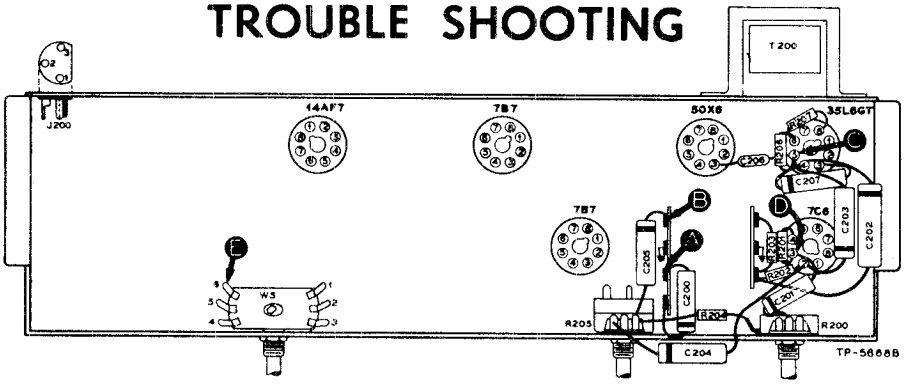

Figure 2. Bottom View, Showing Section 2 Test Points

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 3 (i-f, detector, and a-v-c circuits); if not, isolate and correct the trouble in this section.

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A E	Loud, clear speaker output with moderate signal-generator input.	Trouble within this section. Isolate by the following tests.
2	C	Moderate, clear output with strong input.	Defective: 35L6GT, LS200. Open: R206, R207, T200. Shorted or leaky: C206, C207.
3	D	Loud, clear output with moderate input.	Defective: 7C6. Open: C203, R201, R202, R203. Shorted or leaky: C202, C203, C204.
4	A	Same as step 3.	Open: C200, C201, R200, WS. Shorted: C205 (rotate R200).
5	E	Same as step 3.	Open: WS.
Listening test: Distortion may be caused by shorted or leaky C200, C201, or C203.

MODELS 49-1602, 49-1603, 49-1604, 49-1605

Section 3—I-F, Detector, and A-V-C Circuits

TROUBLE SHOOTING

For the tests in this section, use an r-f signal generator, with modulated output, set at 455 kc. Connect the generator ground lead to B–, test point B; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Set the volume control to maximum, and turn the tone control fully counterclockwise. Set the radio-phono switch to the radio position, and rotate the tuning control until the tuning condenser is fully meshed.

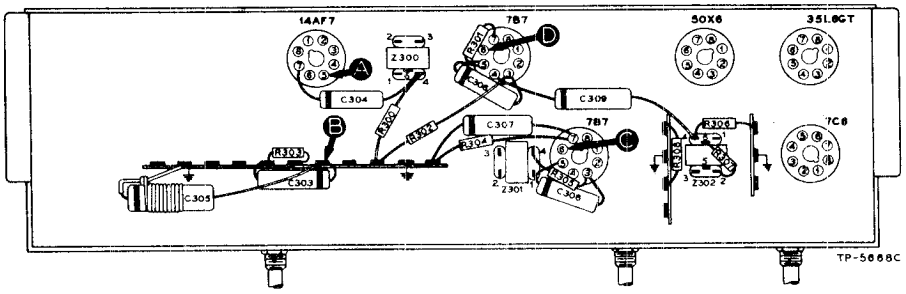

Figure 3. Bottom View, Showing Section 3 Test Points

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 4 (r-f and converter circuits); if not, isolate and correct the trouble in this section.

To provide a complete i-f amplifier check, test point A for this section is placed at the grid of the mixer in Section 4; therefore, the effectiveness of step 1 as a master check is dependent upon the condition of certain parts in the mixer circuit. These parts are listed below under the "POSSIBLE CAUSE OF ABNORMAL INDICATION."

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	Loud, clear speaker output with weak signal-generator input.	Trouble within this section. Isolate by the following tests.
2	C	Loud, clear output with moderate input.	Defective: 7B7 (2nd i-f amplifier), 7C6 (diode section). Misaligned: Z302. Open: L302A, L302B, L301B, C307, C308, C309, R304, R305, R306, R307, R308, WS. Shorted: L302A, L302B, C301B, C302A, C302B, C302C, C302D, C307, C308, C309.
3	D	Loud, clear output with weak input.	Defective: 7B7 (1st i-f amplifier). Misaligned: Z301. Open: L301A, L301B, L300C, C305, C306, R301, R302. Shorted: C300B, C301A, C301B, C306.
4	A	Same as step 3.	Defective: 14AF7*. Misaligned: Z300. Open: L300A, L300B, L300C, R300, R403*, R404*. Shorted: C300A, C300B, C304.

* This part, located in another section, may cause abnormal indication in this section.

Section 4—R-F and Converter Circuits

TROUBLE SHOOTING

For the tests in this section, with the exception of the oscillator test, use an r-f signal generator with modulated output. Connect the generator ground lead to B–, test point B; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Set the volume control to maximum, and turn the tone control fully counterclockwise. Set the radio-phono switch to the radio position, and set the tuning control and the signal-generator frequency as indicated in the chart.

If the "NORMAL INDICATION" is not obtained in step 1, isolate and correct the trouble in this section. If the trouble is not revealed by the tests for this section, check the alignment.

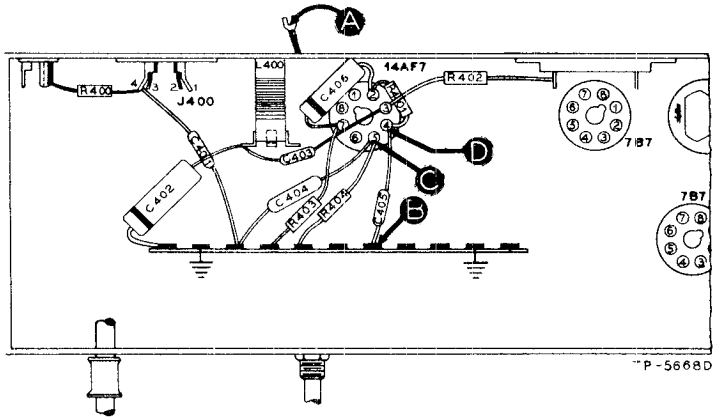

Figure 4. Bottom View, Showing Section 4 Test Points

STEP	TEST POINT	SIG. GEN. FREQ.	RADIO TUNING	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	1000 kc.	1000 kc.	Loud, clear speaker output with weak signal-generator input.	Trouble within this section. Isolate by the following tests.
2	C	1000 kc.	1000 kc.	Same as step 1.	Defective: 14AF7, osc. circuit. Open: C406, R403, R404. Shorted: C406.

ALIGNMENT PROCEDURE

RADIO CONTROLS—Set volume control to maximum, turn tone control fully counterclockwise, and set radio-phono switch to radio position.

OUTPUT LEVEL—During alignment, adjust signal-generator output to maintain output-meter indication below 1.25 volts.

DIAL—Calibration and pointer-index measurements are shown in figure 7. With tuning condenser fully meshed, set pointer to index mark.

OUTPUT METER—Connect across voice coil.

SIGNAL GENERATOR—Connect as indicated in chart. Use modulated output.

STEP	SIGNAL GENERATOR: CONNECTION TO RADIO	SIGNAL GENERATOR: DIAL SETTING	RADIO: DIAL SETTING	RADIO: SPECIAL INSTRUCTIONS	ADJUST
1	Ground lead to B−; output lead through .1-mf. condenser to mixer grid (pin 5 of 14AF7).	455 kc.	540 kc.	Adjust tuning cores, in order given, for maximum output.	TC302B—3rd i-f sec. TC302A—3rd i-f pri. TC301B—2nd i-f sec. TC301A—2nd i-f pri. TC300B—1st i-f sec. TC300A—1st i-f pri.
2	Radiating loop (see note below).	1600 kc.	1600 kc.	Adjust trimmer for maximum output.	C400B—osc.
3	Same as step 2.	1500 kc.	1500 kc.	Adjust trimmer for maximum output.	C400A—aerial

RADIATING LOOP: Make up a 6—8 turn, 6-inch diameter loop from insulated wire; connect to signal-generator leads and place near radio loop aerial. The loop aerial must be connected.

Sectionalized Schematic Diagram, Showing Test Points

OSCILLATOR TESTS

Connect the positive lead of a high-resistance voltmeter to B–, test point B; connect the prod end of the negative lead through a 100,000-ohm isolating resistor to the oscillator grid (pin 4 of 14AF7), test point D. Use a suitable meter range, such as 0—10 volts. Proper operation of the oscillator is indicated by negative voltage of approximately the value given in the chart (measured with 20,000-ohms-per-volt meter) throughout the tuning range.

Circuit Description

Philco Model 49-1606 is a console-model radio-phonograph, which provides reception on the standard-broadcast and FM bands. The radio is a seven-tube superheterodyne, with two selenium rectifiers incorporated in the power supply.

A built-in, high-impedance loop aerial for the broadcast band and a line-cord aerial for the FM band normally provide adequate signal pickup; if additional pickup is required, Philco Dipole Aerial, Part No. 45-1462, may be used. When connecting the dipole aerial, disconnect the black lead from terminal 2 of TB400, and attach this lead to pin 1 of the dipole-aerial plug, which fits into J400. No additional coupler is required.

To eliminate complicated switching and to provide better stability and greater gain on both bands, separate converter tubes are used for broadcast and FM reception. A 12AU6 high-gain pentode is used in a tuned r-f amplifier on the FM band. The output of this tube is fed to the 14F8 dual triode, which functions as the converter for the FM signal. A 12AU7 dual triode is used as the converter for the broadcast signal. Band switching is accomplished by means of a single-wafer switch, which connects the B+ voltage to the proper mixer plate.

A 6BJ6 tube is used in each of the two i-f amplifier stages. Two sets of i-f transformers are used—one set is tuned to 455 kc. for broadcast, and the other set is tuned to 9.1 mc. for FM. The use of two sets of i-f transformers makes better shielding possible, so that undesirable beat signals and interaction between transformers are eliminated.

Two diode sections of a 19T8 triple-diode-triode are used in a ratio-detector circuit, for detection of FM signals. The other diode section is used in a half-wave rectifier circuit, for detection of AM (broadcast) signals and to provide a-v-c action.

The triode section of the 19T8 functions as the first audio amplifier. The output of this stage is resistance-coupled to a 50C6G output tube, which is transformer-coupled to the permanent-magnet speaker.

Two selenium rectifiers are used in a half-wave voltage-doubler circuit, to supply the B+ voltage.

MODEL 49-1606

SPECIFICATIONS

CABINET	Wood console, mahogany and blonde walnut
CIRCUIT	Seven-tube superheterodyne plus rectifiers
FREQUENCY RANGES	
Broadcast	540—1620 kc.
FM	88—108 mc.
AUDIO OUTPUT	5 watts
OPERATING VOLTAGE	105—125 volts, 60 cycles, a.c.
POWER CONSUMPTION	
Radio	65 watts
Phonograph	85 watts
AERIALS	Built-in, low-impedance loop for broadcast; line-cord aerial for FM
INTERMEDIATE FREQUENCY	
AM	455 kc.
FM	9.1 mc.
PHILCO TUBES (7)	12AU6, 12AU7, 14F8, 6BJ6(2), 19T8, 50C6G, selenium rectifier (2)
PHONOGRAPH	Philco Automatic Record Changer Model M-9.

GENERAL INFORMATION

The radio chassis of these two models are electrically and mechanically identical to that of Model 49-1606. The record changer used is a Model M-9C (see diagram below); for record changer service information, refer to Service Manual PR-1599.

Each model is housed in a different type of cabinet. Therefore, the loop aerials are of different dimensions. (The aerial circuits are electrically the same.)

SPECIFICATIONS

CABINET ..... Wood console: Model 49-1609, walnut or light finish; Model 49-1611, mahogany finish

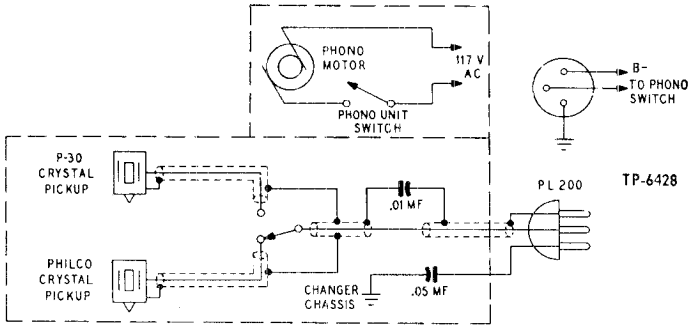
POWER CONSUMPTION:
Radio ..... 40 watts
Phonograph ..... 20 watts

AERIALS ..... Semi-high-impedance loop; line-cord FM aerial; connector for external aerial

PHONOGRAPH ..... Philco Automatic Record Changer, Model M-9C (for service information, refer to Service Manual PR-1599)

Preliminary Checks

Measure the resistance between B+, test point C, and B–, test point B. When the ohmmeter test leads are connected in the proper polarity, the highest resistance reading will be obtained. If the reading is lower than 2500 ohms, check condensers C103A, C103B, and C316 for leakage or shorts. The resistance value given is much lower than normal, and is not intended as a quality check of these condensers; the value given is the lowest at which the rectifier will operate safely while the voltage checks of Section 1 (power supply) are performed.



Wiring Diagram of Model M-9C Automatic Record Changer

Section 1 TROUBLE SHOOTING

POWER SUPPLY

For the tests in this section, use a d-c voltmeter. Connect the negative lead to B–, test point B; connect the positive lead to the test points indicated in the chart. The voltage readings given were taken with a 20,000-ohms-per-volt meter at a line voltage of 117 volts, a.c.

Turn on the power, and set the volume control to minimum. Turn the tone control fully clockwise, and set the band switch to the broadcast position.

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 2 (audio circuits); if not, isolate and correct the trouble in this section.

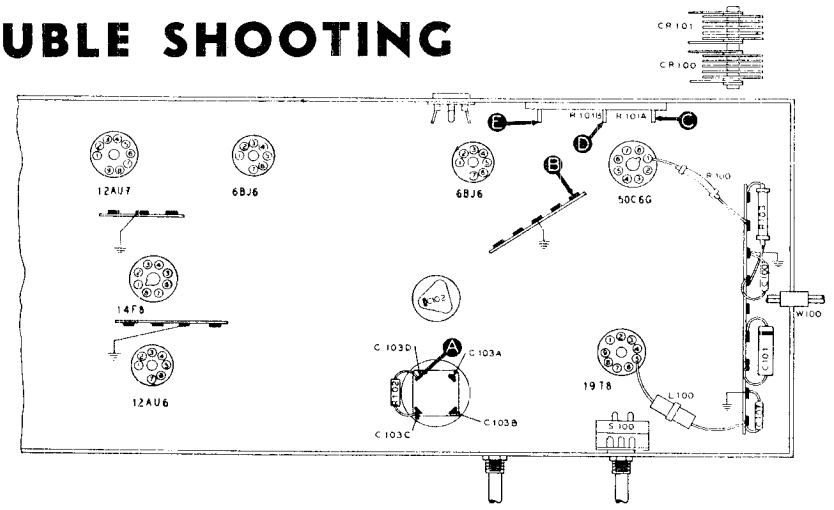


Figure 1. Bottom View, Showing Section 1 Test Points

STEP	TEST POINT	NORMAL INDICATION	ABNORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	145v		Trouble in this section. Isolate by the following tests.
2	C	230v	No voltage.	Defective: CR100, CR101. Open: C102, W100, R103, S100. Shorted: C103A, C101, C104, C100.
			Low voltage.	Defective: CR100, CR101. Open: C103A, R100. Shorted or leaky: C103B.
			High voltage.	Open: R101A, R101B, R102.
3	D	205v	No voltage.	Open: R101A. Shorted: C103B.
			Low voltage.	Leaky: C103B. Shorted: C103C, C316*.
			High voltage.	Open: R101B, R102, R206*, T200*.
4	E	160v	No voltage.	Open: R101B. Shorted: C103C.
			Low voltage.	Leaky: C103C. Shorted: C103D, C310*, C315*.
			High voltage.	Open: R102, R315*.
5	A	145v	No voltage.	Open: R102. Shorted: C103D.
			Low voltage.	Leaky: C103C.
Listening Test: Abnormal hum may be caused by open C103A, C103B, C103C, or C103D.				

* This part, located in another section, may cause abnormal indication in this section.

Section 2

TROUBLE SHOOTING

AUDIO CIRCUITS

For the tests in this section, use an audio-frequency signal generator. Connect the generator ground lead to B–, test point B; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Set the volume control to maximum, and turn the tone control to the midpoint of its range. Set the band switch to the broadcast position for test points A, C, and D, and to the phono position for test point E.

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 3 (i-f, detector, and a-v-c circuits); if not, isolate and correct the trouble in this section.

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A E	Loud, clear speaker output with weak generator input.	Trouble in this section. Isolate by the following tests.
2	C	Clear signal with strong input.	Defective: 50C6G, LS200. Open: T200, R205, R206. Shorted: C206, C207, T200.
3	D	Same as step 1.	Defective: 19T8. Open: C204, R202, R203. Shorted: C203, C205 (rotate R204), C204.
4	A	Same as step 1.	Open: R200 (rotate through range), C200, C201, WS-1 (R). Shorted: C200, C201, C305D*.
5	E	Same as step 1.	Open: WS-1 (R).
Listening Test: Distortion may be caused by shorted or leaky C201 or C204. Distortion on strong signals may be caused by leaky or shorted C200.			

* This part, located in another section, may cause abnormal indication in this section.

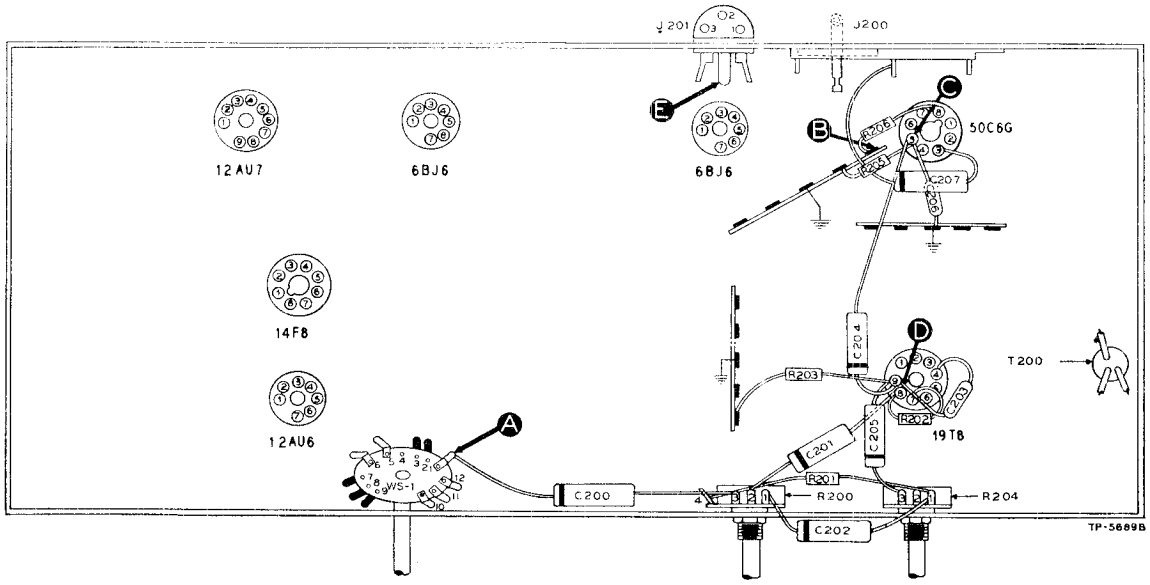

Figure 2. Bottom View, Showing Section 2 Test Points

Section 3

TROUBLE SHOOTING

I-F, DETECTOR, AND A-V-C CIRCUITS

AM Circuits

For the following tests, use an r-f signal generator, with modulated output, set at 455 kc. Connect the generator ground lead to B–, test point B; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Set the volume control to maximum, and turn the tone control to the midpoint of its range. Set the radio-phono switch to the radio position, and rotate the tuning control until the tuning condenser is fully meshed.

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 4 (r-f and converter circuits); if not, isolate and correct the trouble in this section.

To provide a complete i-f-amplifier check, test point A for this section is placed at the grid of the mixer in Section 4; therefore, the effectiveness of step 1 as a master check is dependent upon the condition of certain parts in the mixer circuit. These parts are listed below under the "POSSIBLE CAUSE OF ABNORMAL INDICATION."

Section 3 (Cont.) TROUBLE SHOOTING

I-F, DETECTOR, AND A-V-C CIRCUITS

AM Chart

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	Loud, clear speaker output with weak generator input.	Trouble in AM circuits. Isolate by the following tests.
2	C	Loud, clear output with strong input.	Defective: 6BJ6 (2nd i-f amplifier), 19T8 (diode section). Open: Z302, Z303, Z304, Z305, R307, R308, R309, R310, R311, WS-1 (F). Shorted: Z302, Z303, Z304, Z305, C314, C315, C316, C319. Misaligned: Z305.
3	D	Loud, clear output with moderate input.	Defective: 6BJ6 (1st i-f amplifier). Open: R303, R304, R305, R306, Z300, Z301, Z302, Z303. Shorted or leaky: C308, C310, Z300, Z301, Z302, Z303. Misaligned: Z303.
4	A	Same as step 1.	Defective: 12AU7. Open: Z301, R301, R302, R408*, R411*, R412*, WS-1 (F). Shorted or leaky: C307, Z301. Misaligned: Z301.

* This part, located in another section, may cause abnormal indication in this section.

FM Circuits

The following tests are also made with an AM r-f signal generator, using modulated output.

Observe the instructions preliminary to the tests for the AM circuits, with these exceptions: Set the band switch to the FM position. Set the signal-generator frequency to 9.1 mc., and detune to one side or the other until a satisfactory test signal is obtained.

The best indication of satisfactory FM-detector operation is the ability of this circuit to take the alignment properly (see page 11).

The parts which were found to be satisfactory for AM operation, with the exception of those indicated in the chart, will usually be satisfactory for FM operation.

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 4 (r-f and converter circuits); if not, isolate and correct the trouble in the FM circuits.

FM Chart

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	E	Loud, clear speaker output with weak generator input.	Trouble in FM circuits. Isolate by the following tests.
2	C	Loud, clear output with strong input.	Defective: 6BJ6 (2nd i-f amplifier), 19T8 (diode sections). Open: Z304, C317, C318, C320, C321, C322, C323, R312, R313, R314, WS-1 (R)*. Shorted: Z304, C317, C318, C320, C321, C322, C323, WS-1 (R)*. Misaligned: Z304.
3	D	Loud, clear output with moderate input.	Defective: 6BJ6 (1st i-f amplifier). Misaligned: Z302. Shorted: Z302.
4	E	Same as step 1.	Defective: 14F8*. Open: Z300, R300, R405*, R410*, L402*, WS-1 (F). Shorted: C306, C420*, C328, Z300, WS-1 (F). Misaligned: Z300.

* This part, located in another section, may cause abnormal indication in this section.

Section 4

TROUBLE SHOOTING
R-F AND CONVERTER CIRCUITS

AM Circuits

For the tests in this section, with the exception of the oscillator test, use an AM r-f signal generator with modulated output. Connect the generator ground lead to B–, test point B; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Set the volume control to maximum, and turn the tone control to the midpoint of its range. Set the band switch to the broadcast position, and set the tuning control and the signal-generator frequency as indicated in the chart.

If the "NORMAL INDICATION" is not obtained in step 1, isolate and correct the trouble in the AM circuits. If the trouble is not revealed by the tests for this section, check the alignment.

FM Circuits

The following tests are also made with an AM r-f signal generator, using modulated output. Observe the instructions preliminary to the tests for the AM circuits with the following exceptions:

Set the band switch to the FM position.

If the "NORMAL INDICATION" is not obtained in step 1, isolate and correct the trouble in the FM circuits.

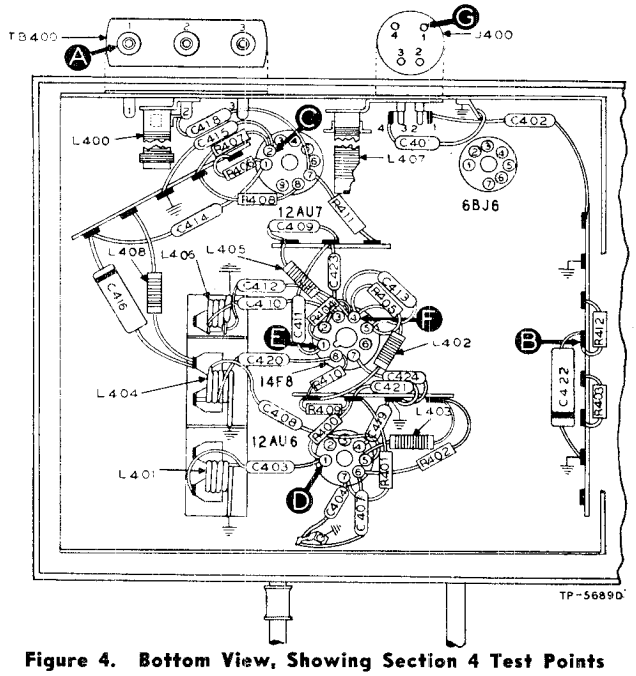

Figure 4. Bottom View, Showing Section 4 Test Points

AM Chart

STEP	TEST POINT	SIG. GEN. FREQ.	RADIO TUNING	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	1000 kc.	Tune to signal.	Loud, clear speaker output with weak generator input.	Trouble in AM circuits. Isolate by the following tests.
2	C (Osc. test; see note below.)		Tune through range.	Negative 2 to 2.5 volts.	Defective: 12AU7 (osc. section). Shorted: C414, C415, C400, C405B, C417, L407. Open: C414, C416, L408, L407, R412, R407, R406.
3	A	1000 kc.	Tune to signal.	Same as step 1.	Defective: 12AU7 (mixer section). Open: L400, C418, R411, R408. Shorted: C400, C405A, C406, C417.

OSCILLATOR TEST: Connect the positive lead of a high-resistance voltmeter to B–, test point B; connect the prod end of the negative lead through a 100,000-ohm isolating resistor to the oscillator grid (pin 2 of 12AU7), test point C. Use a suitable meter range, such as 0—10 volts. Proper operation of the oscillator is indicated by negative voltage of approximately the value given in the chart (measured with 20,000-ohms-per-volt meter) throughout the tuning range.

FM Chart

STEP	TEST POINT	SIG. GEN. FREQ.	RADIO TUNING	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	G	100 mc.	Tune to signal.	Loud, clear speaker output with weak generator input.	Trouble in FM circuits. Isolate by the following tests.
2	E to F (Osc. test; see note below.)		Tune through range.	Negative 1 to 1.5 volts.	Defective: 14F8 (osc. section). Open: R412, L402, L406, L405, C412, R404, C410, R403. Shorted: C400, C400C, L406, C411, C412, C423, C424, C410, C409.

MODELS 49-1606,
49-1609, 49-1611

AM ALIGNMENT PROCEDURE

Make alignment with loop aerial connected to radio. The AM alignment should be completed before the FM alignment is made.

DIAL POINTER—Calibration and pointer-index measurements are shown in figure 7. With tuning gang fully meshed, set pointer to index marker.

OUTPUT METER—Connect between terminal 3 of aerial terminal board TB400 and chassis.

AM R-F SIGNAL GENERATOR—Connect as indicated in chart. Use modulated output.

RADIO CONTROLS—Set volume control to maximum, turn tone control fully counterclockwise, and set band switch to broadcast position.

OUTPUT LEVEL—During alignment, adjust signal-generator output to maintain output-meter indication below 1.25 volts.

FM ALIGNMENT PROCEDURE

Make AM Alignment First

OUTPUT METER—Connect between terminal 3 of aerial terminal board TB400 and chassis.

ALIGNMENT INDICATOR—Connect negative lead of 20,000-ohms-per-volt meter to pin 2 of 19T8 tube; connect positive lead to B–. Use 10-volt range.

AM R-F SIGNAL GENERATOR—Generator must have sufficient output to give a reading of 8.5 volts on alignment indicator. Connect ground lead to B–; connect output lead as indicated in chart. Use modulated output.

RADIO CONTROLS—Set volume control to maximum, turn tone control fully counterclockwise, and set band switch to FM position. Allow radio and signal generator to operate for at least 15 minutes before making alignment.

R-F-COIL—NOTE: Check resonance of coils L401, L404, and L406 by inserting each end of a powdered-iron tuning core, such as Philco Part No. 56-6100, into the coils. If the signal strength increases when the iron end is inserted, compress the turns slightly. If the signal strength increases when the brass end is inserted, spread the turns slightly. If the signal strength decreases when either the iron or the brass end is inserted, no further adjustment is necessary. Do not spread or compress turns of coil excessively; only a small change is required at these high frequencies.

SYMBOLIZATION

The components in the radio circuit are symbolized according to the types of parts and the sections of the radio in which the parts are located. The prefix letter of the symbol designates the type of part as follows:

C—condenser	LS—loud-speaker	W—line cord
I—pilot lamp	R—resistor	WS—wafer switch
L—choke or coil	S—switch	Z—electrical assembly
LA—loop aerial	T—transformer	

The number of the symbol designates the section in which the part is located, as follows:

100-series components are in Section 1—the power supply.
200-series components are in Section 2—the audio circuits.
300-series components are in Section 3—the i-f, detector, and a-v-c circuits.
400-series components are in Section 4—the r-f and converter circuits.

9	Same as step 4.	92 mc.	92 mc.	Adjust coil for maximum (see r-f coil note).	L401—FM aerial coil — LOCATED ON UNDERSIDE OF CHASSIS
10	Repeat steps 4 through 9 until no further increase is obtained.				

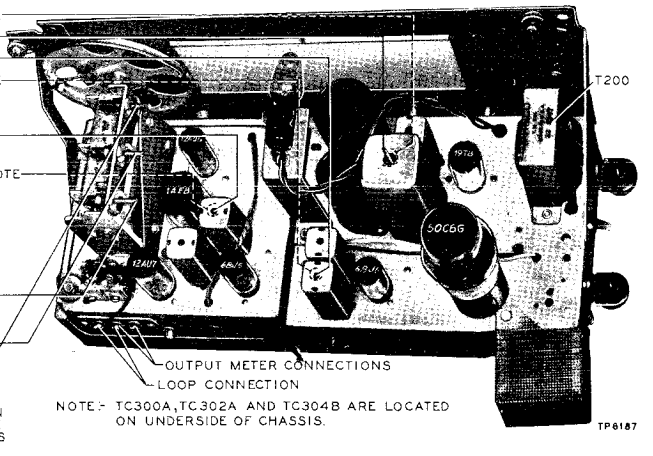

Figure 9. Top View, Showing FM Trimmer Locations

Preliminary Checks

To avoid possible damage to the radio, the following preliminary checks should be made before it is turned on:

1. Inspect both the top and bottom of the chassis. Make sure that all tubes are secure in the proper sockets, and look for any broken or shorted connections, burned resistors, or other obvious sources of trouble.

2. Measure the resistance between B+ (pin 8 of 35Z5GT), test point C, and B—, test point B. When the ohmmeter test leads are connected in the proper polarity, the highest resistance reading will be obtained. If the reading is lower than 1500 ohms, check condensers C101A, C101B, C101C, and C203 for leakage or shorts. The resistance value given is much lower than normal, and is not intended as a quality check of these condensers; the value given is the lowest at which the rectifier will operate safely while the voltage checks of Section 1 (power supply) are performed.

Section 1—Power Supply

TROUBLE SHOOTING

For the tests in this section, use a d-c voltmeter. Connect the negative lead to B—, test point B; connect the positive lead to the test points indicated in the chart. The voltage readings given were taken with a 20,000-ohms-per-volt meter at a line voltage of 117 volts, a.c.

Turn on the power, and set the volume control to minimum.

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 2 (audio circuits); if not, isolate and correct the trouble in this section.

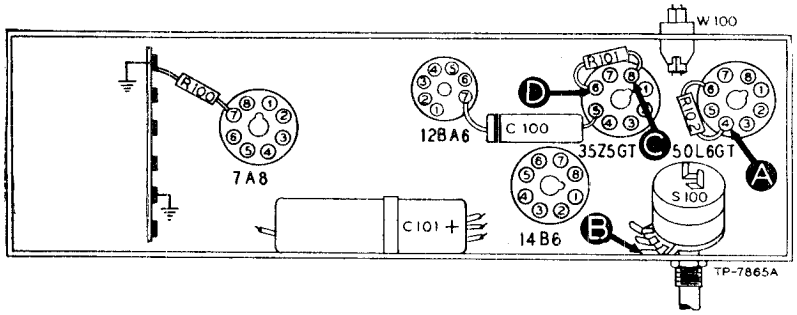

Figure 1. Bottom View, Showing Section 1 Test Points

STEP	TEST POINT	NORMAL INDICATION	ABNORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	105 volts		Trouble in this section. Isolate by the following tests.
2	C	130 volts	No voltage	Defective: 35Z5GT. Open: W100, S100. Shorted: C100, C101A.
			Low voltage	Defective: 35Z5GT. Open: C101A. Leaky: C101A.
			High voltage	Open: R101.
3	D	118 volts	No voltage	Open: R101. Shorted: C101B.
			Low voltage	Open: C101B. Leaky: C101B. Shorted: C203*.
			High voltage	Open: R102, T200*, R204*.
4	A	105 volts	No voltage	Open: R102. Shorted: C101C.
			Low voltage	Open: C101C. Leaky: C101C.
			High voltage	Open: R204*.
Listening Test: Abnormal hum may be caused by open C101A, C101B, or C101C.				

* This part, located in another section, may cause abnormal indication in this section.

Section 2—Audio Circuits

TROUBLE SHOOTING

For the tests in this section, use an audio-frequency generator. Connect the generator ground lead to B—, test point B; connect the output lead through a .1-μf. condenser to the test points in the chart.

Set the volume control to maximum, and adjust the signal-generator output as required for each step.

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 3 (i-f, detector, and a-v-c circuits); if not, isolate and correct the trouble in this section.

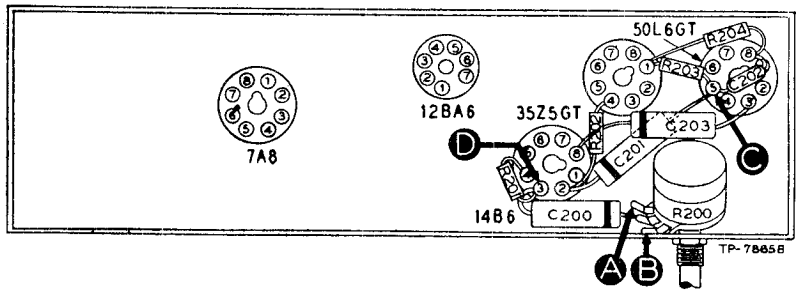

Figure 2. Bottom View, Showing Section 2 Test Points

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	Loud, clear speaker output with weak signal input.	Trouble in this section. Isolate by the following tests.
2	C	Clear output with moderate input.	Defective: 50L6GT, LS200. Open: R204, T200. Shorted: C202, C203.
3	D	Same as step 1.	Defective: 14B6 (triode section). Open: C201, R202, R203. Shorted: C201.
4	A	Same as step 1.	Open: R200 (rotate through range), C200, R201. Shorted: C301D*.

* This part, located in another section, may cause abnormal indication in this section.

©John F. Rider

Section 3—I-F, Detector, and A-V-C Circuits

TROUBLE SHOOTING

For the tests in this section, use an r-f signal generator, with modulated output, set at 455 kc. Connect the generator ground lead to B—, test point B; connect the output lead through a 1-μf. condenser to the test points indicated in the chart.

Set the volume control to maximum, and rotate the tuning control until the tuning condenser is fully meshed.

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 4 (r-f and converter circuits); if not, isolate and correct the trouble in this section.

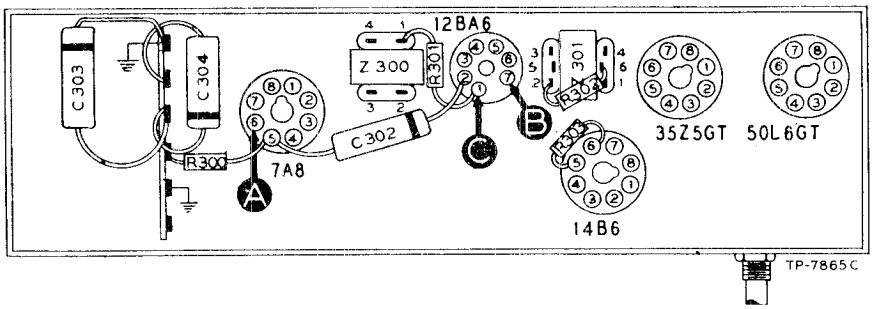

Figure 3. Bottom View, Showing Section 3 Test Points

To provide a complete i-f-amplifier check, test point A for this section is placed at the grid of the mixer in Section 4; therefore, the effectiveness of step 1 as a master check is dependant upon the condition of certain parts in the minor circuit. These parts are listed below under the "POSSIBLE CAUSE OF ABNORMAL INDICATION."

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	Loud, clear speaker output with weak signal input.	Trouble in this section. Isolate by the following tests.
2	C	Loud, clear output with moderate input.	Defective: 12BA6, 14B6 (triode section). Misaligned: Z301. Open: C301A, C301B, L301A, L301B, R300, R302, R303. Shorted: C302, C300B, C301A, C301B, C301C.
3	A	Same as step 1.	Defective: 7A8*. Misaligned: Z300. Open: C300A, C300B, L300A, L300B, R301. Shorted: C300A, C400*, C400A*.

* This part, located in another section, may cause abnormal indication in this section.

Section 4—R-F and Converter Circuits

TROUBLE SHOOTING

For the tests in this section, with the exception of the oscillator test, use an r-f signal generator with modulated output. Connect the generator ground lead to B—, test point B; connect the output lead through a .1-μf. condenser to the test points indicated in the chart.

Set the volume control to maximum, and set the tuning control and the signal-generator frequency as indicated in the chart.

If the "NORMAL INDICATION" is not obtained in step 1, isolate and correct the trouble in this section. If the trouble is not revealed by the tests for this section, check the alignment.

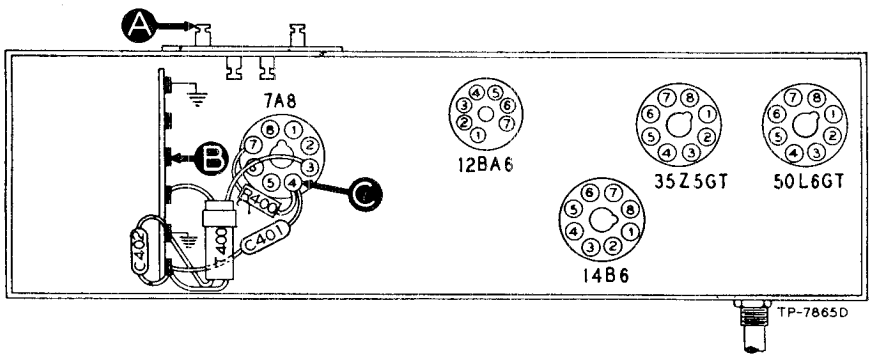

Figure 4. Bottom View, Showing Section 4 Test Points

STEP	TEST POINT	SIG. GEN. FREQ.	RADIO TUNING	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	1000 kc.	1000 kc.	Loud, clear speaker output with weak signal input.	Trouble in this section. Isolate by the following tests.
2	C (Osc. test; see note below.)		Tune through range.	Negative 4.5 to 7.5 volts.	Defective: 7A8. Open: C401, T400, R400. Shorted: T400, C401, C400, C400B, C402.
3	A	1000 kc.	1000 kc.	Same as step 1.	Defective: 7A8. Open: LA400. Shorted: LA400, C400, C400A.

OSCILLATOR TEST: Connect the positive lead of a high-resistance voltmeter to B— test point B; connect the prod end of the negative lead through a 100,000-ohm isolating resistor to the oscillator grid (pin 4 of 7A8), test point D. Use a suitable meter range, such as 0—10 volts. Proper operation of the oscillator is indicated by negative voltage of approximately the value given in the chart (measured with 20,000-ohms-per-volt meter) throughout the tuning range.

ALIGNMENT PROCEDURE

CONTROLS: Turn on radio and set volume control to maximum.

DIAL POINTER: Turn tuning condenser to full-mesh position. Set dial pointer to index mark, located to left of "55."

OUTPUT METER: Connect across voice-coil terminals.

SIGNAL GENERATOR: Connect as indicated in chart. Use modulated output.

OUTPUT LEVEL: During alignment, attenuate signal-generator output to maintain output-meter indication below 1.25 volts.

STEP	SIGNAL GENERATOR		RADIO		ADJUST

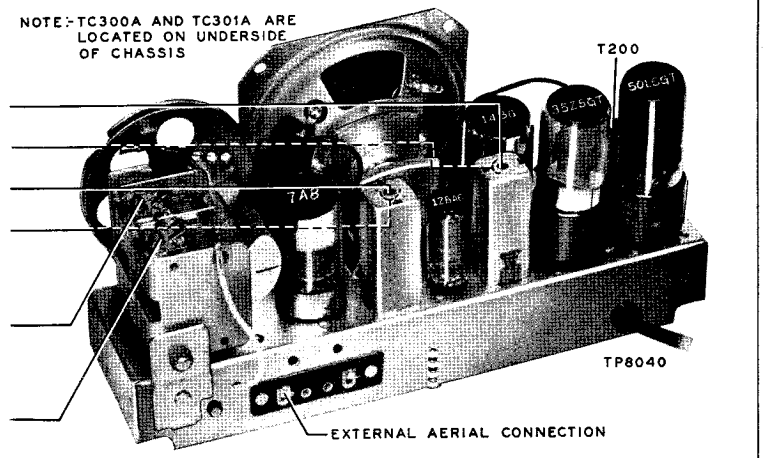

Figure 6. Top View, Showing Trimmer Locations

RADIATING LOOP: Make up a 6—8 turn, 6-inch-diameter loop from insulated wire; connect to signal-generator leads and place near radio loop aerial.

Circuit Description

Philco Radio Model 50-520 is a five-tube table-model superheterodyne, providing reception on the standard broadcast band. The high-impedance loop aerial normally provides adequate signal pickup. An external aerial may be connected, if desired, by attaching the lead to lug 4 on the rear of the chassis. Do not use a ground.

The loop is coupled to the 7A8 converter. Variable-condenser tuning is employed; the oscillator-rotor-section plates are shaped to obtain proper tracking, thus eliminating the necessity for a series padding condenser.

The 7A8 is transformer-coupled to the 12BA6 i-f amplifier, which is also transformer-coupled to the diodes of the 14B6, second detector and first audio amplifier. A-v-c voltage is applied to the control grids of both the i-f and converter tubes.

The triode section of the 14B6 is the first audio stage, and is resistance-coupled to the 50L6GT output tube. The output tube is transformer-coupled to a permanent-magnet speaker.

D-c operating voltages are obtained from a 35Z5GT half-wave rectifier, the output of which is filtered by a two-section, resistor-condenser filter. The 150,000-ohm resistor, R100, prevents hum which might otherwise occur under conditions of high humidity.

REPLACEMENT PARTS LIST

NOTE: Part numbers identified by an asterisk (*) indicate general replacement items. These numbers may not be identical with those on factory assemblies; also, the electrical values of some replacement items may differ from the values indicated in the schematic diagram and replacement parts list. The values substituted in any case are so chosen that the operation of the radio will be either unchanged or improved.

Circuit Description

Philco Radio-Phonograph Model 49-1613 contains an 11-tube superheterodyne and a Model M-12C Philco Automatic Record Changer.

A low-impedance loop aerial within the cabinet normally provides adequate signal pickup on the standard broadcast band. In most locations, the built-in FM dipole aerial provides satisfactory FM reception. In areas where FM signals are weak, an outdoor dipole aerial, such as Philco Part No. 45-1462, will provide additional pickup. To increase the pickup on both bands, use the Philco Aerial Coupler, Part No. 76-2353-1, with the outdoor dipole aerial. For increased pickup on the standard broadcast band only, the coupler may be used with an external aerial of the single-wire type, such as Philco Part No. 45-1494.

The r-f stage (FM only) and converter stage are mounted on a separate chassis, for improved performance at high frequencies. A 6AU6 high-frequency pentode is used in the r-f stage, and a 7F8 high-frequency double triode is employed as a converter.

Two transformer-coupler i-f stages are used. The transformers have two sets of windings; one set is tuned to 455 kc., for AM operation, and the other set is tuned to 9.1 mc., for FM operation. A 6BA6 high-frequency pentode is used in the first i-f stage. The pentode section of a 7R7 duo-diode, pentode functions as the second i-f amplifier; one diode of this tube is used for AM detection, while the other diode provides a.v.c.

The dual-diode section of a 7X7 is employed in the FM ratio-detector circuit; this circuit has good noise-reducing properties and an excellent tuning characteristic.

The triode section of the 7X7 functions as the first audio stage. A 6J5GT triode operates as a plate-and-cathode-loaded phase inverter, driving two 6K6GT output amplifiers, in push-pull operation. Tone fidelity is obtained by the use of inverse feedback in the audio system; feed-back voltage is taken from the secondary of the output transformer.

The Philco Electronic Scratch Eliminator, for phono operation, may be switched on or off, as required. The pentode section of a 7E7 functions as a variable shunt capacitance at the phono-input circuit; at low signal levels, a controlled portion of the higher audio frequencies is by-passed to ground. The grid bias of the reactance tube controls the effective capacitance, which

becomes maximum with low bias, and minimum with high bias. This control bias is developed by the audio signal itself; a proportionate amount of the signal is taken from the pickup output, amplified by each triode section of the 7F7, and rectified by the diode section of the 7E7.

Philco TROUBLE-SHOOTING *Procedure*

For rapid trouble shooting, the radio circuit is divided into four sections, as follows:

Section 1—the power supply
Section 2—the audio circuits
Section 3—the i-f, detector, and a-v-c circuits
Section 4—the r-f and converter circuits

Test points are specified for each section, and are indicated in the sectionalized schematic diagram. The trouble-shooting procedure given for each section includes a simplified test chart and a bottom view of the chassis showing the locations of the test points and the components of that section.

In each chart, the first step is a master check for determining whether trouble exists in that section, without going through the entire chart.

Failure to obtain the "NORMAL INDICATION" in any given step indicates trouble within the circuit under test.

After isolating the trouble to a single stage, the defect is located by: first, testing the tube; second, measuring tube electrode voltages; third, measuring circuit resistances; fourth, substituting condensers. The trouble revealed should be corrected before testing further.

Preliminary Checks

To avoid possible damage to the radio, the following preliminary checks should be made before connecting the radio to a source of power:

1. Inspect the top and bottom of the chassis. Make sure that all tubes are secure in the proper sockets, and look for any broken or shorted connections, burned resistors, or other obvious indications of trouble.

2. Measure the resistance across condenser C102 (see figure 2). When the ohmmeter test leads are connected in the proper polarity, the highest resistance reading will be obtained. If the reading is lower than 3500 ohms, check condensers C102 and C103B for leakage or shorts.

The resistance value above, which is much lower than normal, does not represent a quality check of these condensers; the value given is the lowest at which the rectifier will operate safely while the voltage tests of Section 1 (power supply) are performed.

Important!

To avoid altering FM operation, special care should be used in replacing any part. Replacement parts should be placed in the same physical locations as the original parts; connections should be of the same length, and should be soldered to the same points. The placement or length of leads should not be changed.

CALIBRATING DIAL BACKPLATE

When the radio chassis has been removed from the cabinet, dial calibration and alignment points may be marked on the dial (chassis) backplate at the end of the pointer with a pencil. The method of measuring for these points is illustrated in figure 1.

With the tuning gang fully meshed, the pointer should be adjusted on the dial-drive cord to coincide with the index mark.

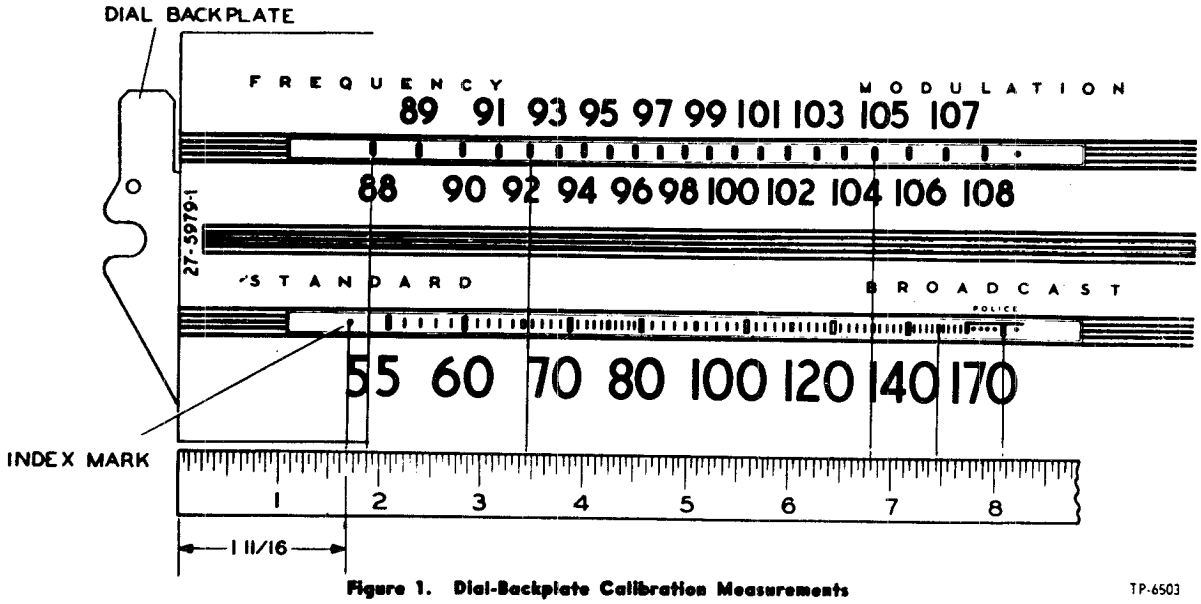

Figure 1. Dial-Backplate Calibration Measurements TP-6503

Section 1 TROUBLE SHOOTING

POWER SUPPLY

CAUTION: Do not turn on the power with the speaker disconnected, or the set may be damaged.

Make the tests for this section with a d-c voltmeter, connecting the leads between the chassis, test point C, and the test points indicated in the chart. The voltage readings given were taken with a 20,000-ohms-per-volt meter, at a line voltage of 117 volts, a.c.

Set the volume control to minimum, and the tone control fully counterclockwise. Set the band selector-phono switch to the broadcast position.

Follow the steps in the order given. If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 2 (audio circuits); if not, isolate and correct the trouble in this section.

STEP	TEST POINT	NORMAL INDICATION	ABNORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	195v		Trouble in this section. Isolate by the following tests.
2	B	300v	No voltage. Low voltage. High voltage.	Defective: 5AZ4. Open: S100, T100. Shorted: C102. Defective: 5AZ4. Shorted: C103B, C310*, C411*. Leaky: C102. Open: C102, L100. Shorted: L100. Open T200*.
3	A	195v	No voltage. Low voltage. High voltage.	Open: R100. Shorted: C103A, C311*. Leaky: C103A, C311*. Changed resistance: R100. Open: T200*
4	D	Negative 27v	No voltage. High voltage.	Open: R101. Open: R102.
Listening Test: Abnormal hum and instability may be caused by open C103A or C103B.				

* This part, located in another section, may cause abnormal indication in this section.

MODEL 49-1613

Section 2 TROUBLE SHOOTING

AUDIO-AMPLIFIER TESTS

AUDIO CIRCUITS

Use an audio-frequency signal generator. Connect the generator ground lead to the chassis, test point C, and connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Set the volume control to maximum, and the tone control fully counterclockwise. Set the band (wafer) switch to the broadcast position. Make certain that the scratch-eliminator switch is turned off (two-position switch turned counterclockwise). If the "NORMAL INDICATION" is obtained in steps 1 and 6, proceed with the scratch-eliminator tests; if not, isolate and correct the trouble in the audio-amplifier circuits.

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	Loud, clear signal with weak signal input.	Trouble in audio-amplifier circuits. Isolate by the following tests.
2	B (Remove 6J5GT)	Clear signal with strong signal input.	Defective: 6K6GT(#1), LS200. Open: C206, R211, T200. Shorted or leaky: C206, C209.
3	D (6J5GT removed)	Same as step 2.	Defective: 6K6GT(#2). Open: C207, R212. Shorted or leaky: C207.
4	E (Replace 6J5GT)	Loud, clear signal with moderate signal input.	Defective: 6J5GT. Open: R208, R209, R207, R210. Shorted or leaky: C205, C204.
5	A	Same as step 1.	Defective: 7X7. Open: R200 (rotate through range), C202, R205, R206. Shorted: C203.
6*	F	Loud, clear signal with weak signal input.	Open: R230, WS-2(R).
Listening Test: Distortion may be caused by leaky C202, C205, C206, or C207; or by open R205, C207, C211, or C212.			

* For this step, set band (wafer) switch to phono.

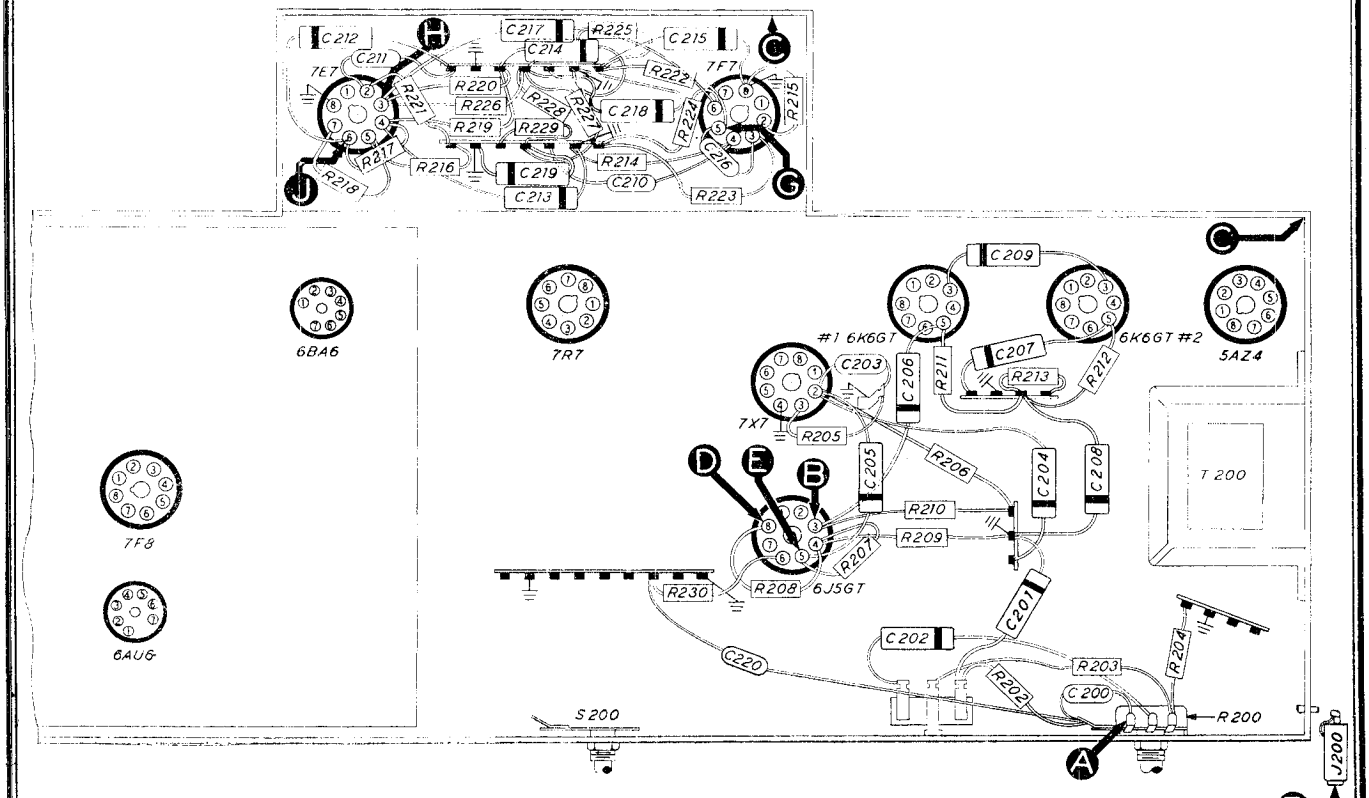

Figure 3. Bottom View, Showing Section 2 Test Points

© John F. Rider

Section 2 (Cont.) TROUBLE SHOOTING

SCRATCH-ELIMINATOR TESTS

Set the tone control fully counterclockwise. Turn the band (wafer) switch to the phono position. For all steps except 1(b), set the volume control to maximum; for this step, adjust the volume control as directed in the chart.

Turn the scratch eliminator on or off as indicated in the chart. (The scratch eliminator is on when the two-position switch is turned clockwise.)

Connect an output meter across the *primary* of the output transformer, T200.

IMPORTANT! For all steps except step 4, use the 0—10-volt output-meter range; for step 4 only, use the 0—50-volt range. If the proper ranges are not used, erroneous readings will result.

Connect the ground lead of an audio signal generator to the chassis, test point C, and connect the output lead through a .1-mf. condenser to the test points indicated in the chart. Set the generator for 5000 cycles. Adjust the generator output as directed in the chart.

If normal operation is indicated by the tests in step 1, (a) and (b), proceed with the tests for Section 3 (i-f, detector, and a-v-c circuits); if not, isolate and correct the trouble in the scratch-eliminator circuits.

NOTE: For steps 2, 3, and 4, connect the positive lead of a 20,000-ohms-per-volt, d-c voltmeter to the chassis, test point C; connect the prod end of the negative lead through a 100,000-ohm isolating resistor to the "VOLTMETER" test points indicated in the chart.

STEP	TEST POINT	SIG. GEN. OUTPUT	VOLT-METER	SPECIAL INSTRUCTIONS	POSSIBLE CAUSE OF ABNORMAL INDICATION
1(a)	F	Adjust for 10v output-meter reading, with scratch-eliminator off.		Turn scratch eliminator on; output voltage should drop to 6.5v (approx.).	
1(b)	F	Same as for 1(a).		Reduce volume control to obtain output-meter reading of 1v. Increase generator output for output-meter reading of 10v. Turn scratch eliminator on; output voltage should not drop below 8.8v (approx.).	Trouble in scratch-eliminator circuits. Isolate by the following tests.
2	G	See SPECIAL INSTRUCTIONS.	H	With scratch eliminator on, increase generator output for voltmeter reading of 8.8v, negative; failure to obtain this value indicates trouble.	Defective: 7F7, 7E7 (diode section), WS-3(R). Open R224, R222, R226, R228, C217, S200.
3	G	Same setting which produced 8.8v reading in step 2, with scratch eliminator on.	J	With scratch eliminator on, voltage at point J should be 2v, negative.	Open: R220, R219, R217. Shorted: C213, C214, C212.
4	F	Same as step 2.	H	With scratch eliminator on, voltage at point H should be approx. 28v, negative.	Defective: 7F7. Open: C210, C216, R214, R215, R223. Shorted or leaky: C216.
5	F	Adjust for 10v output-meter reading, with scratch eliminator off.		Turn scratch eliminator on; output voltage should drop to 6.5v (approx.).	Defective: 7E7 (pentode section). Open: R221, R216, R218, C211, C212. Shorted: C211, C212.

Section 3

TROUBLE SHOOTING

I-F, DETECTOR, AND A-V-C CIRCUITS

AM CIRCUITS

Use an r-f signal generator, with modulated output, set at 455 kc. Connect the generator ground lead to the chassis, test point C, and connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Set the volume control to maximum, and the tone control fully counterclockwise. Set the band (wafer) switch to the broadcast position. Turn the tuning condensers to full-mesh position.

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for the FM circuits, or the tests for Section 4 (r-f and converter circuits); if not, isolate and correct the trouble in the AM circuits.

Since the circuit location of test point A for this section is in Section 4, the effectiveness of step 1 as a master check is dependent upon the condition of certain parts in Section 4; these parts are listed below under "POSSIBLE CAUSE OF ABNORMAL INDICATION."

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	Loud, clear signal with weak signal input.	Trouble in AM circuits. Isolate by the following tests.
2	B	Loud, clear signal with strong signal input.	Defective: 7R7. Open: R309, R310, R312, L302A, L302C, L302D, R313, R314, R316, C325, C317, WS-3(R). Shorted: C317, C318, C321, C322, C323, C324, C320, C302B. Misaligned: Z302.
3	D	Loud, clear signal with moderate signal input.	Defective: 6BA6. Open: R302, R305, R308, R306, L301A, L301B, L301C, L301D, C301A, C301C, C301D. Shorted: C308, C301C, C301D, C309, C313, L301C, L301D, C300D. Misaligned: Z301.
4	A	Loud, clear signal with weak signal input.	Defective: 7F8*. Open: R406*, R405*, L406*, C300C, L300C, L300D, C300D, R300, WS-4(R), WS-4(F). Shorted: C300C, L300C, C303, C304, L300D. Misaligned: Z300.

* This part, located in another section, may cause abnormal indication in this section.

FM CIRCUITS

These tests are also made with an AM r-f signal generator, using modulated output.

Set the band (wafer) switch to the FM position, and follow the instructions preliminary to the tests for the AM circuits, with these exceptions: set the signal-generator frequency to 9.1 mc., and detune to one side or the other until a satisfactory test signal is obtained.

The best indication of satisfactory FM-detector operation is the ability of this circuit to take the alignment properly (see page 14).

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 4 (r-f and converter circuits); if not, isolate and correct the trouble in the FM circuits.

MODEL 49-1613

Section 4 TROUBLE SHOOTING

For the following tests, with the exception of the oscillator tests, use an AM r-f signal generator, with modulated output. Connect the generator ground lead to the chassis, test point C, and connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Set the radio volume control to maximum, and the tone control fully counterclockwise.

Set the band (wafer) switch, tuning control, and signal-generator frequency as indicated in the chart.

OSCILLATOR TESTS (AM AND FM CIRCUITS): Connect the positive lead of a high-resistance d-c voltmeter to the chassis, and connect the negative lead through a 100,000-ohm isolating resistor to the 7F8 oscillator grid (pin 1), test point B. Use a suitable range, such as 0—10 volts. Proper operation of the oscillator is indicated by negative voltages of approximately the values given in the chart (measured with 20,000-ohms-per-volt meter), throughout the tuning range.

If the "NORMAL INDICATION" is not obtained in step 1 of both the AM and the FM test charts, isolate the trouble by following the remaining steps.

AM CIRCUITS

STEP	TEST POINT	SIG. GEN. FREQ.	BAND SWITCH	RADIO TUNING	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION

3	A	1000 kc.	Broadcast	Tune to signal.	Loud, clear signal with weak signal input.	Open: LA400, R401, L402, C402, C413, WS-1(R). Shorted: L402, C400D, C403.
Listening Test: Distortion may be caused by open R401 or R307*. Hum and instability may be caused by open C312* or R301*.						

* This part, located in another section, may cause abnormal indication in this section.

FM CIRCUITS

Observe the instructions preliminary to the tests for the AM circuits, with the following exception: After tuning the signal generator and the radio to 95 mc., detune one or the other until a satisfactory test signal is obtained.

STEP	TEST POINT	SIG. GEN. FREQ.	BAND SWITCH	RADIO TUNING	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	D	95 mc.	FM	Tune to signal.	Loud, clear signal with weak signal input.	Trouble in FM circuits. Isolate by the following tests.

© John F. Rider

Section 4 (Cont.) TROUBLE SHOOTING

STEP	TEST POINT	SIG. GEN. FREQ.	BAND SWITCH	RADIO TUNING	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
2 (Osc. test; see note above.)	B		FM	Tune through range.	Negative 1v.	Defective: 7F8. Open: L403, WS-2(F), WS-2(R), WS-1(F), WS-3(F), WS-3-(R). Shorted: L403, C400C, C400H.
3	D	95 mc.	FM	Tune to signal.	Loud, clear signal with weak signal input.	Defective: 6AU6. Open: L400, L405, R400, R403, R404, C409, L401, WS-1-(R). Shorted: L400, C400A, C400F, C407, C409, C410, C411, L401, C400B, C400G.

MODEL 49-1613

SYMBOLIZATION

The components in the radio circuit are symbolized according to the types of parts and the sections of the radio in which the parts are located. The prefix letter of the symbol designates the type of part, as follows:

C—condenser L—choke or coil LS—loud-speaker S—switch WS—wafer (band selector-phono) switch
I—pilot lamp LA—loop aerial R—resistor T—transformer Z—electrical assembly

The number of the symbol, except when the number is less than 100, designates the section in which the part is located, as follows:

100-series components are in Section 1 — the power supply
200-series components are in Section 2 — the audio circuits
300-series components are in Section 3 — the i-f amplifier, detector, and a v c circuits
400-series components are in Section 4 — the r-f and converter circuits

REPLACEMENT PARTS LIST

NOTE: Parts marked with an asterisk (*) are general replacement items. These numbers may not be identical with those on factory assemblies; also, the electrical values of some replacement items may differ from the values indicated in the schematic diagram and parts list. The values substituted in any case are so chosen that the operation of the radio will be either unchanged or improved. When ordering replacements, use only the "Service Part No."

SECTION 1 POWER SUPPLY

Reference Symbol	Description	Service Part No.
C100	Condenser, line filter, .01 mf.	30-1226-1
C101	Condenser, line filter, .01 mf.	30-1226-1
C102	Condenser, electrolytic, input filter, 20 mf., 450v	30-2568-8
C103	Condenser, electrolytic, 2-section	30-2556
C103A	Condenser, filter, 10 mf., 450v	Part of C103
C103B	Condenser, filter, 25 mf., 450v	Part of C103
I100	Lamp, pilot	34-2064
I101	Lamp, pilot	34-2064
J100	Socket, phono power	27-6200
L100	Speaker, field	Part of LS200
R100	Resistor, filter, 15,000 ohms	66-3155340
R101	Resistor, bias divider, 680,000 ohms	66-4683340*
R102	Resistor, bias divider, 680,000 ohms	66-4683340*
S100	Switch, on-off	Part of R201
T100	Transformer, power	32-8248
W100	Power cord and plug	41-3755-20
WS-5 (R)	Switch-wafer section, phono power	Part of 42-1803-1†

SECTION 2 AUDIO CIRCUITS

C200	Condenser, tone compensation, 100 mmf.	60-10105407*
C201	Condenser, tone compensation, .006 mf.	45-3500-7*
C202	Condenser, d-c blocking, .006 mf.	45-3500-7*
C203	Condenser, r-f by-pass, 100 mmf.	60-10105407*
C204	Condenser, tone control, .01 mf.	60-0120*
C205	Condenser, d-c blocking, .006 mf.	45-3500-7*
C206	Condenser, d-c blocking, .006 mf.	45-3500-7*
C207	Condenser, d-c blocking, .006 mf.	45-3500-7*
C208	Condenser, bias filter, .1 mf.	61-0113*
C209	Condenser, tone compensation, .003 mf.	61-0117*
C210	Condenser, high-pass filter, 150 mmf.	60-10155407*
C211	Condenser, reactance-feedback, 330 mmf.	60-10335407*
C212	Condenser, d-c blocking, .001 mf.	30-4620*
C213	Condenser, bias filter, .01 mf.	61-0120*
C214	Condenser, bias filter, .03 mf.	30-4517*
C215	Condenser, bias filter, .01 mf.	61-0120*
C216	Condenser, d-c blocking, 330 mmf.	60-10335407*
C217	Condenser, d-c blocking, .002 mf.	30-4622*
C218	Condenser, bias filter, .01 mf.	61-0108*
C219	Condenser, bias filter, .03 mf.	30-4517*
C220	Condenser, tone compensation, 150 mmf.	60-10155407*
J200	Phono cable and plug	41-3735-2
J201	Speaker cable and plug	41-3734-9
LS200	Speaker	36-1611-3
R200	Volume control, 2 megohms (tap at 1 megohm)	33-5535-1
R201	Tone control (with on-off switch), 6 megohms	33-5538-1
R202	Resistor, tone compensation, 33,000 ohms	66-3333340*
R203	Resistor, voltage divider, inverse feedback, 4.7 ohms	66-9473340*
R204	Resistor, voltage divider, inverse feedback, 68 ohms	66-0683340*
R205	Resistor, grid return, 10 megohms	66-6103340*
R206	Resistor, plate load, 220,000 ohms	66-4223340*
R207	Resistor, grid return, 1 megohm	66-5103340*
R208	Resistor, cathode bias, 4700 ohms	66-2473340*
R209	Resistor, cathode load, 47,000 ohms	66-3473340*

SECTION 2 (Continued) AUDIO CIRCUITS

Reference Symbol	Description	Service Part No.
R210	Resistor, plate load, 56,000 ohms	66-3563340*
R211	Resistor, grid return, 330,000 ohms	66-4333340*
R212	Resistor, grid return, 330,000 ohms	66-4333340*
R213	Resistor, bias filter, 150,000 ohms	66-4153340*
R214	Resistor, grid return, 1 megohm	66-5103340*
R215	Resistor, cathode bias, 2200 ohms	66-2223340*
R216	Resistor, screen voltage divider, 33,000 ohms	66-3333340*
R217	Resistor, grid return, 1 megohm	66-5103340*
R218	Resistor, screen voltage divider, 33,000 ohms	66-3333340*
R219	Resistor, bias filter, 680,000 ohms	66-4683340*
R220	Resistor, bias filter, 220,000 ohms	66-4223340*
R221	Resistor, plate load, 18,000 ohms	66-3183340*
R222	Resistor, grid return, 560,000 ohms	66-4563340*
R223	Resistor, plate load, 220,000 ohms	66-4223340*
R224	Resistor, plate load, 100,000 ohms	66-4103340*
R225	Resistor, bias filter, 220,000 ohms	66-4223340*
R226	Resistor, diode load, 560,000 ohms	66-4563340*
R227	Resistor, bias filter, 1.5 megohms	66-5153340*
R228	Resistor, diode load, 220,000 ohms	66-4223340*
R229	Resistor, bias filter, 3.3 megohms	66-5333340*
R230	Resistor, low-pass filter, 47,000 ohms	66-3473340*
S200	Switch, on-off, scratch eliminator	42-1848
T200	Transformer, output	32-8274
WS-3 (F)	Switch-wafer section	Part of 42-1803-1†

SECTION 3 I-F, DETECTOR, AND A-V-C CIRCUITS

C300A	Condenser, trimmer	Part of Z300
C300B	Condenser, trimmer	Part of Z300
C300C	Condenser, shunt, 3000 mmf.	Part of Z300
C300D	Condenser, trimmer	Part of Z300

MODEL 49-1613

ALIGNMENT PROCEDURE

When the complete AM and FM alignment is to be made, the AM alignment should be made FIRST; if AM alignment is not required, the FM alignment alone may be made.

ALIGNMENT OF AM CIRCUITS

DIAL POINTER: With tuning condensers fully meshed, dial pointer must coincide with index mark at low-frequency end of dial. (See "CALIBRATING DIAL BACKPLATE," page 2.)

OUTPUT METER: Connect between No. 3 terminal (voice-coil connection) of aerial terminal panel and chassis.

AM R-F SIGNAL GENERATOR: Connect ground lead to chassis, and output lead as indicated in chart. Use modulated output.

OUTPUT LEVEL: During alignment, signal-generator output must be attenuated to maintain radio output below 1.5 volts, as read on output meter.

CONTROLS: Set band switch to broadcast position. Set volume control to maximum, and tone control fully counterclockwise. Set signal-generator frequency and radio tuning dial as indicated in chart.

ALIGNMENT OF FM CIRCUITS

Make AM alignment (if required) first.

OUTPUT METER: Connect as for AM alignment (this meter is used only in step 3).

D-C METER: Connect 20,000-ohms-per-volt meter across 2-mf. condenser, C327, in FM-detector circuit—negative lead to pin 6 of 7X7 tube, and positive lead to chassis. Use 10-volt range.

AM R-F SIGNAL GENERATOR: Use modulated output for entire alignment. Generator must have sufficient output to give reading of approximately 9 volts on d-c meter, and signal should be attenuated during alignment to keep meter at this value. Connect generator ground lead to chassis, and output lead as indicated in chart.

VOLUME AND TONE CONTROLS: Same as for AM alignment.

RADIO BAND SWITCH, RADIO DIAL, AND SIGNAL-GENERATOR DIAL: Set as indicated in chart. Allow radio and generator to warm up for 15 minutes before starting alignment.

R-F COIL NOTE: When making the tracking adjustments, the resonance of the circuits using coils L400, L401, and L403 may be checked with a powdered-iron tuning core such as Part No. 56-6100. If the signal strength (meter reading) increases when the iron end is placed in, or near, the coil, compress the turns slightly. If the threaded brass end causes an increase in signal strength, spread the turns. Do not compress or spread the turns excessively; only a small change is required at these frequencies.

IMPORTANT!

To avoid altering FM operation, special care should be used in replacing any part. Replacement parts should be placed in the same physical positions as the original parts; connections should be of the same length, and should be soldered to the same points. The placement or length of leads should not be changed.

MODEL 49-1615

MODEL 49-1615

CIRCUIT DESCRIPTION

Philco Radio-Phonograph Model 49-1615 consists of an 11-tube superheterodyne and a Model M-12C Philco Automatic Record Changer and Record Player (album length) Combination.

A low-impedance loop aerial within the cabinet normally provides adequate signal pickup on the standard broadcast band. In most localities, the built-in FM line-cord aerial provides satisfactory FM reception. In areas where FM signals are weak, an outdoor dipole aerial, such as Philco Part No. 45-1462, will provide additional pickup. To increase the pickup on both bands, use the Philco Aerial Coupler, Part No. 76-2353-1, with the outdoor dipole aerial. For increased signal pickup on the standard broadcast band only, use the coupler with an external aerial of the single-wire type, such as Philco Part No. 45-1494.

The r-f stage (FM only), the converter, and the 1st i-f amplifier are mounted on a separate chassis for improved operation at high frequencies. A 6AU6 high-frequency pentode is used as the FM r-f amplifier. A 7F8 high-frequency dual triode is employed as the converter. There are two transformer-coupled i-f stages using 6BA6 high-frequency pentodes. Each i-f stage has a double set of transformers; one is tuned to 9.1 mc., the FM intermediate frequency, and the other is tuned to 455 kc., the AM intermediate frequency. The use of individual transformers for FM and AM gives better stability and allows more complete shielding. In FM operation, the primary and secondary of the first AM i-f transformer are shorted out, to attenuate undesirable beat frequencies; switching of other windings is unnecessary.

The multi-purpose 6T8 provides AM and FM detection and functions as the first audio amplifier. Two diodes of this tube operate in a ratio detector circuit. The other diode acts as the AM detector and also supplies the a-v-c voltage. The triode section is the first audio amplifier for both radio and phono operation.

A 7A4 triode operates as a plate-and-cathode-loaded phase inverter, driving a pair of 6V6GT's in the push-pull output stage. Tone fidelity is obtained by the use of inverse feedback in the audio system. This feedback voltage is taken from the secondary of the output transformer and returned to the low side of the volume control.

Selective tone compensation is provided by a continuously variable bass booster and a five-step treble switch that ranges from Scratch Eliminator "on" through maximum high-cut to Hi Fidelity.

The Philco Electronic Scratch Eliminator, for phono operation, may be switched on or off, as required. In this circuit, the reactance tube (pentode section of a 7E7) functions as a variable shunt capacitance at the phono-input circuit; at low signal levels, this tube bypasses a controlled portion of the higher audio frequencies to ground. The grid bias of the reactance tube controls its effective capacitance, which becomes maximum with low bias and minimum with high bias. This control bias is developed by the audio signal itself; a proportionate amount of the signal is taken from the pickup output, amplified by each triode section of the 7F7, and rectified by the diode section of the 7E7.

MODEL 49-1615

TROUBLE SHOOTING

POWER SUPPLY

Section 1.

CAUTION: Do not turn on the power with the speaker disconnected, as this may cause damage to the set.

For the tests in this section, use a d-c voltmeter, connecting the leads between the chassis, test point C, and the test points indicated in the chart. The voltage readings given were taken with a 20,000-ohms-per-volt meter at a line voltage of 117 volts, a.c.

Turn on the power, and set the volume control to minimum. Turn the bass control fully counterclockwise, and set the treble selector switch to the left-hand TREBLE position. Set the band switch to the broadcast position.

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 2 (audio circuits); if not, isolate and correct the trouble in this section.

STEP	TEST POINT	NORMAL INDICATION	ABNORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	230v		Trouble in this section. Isolate by the following tests.
2	B	300v	No voltage	Defective: 5U4G. Open: T100, PB100, W100. Shorted: C100, C101.
			Low voltage	Defective: 5U4G. Open: C102, L100. Shorted: C103B, C311* C307*. Leaky: C102.
			High voltage	Open: T200*, R103. Shorted: L100.
3	A	230v	No voltage	Open: R100. Shorted: C103A, C303*.
			Low voltage	Leaky: C103A, C303*. Increased resistance: R100.
			High voltage	Open: T200*.
4	D	−16v	No voltage	Open: R101. Shorted: C210*.
			Low voltage	Leaky: C210*.
			High voltage	Open: R102.

Listening Test: Abnormal hum and instability may be caused by open C102, C103A, or C103B.

* This part, located in another section, may cause abnormal indication in this section.

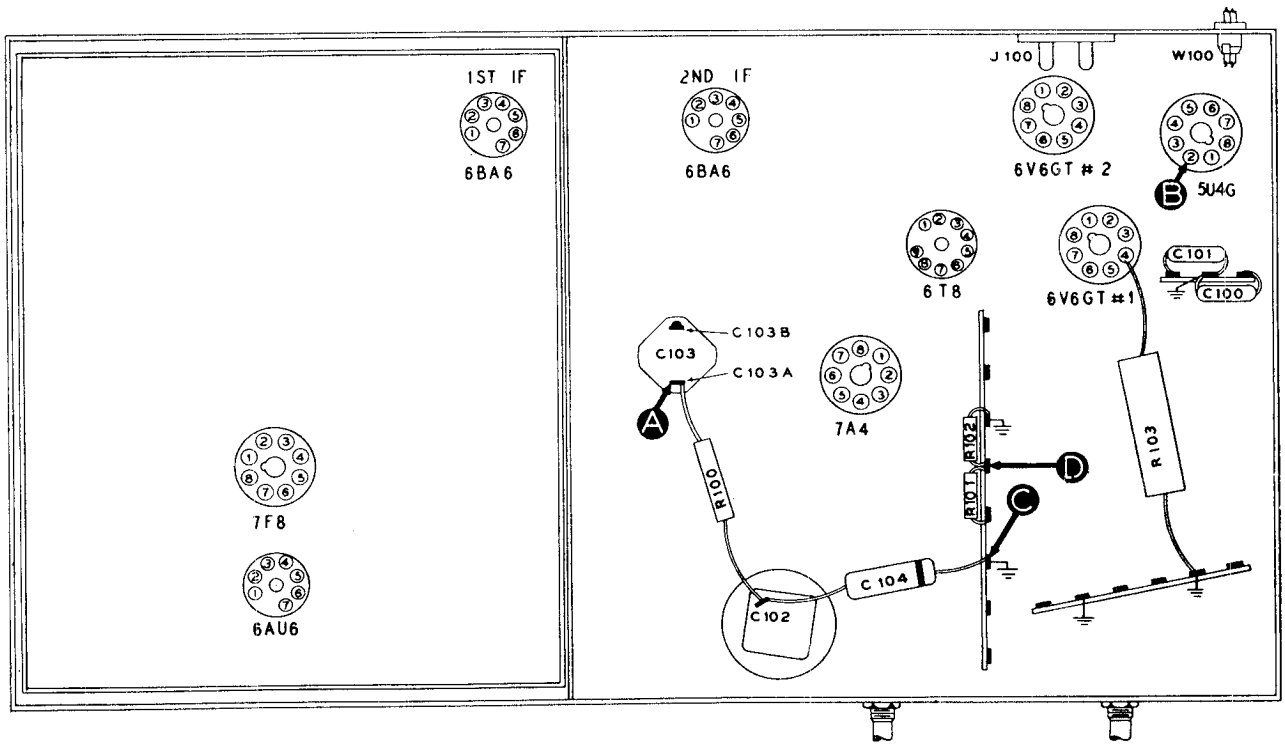

FIGURE 1. BOTTOM VIEW, SHOWING SECTION 1 TEST POINTS

MODEL 49-1615

TROUBLE SHOOTING

Section 2. AUDIO CIRCUITS

AUDIO-AMPLIFIER TESTS

For the tests in this section, use an audio-frequency signal generator. Connect the generator ground lead to the chassis, test point C; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Set the volume control to maximum, and turn the bass control fully counterclockwise. Set the treble selector switch to the second TREBLE position. Set the band switch to the broadcast position unless otherwise noted in the chart.

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for the scratch-eliminator circuits; if not, isolate and correct the trouble in the audio-amplifier circuits.

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	Loud, clear speaker output with weak signal input.	Trouble in audio-amplifier circuits. Isolate by the following tests.
2	B (Remove 7A4)	Clear output with strong input.	Defective: 6V6GT (#1), LS200. Open: C208, R213, T200. Shorted or leaky: C208, C210, C211,
3	D (7A4 removed)	Clear output with strong input.	Defective: 6V6GT (#2). Open: C209, R214. Shorted or leaky: C209.
4	E (Replace 7A4)	Loud, clear output with moderate input.	Defective: 7A4. Open: R209, R210, R211, R212. Shorted or leaky: C207.
5 (a)	F	Loud, clear output with weak input.	Defective: 6T8. Open: R208, C207, R207. Shorted or leaky: C206, C215, C320*.
5 (b)	F	Loud, clear output with weak input, for all 5 positions of treble selector switch.	Open: C212, C213, C214, C215, R215, R216, R217, WS2. Shorted or leaky: C212, C213, C214.
6 (a)	A	Loud, clear output with weak input.	Open: C203, C205, R204, R200 (rotate through range).
6 (b)	A	Loud, clear output with weak input, for any position of bass control.	Open: R203, R202, C202. Shorted: C202.
7	G (Band switch in Phono position)	Loud, clear output with weak input.	Open: WS1-3 (F), R220. Shorted: shielded cable.
Listening Test: Abnormal hum and distortion may be caused by leaky C207, C208, C209, or by open C206 or C210.			

* This part, located in another section, may cause abnormal indication in this section.

SCRATCH-ELIMINATOR TESTS

Set the bass control fully counterclockwise. Turn the treble selector switch to the high-fidelity position, maximum clockwise. Set the band switch to the phono position. For all steps except 1(b), set the volume control to maximum; for this step, adjust the volume control as directed in the chart.

Turn the scratch eliminator on or off as indicated in the chart. (The scratch eliminator is on when the treble selector switch is in the counterclockwise position.)

Connect an output meter across the primary of the output transformer, T200.

IMPORTANT! For all steps except step 4, use the 0—10-volt output-meter range; for step 4 only, use the 0—50-volt range. If the proper ranges are not used, erroneous readings will result.

Connect the ground lead of an audio signal generator to the chassis, test point C, and connect the output lead through a .1-mf. condenser to the test points indicated in the chart. Set the generator for 5000 cycles. Adjust the generator output as directed in the chart.

If normal operation is indicated by the tests in step 1, (a) and (b), proceed with the tests for Section 3 (i-f, detector, and a-v-c circuits); if not, isolate and correct the trouble in the scratch-eliminator circuits.

NOTE: For steps 2, 3, and 4, connect the positive lead of a 20,000-ohms-per-volt, d-c voltmeter to the chassis, test point C; connect the prod end of the negative lead through a 100,000-ohm isolating resistor to the "VOLTMETER" test points indicated in the chart.

TROUBLE SHOOTING

Section 3. I-F, DETECTOR, AND A-V-C CIRCUITS

AM TESTS

For the tests in this section, use an r-f signal generator, with modulated output, set at 455 kc. Connect the generator ground lead to the chassis, test point C; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Set the volume control to maximum, and turn the bass control fully counterclockwise. Set the treble selector switch to the second TREBLE position. Set the band switch to the broadcast position, and rotate the tuning control until the tuning condenser is fully meshed.

If the "NORMAL INDICATION" is obtained in step 1, proceed with the FM tests; if not, isolate and correct the trouble in the AM circuits.

To provide a complete i-f-amplifier check, test point A for this section is placed at the grid of the mixer in Section 4; therefore, the effectiveness of step 1 as a master check is dependent upon the condition of certain parts in the mixer circuit. These parts are listed below under "POSSIBLE CAUSE OF ABNORMAL INDICATION."

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	Loud, clear speaker output with weak signal input.	Trouble in AM i-f circuits. Isolate by the following tests.
2	B	Loud, clear output with strong input.	Defective: 6BA6 (2nd i-f ampl.), 6T8. Misaligned: Z305. Open: R310, R311, R312, R313, R314, L304A, L305B, L302B, L303B, WS1-5. Shorted: L303B, L305A, L305B. Shorted or leaky: C316, C315, C317, C318, C305A, C305B, C305C, C305D.
3	D	Loud, clear output with moderate input.	Defective: 6BA6 (1st i-f ampl.). Misaligned: Z303. Open: L300B, L301C, L302A, L302B, R303, R309, R305, R307, R308. Shorted: L303A. Shorted or leaky: C313, C312, C310, C314, C301B, C303A.
4	A	Loud, clear output with weak input.	Defective: 7F8*. Misaligned: Z301. Open: R405*, R300, R301, L300A, L301A, L301B. Shorted: L301A, L301B, L301C, WS1-5. Shorted or leaky: C410*, C411*, C409*, C301A, C301B, C306.
Listening Test: Abnormal hum may be caused by open: C306, C310, C312, C313, C314, C316, C317, C318.			

* This part, located in another section, may cause abnormal indication in this section.

FM CIRCUITS

Set the band switch to FM position, and follow the instructions preliminary to the AM tests with these exceptions; set the signal-generator frequency to 9.1 mc., and detune to one side or the other until a satisfactory test signal is obtained.

The most satisfactory check on the operation of the discriminator circuit is the ability of the circuit to take proper alignment. See ALIGNMENT OF FM CIRCUITS.

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 4 (r-f and converter circuits); if not, isolate and correct the trouble in the FM circuits.

Usually, if a part is found to operate satisfactorily for AM it will also operate satisfactorily for FM.

TROUBLE SHOOTING

Section 4. R-F AND CONVERTER CIRCUITS

For the tests in this section, with the exception of the oscillator test, use an r-f signal generator with modulated output. Connect the generator ground lead to the chassis, test point C; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Set the volume control to maximum, and turn the bass control fully counterclockwise. Set the treble selector switch to the second TREBLE position. Set the band switch, tuning control, and signal-generator frequency as indicated in the chart.

If the "NORMAL INDICATION" is not obtained in step 1 of each chart, isolate and correct the trouble in this section. If the trouble is not revealed by the tests for this section, check the alignment.

OSCILLATOR TESTS: For the oscillator tests (steps 2 and 4 of the AM test chart, and step 2 of the FM test chart), connect the positive lead of a high-resistance voltmeter to the oscillator cathode, pin 4 of the 7F8 tube (test point D). Connect the prod end of the negative lead through a 100,000-ohm isolating resistor to the oscillator grid, pin 1 of the 7F8 tube (test point B). Use a suitable meter range, such as 0—10 volts. Proper operation of the oscillator is indicated by negative voltages of approximately the values given in the chart (measured with 20,000-ohms-per-volt meter) throughout the tuning ranges of the broadcast and FM bands.

AM TESTS

STEP	TEST POINT	SIGNAL GEN. FREQ.	BAND SWITCH	RADIO TUNING	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1 (a) 1 (b)	A A	1000 kc. Tune to frequency of each push-button.	BC Push-button	Tune to signal. Depress each button, in order.	Loud, clear speaker output with weak signal input.	Trouble in AM r-f circuits. Isolate by the following tests.
2 (Osc. Test.)	B to D		BC	Tune through range.	Negative 2—5 volts.	Defective: 7F8. Open: R404, T401, L405, C412, L404, R306*, WS1-3, WS1-4. Shorted: C412, C400, C417B, C407.
3	A	1000 kc.	BC	Tune to signal.	Loud, clear output with weak input.	Open: T400, WS1-2, C413. Shorted: C400, C417A.
4 (Osc. Test.)	B to D		Push-button	Depress each button, in order.	Negative 2—5 volts.	Open: L406, PB400, R406, WS1-3, WS1-4. Shorted: C414, C415.
5	A	Tune to frequency of each push-button.	Push-button	Depress each button, in order.	Loud, clear output with weak input.	Open: WS1-2, PB400. Shorted: C416.
Listening Test: Distortion may be caused by open R301*, R302*, or R309*. Hum and distortion may be caused by open C308* or C310*.						

* This part, located in another section, may cause abnormal indication in this section.

FM TESTS

STEP	TEST POINT	SIGNAL GEN. FREQ.	BAND SWITCH	RADIO TUNING	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	E	95 mc.	FM	Tune to signal.	Loud, clear speaker output with weak signal input.	Trouble in FM r-f circuits. Isolate by the following tests.
2 (Osc. Test.)	B to D		FM	Tune through range.	Negative 1—1.5 volts.	Defective: 7F8. Open: L402, WS1-3, WS1-4. Shorted: C400, C400C, C309*. Shorted or leaky: C407, C409.
3	E	95 mc.	FM	Tune to signal.	Loud, clear output with weak input.	Defective: 6AU6. Open: L400, C401, R400, R401, R402, R403, L403, C405, L401. Shorted: C400, C400A, L400, L401, WS1-2, C400B. Shorted or leaky: C402, C404, C403, C405, C406.
Listening Test: Hum and distortion may be caused by open C402, C406, C408, C409.						

* This part, located in another section, may cause abnormal indication in this section.

MODEL 49-1615

TROUBLE SHOOTING

R-F AND CONVERTER CIRCUITS (Cont.)

SETTING THE PUSH BUTTONS

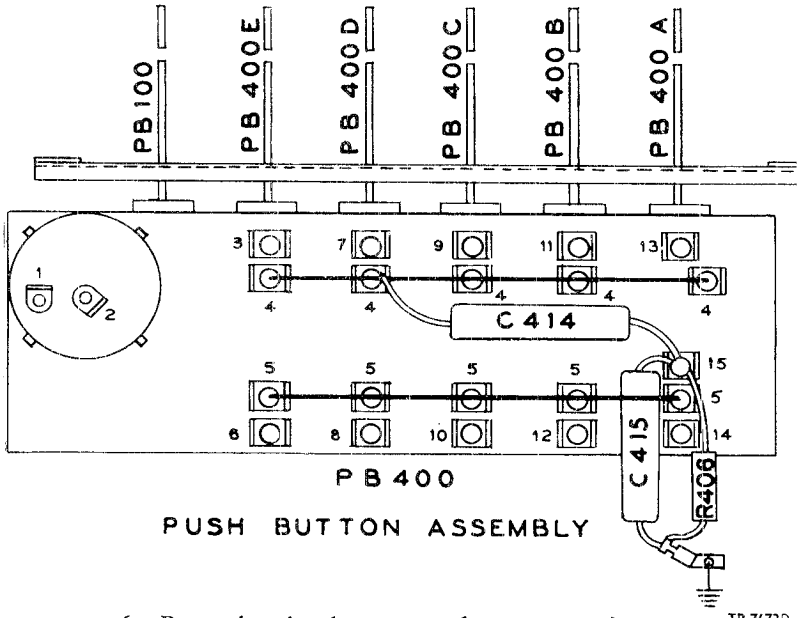
1. Connect the output meter between the No. 3 pin of the aerial input jack, J400, and the chassis. See figure 8.

2. Turn the volume control to maximum, and the bass control fully counterclockwise. Turn the treble selector switch fully clockwise. Set the band switch to the push-button position.

3. Couple the signal generator loosely to the loop aerial (see RADIATING LOOP note under AM ALIGNMENT CHART).

4. Turn on the power, and allow the radio to warm up for 15 minutes before starting the adjustments.

5. Starting with the lowest frequency desired, set the signal generator to the frequency (modulation on), push the station-selector push button, and adjust the associated oscillator tuning core and aerial trimmer condenser (marked on rear of chassis) for maximum indication on the output meter.



6. Reset the signal-generator frequency, and repeat the procedure for each remaining station-selector push button.

7. Turn off the signal generator, and make a final adjustment of all tuning cores and trimmer condensers while listening to the stations for which the adjustments are being made.

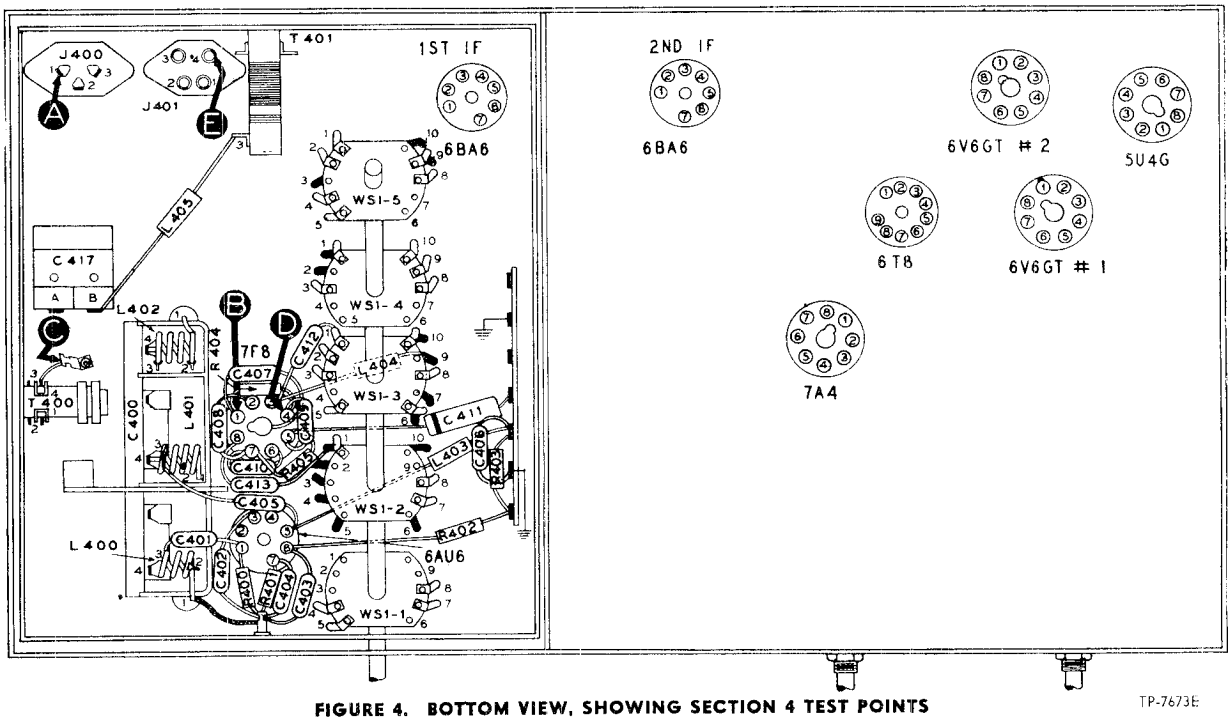


FIGURE 4. BOTTOM VIEW, SHOWING SECTION 4 TEST POINTS

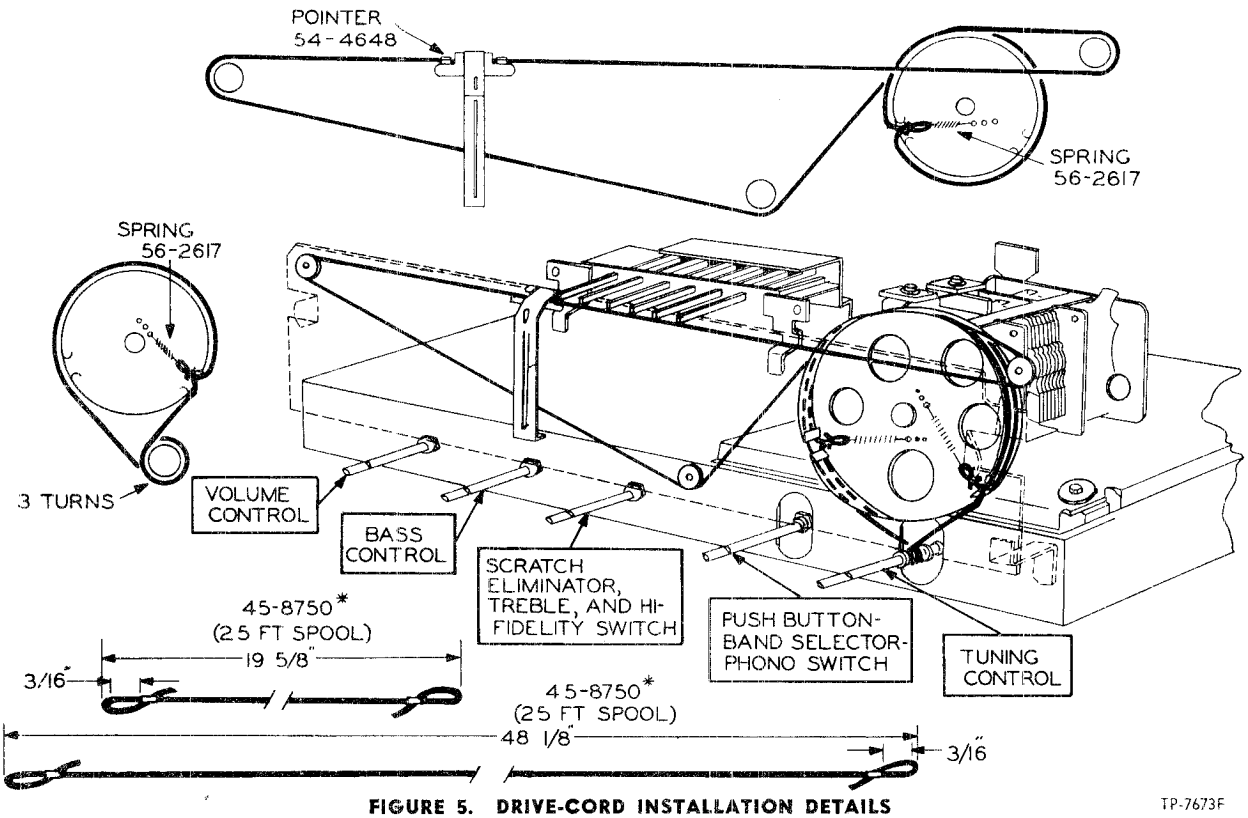

FIGURE 5. DRIVE-CORD INSTALLATION DETAILS TP-7673F

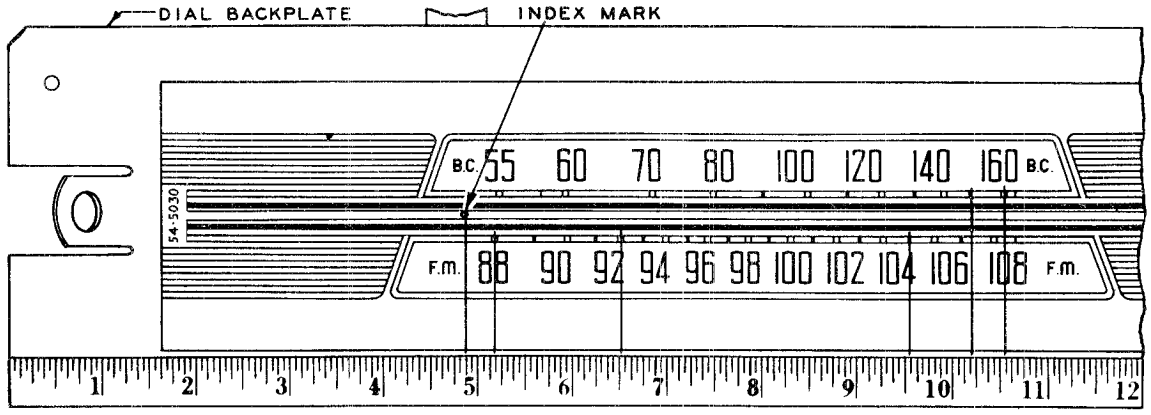

FIGURE 6. DIAL-BACKPLATE CALIBRATION MEASUREMENTS TP-7088

CALIBRATING DIAL BACKPLATE

When the radio chassis has been removed from the cabinet, dial calibration and alignment points may be marked on the dial backplate below the pointer.

The method of measuring for these points is illustrated in figure 6. Hold a ruler against the scale backplate, with the start of the ruler at the left-hand edge of the backplate, and mark pencil dots at the proper points for the required frequency settings. When the ruler is correctly placed, the index mark is approximately 4-7/8" from the reference point indicated in figure 6.

With the tuning gang fully meshed, the pointer should be adjusted on the dial drive cord to coincide with the index mark.

After the chassis is installed in the cabinet, the tuning condenser should be fully meshed, and the dial pointer should be moved to coincide with the index mark on the dial.

REPLACEMENT PARTS LIST

NOTE: Part numbers identified by an asterisk (*) are general replacement items. These numbers may not be identical with those on factory assemblies; also, the electrical values of some replacement items may differ from the values indicated in the schematic diagram and parts list. The values substituted in any case are so chosen that the operation of the radio will be either unchanged or improved. When ordering replacements, use only the "Service Part No."

ALIGNMENT PROCEDURE

CAUTION: Do not turn on the power with the speaker disconnected, or the radio may be damaged.

ALIGNMENT OF AM CIRCUITS

When the complete AM and FM alignment is to be made, the AM alignment should be made first; however, if AM alignment is not required, the FM alignment alone may be made.

DIAL POINTER: With the tuning condensers fully meshed, the dial pointer must coincide with the index mark at the low-frequency end of the dial. See "CALIBRATING DIAL BACKPLATE" for the method of measuring the backplate for index and calibration points.

CONTROLS: Set the volume control to maximum, and the bass control fully counterclockwise. Set the treble selector switch fully clockwise. Set the band switch to the broadcast position. Set the signal-generator dial and radio dial as indicated in the chart.

OUTPUT METER: Connect between the No. 3 terminal (voice-coil connection) of the loop aerial socket, J400, and the chassis. See figure 8.

AM SIGNAL GENERATOR: Connect the ground lead to the chassis, and the output lead as indicated in the chart. Use modulated output.

OUTPUT LEVEL: During alignment, the signal-generator output must be attenuated to hold the radio output below 1.5 volts, as read on the output meter.

ALIGNMENT OF FM CIRCUITS

BEFORE STARTING ALIGNMENT, ALLOW THE RADIO AND SIGNAL GENERATOR TO WARM UP FOR 15 MINUTES.

CONTROLS: Set the volume control to maximum, and the bass control fully counterclockwise. Set the treble selector switch fully clockwise. Set the band switch to the FM position. Set the signal-generator dial and radio dial as indicated in the chart.

OUTPUT METER: Connect between the No. 3 terminal (voice-coil connection) of the loop aerial socket, J400, and the chassis. See figure 8.

AM SIGNAL GENERATOR: Connect the ground lead to the chassis; connect the output lead through a .1-mf. condenser to the points specified in the chart. Use modulated output.

OUTPUT LEVEL: During alignment, the signal-generator output must be attenuated to hold the radio output below 1.5 volts, as read on the output meter.

LOCATIONS OF COILS: For the locations of coils L400, L401, and L402 (steps 8, 9, and 10), refer to figure 4.

Note 1. Check the tracking of oscillator and r-f circuits with a tuning wand. If placing the brass end in or near the coil increases the output-meter reading, spread the turns; if the powdered-iron end increases the output reading, compress the turns. If both ends cause a decrease in the output, the coil is correctly tuned. Do not change the coils excessively, since only a small adjustment is required at these frequencies.

Note 2. Make two simple dipole aerials to feed the signals from the signal generator to the radio. Each dipole aerial may consist of two 30-inch lengths of rubber-covered wire. Connect one dipole aerial to terminals 3 and 4 on the FM aerial socket, J401, of the radio. See figure 8. Connect the other dipole aerial to the output leads of the signal generator. Place the two dipoles several feet apart.

Note 3. The use of a signal generator for steps 5 through 11 is recommended only if the available generator is sufficiently accurate to insure correct frequency settings. Otherwise, an alternative procedure employing FM broadcast-station signals is recommended. For the adjustments at the high-frequency end of the band, use the station nearest 105 mc.; for the adjustments at the low-frequency end of the band, use the station nearest 88 mc. or 92 mc., as indicated. If the radio is greatly misaligned, it may be necessary to adjust the trimmers and coils for maximum noise at each end of the band before station signals can be heard.

MODEL 49-1615

Production Change Supplement

PRE-PRODUCTION CHANGES

The following parts were deleted:

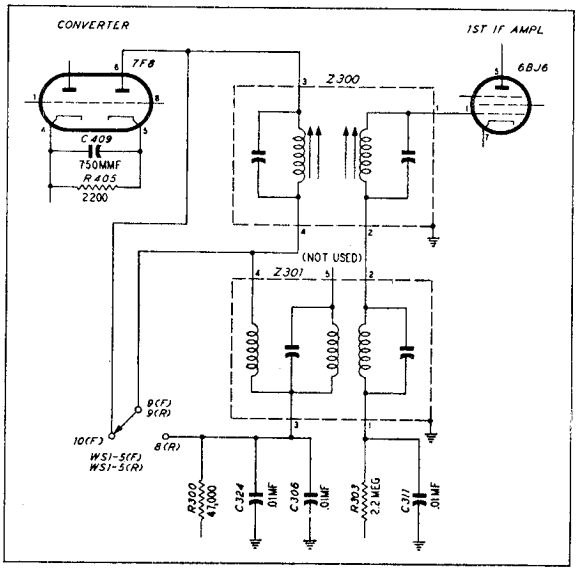
Reference Symbol	Description	Service Part No.
C104	Condenser, filter, .01 mf.	61-0120*
C410	Condenser, plate by-pass, 3 mmf.	30-1221
C411	Condenser, r-f by-pass, .01 mf.	61-0120*

The following parts were changed:

Reference Symbol	New Description	New Service Part No.
C202	Condenser, bass compensation, .006 mf.	45-3500-7*
C312	Condenser, screen by-pass, .003 mf.	61-0109*
C315	Condenser, cathode by-pass, .05 mf.	61-0122*
C317	Condenser, screen by-pass, .003 mf.	61-0109*
R100	Resistor, filter, 10,000 ohms, 2 watts	66-3103340*
R304	Resistor, cathode bias (FM), 100 ohms	66-1108340*
R310	Resistor, cathode bias, 82 ohms	66-0828340*
R311	Resistor, screen dropping, 33,000 ohms	66-3338340*
R405	Resistor, cathode bias, 2200 ohms (R405 was disconnected from ground and connected to the oscillator cathode, pin 4 of the 7F8.)	66-2228340*
R406	Resistor, cathode bias, 1000 ohms The 1st and 2nd i-f amplifier tubes were changed to type 6BJ6.	66-2108340*

The following parts were added:

Reference Symbol	Description	Service Part No.
C324	Condenser, plate by-pass, .01 mf. (Connected from lug 3 of Z301 to ground, as shown in figure 1.)	61-0120*
L407	Coil, r-f choke (Connected in the lead from C417A to the BC aerial section of C400.)	32-4061-2



TP-8462

Figure 1.

The following circuit changes were made:
C314 was disconnected from ground, and connected to the 1st i-f amplifier screen, pin 6 of the first 6BJ6. In its new connection, C314 provides screen neutralization. C318 was disconnected from ground, and connected to the 2nd i-f amplifier screen, pin 6 of the second 6BJ6. In its new connection, C318 provides screen neutralization. The switching of the primaries of Z300 and Z301 was revised as shown in figure 1.

RUN 2 CHANGES (MAIN CHASSIS)

To eliminate inverse-feedback oscillation, the following part was changed:

Reference Symbol	New Description	New Service Part No.
R205	Resistor, voltage divider, inverse feedback, 12[illegible]	66-1128340*

RUN 2 CHANGES (SCRATCH-ELIMINATOR CHASSIS)

To improve phono-noise suppression, the following parts were changed:

Reference Symbol	New Description	New Service Part No.
C218	Condenser, d-c blocking, reactance feedback, 220 mmf.	62-122001001*
R229	Resistor, plate load, 33,000 ohms	66-3338340*

RUN 3 CHANGES

To prevent AM noise-pulse interference on FM, the following circuit changes were made:

The switching was removed from the secondary of Z301. C311 is now connected directly to lug 1 of Z301. The removed switch section is now used to ground the AM audio lead when in the FM position. Lug 2 of WS1-5(R) is tied to lug 5 of WS1-3(R), and lug 1 of WS1-5(R) is grounded. See figure 2.

MODELS 50-522,
50-522-I, 50-524

Preliminary Checks

To avoid possible damage to the radio, the following preliminary checks should be made before it is turned on:

1. Inspect both the top and bottom of the chassis. Make sure that all tubes are secure in the proper sockets, and look for any broken or shorted connections, burned resistors, or other obvious indications of trouble.

Section 1—Power Supply

For the tests in this section, use a d-c voltmeter. Connect the negative lead to B—, test point B; connect the positive lead to the test points indicated in the chart. The voltage readings given were taken with a 20,000-ohms-per-volt meter at a line voltage of 117 volts, a.c.

Turn on the power, and set the volume control to minimum.

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 2 (audio circuits); if not, isolate and correct the trouble in this section.

2. Measure the resistance between B+ (test point C) and B— (test point B). See figure 1. When the ohmmeter test leads are connected in the proper polarity, the highest resistance reading will be obtained. If the reading is lower than 1500 ohms, check condensers C101A, C101B, C101C, and C203 for leakage or shorts. The resistance value given is much lower than normal, and is not intended as a quality check of these condensers; the value given is the lowest at which the rectifier will operate safely while the voltage checks of Section 1 (power supply) are performed.

TROUBLE SHOOTING

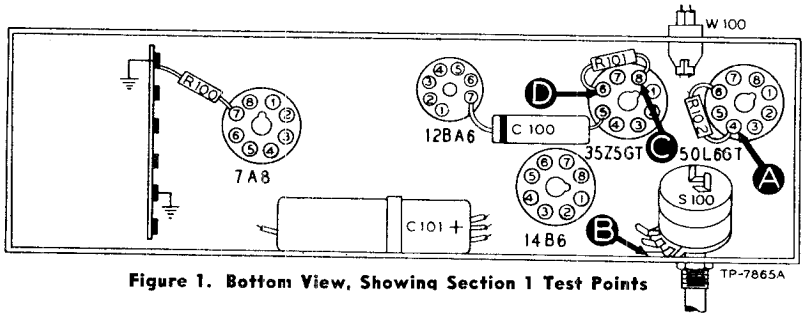

Figure 1. Bottom View, Showing Section 1 Test Points

STEP	TEST POINT	NORMAL INDICATION	ABNORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	105 volts		Trouble in this section. Isolate by the following tests.
2	C	130 volts	No voltage	Defective: 35Z5GT. Open: W100, S100. Shorted: C100, C101A.
			Low voltage	Defective: 35Z5GT. Open: C101A. Leaky: C101A.
			High voltage	Open: R101.
3	D	118 volts	No voltage	Open: R101. Shorted: C101B.
			Low voltage	Open: C101B. Shorted: C203*. Leaky: C101B.
			High voltage	Open: R102, T200*, R204*.
4	A	105 volts	No voltage	Shorted: C101C. Open: R102.
			Low voltage	Leaky: C101C. Open: C101C.
			High voltage	Open: R204*.
Listening Test: Abnormal hum may be caused by open C101A, C101B, or C101C.				

* This part, located in another section, may cause abnormal indication in this section.

Section 2—Audio Circuits

TROUBLE SHOOTING

For the tests in this section, use an audio-frequency signal generator. Connect the generator ground lead to B—, test point B; connect the output lead through a .1-μf. condenser to the test points indicated in the chart.

Set the volume control to maximum.

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Sections 3 (i-f, detector, and a-v-c circuits); if not, isolate and correct the trouble in this section.

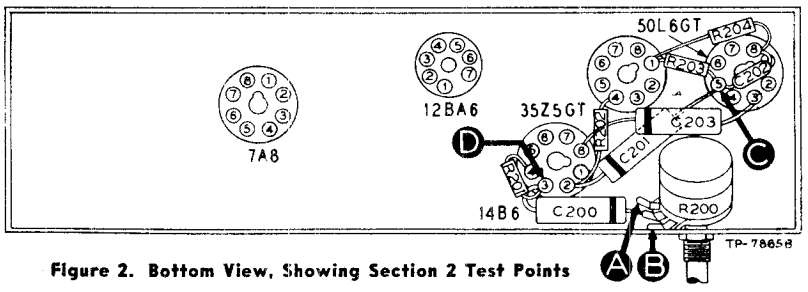

Figure 2. Bottom View, Showing Section 2 Test Points

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	Loud, clear speaker output with weak signal input.	Trouble in this section. Isolate by the following tests.
2	C	Clear output with moderate signal input.	Defective: 50L6GT, LS200. Open: R204, T200. Shorted: C202, C203.
3	D	Same as step 1.	Defective: 14B6 (triode section). Open: C201, R202, R203. Shorted: C201.
4	A	Same as step 1.	Open: R200 (rotate through range), C200, R201. Shorted: C301D*.

* This part, located in another section, may cause abnormal indication in this section.

MODELS 50-522,
50-522-I, 50-524

Section 3—I-F, Detector, and A-V-C Circuits TROUBLE SHOOTING

For the tests in this section, use an r-f signal generator, with modulated output, set at 455 kc. Connect the generator ground lead to B—, test point B; connect the output lead through a .1-μf. condenser to the test points indicated in the chart.

Set the volume control to maximum, and turn the tuning control until the tuning condenser is fully meshed.

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 4 (r-f and converter circuits); if not, isolate and correct the trouble in this section.

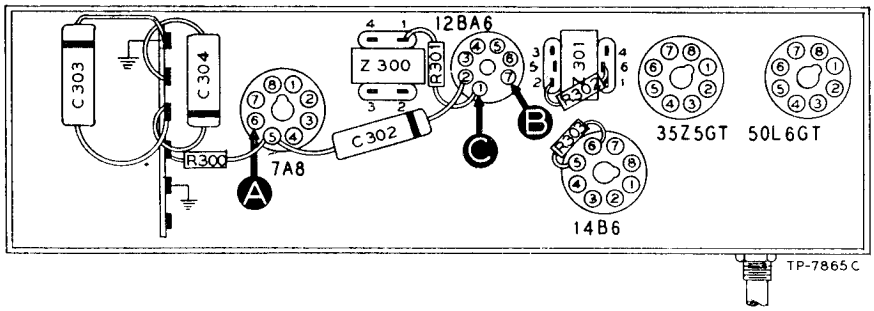

Figure 3. Bottom View, Showing Section 3 Test Points

To provide a complete i-f-amplifier check, test point A for this section is placed at the grid of the mixer in Section 4; therefore, the effectiveness of step 1 as a master check is dependent upon the condition of certain parts in the mixer circuit. These parts are listed below under "POSSIBLE CAUSE OF ABNORMAL INDICATION."

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	Loud, clear speaker output with weak signal input.	Trouble in this section. Isolate by the following tests.
2	C	Loud, clear output with moderate input.	Defective: 12BA6, 14B6, (diode section). Misaligned: Z301. Open: R300, C301A, C301B, L301A, L301B, R302, R303. Shorted: C302, C300B, C301A, C301B, C301C.
3	A	Same as step 1.	Defective: 7A8*. Misaligned: Z300. Open: L300A, L300B, R301, C300A, C300B. Shorted: C300A, C400, C400A.

* This part, located in another section, may cause abnormal indication in this section.

Section 4—R-F and Converter Circuits TROUBLE SHOOTING

For the tests in this section, with the exception of the oscillator test, use an r-f signal generator with modulated output. Connect the generator ground lead to B—, test point B; connect the output lead through a .1-μf. condenser to the test points indicated in the chart.

Set the volume control to maximum. Set the tuning control and the signal-generator frequency as indicated in the chart.

If the "NORMAL INDICATION" is not obtained in step 1, isolate and correct the trouble in this section. If the trouble is not revealed by the tests for this section, check the alignment.

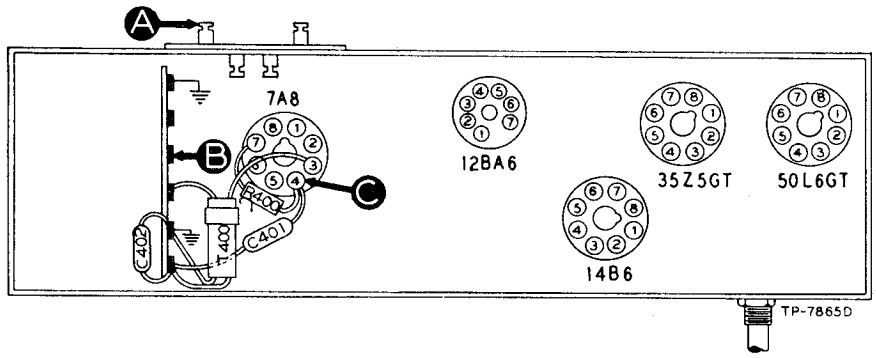

Figure 4. Bottom View, Showing Section 4 Test Points

STEP	TEST POINT	SIG. GEN. FREQ.	RADIO TUNING	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	1000 kc.	1000 kc.	Loud, clear speaker output with weak signal input.	Trouble in this section. Isolate by the following tests.
2	C Osc. test; see note below.		Tune through range.	Negative 4.5 to 7.5 volts.	Defective: 7A8. Open: C401, T400, R400. Shorted: T400, C401, C400, C400B, C402.
3	A	1000 kc.	1000 kc.	Same as step 1.	Defective: 7A8. Open: LA400. Shorted: C400, C400A, LA400.

OSCILLATOR TEST: Connect the positive lead of a high-resistance voltmeter to B—, test point B; connect the prod end of the negative lead through a 100,000-ohm isolating resistor to the 7A8 oscillator grid (pin 4), test point D. Use a suitable meter range, such as 0—10 volts. Proper operation of the oscillator is indicated by negative voltage of approximately the value given in the chart (measured with 20,000-ohms-per-volt meter), throughout the tuning range.

ALIGNMENT PROCEDURE

CONTROLS: Turn on the radio, and set the volume control to maximum.

DIAL POINTER: Turn the tuning condenser to the full-mesh position. Set the dial pointer to the index mark, located to the left of "55."

OUTPUT METER: Connect across the voice-coil terminals.

SIGNAL GENERATOR: Connect as indicated in the chart.

OUTPUT LEVEL: During the alignment, adjust the signal-generator output to hold the output-meter indication below 1.25 volts.

STEP	SIGNAL GENERATOR		RADIO		ADJUST
	CONNECTION TO RADIO	DIAL SETTING	DIAL SETTING	SPECIAL INSTRUCTIONS	
1	Ground lead to B—; output lead through .1-μf. condenser to pin 6 of 7A8 tube.	455 kc.	540 kc. (gang fully meshed).	Adjust tuning cores, in order given, for maximum output.	TC301B—2nd i-f sec. TC301A—2nd i-f pri. TC300B—1st i-f sec. TC300A—1st i-f-pri.
2	Radiating loop; see note below.	1600 kc.	1600 kc.	Adjust for maximum.	C400B—osc.
3	Same as step 2.	1500 kc.	1500 kc.	Adjust for maximum.	C400A—aerial

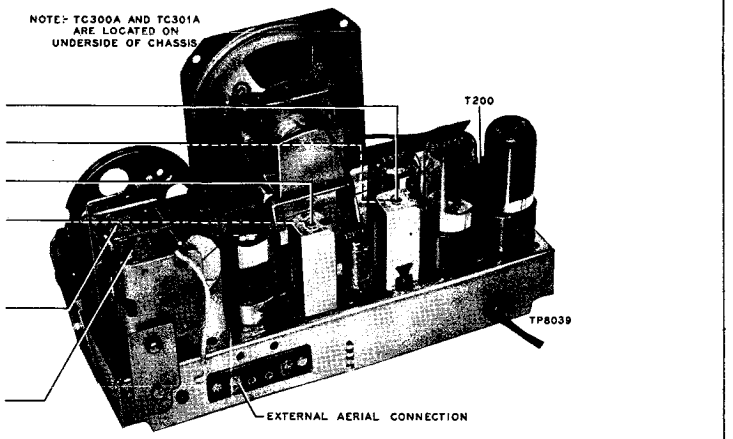

Figure 6. Top View, Showing Trimmer Locations

RADIATING LOOP: make up a 6—8 turn, 6-inch-diameter loop from insulated wire; connect to signal-generator leads and place near radio loop aerial.

Circuit Description

Philco Models 50-522, 50-522-I, and 50-524 are 5-tube, table-model superheterodyne radios, providing reception in the standard broadcast band. These three models are identical except for the cabinets and certain cabinet parts, as indicated in the Replacement Parts List.

The high-impedance loop aerial normally provides adequate signal pickup. An external aerial may be connected, if desired, by attaching the lead to lug No. 4 (shown in figure 6) on the rear of the chassis. Do not use a ground.

The converter employs a 7A8 tube. Variable-condenser tuning is used; the rotor plates of the oscillator section are specially shaped to obtain tracking, thus eliminating the necessity for a series padding condenser.

The 7A8 is transformer-coupled to the 12BA6 i-f amplifier, which is, in turn, transformer-coupled to the diodes of the 14B6 detector-first audio amplifier. A-v-c voltage is applied to the control grids of the i-f and converter tubes.

The triode section of the 14B6 is the first audio amplifier, and is resistance-coupled to the 50L6GT output tube, which works into a permanent-magnet speaker.

D-c operating voltages are obtained from a 35Z5GT half-wave rectifier, the output of which is filtered by a two-section resistance-capacitance filter.

Resistor R100, 150,000 ohms (in Section 1), prevents hum which might otherwise occur under conditions of high humidity.

REPLACEMENT PARTS LIST

NOTE: Part numbers identified by an asterisk (*) are general replacement items. These numbers may not be identical with those on factory parts; also, the electrical values of some replacement items may differ from the values indicated in the schematic diagram and parts list. The values substituted in any case are so chosen that the operation of the radio will be either unchanged or improved.

Section 1 TROUBLE SHOOTING

POWER SUPPLY

For the tests in this section, use a d-c voltmeter. Connect the negative lead to B–, test point B; connect the positive lead to the test points indicated in the chart. The voltage readings given were taken with a 20,000-ohms-per-volt meter at a line voltage of 117 volts, a.c.

Turn on the power, and set the volume control to minimum.

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 2 (audio circuits); if not, isolate and correct the trouble in this section.

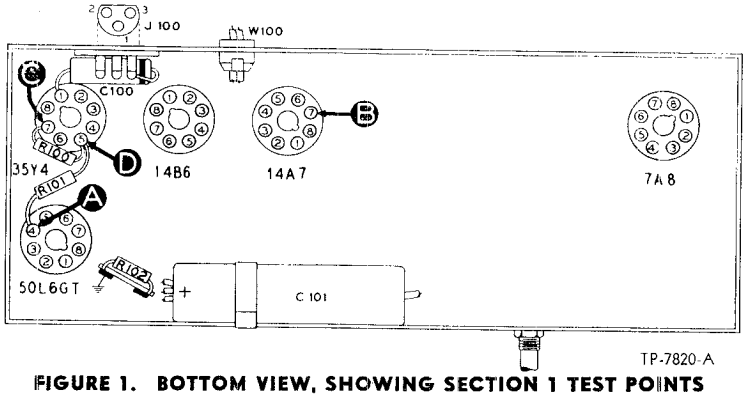

FIGURE 1. BOTTOM VIEW, SHOWING SECTION 1 TEST POINTS

STEP	TEST POINT	NORMAL INDICATION	ABNORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	95v		Trouble within this section. Isolate by the following tests.
2	C	108v	No voltage Low voltage High voltage	Defective: 35Y4. Shorted: C101A. Open: S100, W100, J100. Defective: 35Y4. Open: C101A. Leaky: C101A. Open: R100.
3	D	120v	No voltage Low voltage High voltage	Shorted: C101B. Open: R100. Open: C101B. Leaky: C101B, C203*. Open: R101, T200*, R203*.
4	A	95v	No voltage Low voltage	Shorted: C101C. Open: R101. Leaky: C101C.
Listening Test: Abnormal hum may be caused by open C101A, C101B, or C101C.				

* This part, located in another section, may cause abnormal indication in this section.

Section 2 TROUBLE SHOOTING

AUDIO CIRCUITS

For the tests in this section, use an audio-frequency signal generator. Connect the generator ground lead to B–, test point B; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Set the volume control to maximum.

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 3 (i-f, detector, and a-v-c circuits); if not, isolate and correct the trouble in this section.

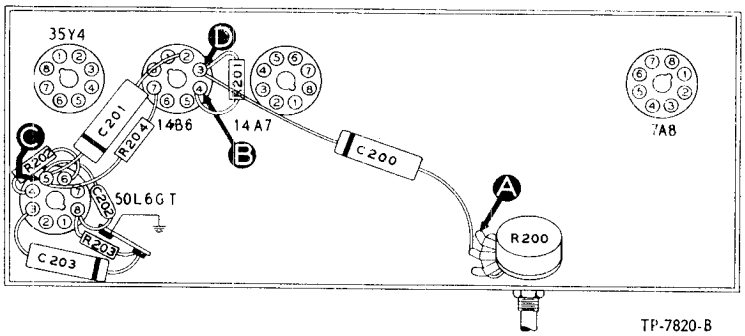

FIGURE 2. BOTTOM VIEW, SHOWING SECTION 2 TEST POINTS

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	Loud, clear speaker output with weak signal-generator input.	Trouble within this section. Isolate by the following tests.
2	C	Clear output with strong input.	Defective: 50L6GT, LS200. Shorted: C202, C203. Open: R203, T200.
3	D	Clear output with moderate input.	Defective: 14B6. Shorted: C201. Open: C201, R202, R204.
4	A	Same as step 1.	Shorted: C301D*. Open: R200, R201, C200.
Listening Test: Distortion may be caused by shorted or leaky C201.			

* This part, located in another section, may cause abnormal indication in this section.

50-527-I

Section 3 TROUBLE SHOOTING

I-F, DETECTOR, AND A-V-C CIRCUITS

For the tests in this section, use an r-f signal generator, with modulated output, set at 455 kc. Connect the generator ground lead to B–, test point B; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Set the volume control to maximum, and rotate the tuning control until the tuning condenser is fully meshed.

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 4 (r-f and converter circuits); if not, isolate and correct the trouble in this section.

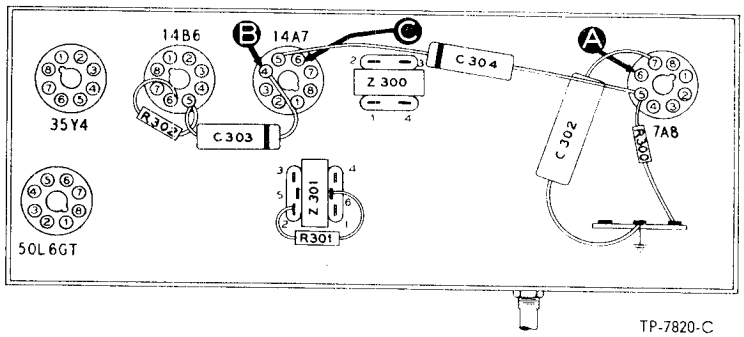

FIGURE 3. BOTTOM VIEW, SHOWING SECTION 3 TEST POINTS

To provide a complete i-f-amplifier check, test point A for this section is placed at the grid of the mixer in Section 4; therefore, the effectiveness of step 1 as a master check is dependent upon the condition of certain parts in the mixer circuit. These parts are listed below under "POSSIBLE CAUSE OF ABNORMAL INDICATION."

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	Loud, clear speaker output with weak signal-generator input.	Trouble within this section. Isolate by the following tests.
2	C	Same as step 1.	Defective: 14A7, 14B6 (diode section). Shorted: L300B, C300B, L301A, C301A, L301B, C301B, C301C, C301D. Open: L301A, L301B, C301A, C301B, R300, R301, C304. Misaligned: Z301.
3	A	Same as step 1.	Defective: 7A8*. Shorted: C400*, C400A*, L300A, C300A. Open: L300A, L300B, C300A, C300B. Misaligned: Z300.
Listening Test: Hum and instability may be caused by open C302, C303.			

* This part, located in another section, may cause abnormal indication in this section.

Section 4 TROUBLE SHOOTING

R-F AND CONVERTER CIRCUITS

For the tests in this section, with the exception of the oscillator test, use an r-f signal generator, with modulated output. Connect the generator ground lead to B–, test point B; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Set the volume control to maximum, and set the tuning control and the signal-generator frequency as indicated in the chart.

If the "NORMAL INDICATION" is not obtained in step 1, isolate and correct the trouble in this section. If the trouble is not revealed by the tests for this section, check the alignment.

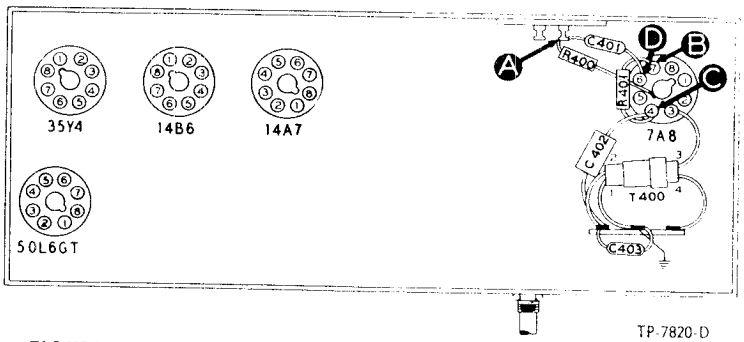

FIGURE 4. BOTTOM VIEW, SHOWING SECTION 4 TEST POINTS

STEP	TEST POINT	SIG. GEN. FREQUENCY	RADIO TUNING	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	1000 kc.	1000 kc.	Clear speaker output with weak signal-generator input.	Trouble within this section. Isolate by the following tests.
2	C (Osc. test; see note below.)		Rotate through range.	Negative 4v to 6v.	Defective: 7A8. Open: C402, R401, T402. Shorted: T400, C400, C400B, C403.
3	D	1000 kc.	1000 kc.	Same as step 1.	Defective: 7A8. Open: LA400. Shorted: C400, C400A, LA400.
4	A	1000 kc.	1000 kc.	Same as step 1.	Open: C401.

OSCILLATOR TEST: Connect the positive lead of a high-resistance voltmeter to the B–, test point B; connect the prod end of the negative lead through a 100,000-ohm isolating resistor to the 7A8 oscillator grid (pin 4), test point C. Use a suitable meter range, such as 0—10 volts. Proper operation of the oscillator is indicated by negative voltage of approximately the value given in the chart (measured with 20,000-ohms-per-volt meter) throughout the tuning range.

ALIGNMENT PROCEDURE

RADIO CONTROLS — Set volume control to maximum. Set tuning control as indicated in chart.

OUTPUT METER — connect across voice-coil terminals.

SIGNAL GENERATOR — Connect generator and set frequency as indicated in chart. Use modulated output.

OUTPUT LEVEL — During alignment, adjust signal-generator output to hold output-meter reading below 1.25 volts.

STEP	SIGNAL GENERATOR		RADIO		ADJUST
	CONNECTION TO RADIO	DIAL SETTING	DIAL SETTING	SPECIAL INSTRUCTIONS	
1	Connect ground lead to B–; output lead through .1-mf. condenser to grid (pin 6) of 7A8.	455 kc.	Tuning condenser fully meshed.	Adjust tuning cores, in order given, for maximum output.	TC301B—2nd i-f sec. TC301A—2nd i-f pri. TC300B—1st i-f sec. TC300A—1st i-f pri.
2	Radiating loop (see note below).	1600 kc.	1600 kc.	Adjust trimmer for maximum output.	C400B—Osc.
3	Same as step 2.	1500 kc.	1500 kc.	Adjust trimmer for maximum output.	C400A—Aerial

Preliminary Checks

To avoid possible damage to the radio, the following preliminary checks should be made before it is turned on:

1. Inspect both the top and the bottom of the chassis. Make sure that all tubes are secure in the proper sockets, and look for any broken or shorted connections, burned resistors, or other obvious indications of trouble.
2. Measure the resistance between B+ (pin 7 of the 35Y4) and B–, test point B. When the ohmmeter test leads are connected in the proper polarity, the highest resistance reading will be obtained. If the reading is lower than 1500 ohms, check condensers C101A, C101B, C101C, and C203 for leakage or shorts. The resistance value given is much lower than normal, and is not intended as a quality check of these condensers; the value given is the lowest at which the rectifier will operate safely while the voltage checks of Section 1 (power supply) are performed.

Circuit Discription

Philco Radio-Clock Models 50-527 and 50-527-I are 5-tube table-model superheterodynes, providing reception in the standard broadcast band and the functions of an electric alarm clock.

A high-impedance loop aerial normally provides adequate signal pickup. An external aerial may be connected, if desired, by detaching the aerial lead from the chassis and connecting it to the external aerial leadin. Do not use a ground.

The loop aerial is coupled to the 7A8 converter. The aerial and oscillator circuits are tuned by ganged variable condensers, and the oscillator rotor-section plates are properly shaped to obtain tracking, thus eliminating the necessity for a series padding condenser.

The 7A8 converter is transformer-coupled to the 14A7 i-f amplifier, which is also transformer-coupled to the diodes of the 14B6 second detector — first audio amplifier. A-v-c voltage is applied to the control grids of both the i-f amplifier and converter tubes. The triode section of the 14B6 is the first audio stage, and is resistance-coupled to the 50L6GT output tube. The output tube works into a permanent-magnet speaker.

D-c operating voltages are supplied from a 35Y4 half-wave rectifier, and filtered by a three-section resistor-condenser network.

R102, a 150,000-ohm resistor, prevents hum which might otherwise occur under conditions of high humidity.

In addition to the normal features of a table-model radio and an electric clock, a radio alarm is included, which turns the radio on at any preset time; there is also a "delayed off" feature that automatically shuts the set off after any desired period up to an hour. These functions are available by the following control settings: For alarm action, the AUTO-OFF-ON switch is set to the AUTO position, and the alarm is set to the desired time. When the delayed off action is required, as when retiring, the DELAYED OFF switch is turned to the right, and the AUTO-OFF-ON switch is set to the AUTO position. The two actions may be combined, i.e., before retiring, the alarm may be set for the morning time, and the DELAYED OFF switch also set. The radio then plays for an hour, shuts itself off, and comes on again in the morning. When the AUTO-OFF-ON switch is set to the ON position, the radio operates independently of the clock. When the switch is set to the OFF position, the radio is turned off, and is not under the control of the clock.

REPLACEMENT PARTS LIST

NOTE: Part numbers identified by an asterisk (*) are general replacement items. These numbers may not be identical with those on factory parts; also, the electrical values of some replacement items may differ from the values indicated in the schematic diagram and parts list. The values substituted in any case are so chosen that the operation of the radio will be either unchanged or improved.

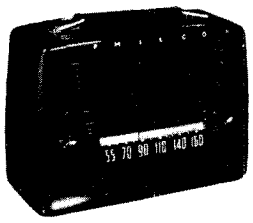
Circuit Description

Philco Model 50-620 is a portable four-tube superheterodyne providing reception on the standard-broadcast band. A high-impedance loop within the cabinet normally provides adequate signal pickup. However, provisions have been made for connecting an external aerial, if required.

The aerial circuit works directly into a 1R5 converter, where the incoming signal is converted to the 455-kc. intermediate frequency. A 1T4 is used in a single high-gain stage of i-f amplification, which employs neutralization to suppress oscillation. A 1.5-mmf. condenser, C304, feeds part of the i-f voltage, of the proper phase, back to the 1T4 grid through the tube-socket capacitance.

A 1U5 diode-pentode is used in the detector, a-v-c, and first audio circuits. The pentode section is resistance-coupled to a 3V4 pentode output amplifier, which works into a p-m speaker.

The d-c operating voltages are obtained from either a battery pack, Philco type P-361, or from a 105—120 volt, a-c or d-c power line. For power-line operation, the plate, screen, and filament voltages are provided by a power supply using a selenium rectifier, CR100.



MODEL 50-620

SPECIFICATIONS

CABINET	Molded Polystyrene (maroon, brown, or green)
CIRCUIT	Four-tube superheterodyne
FREQUENCY RANGE	540—1600 kc.
AUDIO OUTPUT	160 milliwatts
OPERATING VOLTAGES	Battery: "B", 90 volts; "A", 7.5 volts. A.c./d.c.: 105—120 volts
POWER CONSUMPTION	Battery: "B", 13 ma. at 90 volts; "A", 50 ma. at 7.5 volts. A.c./d.c.: 25 watts
AERIAL	Built-in high-impedance loop: terminal also provided for external aerial
INTERMEDIATE FREQUENCY	455 kc.
PHILCO TUBES (4)	1R5, 1T4, 1U5, 3V4
BATTERY TYPE	Philco P-361

TP-4523

Philco TROUBLE-SHOOTING Procedure

For rapid trouble shooting, the radio circuit is divided into four sections, with test points specified for each section; these sections and test points are indicated in the schematic diagram. The trouble-shooting procedure given for each section includes a simplified test chart and a bottom view of the chassis showing the locations of the test points and the components of that section.

In each chart, the first step is a master check for determining whether trouble exists in that section, without going through the entire chart.

Failure to obtain the "NORMAL INDICATION" in any given step indicates trouble within the circuit under test.

After isolating the trouble to a single stage, the defect is located by: first, testing the tube; second, measuring tube electrode voltages; third, measuring circuit resistances; fourth, substituting condensers. The trouble revealed should be corrected before testing further.

Preliminary Checks

To avoid possible damage to the radio, the following preliminary checks should be made before turning on the power:

1. Inspect both the top and the bottom of the chassis. Make sure that all tubes are secure in the proper sockets, and look for any broken or shorted connections, burned resistors, or other obvious sources of trouble.

2. Check the total filament resistance, with the power switch turned on, the battery plug disconnected from the battery, and the change-over switch in the battery position (power-cord plug inserted in receptacle on rear of chassis). If the resistance between the A+ and A—pins on the battery plug is higher than 100 ohms, one of the tube filaments is probably open.

NOTE: If the 3V4 filament is open, check condenser C202 before replacing the tube.

3. Measure the resistance between B+ (output of selenium rectifier), test point D, and B—, test point B. See figure 1. When the ohmmeter leads are connected in the proper polarity, the highest resistance reading will be obtained. If the reading is lower than 2000 ohms, check condensers C101A and C101B for leakage or shorts.

The resistance value above, which is much lower than normal, does not represent a quality check of these condensers; it is the lowest value which will permit the rectifier to operate safely while the voltage checks of Section 1 (power supply) are performed.

©John F. Rider

MODEL 50-620

TROUBLE SHOOTING

Section 1—Power Supply

Make the tests for this section with a d-c voltmeter. Connect the negative lead to B—, test point B; connect the positive lead to the test points indicated in the chart. The voltage readings given were taken with a 20,000-ohms-per-volt meter at a line voltage of 117 volts, a.c.

Set the volume control to minimum.

The battery pack should be replaced when the "A" voltage drops below 5 volts, or the "B" voltage drops below 60 volts.

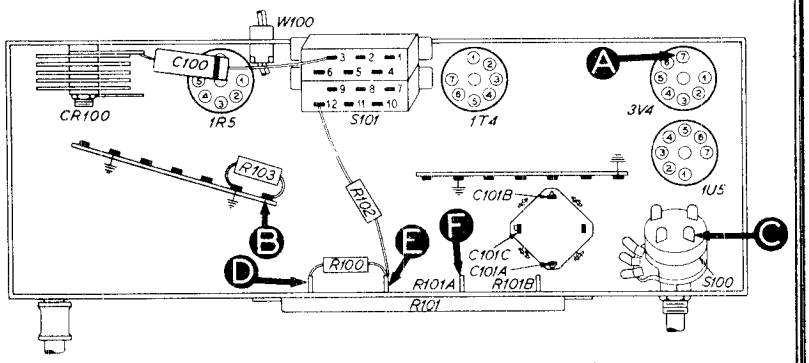


Figure 1. Bottom View, Showing Section 1 Test Points TP-5355A-1

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 2 (audio circuits); if not, isolate and correct the trouble in this section.

STEP	TEST POINT	NORMAL INDICATION	ABNORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1(a) 1(b)	A C	7.5v 90v		Trouble in this section. Isolate by the following tests.
2	D	125v	Low voltage No voltage	Defective: CR100. Open C101A. Defective: CR100. Open: S100, S101.
3	E	120v	Low voltage No voltage	Changed resistance: R100. Leaky: C101A. Open: R100. Shorted: C101A.
4	F	65v	Low voltage No voltage	Changed resistance: R101A. Leaky: C101B. Open: R101A. Shorted: C101B.
5	A	7.5v	Low voltage High voltage No voltage	Changed resistance: R101B. Open: One or more filaments, R205*. Open: R101B, S101.
6	C	90v	Low voltage High voltage No voltage	Changed resistance: R102. Leaky: C101C. Open: R205*, T200*, S100. Open: R102, S101. Shorted: C101C.
Listening Test: Abnormal hum may be caused by open C101B, C101C, or C202*.				

*This part, located in another section, may cause abnormal indication in this section.

TROUBLE SHOOTING

Section 2—Audio Circuits

For the tests in this section, use an audio-frequency signal generator. Connect the generator ground lead to B—, test point B; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Set the radio volume control to maximum.

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 3 (i-f, detector, and a-v-c circuits); if not, isolate and correct the trouble in this section.

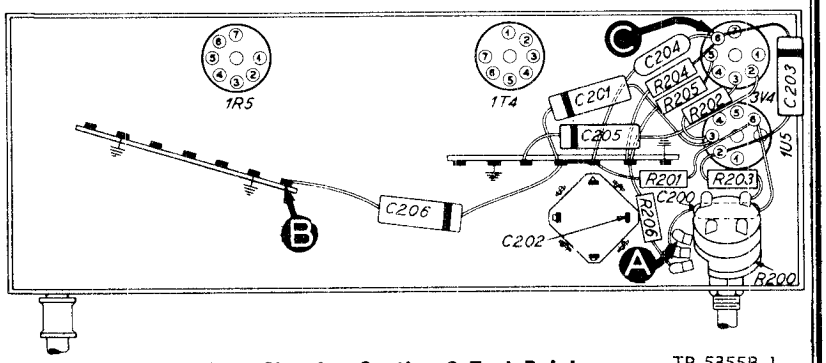

Figure 2. Bottom View, Showing Section 2 Test Points TP-5355B-1

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	Loud, clear speaker output with moderate generator input.	Trouble in this section. Isolate by the following tests.
2	C	Clear speaker output with strong generator input.	Defective: 3V4, LS200. Open: R204, T200. Shorted: C203, C204, C205, T200.
3	A	Same as step 1.	Defective: 1U5, R200 (rotate). Open: C200, R201, R202, R203, C203. Shorted: C201, C301C*.
Listening Test: Distortion may be caused by leaky or shorted C203, or by changed resistance of R202. Distortion or strong signals may be caused by leaky or shorted C200.			

*This part, located in another section, may cause abnormal indication in this section.

©John F. Rider

Section 3—I-F, Detector, And A-V-C Circuits TROUBLE SHOOTING

For the tests in this section, use an r-f signal generator, with modulated output, set at 455 kc. Connect the generator ground lead to B—, test point B; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Set the radio volume control to maximum.

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 4 (r-f and converter circuits); if not, isolate and correct the trouble in this section.

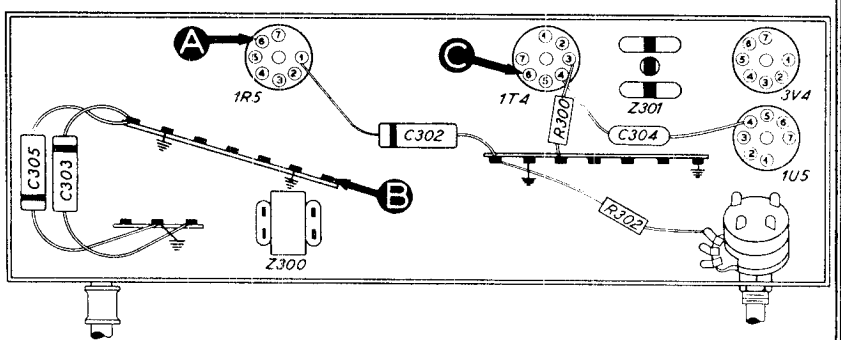

Figure 3. Bottom View, Showing Section 3 Test Points TP-5355C

To provide a complete i-f amplifier check, test point A for this section is placed at the grid of the mixer in Section 4; therefore, the effectiveness of step 1 as a master check is dependent upon the condition of certain parts in the mixer circuit. These parts are listed below under "POSSIBLE CAUSE OF ABNORMAL INDICATION."

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	Loud, clear speaker output with weak generator input.	Trouble in this section. Isolate by the following tests.
2	C	Loud, clear output with moderate input.	Defective: 1T4, 1U5 (diode section). Misaligned: Z301. Open: R300, C303, L301A, R301, L301B, C301A. Shorted: C300B, C303, L301A, L301B, C301A, C301B.
3	A	Same as step 1.	Defective: 1R5*. Misaligned: Z300. Open: C300A, L300A, L300B, C300B, T400*. Shorted: C400A*, C400B*, C300A, L300A, L300B, C300B.

*This part, located in another section, may cause abnormal indication in this section.

Section 4—R-F And Converter Circuits TROUBLE SHOOTING

For the tests in this section, with the exception of the oscillator test, use an r-f signal generator with modulated output. Connect the generator ground lead to B—, test point B; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Set the radio volume control to maximum. Set the tuning control and signal-generator frequency as indicated in the chart.

If the "NORMAL INDICATION" is obtained in step 1, further tests should be unnecessary; if not, isolate and correct the trouble in this section. If the trouble is not revealed by the tests for this section, check the alignment.

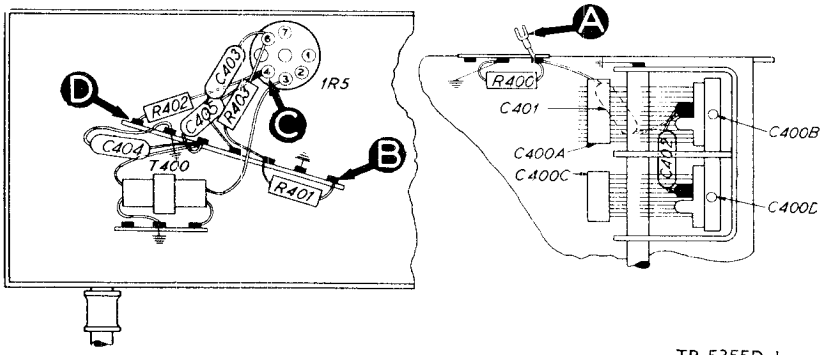

Figure 4. Bottom View, Showing Section 4 Test Points TP-5355D-1

STEP	TEST POINT	SIGNAL GEN. FREQUENCY	RADIO TUNING	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	1000 kc.	Tune to signal.	Loud, clear speaker output with weak generator input.	Trouble in this section. Isolate by the following tests.
2	C to D (Osc. test; see note below.)		Rotate through range.	Negative 5 to 10 volts.	Defective: 1R5. Open: R402, T400, C405. Shorted: C402, C400C, C400D.
3	A	1000 kc.	Tune to signal.	Same as step 1.	Open: C401, C403, R401, R403, LA400.

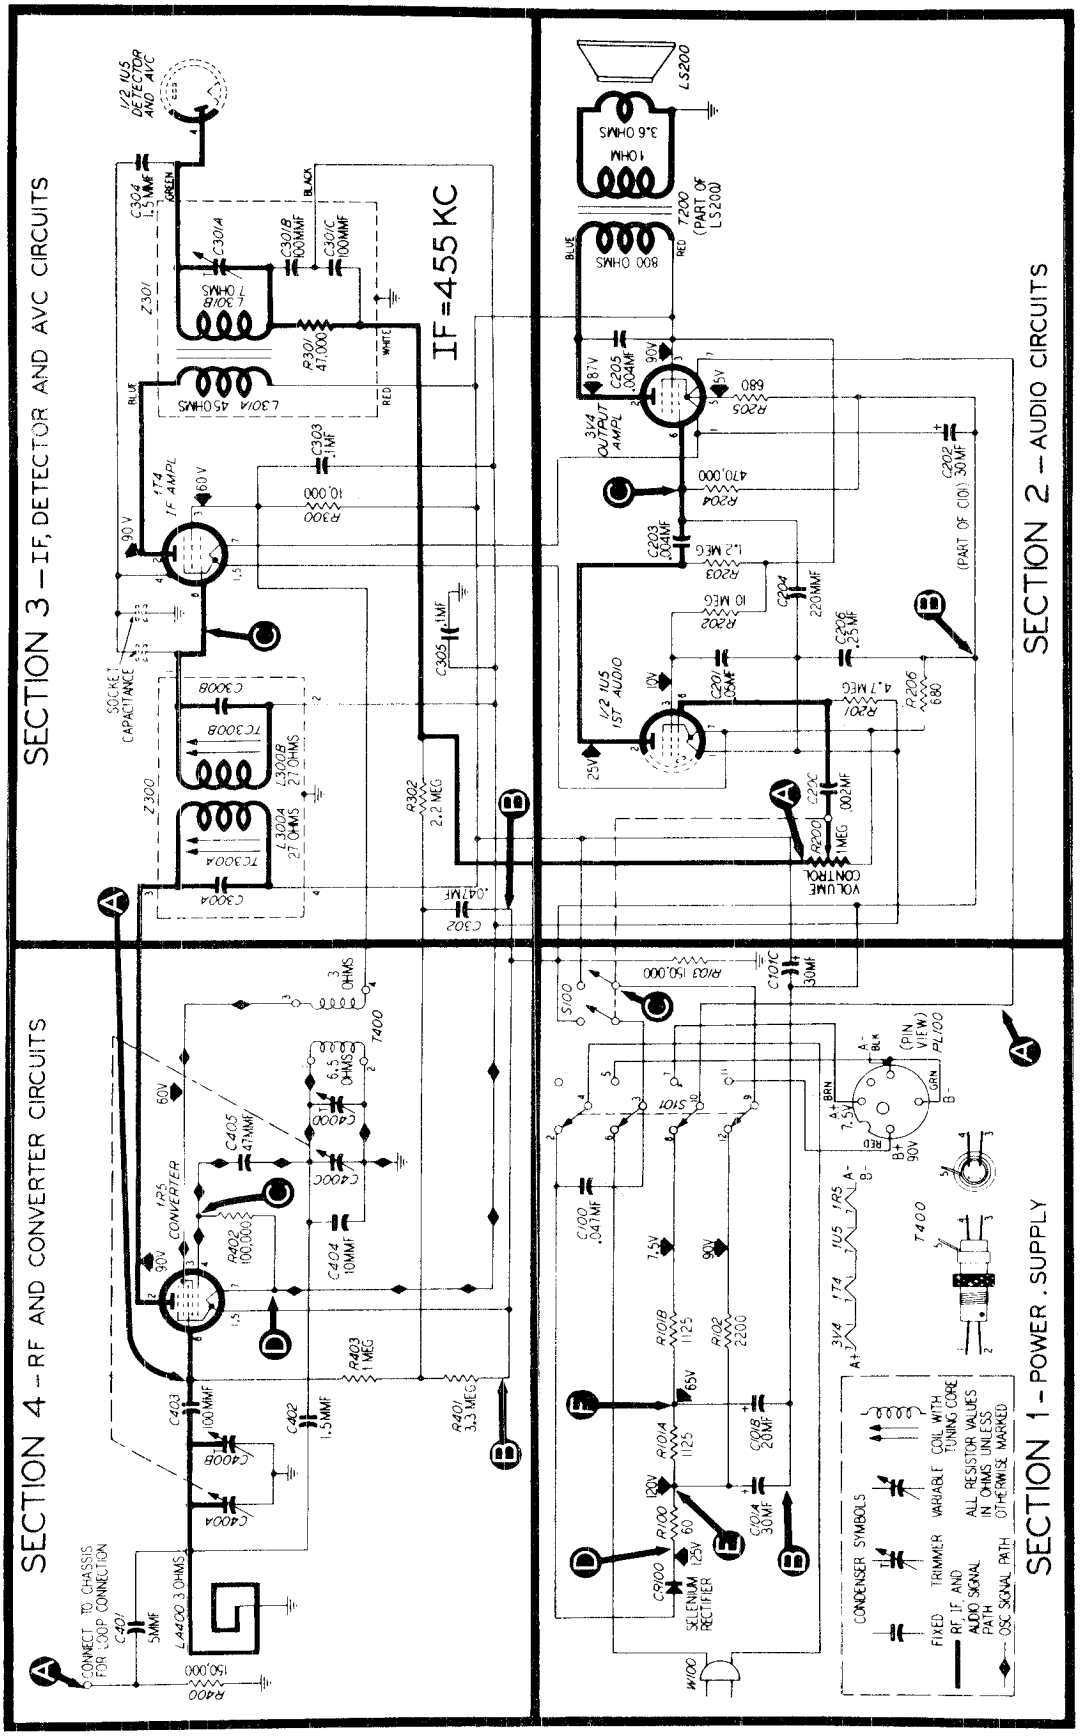
MODEL 50-620



TP-5315-1

Figure 5. Philco Model 50-620, Sectionalized Schematic Diagram, Showing Test Points

OSCILLATION TEST. Connect the positive lead of a high-resistance voltmeter to test point D, connect the probe end of the negative lead through a 100,000-ohm isolating resistor to the oscillator grid (pin 5 of the 1R5), test point C. Use a suitable meter range, such as 0–10 volts. Proper operation of the oscillator is indicated by negative voltage within the range given in the chart (measured with a 20,000-ohms-per-volt meter) throughout the tuning range.

©John F. Rider

ALIGNMENT PROCEDURE

DIAL—Calibration and pointer-index measurements are shown in figure 7. With tuning condenser fully meshed, set pointer to index mark.

RADIO CONTROLS—Set volume control to maximum.

OUTPUT METER—Connect across voice-coil terminals.

SIGNAL GENERATOR—Use modulated output.

OUTPUT LEVEL—During alignment, adjust signal-generator output to maintain output-meter indication below .5 volt.

SPECIAL NOTE—The orientation of the loop with respect to the chassis is critical for correct tracking. During alignment, with the cabinet back (containing the loop) laid down on the bench, the chassis should be laid on its back, in approximately its normal relation to the loop.

STEP	SIGNAL GENERATOR		RADIO		ADJUST
	CONNECTION TO RADIO*	DIAL SETTING	DIAL SETTING	SPECIAL INSTRUCTIONS	
1	Ground lead to B— (test point B in figure 4). Positive lead through .05-mf. condenser to external aerial lead. Make sure that radio loop aerial is connected to radio.	455 kc.	Tuning condenser fully meshed.	Adjust, in order given, for maximum output.	C301A—2nd i-f sec. TC300B—1st i-f sec. TC300A—1st i-f pri.
2	Radiating loop (see note below).	1600 kc.	1600 kc.	Adjust for maximum output.	C400D—osc.
3	Same as step 2.	1500 kc.	1500 kc.	Adjust for maximum output while rocking tuning condenser.	C400B—aerial

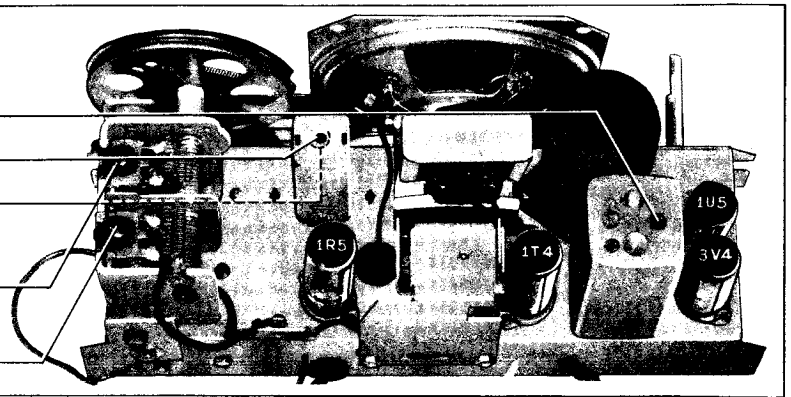

Figure 6. Top View, Showing Trimmer Locations TP-5283

RADIATING LOOP: Make up a 6—8-turn, 6-inch-diameter loop, using insulated wire; connect to signal-generator leads and place near radio loop aerial. Make sure that radio loop aerial is connected to radio.

CALIBRATING DIAL BACKPLATE

When the radio chassis has been removed from the cabinet, dial calibration and alignment points may be marked on the dial (chassis) backplate at the end of the pointer with a pencil. The method of measuring for these points is illustrated in figure 7.

With the tuning gang fully meshed, the pointer should be adjusted on the dial-drive cord to coincide with the index mark.

MODEL 50-620

SYMBOLIZATION

The components in the radio circuit are symbolized according to the types of parts and the sections of the radio in which the parts are located. The prefix letter of the symbol designates the type of part, as follows:

C—condenser
I—pilot lamp
L—choke or coil
LA—loop aerial
LS—loud-speaker
R—resistor
S—switch
T—transformer
W—line cord
Z—electrical assembly

The number of the symbol designates the section in which the part is located, as follows:

100-series components are in Section 1—the power supply
200-series components are in Section 2—the audio circuits
300-series components are in Section 3—the i-f, detector, and a-v-c circuits
400-series components are in Section 4—the r-f and converter circuits

A suffix letter identifies the part as a component of the assembly which bears an identical number without a suffix letter, and with perhaps a different prefix letter.

REPLACEMENT PARTS LIST

NOTE: Part numbers identified by an asterisk (*) are general replacement items. These numbers may not be identical with those on factory assemblies; also, the electrical values of some replacement items may differ from the values indicated in the schematic diagram and parts list. The values substituted in any case are so chosen that the operation of the radio will be either unchanged or improved. When ordering replacements, use only the "Service Part No."

MODEL 50-621

ALIGNMENT PROCEDURE

POINTER—Set pointer to coincide with first index mark from left side of dial backplate (looking at backplate).

RADIO CONTROLS—Set volume control to maximum.

OUTPUT METER—Connect across voice-coil terminals.

SIGNAL GENERATOR—Use modulated output.

OUTPUT LEVEL—During alignment, adjust signal-generator output to maintain output-meter indication below .5 volt.

SPECIAL NOTE—The orientation of the loop with respect to the chassis and battery is critical for correct tracking. During alignment, with the cabinet back (containing the loop) lying flat on the bench, the chassis should be laid on its back in approximately its normal relation to the loop, with a 1/4"-thick wooden board separating the loop and chassis. The battery should also be placed as close as possible to its normal position with respect to the chassis and loop.

CRITICAL LEAD DRESS—To secure proper padding capacity, the green lead from pin 6 of the 1R5 tube to Z1 must be dressed over wiring panel, away from chassis, and the green lead from Z1 to the tuning condenser must be dressed away from chassis.

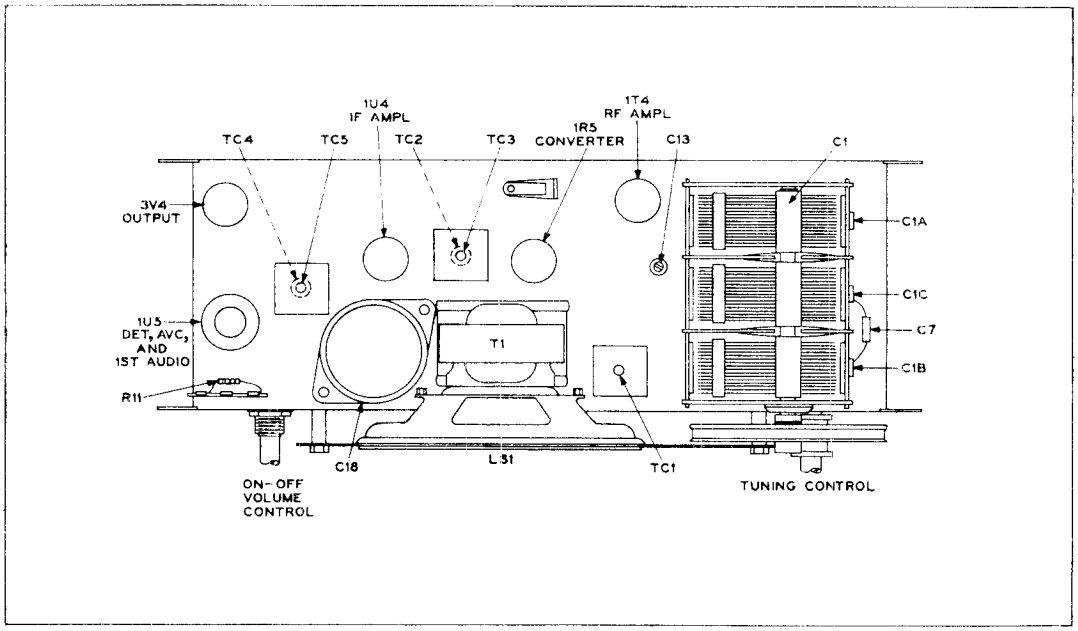

Figure 4. Top View, Showing Trimmer Locations TP9-516

STEP	SIGNAL GENERATOR		RADIO		ADJUST
	CONNECTION TO RADIO	DIAL SETTING	DIAL SETTING	SPECIAL INSTRUCTIONS	
1	Through a .1-μf. condenser to pin 6 of the 1R5 converter.	265 kc.	540 kc. (gang fully meshed)	Adjust, in order given, for maximum output.	TC5—2nd i-f sec. TC4—2nd i-f pri. TC2—1st i-f pri. TC3—1st i-f sec.
2	Radiating loop. See note below.	1620 kc.	1620 kc. (gang fully open)	Adjust for maximum output. If low-frequency dial tracking is far off, make adjustments in steps 3 and 4 before making this adjustment.	C1C—osc. shunt
3	Same as step 2.	580 kc.	580 kc.	Adjust for maximum output while rocking tuning control.	C13—osc. series
4	Same as step 2.	580 kc.	580 kc.	Adjust for maximum output. This adjustment should not be made unless dial tracking is off, or sensitivity is low at low-frequency end (580 kc.).	TC1—r-f sec.
5	Same as step 2.	1500 kc.	1500 kc. (index mark at right)	Adjust, in order given, for maximum output.	C1B—r-f trimmer C1A—aerial trimmer
6	Repeat steps 3 and 5 until no further improvement is obtained.				

RADIATING LOOP: Make up a six-to-eight-turn, 6-inch-diameter loop using insulated wire; connect to signal-generator leads and place near radio loop.

©John F. Rider

MODEL 50-925

Circuit Description

Philco Radio Model 50-925 is a superheterodyne employing six tubes plus a selenium rectifier. Reception is provided in the standard-broadcast and FM bands. A built-in high-impedance loop is used as the aerial for the broadcast band, and the line cord is used as the aerial for the FM band. These aerials normally provide adequate signal pickup; if additional pickup is required on the FM band, Philco Dipole Aerial Part No. 45-1462 may be used. If it is desired to use the FM dipole aerial to provide additional AM as well as FM pickup, Aerial Coupler Part No. 45-1598 and Aerial Coupler Cable Part No. 45-1652 should be used in conjunction with the dipole aerial. The purpose of the cable is to permit the isolation of the coupler from the chassis, since the coupler must not be connected directly to the "hot" chassis.

A 12BA6 pentode is used as an r-f amplifier, for FM only. This stage is capacity-coupled to a 12BA7, which is employed as a mixer and oscillator for both bands, by switching the mixer grid and common cathode to the proper circuits.

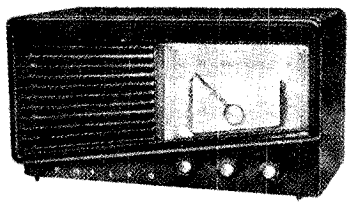
For broadcast reception, the i-f signal is transformer-coupled to a 12BA6 i-f amplifier. The output of this stage is transformer-coupled to a diode section of the 19T8, which provides detection and a-v-c action.

For FM reception, an additional i-f amplifier stage, which employs another 12BA6, is used to provide adequate gain and stability. The 12BA6 is transformer-coupled to two diode sections of the 19T8, in a ratio-detector circuit. The proper detector for AM or FM is selected by the band switch at the detector output circuits.

In the i-f circuits, two sets of i-f transformers are used. One set is tuned to 455 kc., for standard broadcast, and the other set is tuned to 9.1 mc., for FM. The use of two sets of transformers makes better shielding possible, so that undesirable beat signals and interaction between transformers are eliminated. In switching bands, the band switch shorts the primary of the 1st i-f transformer for the undesired band.

The triode section of the 19T8 is employed as the first audio amplifier; this section is resistance-coupled to the 50C5 output tube, which supplies an audio output of approximately one watt to the permanent-magnet speaker.

The power supply utilizes a selenium rectifier in a half-wave-rectifier circuit, and operates from a line voltage of 105—120 volts, a.c. or d.c.



MODEL 50-925

SPECIFICATIONS

CABINET	Plastic, brown finish
CIRCUIT	6-tube superheterodyne, plus selenium rectifier
FREQUENCY RANGES	
Broadcast	540—1620 kc.
FM	88—108 mc.
AUDIO OUTPUT	1 watt
OPERATING VOLTAGE	105—120 volts, a.c. or d.c.
POWER CONSUMPTION	35 watts
AERIALS	Built-in high-impedance loop for AM, line cord for FM; also connector for external aerial
INTERMEDIATE FREQUENCIES	
Broadcast	455 kc.
FM	9.1 mc.
PHILCO TUBES (6)	12BA6(3), 12BA7, 19T8, 50C5

TP-8091

Philco TROUBLE SHOOTING *Procedure*

For rapid trouble shooting, the radio circuit is divided into four sections, with test points specified for each section; these sections and test points are indicated in the schematic diagram. The trouble-shooting procedure given for each section includes a simplified test chart and a bottom view of the chassis showing the locations of the test points and the components of that section.

In each chart, the first step is a master check for determining whether trouble exists in that section, without going through the entire test procedure.

Failure to obtain the "NORMAL INDICATION" in any given step indicates trouble within the circuit under test.

After isolating the trouble to a single stage, the defect is located by: first, testing the tube; second, measuring tube electrode voltages; third, measuring circuit resistances; fourth, substituting condensers. The trouble revealed should be corrected before testing further.

©John F. Rider

MODEL 50-925

Preliminary Checks

To avoid possible damage to the radio, the following preliminary checks should be made before it is turned on:

1. Inspect both the top and the bottom of the chassis. Make sure that all tubes are secure in the proper sockets, and look for any broken or shorted connections, burned resistors, or other obvious indications of trouble.
2. Measure the resistance between B+ (test point B) and the chassis (test point C). When the ohmmeter test leads are connected in the proper polarity, the highest resistance reading will be obtained. If the reading is lower than 1500 ohms, check condensers C102A, C102B, C102C, and C309 for leakage or shorts. The resistance value given is much lower than normal, and is not intended as a quality check of these condensers; the value given is the lowest at which the rectifier will operate safely while the voltage checks of Section 1 (power supply) are performed.

Section 1 TROUBLE SHOOTING

POWER SUPPLY

CAUTION—One side of the power line is connected directly to the chassis. Do not connect chassis to ground. Use all precautions to avoid shock.

For the tests in this section, use a d-c voltmeter. Connect the negative lead to the chassis, test point C; connect the positive lead to the test points indicated in the chart. The voltage readings given were taken with a 20,000-ohms-per-volt meter, at a line voltage of 117 volts, a.c.

Turn on the power, and set the volume control to minimum. Set the band switch for broadcast reception.

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 2 (audio circuits); if not, isolate and correct the trouble in this section.

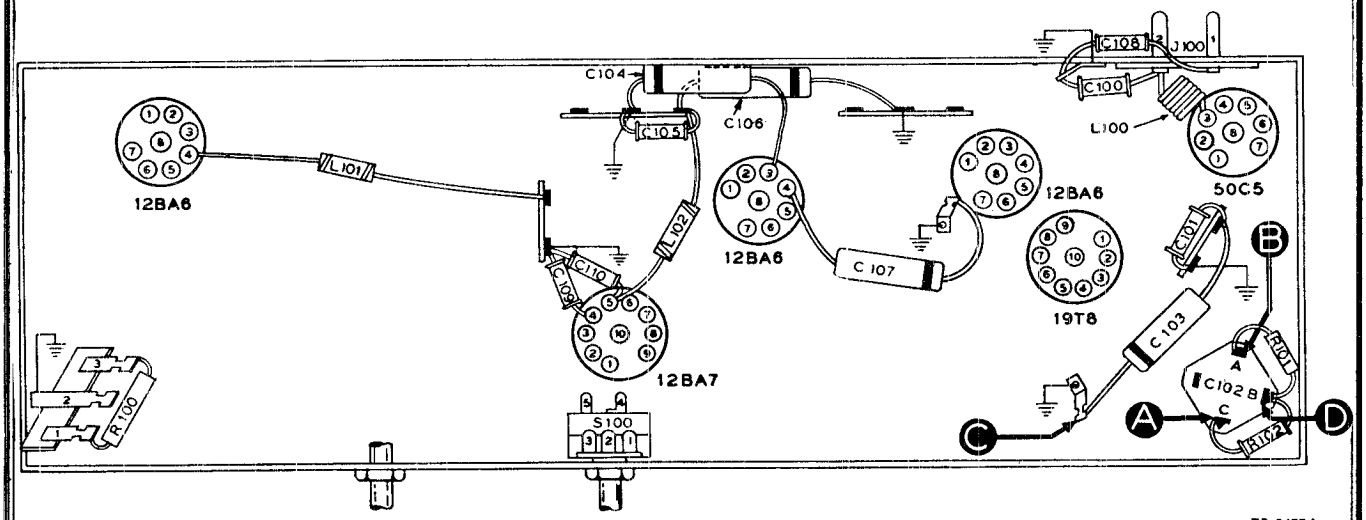


Figure 1. Bottom View, Showing Section 1 Test Points TP-8455A

STEP	TEST POINT	NORMAL INDICATION	ABNORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	100v		Trouble in this section. Isolate by the following tests.
2	B	135v	No voltage Low voltage High voltage	Defective: CR100. Open: R100. Shorted: C102A. Defective: CR100. Shorted: C102A, C102B, C102C, C309*, C310*. Open: R101.
3	D	120v	No voltage Low voltage High voltage	Shorted: C102B. Open: R101. Leaky: C102B. Shorted: C102A, C102C. Open: R102, T200* (primary), R204*.
4	A	100v	No voltage Low voltage	Open: R102. Shorted: C102C. Shorted: C102B. Leaky: C102C.
Listening Test: Abnormal hum may be caused by open C102A, C102B, or C102C.				

* This part, located in another section, may cause abnormal indication in this section.

Section 2 TROUBLE SHOOTING

AUDIO CIRCUITS

For the tests in this section, use an audio-frequency signal generator. Connect the generator ground lead to the chassis, test point C; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

With the band switch set for broadcast reception (except for test point E), set the volume control to maximum.

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 3 (i-f, detector, and a-v-c circuits); if not, isolate and correct the trouble in this section.

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A E (Band switch in FM position)	Loud, clear speaker output with weak generator input.	Trouble in this section. Isolate by the following tests.
2	B	Loud, clear output with strong input.	Defective: 50C5. Open: R204, R203, C207, T200. Shorted: C205, C206, C207, C208. Leaky: C205, C206, C208.
3	D	Same as step 1.	Defective: 19T8 (triode section). Open: R201, R202, C205. Shorted or leaky: C204, C205.
4	A	Same as step 1.	Open: WS-1(F), R200, C203. Shorted: C202, C307*.
5	E (Band switch in FM position)	Same as step 1.	Open: C200, WS-1(F). Shorted: C201, C202.
Listening Test: Distortion may be caused by shorted or leaky C205 or by shorted, leaky, or open C207.			

* This part, located in another section, may cause abnormal indication in this section.

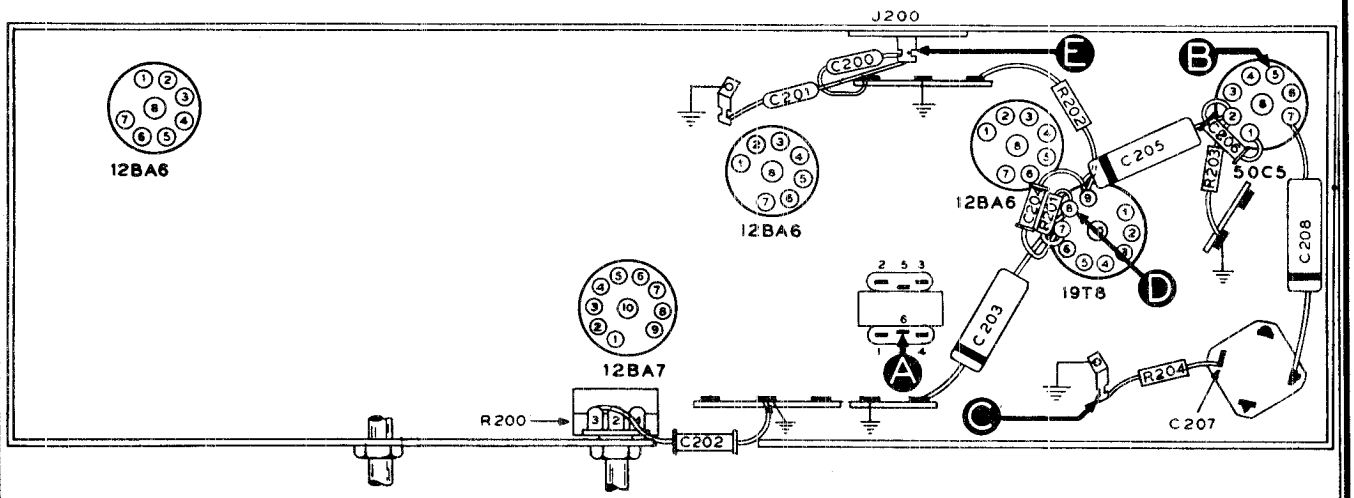

Figure 2. Bottom View, Showing Section 2 Test Points TP-8455B

Section 3 TROUBLE SHOOTING

I-F, DETECTOR, AND A-V-C CIRCUITS

AM Circuits

For the AM tests in this section, use an AM r-f signal generator, with modulated output, set at 455 kc. Connect the generator ground lead to the chassis, test point C; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

With the volume control set to maximum, and the band switch set for broadcast reception, rotate the tuning control until the tuning condenser is fully meshed.

If the "NORMAL INDICATION" is obtained in step 1, proceed with the FM tests: if not, isolate and correct the trouble in the AM circuits.

To provide a complete i-f-amplifier check, test point A for this section is placed at the grid of the mixer in Section 4; therefore, the effectiveness of step 1 as a master check is dependent upon the condition of certain parts in the mixer circuit. These parts are listed on next page under "POSSIBLE CAUSE OF ABNORMAL INDICATION."

Section 3 (Cont.) TROUBLE SHOOTING

AM Chart

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	Loud, clear speaker output with weak generator input.	Trouble in AM circuits. Isolate by the following tests.
2	B	Loud, clear output with moderate input.	Defective: 12BA6, 19T8. Open: R301, R303, R305, R102*, R302. Shorted: C305, C303C, C303D. Misaligned or open: Z303.
3	A	Same as step 1.	Defective: 12BA7. Open: Z301, R404*, R300, WS-1(F), R402*, R307, L404. Shorted: C304, C408*, C409*. Misaligned: Z301.

* This part, located in another section, may cause abnormal indication in this section.

FM Circuits

For the FM tests in this section, follow the preliminary instructions for the AM tests, with the following exceptions:

Set the band switch for FM reception, set the signal generator to 9.1 mc., and detune to one side or the other until a satisfactory test signal is obtained.

The most satisfactory check on the operation of the discriminator circuit is the ability to make proper alignment as described under "ALIGNMENT PROCEDURE."

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 4 (r-f and converter circuits); if not, isolate and correct the trouble in this section.

FM Chart

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	Loud, clear speaker output with weak generator input.	Trouble in FM circuits. Isolate by the following tests.
2	D	Loud, clear output with strong input.	Defective: 12BA6, 19T8 (diode sections). Open: R304, R308, R102*, R309, R310, Z304, C314, Z303. Shorted: C311, C312, C313, C314, C200*, C201*, Z304. Misaligned: Z304.
3	B	Loud, clear output with moderate input.	Open: Z302, R302, R306, R307, R301, R303. Shorted: C305, C309, C310. Misaligned: Z302.
4	A	Same as step 1.	Open: WS-1(F), R404*, Z300, Z301, R300, R102*, WS-2(R). Shorted: C408*, C409*, C304. Misaligned: Z300.

* This part, located in another section, may cause abnormal indication in this section.

Section 4 TROUBLE SHOOTING

R-F AND CONVERTER CIRCUITS

AM Circuits

For the AM tests in this section, with the exception of the oscillator test, use an AM r-f signal generator with modulated output. Connect the generator ground lead to the chassis, test point C; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

With the volume control set to maximum, set the band switch for broadcast reception, and set the tuning control and signal-generator frequency as indicated in the chart.

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for the FM circuits; if not, isolate and correct the trouble in the AM circuits.

FM Circuits

For the FM tests in this section, follow the preliminary instructions for the AM tests, except set the band switch for FM reception.

If the "NORMAL INDICATION" is obtained in step 1, further tests should be unnecessary; if not, isolate and correct the trouble in this section. If the trouble is not corrected by the tests for this section, check the alignment.

Figure 4. Bottom View, Showing Section 4 Test Points

AM Chart

STEP	TEST POINT	SIG. GEN. FREQ.	RADIO TUNING	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	1000 kc.	Tune to signal	Loud, clear speaker output with weak generator input.	Trouble in AM circuits. Isolate by the following tests.
2	B (Osc. test; see note below.)		Tune through range.	Negative .8 to 2.4 volts.	Open: WS-1(F), L401, C407, R403, R404, C408, C409. Shorted: C400C, C407, C304*, C408, C409. Defective: 12BA7 (osc. section). Misaligned: L401.
3	A	1000 kc.	Tune to signal	Same as step 1.	Open: T401, WS-2(F), R404, R300*, WS-1(F), R402. Shorted: C406, C408, C409.

* This part, located in another section, may cause abnormal indication in this section.

OSCILLATOR TEST: Connect the positive lead of a high-resistance voltmeter to the chassis, test point C; connect the prod end of the negative lead through a 100,000-ohm isolating resistor to the oscillator grid (pin 2) of the 12BA7, test point B. Use a suitable meter range, such as 0—10 volts. Proper operation of the oscillator is indicated by negative voltage of approximately the value given in the chart (measured with 20,000-ohms-per-volt meter) throughout the tuning range.

FM Chart

STEP	TEST POINT	SIG. GEN. FREQ.	RADIO TUNING	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION

AM ALIGNMENT PROCEDURE

Make alignment with loop aerial connected to radio. The AM alignment should be completed before the FM alignment is made.

DIAL POINTER — With tuning-condenser plates fully meshed, adjust pointer to coincide with index mark at low-frequency end of scale.

RADIO CONTROLS — Set volume control to maximum, set band switch for broadcast reception, and set tuning control a, indicated in chart.

OUTPUT METER — Connect across voice-coil terminals.

SIGNAL GENERATOR — Use AM r-f signal generator, with modulated output. Connect generator and set frequency as indicated in chart.

OUTPUT LEVEL — During alignment, signal-generator output must be attenuated to hold output-meter reading below 1.25 volts.

FM ALIGNMENT PROCEDURE

Make AM alignment first.

RADIO CONTROLS — Set volume control to maximum, set band switch for FM reception, and set tuning control as indicated in chart.

OUTPUT METER — Connect across voice-coil terminals. (This meter is used only for step 3.)

D-C VOLTMETER — Connect negative lead of d-c voltmeter (resistance of at least 20,000 ohms per volt) to pin 2 of 19T8 tube, and positive lead to chassis. Use 0—10-volt range.

SIGNAL GENERATOR — Use AM r-f signal generator, with modulated output. Connect ground lead to chassis. Connect output lead and set frequency as indicated in chart. Generator must have sufficient output to give reading of approximately 8.5 volts on d-c voltmeter; during alignment, generator output must be attenuated to hold meter reading at this value.

NOTE: Before starting FM alignment, allow radio and signal generator to warm up for 15 minutes.

MODIFICATIONS

MODEL 50-925 - Service Replacement
When replacing C-208, use the following:
C-208, Condenser, tone compensation, .0068mf 30-4650-91

PRE-PRODUCTION CHANGES - To Increase Undistorted Output:
R-204, Resistor, cathode bias, 100 ohms 66-1108340*

FOUR ADDITIONS TO IMPROVE F-M

1 A .01 mf condenser, C-111, has been added from the filament, pin #5, of the 12BA7 to ground in parallel with C-110.
C-111 Condenser, filament by-pass, .01 mf 61-0120*

2 A 100 mmf condenser, C-414, has been added from pin #4 of J-400 to ground, making the low side of the primary of the F-M antenna coil ground at r-f potential. This is to prevent the F-M r-f stage from oscillating when the antenna is disconnected.
C-414, Condenser, r-f by-pass, 100 mmf 62-110009001*

3) A tube shield has been added to the 12BA6, 1st I-F amplifier.
Shield 56-3979FA5
Shield Base 56-3976FA5

4 A special lead shield assembly has deen added to the 12BA7 converter tube to reduce microphonics in the F-M band.
Socket, 12BA7 27-6249
Tube shield and Lead Weight assembly 76-5124
C-406, Condenser, r-f by-pass, .047 mf 30-4650 45
A pilot lamp, I-100, has been added to improve dial lighting. It is wired from the junction of L-100 and R-100 to ground.
I-100, Pilot Lamp 110-125V., intermediate base 34 2603*
Pilot Lamp Socket 27 6233 34
Pilot Lamp Shield 56 6331FA2
Spring Clip, Pilot Lamp socket mtg. 28 2488FA1

RUN #2 - To Improve Conversion Gain
L-401 Coil, AM oscillator 32 4153 5

RUN #3 Prevention of Selenium Rectifier Burnouts
CR-100, has been changed to one of higher current rating.
RUN #2R and #3 are identical.
CR-100 Selenium Rectifier, 150 ma 34 8300 2

RUN #4 Also to prevent rectifier burnout and to reduce ripple current in the electrolytic condenser, C-102, and additional 20 ohm current limiting resistor, R-103, has been added between L-100 and R-100. This resistor wires between pin #3 of the 50C5 socket and the ungrounded lug of the 2 lug terminal panel, the junction of C-101, C-103 and the white wire to R-100.

R-103 Resistor, current limiting, 20 ohms 33-1345

Part Number Changes:-

C-305 Condenser, screen by pass .003 mf 61 0109*
L-400 Coil, F-M r-f 32 4392-1
L-402 Coil, F-M osc. 32 4391-1
LA400, Loop Aerial 32-4052-35
Pointer 54-4599

Circuit Description

Philco Radio-Phonograph Model 50-1420 is a table-model 5-tube superheterodyne radio with a Model M-9C Automatic Record Changer. For service information on the record changer, refer to the Service Manual (PR-1599) for Model M-9C Automatic Record Changer.

Reception is provided on the standard broadcast band.

The built-in loop aerial normally provides adequate signal pickup; however, a terminal is provided for an external aerial, if additional pickup is required.

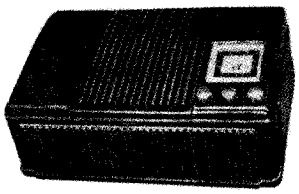
The loop works directly into a 12BE6 converter; no series padder is required for the oscillator, as the tuning-condenser plates are shaped for tracking.

The i-f stage employs a 12BA6, operating at 455 kc. Both transformers are permeability-tuned in both primary and secondary windings.

The diode section of a 6AQ6 provides detection and a-v-c voltage; the triode section is the 1st audio amplifier, and is resistance-coupled to a 35L6GT beam-power output amplifier, which works into a PM speaker.

The d-c operating voltages are supplied by a voltage-doubling circuit using a 50Y7GT rectifier and a resistance-capacitance filter.

The 120,000-ohm resistor, R103, is connected between B— and the chassis, to prevent hum due to condenser leakage under high-humidity conditions.



MODEL 50-1420

SPECIFICATIONS

CABINET	Brown molded bakelite
RADIO CIRCUIT	Five-tube superheterodyne
FREQUENCY RANGE	540—1600 kc.
AUDIO OUTPUT	2 watts
OPERATING VOLTAGES	105—120 volts, 60 cycles, a.c.
POWER CONSUMPTION	
Radio only	35 watts
Radio-phonograph	50 watts
AERIAL	Built-in loop; terminal also provided for external aerial
INTERMEDIATE FREQUENCY	455 kc.
PHILCO TUBES (5)	12BE6, 12BA6, 6AQ6, 35L6GT, 50Y7GT
PHONOGRAPH	Philco Automatic Record Changer Model M-9C (for service information see manual PR-1599)

TP-6527

Philco TROUBLE-SHOOTING Procedure

For rapid trouble shooting, the radio circuit is divided into four sections, as follows:

Section 1—the power supply
Section 2—the audio circuits
Section 3—the i-f, detector, and a-v-c circuits
Section 4—the r-f and converter circuits

Test points are specified for each section, and are indicated in the sectionalized schematic diagram. The trouble-shooting procedure given for each section includes a simplified test chart and a bottom view of the chassis showing the locations of the test points and the components of that section.

In each chart, the first step is a master check for determining whether trouble exists in that section, without going through the entire chart.

Failure to obtain the "NORMAL INDICATION" in any given step indicates trouble within the circuit under test.

After isolating the trouble to a single stage, the defect is located by: first, testing the tube; second, measuring tube electrode voltages; third, measuring circuit resistances; fourth, substituting condensers. The trouble revealed should be corrected before testing further.

Preliminary Checks

To avoid possible damage to the radio, the following preliminary checks should be made before turning on the power:

1. Inspect both the top and the bottom of the chassis. Make sure that all tubes are secure in the proper sockets, and look for any broken or shorted connections, burned resistors, or other obvious indications of trouble.

2. Measure the resistance between B+ (pin 4 of the 50Y7GT) and B—, test point B. When the ohmmeter leads are connected in the proper polarity, the highest resistance reading will be obtained. If the reading is lower than 2000 ohms, check condenser C102A for leakage or a short. This resistance value, which is much lower than normal, does not represent a quality check of this condenser; it is the lowest value which will permit the rectifier to operate safely while the voltage checks of Section 1 (power supply) are performed.

©John F. Rider

MODEL 50-1420

Section 1—Power Supply

TROUBLE SHOOTING

For the tests in this section, use a d-c voltmeter. Connect the negative lead to B—, test point B; connect the positive lead to the test points indicated in the chart. The voltage readings given were taken with a 20,000-ohms-per-volt meter at a line voltage of 117 volts, a.c.

Turn on the power, and set the volume control to minimum.

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 2 (audio circuits); if not, isolate and correct the trouble in this section.

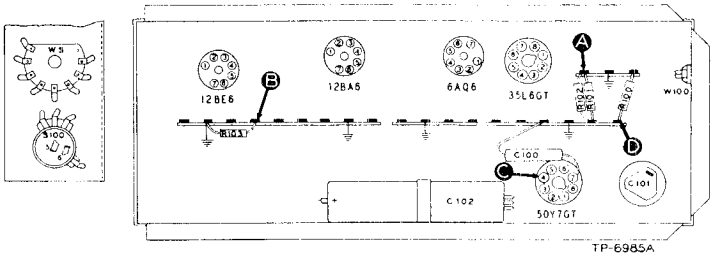


Figure 1. Bottom View, Showing Section 1 Test Points

STEP	TEST POINT	NORMAL INDICATION	ABNORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	120 volts		Trouble in this section. Isolate by the following tests.
2	C	212 volts	No voltage	Defective: 50Y7GT, I100. Shorted: C100, C101, C102A.
			Low voltage	Leaky: C100, C101, C102A.
			High voltage	Open: R100.
3	D	205 volts	No voltage	Defective: 50Y7GT. Shorted: C102B. Open: R100.
			Low voltage	Leaky: C102B.
			High voltage	Open: R101, R102, T200*.
4	A	120 volts	No voltage	Shorted: C102C. Open: R101 and R102 (in parallel).
			Low voltage	Leaky: C102C.

* This part, located in another section, may cause abnormal indication in this section.

Section 2—Audio Circuits

TROUBLE SHOOTING

For the tests in this section, use an audio-frequency signal generator. Connect the generator ground lead to B—, test point B; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Set the radio volume control to maximum, and the radio-phono switch as indicated in the chart.

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 3 (i-f, detector, and a-v-c circuits); if not, isolate and correct the trouble in this section.

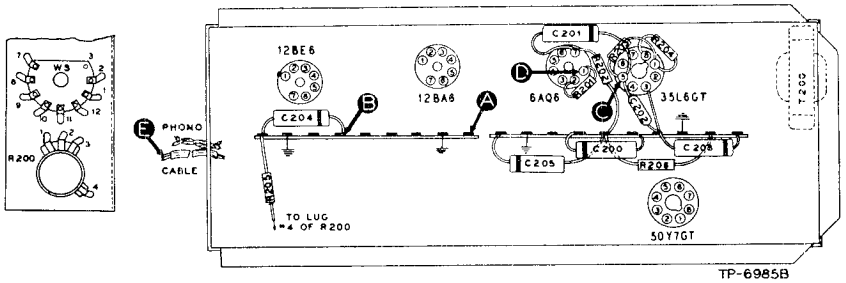

Figure 2. Bottom View, Showing Section 2 Test Points

STEP	TEST POINT	RADIO-PHONO SWITCH	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1 (a)	A	Radio	Loud, clear speaker output with moderate generator input.	Trouble in this section. Isolate by the following tests.
1 (b)	E	Phono		
2	C	Radio	Clear output with strong input.	Defective: LS200, 35L6GT. Shorted: T200, C203, C201, C204, C202. Open: T200, R204, R205, R203. Leaky: C203.
3	D	Radio	Loud, clear output with moderate input.	Defective: 6AQ6. Shorted: C200, C205. Open: C201, R202, R201, R206. Leaky: C201.
4	A	Radio	Loud, clear output with moderate input.	Open: R200 (rotate), C200, WS. Shorted: WS.
5	E	Phono	Same as step 4.	Open or shorted: WS.
Listening Test: Distortion may be caused by leaky C201. Distortion on strong signals may be caused by shorted or leaky C200.				

©John F. Rider

Section 3—I-F, Detector, and A-V-C Circuits

TROUBLE SHOOTING

For the tests in this section, use an r-f signal generator, with modulated output, set at 455 kc. Connect the generator ground lead to B—, test point B; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Set the radio volume control to maximum, and the radio-phono switch to the radio position. Rotate the tuning control until the tuning condenser is fully meshed.

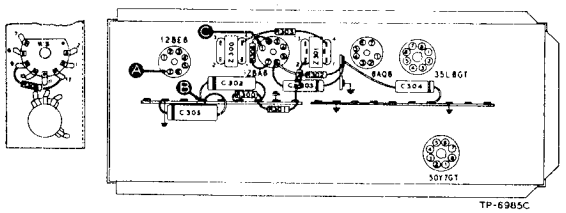

Figure 3. Bottom View, Showing Section 3 Test Points

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 4 (r-f and converter circuits); if not, isolate and correct the trouble in this section.

To provide a complete i-f amplifier check, test point A for this section is placed at the grid of the mixer in Section 4; therefore, the effectiveness of step 1 as a master check is dependent upon the condition of certain parts in the mixer circuit. These parts are listed below under "POSSIBLE CAUSE OF ABNORMAL INDICATION."

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	Loud, clear speaker output with weak generator input.	Trouble in this section. Isolate by the following tests.
2	C	Loud, clear output with strong input.	Defective: 12BA6, 6AQ6. Shorted: C300B, C301A, C301B, C301C, C301D, C303, C304, WS, L300B, L301A, L301B. Open: R302, R303, R304, R305, L300B, L301A, L301B, R301, C301A, C301B. Leaky: C303, C304. Misaligned: Z301.
3	A	Loud, clear output with weak input.	Defective: 12BE6*. Shorted: C400A*, C400B*, C300A, L300A, L300B, C302. Open: L300A, R300, C300A, C300B. Misaligned: Z300.

* This part, located in another section, may cause abnormal indication in this section.

Section 4—R-F and Converter Circuits

TROUBLE SHOOTING

For the tests in this section, with the exception of the oscillator test, use an r-f signal generator with modulated output. Connect the generator ground lead to B—, test point B; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Set the radio volume control to maximum, and the radio-phono switch to the radio position. Set the tuning control and signal-generator frequency as indicated in the chart.

If the "NORMAL INDICATION" is obtained in step 1, further tests should be unnecessary; if not, isolate and correct the trouble in this section. If the trouble is not revealed by the tests for this section, check the alignment.

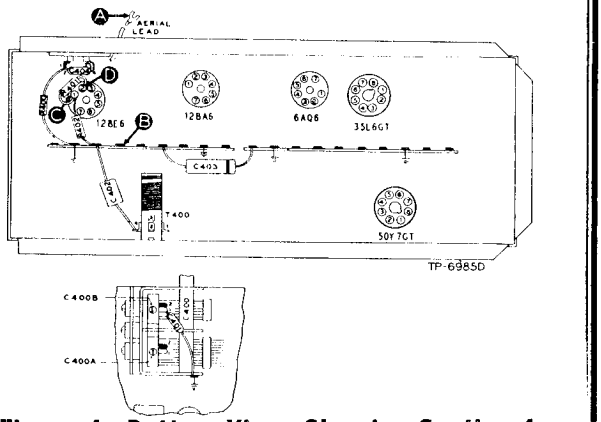

Figure 4. Bottom View, Showing Section 4 Test Points

STEP	TEST POINT	SIG. GEN. FREQ.	RADIO TUNING	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	1000 kc.	Tune to signal.	Loud, clear speaker output with weak generator input.	Trouble in this section. Isolate by the following tests.
2	C—D Osc. Test (see note below).		Rotate through range.	Negative 1.8 to 3.2 volts.	Defective: 12BE6. Shorted: C400, C400B, C402, C401, L400A, L400B. Open: C402, L400A, L400B, R401, R402.
3	A	1000 kc.	Tune to signal.	Same as step 1.	Shorted: LA400, C400, C400A. Open: LA400, C404.

OSCILLATOR TEST: Connect the positive lead of a high-resistance voltmeter to the oscillator cathode (pin 2 of 12BE6), test point D; connect the prod end of the negative lead through a 100,000-ohm isolating resistor to the oscillator grid (pin 1 of 12BE6), test point C. Use a suitable meter range, such as 0—10 volts. Proper operation of the oscillator is indicated by negative voltage within the range given in the chart (measured with a 20,000-ohms-per-volt meter) throughout the tuning range.

REPLACEMENT PARTS LIST

NOTE: A part number identified by an asterisk (*) indicates a general replacement item. The part numbers of these items may not be identical with those on factory parts; also, the electrical values of some replacement items may differ from the values given in the schematic diagram and parts list. The values substituted in any case are so chosen that the operation of the radio will be either unchanged or improved. When ordering replacements, use only the "Service Part No."

ALIGNMENT PROCEDURE

DIAL—With tuning condenser fully meshed, set pointer to index mark at low-frequency end of dial, beyond "55"

RADIO CONTROLS—Set volume control to maximum, and radio-phono switch to radio position.
OUTPUT METER—Connect to voice-coil terminals.

SIGNAL GENERATOR—Connect ground lead to B—, test point B in figure 4, and connect output lead as indicated in chart. Use modulated output.

OUTPUT LEVEL—During alignment, adjust signal-generator output to hold output-meter indication below 1.25 volts.

STEP	SIGNAL GENERATOR		RADIO		ADJUST
	CONNECTION TO RADIO	DIAL SETTING	DIAL SETTING	SPECIAL INSTRUCTIONS	
1	Through .1-mf. condenser to external-aerial lead. Make sure that radio loop aerial is connected to radio.	455 kc.	Tuning condenser fully meshed.	Adjust, in order given, for maximum output.	TC301B—2nd i-f sec. TC301A—2nd i-f pri. —SEE NOTE TC300B—1st i-f sec. TC300A—1st i-f pri. —SEE NOTE
2	Radiating loop (see note below).	1600 kc.	1600 kc.	Adjust for maximum output.	C400B—osc.
3	Same as step 2.	1500 kc.	1500 kc.	Adjust for maximum output.	C400A—aerial

RADIATING LOOP: Make up a 6—8-turn, 6-in-diameter loop, using insulated wire; connect to signal-generator leads and place near radio loop aerial.

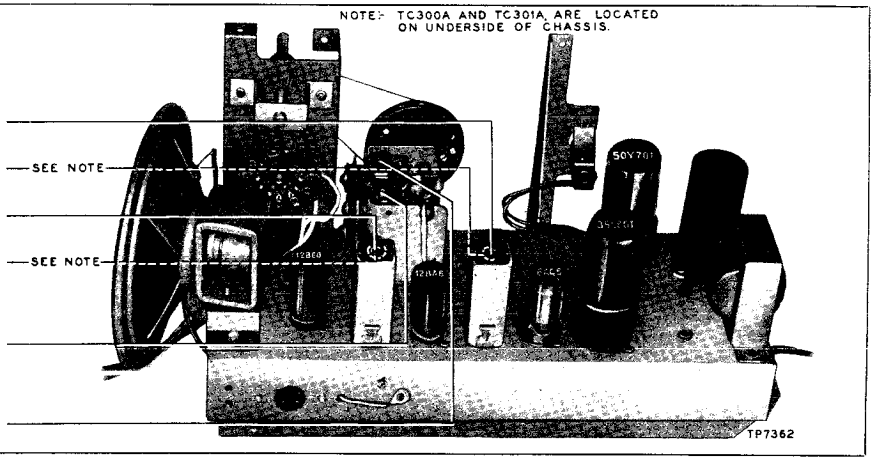

Figure 6. Top View, Showing Trimmer Locations

SYMBOLIZATION

The components in the radio circuit are symbolized according to the types of parts and the sections of the radio in which the parts are located. The prefix letter of the symbol designates the type of part, as follows:

C—condenser	LS—loud-speaker	W—wire or cable
I—pilot lamp	R—resistor	WS—wafer switch
L—choke or coil	S—switch	Z—electrical assembly
LA—loop aerial	T—transformer	

The number of the symbol designates the section in which the part is located, as follows:

100-series components are in Section 1—the power supply
200-series components are in Section 2—the audio circuits
300-series components are in Section 3—the i-f, detector, and a-v-c circuits
400-series components are in Section 4—the r-f and converter circuits

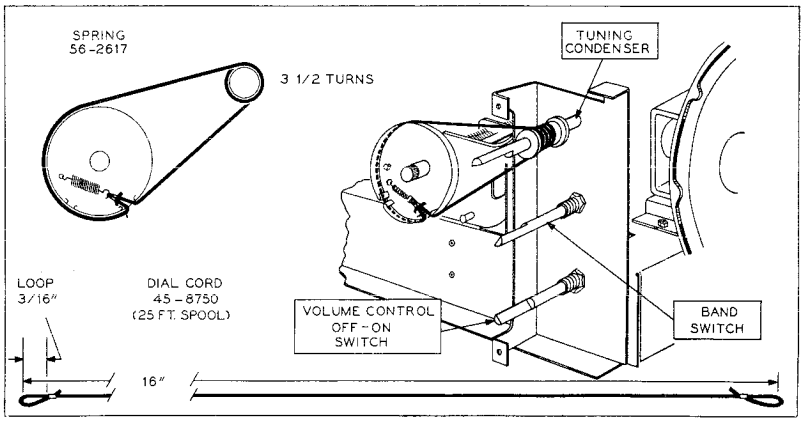

Figure 7. Drive-Cord Installation Details

Circuit Description

Philco Model 50-1725 is a console-model radio-phonograph, which provides reception on the standard-broadcast and FM bands. The radio is a seven-tube superheterodyne, with two selenium rectifiers incorporated in the power supply.

A built-in, high-impedance loop aerial for the broadcast band and a line-cord aerial for the FM band normally provide adequate signal pickup; if additional pickup is required, Philco Dipole Aerial, Part No. 45-1462, may be used. When connecting the dipole aerial disconnect the black lead from terminal 2 of TB400 and attach this lead to pin 1 of the dipole-aerial plug which fits into J400. No additional coupler is required.

To eliminate complicated switching and to provide better stability and greater gain on both bands, separate converter tubes are used for broadcast and FM reception. A 12AU6 high-gain pentode is used in a tuned r-f amplifier on the FM band. The output of this tube is fed to the 14F8 dual triode, which functions as the converter for the FM signal. A 12AU7 dual triode is used as the converter for the broadcast signal. Band switching is accomplished by means of a single-wafer switch, which connects the B+ voltage to the proper mixer plate.

A 6BJ6 tube is used in each of the two i-f amplifier stages. Two sets of i-f transformers are used—one set is tuned to 455 kc. for broadcast, and the other set is tuned to 9.1 mc. for FM. The use of two sets of i-f transformers makes better shielding possible, so that undesirable beat signals and interaction between transformers are eliminated.

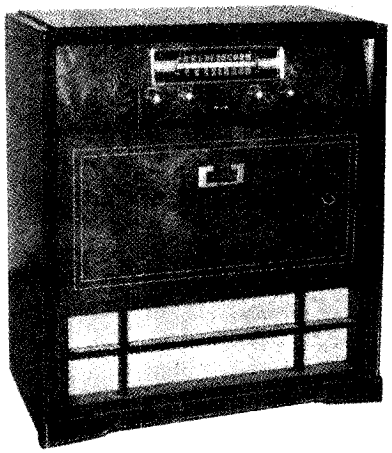
Two diode sections of a 19T8 triple-diode are used in a ratio-detector circuit, for detection of FM signals. The other diode section is used in a half-wave rectifier circuit, for detection of AM (broadcast) signals and to provide a-v-c action.

The triode section of the 19T8 functions as the first audio amplifier. The output of this stage is resistance-coupled to a 50C6G output tube, which is transformer-coupled to the permanent-magnet speaker.

Two selenium rectifiers are used in a half-wave voltage-doubler circuit, to supply the B+ voltage.

Philco TROUBLE-SHOOTING Procedure

For rapid trouble shooting, the radio circuit is divided into four sections with test points specified for each section these sections and test points are indicated in the schematic diagram. The trouble-shooting procedure given for each section includes a simplified test chart and a bottom view of the chassis showing the locations of the test points and the components of that section.



MODEL 50-1725

SPECIFICATIONS

CABINET	Wood console, mahogany finish
CIRCUIT	Seven-tube superheterodyne plus rectifiers
FREQUENCY RANGES	
Broadcast	540—1620 kc.
FM	88—108 mc.
AUDIO OUTPUT	5 watts
OPERATING VOLTAGE	105—125 volts, 60 cycles, a.c.
POWER CONSUMPTION	
Radio	65 watts
Phonograph	85 watts
AERIALS	Built-in, semi-high-impedance loop for broadcast; line-cord aerial for FM
INTERMEDIATE FREQUENCY	
AM	455 kc.
FM	9.1 mc.
PHILCO TUBES (7)	12AU6, 12AU7, 14F8, 6BJ6(2), 19T8, 50C6G, selenium rectifier (2)

MODEL 50-1725

In each chart, the first step is a master check for determining whether trouble exists in that section without going through the entire test procedure.

Failure to obtain the "NORMAL INDICATION" in any given step indicates trouble within the circuit under test.

After isolating the trouble to a single stage, the defect is located by: first, testing the tube; second, measuring tube electrode voltages; third, measuring circuit resistances; fourth, substituting condensers. The trouble revealed should be corrected before testing further.

Preliminary Checks

To avoid possible damage to the radio, the following preliminary checks should be made before it is turned on:

1. Inspect both the top and the bottom of the chassis. Make sure that all tubes are secure in the proper sockets, and look for any broken or shorted connections, burned resistors, or other obvious sources of trouble.

2. Measure the resistance between B+, test point C, and B—, test point B. When the ohmmeter test leads are connected in the proper polarity, the highest resistance reading will be obtained. If the reading is lower than 2500 ohms, check condensers C103A, C103B, and C316 for leakage or shorts. The resistance value given is much lower than normal, and is not intended as a quality check of these condensers; the value given is the lowest at which the rectifier will operate safely while the voltage checks of Section 1 (power supply) are performed.

Important!

To avoid altering FM operation, special care should be used in replacing any part. Replacement parts should be placed in the same physical positions as the original parts; connections should be of the same length, and should be soldered to the same points. The placement or length of leads should not be altered.

Section 1 TROUBLE SHOOTING

POWER SUPPLY

For the tests in this section, use a d-c voltmeter. Connect the negative lead to B—, test point B; connect the positive lead to the test points indicated in the chart. The voltage readings given were taken with a 20,000-ohms-per-volt meter at a line voltage of 117 volts, a.c.

Turn on the power, and set the volume control to minimum. Turn the tone control fully clockwise, and set the band switch to the broadcast position.

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 2 (audio circuits); if not, isolate and correct the trouble in this section.

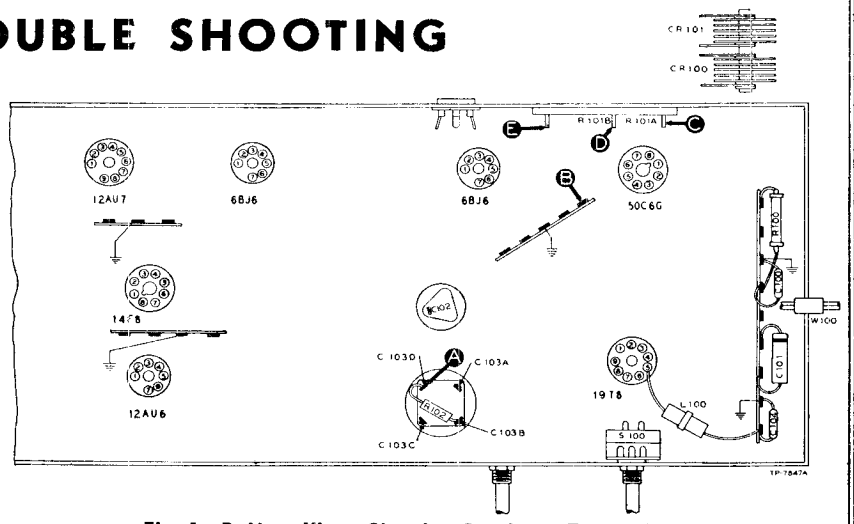

Fig. 1. Bottom View, Showing Section 1 Test Points

STEP	TEST POINT	NORMAL INDICATION	ABNORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	145v		Trouble in this section. Isolate by the following tests.
2	C	230v	No voltage.	Defective: CR100, CR101. Open: C102, W100, R100, S100. Shorted: C103A, C101, C104, C100, C313*, C330*.
			Low voltage.	Defective: CR100, CR101. Open: C103A. Shorted or leaky: C103B.
			High voltage.	Open: R101A, R101B, R102.
3	D	205v	No voltage.	Open: R101A. Shorted: C103B.
			Low voltage.	Leaky: C103B. Shorted: C103C, C316*.
			High voltage.	Open: R101B, R102, R206*, T200*.
4	E	160v	No voltage.	Open: R101B. Shorted: C103C.
			Low voltage.	Leaky: C103C. Shorted: C103D, C310*, C315*.
			High voltage.	Open: R102, R315*.
5	A	145v	No voltage.	Open: R102. Shorted: C103D.
			Low voltage.	Leaky: C103C.
Listening Test: Abnormal hum may be caused by open C103A, C103B, C103C, or C103D.				

* This part, located in another section, may cause abnormal indication in this section.

Section 2

TROUBLE SHOOTING

AUDIO CIRCUITS

For the tests in this section, use an audio-frequency signal generator. Connect the generator ground lead to B—, test point B; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Set the volume control to maximum, and turn the tone control to the midpoint of its range. Set the band switch to the broadcast position for test points A, C, and D, and to the phono position for test point E.

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 3 (i-f, detector, and a-v-c circuits); if not, isolate and correct the trouble in this section.

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A E	Loud, clear speaker output with weak generator input.	Trouble in this section. Isolate by the following tests.
2	C	Clear signal with strong input.	Defective: 50C6G, LS200. Open: T200, R205, R206. Shorted: C206, C207, T200, C209.
3	D	Same as step 1.	Defective: 19T8. Open: C204, R202, R203. Shorted: C203, C205 (rotate R204), C204, C208.
4	A	Same as step 1.	Open: R200 (rotate through range), C200, C201, WS-1 (R). Shorted: C200, C201, C305D*.
5	E	Same as step 1.	Open: WS-1 (R).
Listening Test: Distortion may be caused by shorted or leaky C201 or C204. Distortion on strong signals may be caused by leaky or shorted C200.			

* This part, located in another section, may cause abnormal indication in this section.

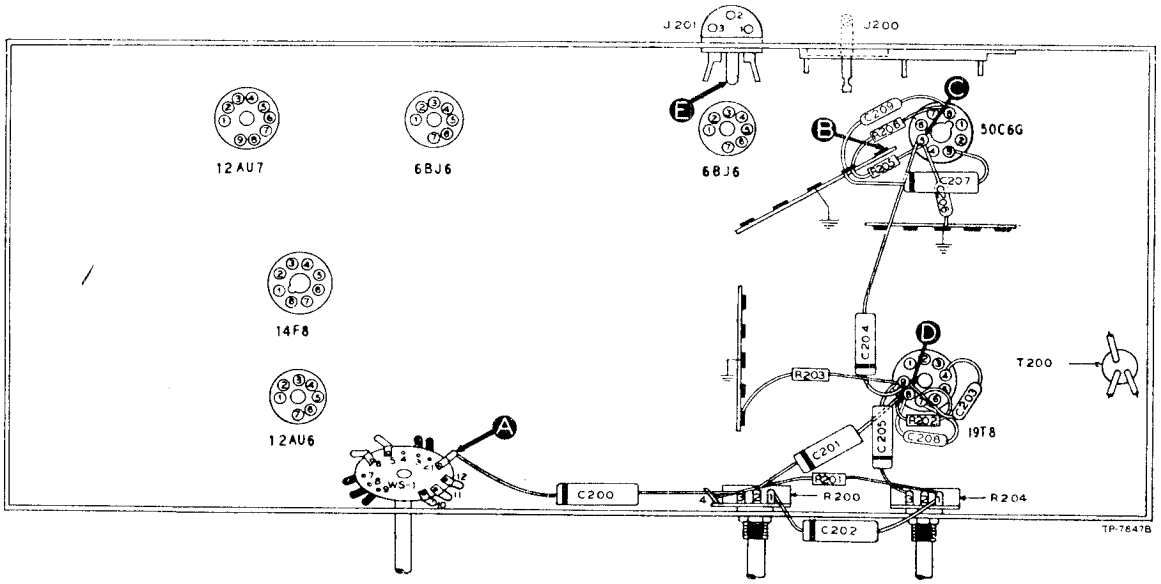

Fig. 2. Bottom View, Showing Section 2 Test Points

Section 3

TROUBLE SHOOTING

I-F, DETECTOR, AND A-V-C CIRCUITS

AM Circuits

For the following tests, use an r-f signal generator, with modulated output, set at 455 kc. Connect the generator ground lead to B—, test point B; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Set the volume control to maximum, and turn the tone control to the midpoint of its range. Set the radio-phono switch to the radio position, and rotate the tuning control until the tuning condenser is fully meshed.

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 4 (r-f and converter circuits); if not, isolate and correct the trouble in this section.

To provide a complete i-f-amplifier check, test point A for this section is placed at the grid of the mixer in Section 4; therefore, the effectiveness of step 1 as a master check is dependent upon the condition of certain parts in the mixer circuit. These parts are listed below under the "POSSIBLE CAUSE OF ABNORMAL INDICATION."

MODEL 50-1725

Section 3 (Cont.)

TROUBLE SHOOTING

I-F, DETECTOR, AND A-V-C CIRCUITS

AM Chart

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	Loud, clear speaker output with weak generator input.	Trouble in AM circuits. Isolate by the following tests.
2	C	Loud, clear output with strong input.	Defective: 6BJ6, (2nd i-f amplifier), 19T8 (diode section). Open: Z302, Z303, Z304, Z305, R307, R308, R309, R310, R311, WS-1 (F). Shorted Z302, Z303, Z304, Z305, C314, C315, C316, C319. Misaligned: Z305.
3	D	Loud, clear output with moderate input.	Defective: 6BJ6 (1st i-f amplifier). Open: R303, R304, R305, R306, Z300, Z301, Z302, Z303. Shorted or leaky: C308, C310, Z300, Z301, Z302, Z303. Misaligned: Z303.
4	A	Same as step 1.	Defective: 12AU7. Open Z301, R301, R302, R408*, R411*, R412*, WS-1 (F). Shorted or leaky: C307, Z301. Misaligned: Z301.

* This part, located in another section, may cause abnormal indication in this section.

FM Circuits

The following tests are also made with an AM r-f signal generator, using modulated output.

Observe the instructions preliminary to the tests for the AM circuits, with these exceptions: Set the band switch to the FM position. Set the signal-generator frequency to 9.1 mc., and detune to one side or the other until a satisfactory test signal is obtained.

The best indication of satisfactory FM-detector operation is the ability of this circuit to take the alignment properly (see page 11).

The parts which were found to be satisfactory for AM operation, with the exception of those indicated in the chart, will usually be satisfactory for FM operation.

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 4 (r-f and converter circuits); if not, isolate and correct the trouble in the FM circuits.

FM Chart

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	E	Loud, clear speaker output with weak generator input.	Trouble in FM circuits. Isolate by the following tests.
2	C	Loud, clear output with strong input.	Defective: 6BJ6 (2nd i-f amplifier), 19T8 (diode sections). Open Z304, C317, C318, C320, C321, C322, C323, R312, R313, R314, WS-1 (R)*. Shorted: Z304, C317, C318, C320, C321, C322, C323, C332, WS-1 (R)*. Misaligned: Z304.
3	D	Loud, clear output with moderate input.	Defective: 6BJ6 (1st i-f amplifier). Misaligned: Z302. Shorted: Z302.
4	E	Same as step 1.	Defective: 14F8*. Open: Z300, R300, R405*, R410*, L407*, WS-1 (F). Shorted: C306, C420*, C328, Z300, WS-1 (F). Misaligned: Z300.

* This part, located in another section, may cause abnormal indication in this section.

Section 4

TROUBLE SHOOTING
R-F AND CONVERTER CIRCUITS

AM Circuits

For the tests in this section, with the exception of the oscillator test, use an AM r-f signal generator with modulated output. Connect the generator ground lead to B—, test point B; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Set the volume control to maximum, and turn the tone control to the midpoint of its range. Set the band switch to the broadcast position, and set the tuning control and the signal-generator frequency as indicated in the chart.

If the "NORMAL INDICATION" is not obtained in step 1, isolate and correct the trouble in the AM circuits. If the trouble is not revealed by the tests for this section, check the alignment.

FM Circuits

The following tests are also made with an AM r-f signal generator, using modulated output. Observe the instructions preliminary to the tests for the AM circuits with the following exceptions:

Set the band switch to the FM position.

If the "NORMAL INDICATION" is not obtained in step 1, isolate and correct the trouble in the FM circuits.

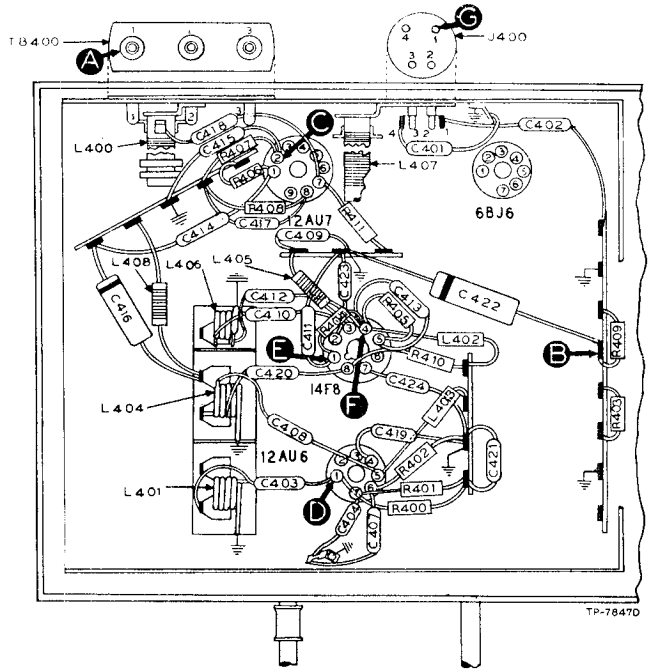

Fig. 4. Bottom View, Showing Section 4 Test Points

AM Chart

STEP	TEST POINT	SIG. GEN. FREQ.	RADIO TUNING	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	1000 kc.	Tune to signal.	Loud, clear speaker output with weak generator input.	Trouble in AM circuits. Isolate by the following tests.
2	C (Osc. test; see note below.)		Tune through range.	Negative 2 to 2.5 volts.	Defective: 12AU7 (osc. section). Shorted: C414, C415, C400, C405B, C417, L407. Open C414, C416, L408, L407, R412, R407, R406.
3	A	1000 kc.	Tune to signal.	Same as step 1.	Defective: 12AU7 (mixer section). Open: L400, L409, C418, R411, R408. Shorted: C400, C405A, C406, C417.

OSCILLATOR TEST: Connect the positive lead of a high-resistance voltmeter to B—, test point B; connect the prod end of the negative lead through a 100,000-ohm isolating resistor to the oscillator grid (pin 2 of 12AU7), test point C. Use a suitable meter range, such as 0—10 volts. Proper operation of the oscillator is indicated by negative voltage of approximately the value given in the chart (measured with 20,000-ohms-per-volt meter) throughout the tuning range.

FM Chart

STEP	TEST POINT	SIG. GEN. FREQ.	RADIO TUNING	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	G	100 mc.	Tune to signal.	Loud, clear speaker output with weak generator input.	Trouble in FM circuits. Isolate by the following tests.
2	E to F (Osc. test; see note below.)		Tune through range.	Negative 1 to 1.5 volts.	Defective: 14F8 (osc. section). Open: R409, L402, L406, L405, C412, R404, C410, R403. Shorted: C400, C400C, L406, C411, C412, C423, C424, C410, C409.
3	D	100 mc.	Tune to signal.	Same as step 1.	Defective: 12AU6. Open: L403, R402, R401, R400, C408, L404, C420, R410, R405, C413. Shorted: C403, C404, C407, C408, L404, C400B, C400, C420.
4	G	100 mc.	Tune to signal.	Same as step 1.	Open: C402, L401, C403. Shorted: L401, C400A, C400, C403.

OSCILLATOR TEST: Connect the positive lead of a high-resistance voltmeter to test point F; connect the prod end of the negative lead through a 100,000-ohm isolating resistor to the oscillator grid (pin 2 of 14F8), test point E. Use a suitable meter range, such as 0—10 volts. Proper operation of the oscillator is indicated by negative voltage of approximately the value given in the chart (measured with 20,000-ohms-per-volt meter) throughout the tuning range.

MODEL 50-1725

AM ALIGNMENT PROCEDURE

Make alignment with loop aerial connected to radio. The AM alignment should be completed before the FM alignment is made.

DIAL POINTER—Calibration and pointer-index measurements are shown in figure 7. With tuning gang fully meshed, set pointer to index marker.

OUTPUT METER—Connect between terminal 3 of aerial terminal board TB400 and chassis.

AM R-F SIGNAL GENERATOR—Connect as indicated in chart. Use modulated output.

RADIO CONTROLS—Set volume control to maximum, turn tone control fully counterclockwise, and set band switch to broadcast position.

OUTPUT LEVEL—During alignment, adjust signal-generator output to maintain output-meter indication below 1.25 volts.

FM ALIGNMENT PROCEDURE

Make AM Alignment First

OUTPUT METER—Connect between terminal 3 of aerial terminal board TB400 and chassis.

ALIGNMENT INDICATOR—Connect negative lead of 20,000-ohms-per-volt meter to pin 2 of 19T8 tube; connect positive lead to B—. Use 10-volt range.

AM R-F SIGNAL GENERATOR—Generator must have sufficient output to give a reading of 8.5 volts on alignment indicator. Connect ground lead to B—; connect output lead as indicated in chart. Use modulated output.

RADIO CONTROLS—Set volume control to maximum, turn tone control fully counterclockwise, and set band switch to FM position. Allow radio and signal generator to operate for at least 15 minutes before making alignment.

R-F-COIL—NOTE: Check resonance of coils L401, L404, and L406 by inserting each end of a powdered-iron tuning core such as Philco Part No. 56-6100, into the coils. If the signal strength increases when the iron end is inserted, compress the turns slightly. If the signal strength increases when the brass end is inserted, spread the turns slightly. If the signal strength decreases when either the iron or the brass end is inserted, no further adjustment is necessary. Do not spread or compress turns of coil excessively; only a small change is required at these high frequencies.

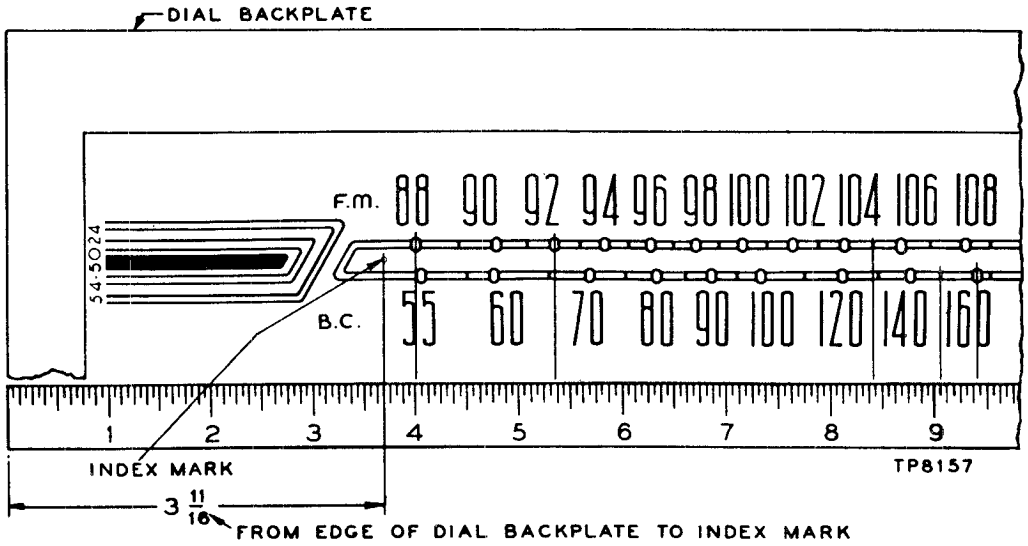

Figure 7. Dial-Backplate Calibration Measurements

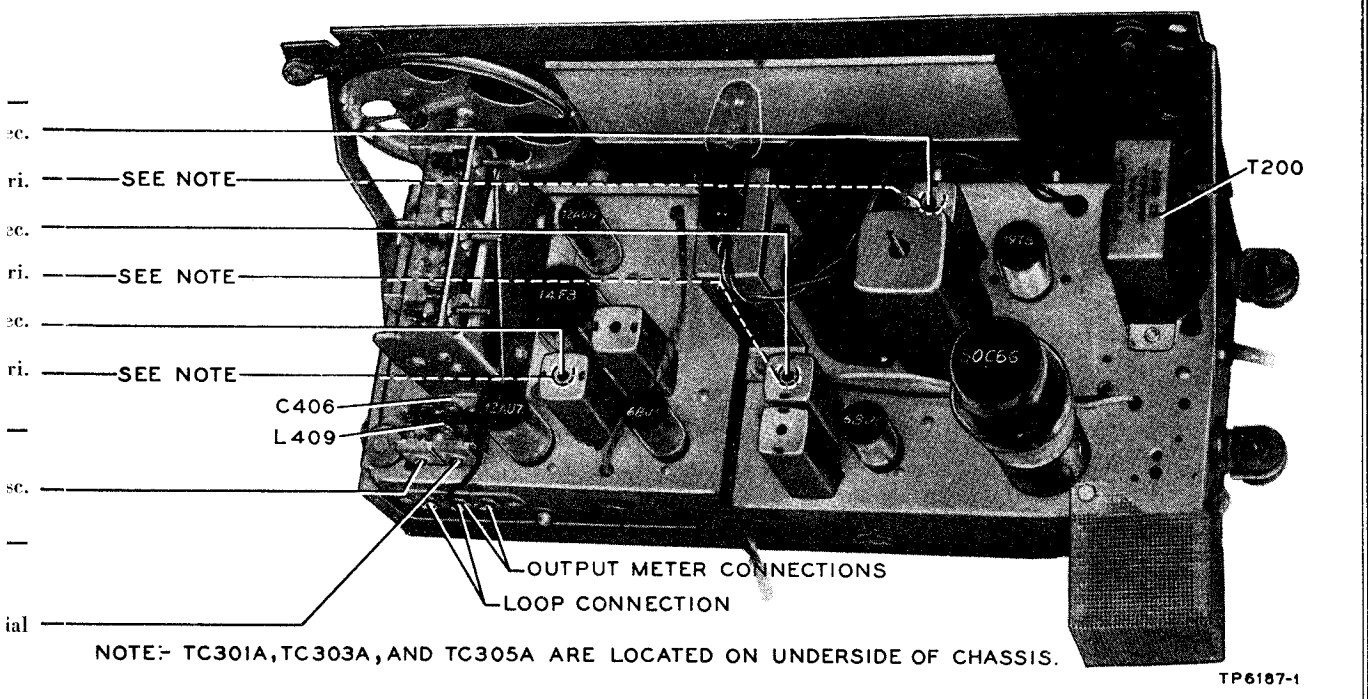

Figure 8. Top View, Showing AM Trimmer Locations

TP-5132-2

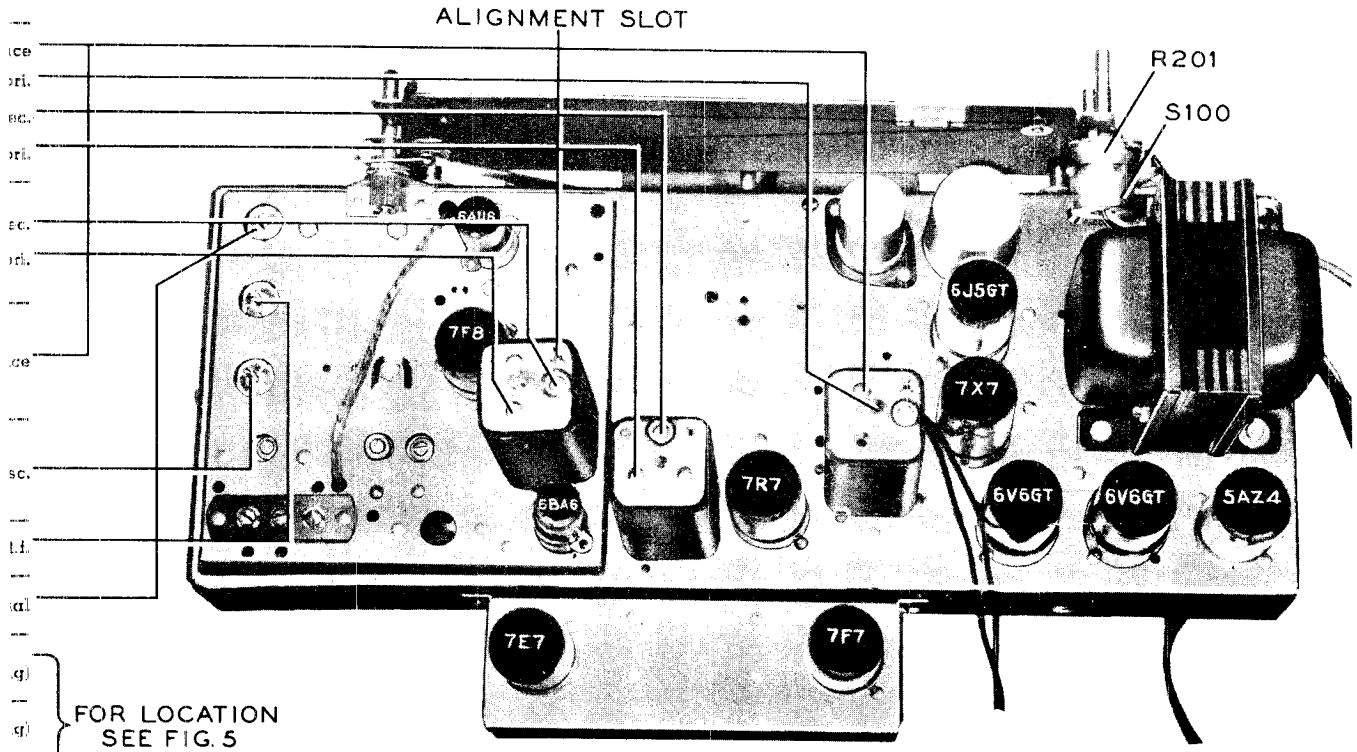

Figure 9. Top View, Showing FM Trimmer Locations

TP-5132-2

ALIGNMENT PROCEDURE

When the complete AM and FM alignment is to be made, the AM alignment should be made FIRST; if AM alignment is not required, the FM alignment alone may be made.

ALIGNMENT OF AM CIRCUITS

DIAL POINTER: With tuning condensers fully meshed, dial pointer must coincide with index mark at low-frequency end of dial. (See "CALIBRATING DIAL BACKPLATE," page 2.)

OUTPUT METER: Connect between No. 3 terminal (voice-coil connection) of aerial terminal panel and chassis.

AM R-F SIGNAL GENERATOR: Connect ground lead to chassis, and output lead as indicated in chart. Use modulated output.

OUTPUT LEVEL: During alignment, signal-generator output must be attenuated to maintain radio output below 1.5 volts, as read on output meter.

CONTROLS: Set band switch to broadcast position. Set volume control to maximum, and tone control fully counterclockwise. Set signal-generator frequency and radio tuning dial as indicated in chart.

ALIGNMENT OF FM CIRCUITS

Make AM alignment (if required) first.

OUTPUT METER: Connect as for AM alignment (this meter is used only in step 3).

D-C METER: Connect 20,000-ohms-per-volt meter across 2-mf. condenser, C327, in FM-detector circuit—negative lead to pin 6 of 7X7 tube, and positive lead to chassis. Use 10-volt range.

AM R-F SIGNAL GENERATOR: Use modulated output for entire alignment. Generator must have sufficient output to give reading of approximately 9 volts on d-c meter, and signal should be attenuated during alignment to keep meter at this value. Connect generator ground lead to chassis, and output lead as indicated in chart.

VOLUME AND TONE CONTROLS: Same as for AM alignment.

RADIO BAND SWITCH, RADIO DIAL, AND SIGNAL-GENERATOR DIAL: Set as indicated in chart. Allow radio and generator to warm up for 15 minutes before starting alignment.

R-F COIL NOTE: When making the tracking adjustments, the resonance of the circuits using coils L400, L401, and L403 may be checked with a powdered-iron tuning core such as Part No. 56-6100. If the signal strength (meter reading) increases when the iron end is placed in, or near, the coil, compress the turns slightly. If the threaded brass end causes an increase in signal strength, spread the turns. Do not compress or spread the turns excessively; only a small change is required at these frequencies.

MODEL 50-1726

Circuit Description

Philco Radio-Phonograph Model 50-1726 contains an 11-tube superheterodyne and a Model M-20 Philco Automatic Record Changer.

A low-impedance loop aerial within the cabinet normally provides adequate signal pickup on the standard broadcast band. In most locations, the built-in FM dipole aerial provides satisfactory FM reception. In areas where FM signals are weak, an outdoor dipole aerial, such as Philco Part No. 45-1462, will provide additional pickup. To increase the pickup on both bands, use the Philco Aerial Coupler, Part No. 76-2353-1, with the outdoor dipole aerial. For increased pickup on the standard broadcast band only, the coupler may be used with an external aerial of the single-wire type, such as Philco Part No. 45-1494.

The r-f stage (FM only) and converter stage are mounted on a separate chassis, for improved performance at high frequencies. A 6AU6 high-frequency pentode is used in the r-f stage, and a 7F8 high-frequency double triode is employed as a converter.

Two transformer-coupler i-f stages are used. The transformers have two sets of windings; one set is tuned to 455 kc., for AM operation, and the other set is tuned to 9.1 mc., for FM operation. A 6BA6 high-frequency pentode is used in the first i-f stage. The pentode section of a 7R7 duo-diode, pentode functions as the second i-f amplifier; one diode of this tube is used for AM detection, while the other diode provides a.v.c.

The dual-diode section of a 7X7 is employed in the FM ratio-detector circuit; this circuit has good noise-reducing properties and an excellent tuning characteristic.

The triode section of the 7X7 functions as the first audio stage. A 6J5GT triode operates as a plate-and-cathode-loaded phase inverter, driving two 6V6GT output amplifiers, in push-pull operation. Tone fidelity is obtained by the use of inverse feedback in the audio system; feed-back voltage is taken from the secondary of the output transformer.

The Philco Electronic Scratch Eliminator, for phono operation, may be switched on or off, as required. The pentode section of a 7E7 functions as a variable shunt capacitance at the phono-input circuit; at low signal levels, a controlled portion of the higher audio frequencies is by-passed to ground. The grid bias of the reactance tube controls the effective capacitance, which

becomes maximum with low bias, and minimum with high bias. This control bias is developed by the audio signal itself; a proportionate amount of the signal is taken from the pickup output, amplified by each triode section of the 7F7, and rectified by the diode section of the 7E7.

Philco TROUBLE-SHOOTING *Procedure*

For rapid trouble shooting, the radio circuit is divided into four sections, as follows:

Section 1—the power supply
Section 2—the audio circuits
Section 3—the i-f, detector, and a-v-c circuits
Section 4—the r-f and converter circuits

Test points are specified for each section, and are indicated in the sectionalized schematic diagram. The trouble-shooting procedure given for each section includes a simplified test chart and a bottom view of the chassis showing the locations of the test points and the components of that section.

In each chart, the first step is a master check for determining whether trouble exists in that section, without going through the entire chart.

Failure to obtain the "NORMAL INDICATION" in any given step indicates trouble within the circuit under test.

After isolating the trouble to a single stage, the defect is located by: first, testing the tube; second, measuring tube electrode voltages; third, measuring circuit resistances; fourth, substituting condensers. The trouble revealed should be corrected before testing further.

Preliminary Checks

To avoid possible damage to the radio, the following preliminary checks should be made before connecting the radio to a source of power:

1. Inspect the top and bottom of the chassis. Make sure that all tubes are secure in the proper sockets, and look for any broken or shorted connections, burned resistors, or other obvious indications of trouble.

2. Measure the resistance across condenser C102 (see figure 2). When the ohmmeter test leads are connected in the proper polarity, the highest resistance reading will be obtained. If the reading is lower than 3500 ohms, check condensers C102 and C103B for leakage or shorts.

The resistance value above, which is much lower than normal, does not represent a quality check of these condensers; the value given is the lowest at which the rectifier will operate safely while the voltage tests of Section 1 (power supply) are performed.

Important!

To avoid altering FM operation, special care should be used in replacing any part. Replacement parts should be placed in the same physical locations as the original parts; connections should be of the same length, and should be soldered to the same points. The placement or length of leads should not be changed.

CALIBRATING DIAL BACKPLATE

When the radio chassis has been removed from the cabinet, dial calibration and alignment points may be marked on the dial (chassis) backplate at the end of the pointer with a pencil. The method of measuring for these points is illustrated in figure 1.

With the tuning gang fully meshed, the pointer should be adjusted on the dial-drive cord to coincide with the index mark.

MODEL 50-1726

Section 1 TROUBLE SHOOTING

POWER SUPPLY

CAUTION: Do not turn on the power with the speaker disconnected, or the set may be damaged.

Make the tests for this section with a d-c voltmeter, connecting the leads between the chassis, test point C, and the test points indicated in the chart. The voltage readings given were taken with a 20,000-ohms-per-volt meter, at a line voltage of 117 volts, a.c.

Set the volume control to minimum, and the tone control fully counterclockwise. Set the band selector-phono switch to the broadcast position.

Follow the steps in the order given. If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 2 (audio circuits); if not, isolate and correct the trouble in this section.

STEP	TEST POINT	NORMAL INDICATION	ABNORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	195v		Trouble in this section. Isolate by the following tests.
2	B	300v	No voltage. Low voltage. High voltage.	Defective: 5AZ4. Open: S100, T100. Shorted: C102. Defective: 5AZ4. Shorted: C103B, C310*, C411*. Leaky: C102. Open: C102, L100. Shorted: L100. Open T200*.
3	A	195v	No voltage. Low voltage. High voltage.	Open: R100. Shorted: C103A, C311*. Leaky: C103A, C311*. Changed resistance: R100. Open: T200*.
4	D	Negative 27v	No voltage. High voltage.	Open: R101. Open: R102.
Listening Test: Abnormal hum and instability may be caused by open C103A or C103B.				

* This part, located in another section, may cause abnormal indication in this section.

Section 2

TROUBLE SHOOTING

AUDIO-AMPLIFIER TESTS

AUDIO CIRCUITS

Use an audio-frequency signal generator. Connect the generator ground lead to the chassis, test point C, and connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Set the volume control to maximum, and the tone control fully counterclockwise. Set the band (wafer) switch to the broadcast position. Make certain that the scratch-eliminator switch is turned off (two-position switch turned counterclockwise). If the "NORMAL INDICATION" is obtained in steps 1 and 6, proceed with the scratch-eliminator tests; if not, isolate and correct the trouble in the audio-amplifier circuits.

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	Loud, clear signal with weak signal input.	Trouble in audio-amplifier circuits. Isolate by the following tests.
2	B (Remove 6J5GT)	Clear signal with strong signal input.	Defective: 6V6GT(#1), LS200. Open: C206, R211, T200. Shorted or leaky: C206, C209.
3	D (6J5GT removed)	Same as step 2.	Defective: 6V6GT(#2). Open: C207, R212. Shorted or leaky: C207.
4	E (Replace 6J5GT)	Loud, clear signal with moderate signal input.	Defective: 6J5GT. Open: R208, R209, R207, R210. Shorted or leaky: C205, C204.
5	A	Same as step 1.	Defective: 7X7. Open: R200 (rotate through range), C202, R205, R206. Shorted: C203.
6*	F	Loud, clear signal with weak signal input.	Open: R230, WS-2(R).
Listening Test: Distortion may be caused by leaky C202, C205, C206, or C207; or by open R205, C207, C211, or C212.			

* For this step, set band (wafer) switch to phono.

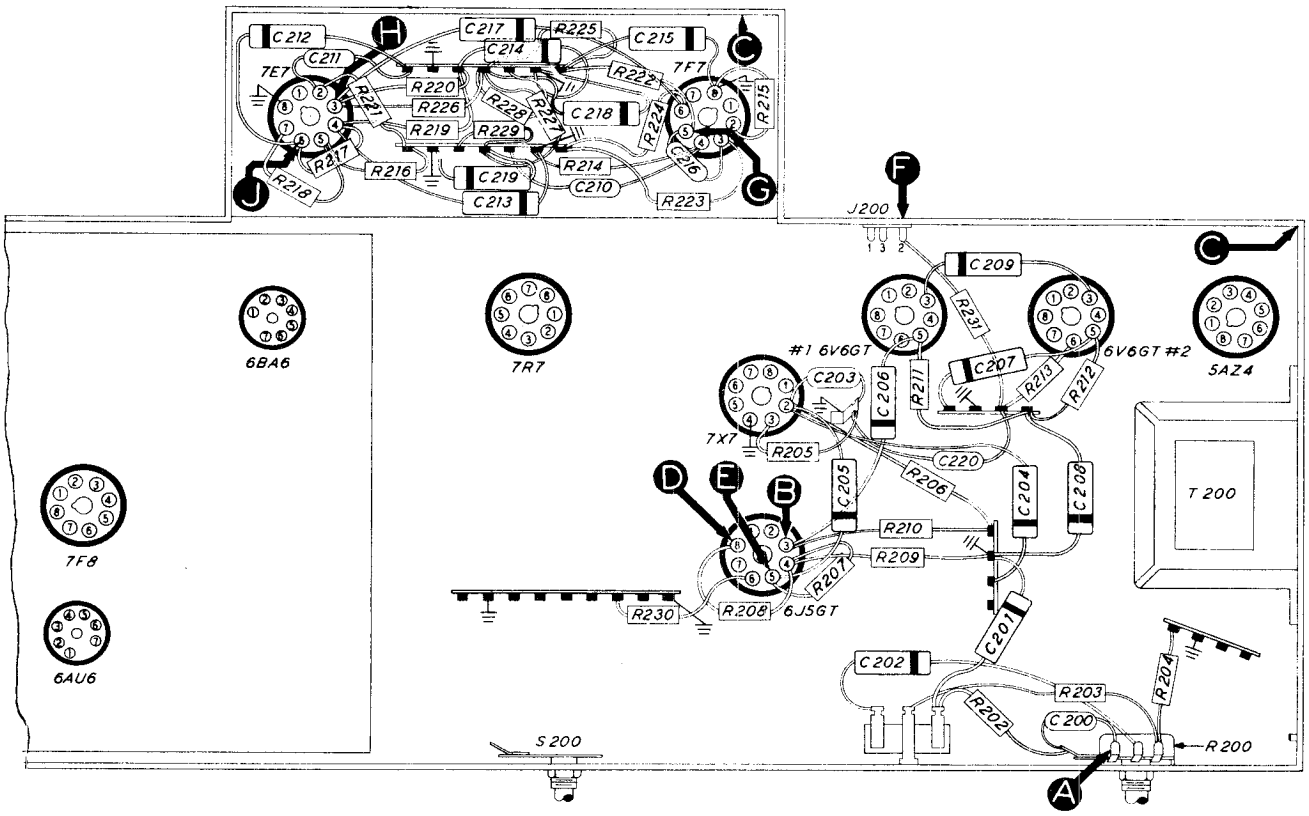

Figure 3. Bottom View, Showing Section 2 Test Points TP-6456-1

MODEL 50-1726

Section 2 (Cont.) TROUBLE SHOOTING

SCRATCH-ELIMINATOR TESTS

Set the tone control fully counterclockwise. Turn the band (wafer) switch to the phono position. For all steps except 1(b), set the volume control to maximum; for this step, adjust the volume control as directed in the chart.

Turn the scratch eliminator on or off as indicated in the chart. (The scratch eliminator is on when the two-position switch is turned clockwise.)

Connect an output meter across the *primary* of the output transformer, T200.

IMPORTANT! For all steps except step 4, use the 0—10-volt output-meter range; for step 4 only, use the 0—50-volt range. If the proper ranges are not used, erroneous readings will result.

Connect the ground lead of an audio signal generator to the chassis, test point C, and connect the output lead through a .1-mf. condenser to the test points indicated in the chart. Set the generator for 5000 cycles. Adjust the generator output as directed in the chart.

If normal operation is indicated by the tests in step 1, (a) and (b), proceed with the tests for Section 3 (i-f, detector, and a-v-c circuits); if not, isolate and correct the trouble in the scratch-eliminator circuits.

NOTE: For steps 2, 3, and 4, connect the positive lead of a 20,000-ohms-per-volt, d-c voltmeter to the chassis, test point C; connect the prod end of the negative lead through a 100,000-ohm isolating resistor to the "VOLTMETER" test points indicated in the chart.

STEP	TEST POINT	SIG. GEN. OUTPUT	VOLT-METER	SPECIAL INSTRUCTIONS	POSSIBLE CAUSE OF ABNORMAL INDICATION
1(a)	F	Adjust for 10v output-meter reading, with scratch-eliminator off.		Turn scratch eliminator on; output voltage should drop to 6.5v (approx.).	
1(b)	F	Same as for 1(a).		Reduce volume control to obtain output-meter reading of 1v. Increase generator output for output-meter reading of 10v. Turn scratch eliminator on; output voltage should not drop below 8.8v (approx.).	Trouble in scratch-eliminator circuits. Isolate by the following tests.
2	G	See SPECIAL INSTRUCTIONS.	H	With scratch eliminator on, increase generator output for voltmeter reading of 8.8v, negative; failure to obtain this value indicates trouble.	Defective: 7F7, 7E7 (diode section), WS-3(R). Open R224, R222, R226, R228, C217, S200.
3	G	Same setting which produced 8.8v reading in step 2, with scratch eliminator on.	J	With scratch eliminator on, voltage at point J should be 2v, negative.	Open: R220, R219, R217. Shorted: C213, C214, C212.
4	F	Same as step 2.	H	With scratch eliminator on, voltage at point H should be approx. 28v, negative.	Defective: 7F7. Open: C210, C216, R214, R215, R223. Shorted or leaky: C216.
5	F	Adjust for 10v output-meter reading, with scratch eliminator off.		Turn scratch eliminator on; output voltage should drop to 6.5v (approx.).	Defective: 7E7 (pentode section). Open: R221, R216, R218, C211, C212. Shorted: C211, C212.

Section 3

TROUBLE SHOOTING

I-F, DETECTOR, AND A-V-C CIRCUITS

AM CIRCUITS

Use an r-f signal generator, with modulated output, set at 455 kc. Connect the generator ground lead to the chassis, test point C, and connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Set the volume control to maximum, and the tone control fully counterclockwise. Set the band (wafer) switch to the broadcast position. Turn the tuning condensers to full-mesh position.

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for the FM circuits, or the tests for Section 4 (r-f and converter circuits); if not, isolate and correct the trouble in the AM circuits.

Since the circuit location of test point A for this section is in Section 4, the effectiveness of step 1 as a master check is dependent upon the condition of certain parts in Section 4; these parts are listed below under "POSSIBLE CAUSE OF ABNORMAL INDICATION."

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	Loud, clear signal with weak signal input.	Trouble in AM circuits. Isolate by the following tests.
2	B	Loud, clear signal with strong signal input.	Defective: 7R7. Open: R309, R310, R312, L302A, L302C, L302D, R313, R314, R316, C325, C317, WS-3(R). Shorted: C317, C318, C321, C322, C323, C324, C320, C302B. Misaligned: Z302.
3	D	Loud, clear signal with moderate signal input.	Defective: 6BA6. Open: R302, R305, R308, R306, L301A, L301B, L301C, L301D, C301A, C301C, C301D. Shorted: C308, C301C, C301D, C309, C313, L301C, L301D, C300D. Misaligned: Z301.
4	A	Loud, clear signal with weak signal input.	Defective: 7F8*. Open: R406*, R405*, L406*, C300C, L300C, L300D, C300D, R300, WS-4(R), WS-4(F). Shorted: C300C, L300C, C303, C304, L300D. Misaligned: Z300.

*This part, located in another section, may cause abnormal indication in this section.

FM CIRCUITS

These tests are also made with an AM r-f signal generator, using modulated output.

Set the band (wafer) switch to the FM position, and follow the instructions preliminary to the tests for the AM circuits, with these exceptions: set the signal-generator frequency to 9.1 mc., and detune to one side or the other until a satisfactory test signal is obtained.

The best indication of satisfactory FM-detector operation is the ability of this circuit to take the alignment properly (see page 14).

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 4 (r-f and converter circuits); if not, isolate and correct the trouble in the FM circuits.

Section 4 TROUBLE SHOOTING

For the following tests, with the exception of the oscillator tests, use an AM r-f signal generator, with modulated output. Connect the generator ground lead to the chassis, test point C, and connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Set the radio volume control to maximum, and the tone control fully counterclockwise.

Set the band (wafer) switch, tuning control, and signal-generator frequency as indicated in the chart.

OSCILLATOR TESTS (AM AND FM CIRCUITS): Connect the positive lead of a high-resistance d-c voltmeter to the chassis, and connect the negative lead through a 100,000-ohm isolating resistor to the 7F8 oscillator grid (pin 1), test point B. Use a suitable range, such as 0—10 volts. Proper operation of the oscillator is indicated by negative voltages of approximately the values given in the chart (measured with 20,000-ohms-per-volt meter), throughout the tuning range.

If the "NORMAL INDICATION" is not obtained in step 1 of both the AM and the FM test charts, isolate the trouble by following the remaining steps.

AM CIRCUITS

STEP	TEST POINT	SIG. GEN. FREQ.	BAND SWITCH	RADIO TUNING	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION

SYMBOLIZATION

MODEL 50-1726

The components in the radio circuit are symbolized according to the types of parts and the sections of the radio in which the parts are located. The prefix letter of the symbol designates the type of part, as follows:

C—condenser L—choke or coil LS—loud-speaker S—switch WS—wafer (band selector-phono) switch
I—pilot lamp LA—loop aerial R—resistor T—transformer Z—electrical assembly

The number of the symbol, except when the number is less than 100, designates the section in which the part is located, as follows:

100-series components are in Section 1 — the power supply
200-series components are in Section 2 — the audio circuits
300-series components are in Section 3 — the i-f amplifier, detector, and a-v-c circuits
400-series components are in Section 4 — the r-f and converter circuits

REPLACEMENT PARTS LIST

NOTE: Parts marked with an asterisk (*) are general replacement items. These numbers may not be identical with those on factory assemblies: also, the electrical values of some replacement items may differ from the values indicated in the schematic diagram and parts list. The values substituted in any case are so chosen that the operation of the radio will be either unchanged or improved. When ordering replacements, use only the "Service Part No."

ALIGNMENT CHART

STEP	CIRCUIT ALIGNED	RECEIVER		SIGNAL GENERATOR		METER		TRIMMER OR SLUG ADJUST	PROCEDURE
		BAND SWITCH	DIAL POINTER	FREQUENCY	CONNECTIONS	TYPE (See Notes)	CONNECTIONS		
1	AM IF	BC ANT.	55	455 kc	Through .1 mfd. to center gang large stator	A	Across speaker voice coil	15, 12, 16, 19	Adjust for maximum output
2	FM IF	FM	88	10.7 mc	Through .1 mfd. to center gang small stator	B	FM Test Socket, #4 cold (+), #5 high (—)	4, 13, 14, 17, 18, 20, 21	Adjust for maximum negative DC voltage
3	Ratio Detector	FM	88	10.7 mc	Through .1 mfd. to center gang small stator	B	FM Test Socket, #2 cold #1 high	5	Check VTVM zero set. Turn trimmer slowly through point where DC polarity reverses. Carefully set for zero DC at reversal point
4	AM IF Trap	BC ANT	55	455 kc	Through 200 mmf to "A" and "G" posts of AM antenna strip	A	Across speaker voice coil	3	Adjust for minimum output
5	BC RF	BC ANT	150	1500 kc	Through 200 mmf to "A" and "G" posts of AM antenna strip	A	Across speaker voice coil	11, 6, 1	Adjust for maximum output
6			60	600 kc	Through 200 mmf to "A" and "G" posts of AM antenna strip	A	Across speaker voice coil	8	Adjust for maximum output while rocking gang
7			Repeat Steps 5 and 6						
8	SW RF	SW	18	18 mc	Through 400 ohms to "A" and "G" posts of AM antenna strip	A	Across speaker voice coil	10	Adjust osc. trimmer for maximum output. (osc. on high side of signal)
9			15	15 mc	Through 400 ohms to "A" and "G" posts of AM antenna strip	A	Across speaker voice coil	7, 2	Adjust for maximum output
10			6	6.0 mc	Through 400 ohms to "A" and "G" posts of AM antenna strip	A	Across speaker voice coil	9	Adjust for maximum output while rocking gang
11			Repeat Steps 8, 9 and 10						
12	FM RF	FM	90	90 mc	To dipole terminals FM antenna strip	B	FM Test Socket, #4 low (+), #5 high (—)	24, 23, 22	Adjust for maximum negative DC voltage
13			106	106 mc	To dipole terminals FM antenna strip	B	FM Test Socket, #4 low (+), #5 high (—)	27, 26, 25	Adjust for maximum negative DC voltage
14			Repeat Steps 12 and 13 as required						

ALIGNMENT NOTES

See Alignment chart (next Page) and layout diagram showing trimmers.

The following notes are intended for the use of an expert radio technician:

Alignment should be attempted only if the proper meters and a signal generator are at your disposal. Insulated alignment tools are necessary. Output meters should include:

A) a low range AC Voltmeter

B) a 0-20 volt DC vacuum tube Voltmeter

The signal generator must cover the frequencies of 455 kc, 600 kc, 1500 kc, 6 mc, 10.7 mc, 15 mc, 18 mc, 90 mc and 106 mc.

During alignment the line voltage feeding the receiver power supply should be kept at approximately 117 volts.

The receiver should be allowed to warm up for at least 30 minutes before making any adjustments.

The location of adjustment screws are indicated clearly on the schematic diagram. Alignment adjustments should be made only in the sequence given in the chart.

SETTING THE PUSHBUTTONS

The Model FM-210 Series is equipped with 8 pushbuttons which mechanically operate the dual three-gang tuning condenser. It is permissible for some of these buttons to be used for tuning into FM stations (preferably those toward the left of the dial), but for best FM reception the tuning knob should be adjusted slightly after the pushbutton has located the approximate setting of the FM station. For the broadcast band, however, push-button tuning will be sufficient, and no further adjustment will be necessary.

The initial adjustment of the pushbuttons is as follows:

1. Remove the bakelite cap
2. Loosen the locking screw behind the cap
3. Tune into the desired station carefully by turning the manual tuning knob until the opening in the tuning indicator eye is at a minimum
4. Depress the exposed pushbutton shaft as far as possible and tighten the locking screw
5. Place the station identification tab in the bakelite button and cover with celluloid tab.
6. Replace the button on the shaft

TUNING RANGE

Broadcast Band—535 to 1720 kc or 174 to 561 meters.

Short Wave Band—5.67 to 24.0 mc or 12.5 to 53.6 meters.

ALIGNMENT NOTES

Alignment should be attempted only if a low range A.C. meter, a signal generator, and insulated alignment tools are at your disposal. The A.C. meter is used as an outputmeter. The signal generator must cover a frequency range from 450 kc to 24 mc.

It is essential that the signal generator be connected to the points indicated in the alignment chart through the proper dummy antenna.

A good ground connection, secured between the groundpost of the signal generator and the chassis, is necessary.

The output of the signal generator must always be kept at its lowest possible value. This is to prevent the automatic volume control of the receiver from interfering with accurate alignment.

During alignment, the line voltage feeding the receiver power supply should be kept at approximately 230 volts.

The locations of adjustment screws are indicated clearly on the schematic diagram. Alignment adjustments should be made only in the sequence given in the chart.

For all alignments, connect the outputmeter across the voice coil. With the volume control turned fully clockwise, tune for a maximum reading.

This Pilot superheterodyne receiver has FIVE tubes and one selenium rectifier. The set operates on either alternating or direct current power supply (105 to 125 volts) or on self-contained batteries. Since it features a selenium rectifier, it will play immediately after being turned on, on either battery or house current power supply.

TUNING RANGE

Broadcast Band—535 to 1605 kc or 187 to 561 meters.

Short Wave Band—5.63 to 16.56 mc or 18.2 to 53.2 meters.

ALIGNMENT NOTES

. Alignment should be attempted only if a low range A.C. meter, a signal generator, and insulated alignment tools are at your disposal. The A.C. meter is used as an output-meter. The signal generator must cover a frequency range from 262 kc to 16 mc.

It is essential that the signal generator be connected to the points indicated in the alignment chart through the proper dummy antenna.

A good connection between the groundpost of the signal generator and the chassis, is necessary. DO NOT connect chassis or generator to an external ground.

The output of the signal generator must always be kept at its lowest possible value. This is to prevent the automatic volume control of the receiver from interfering with accurate alignment.

During alignment, the line voltage feeding the receiver power supply should be kept at approximately 117 volts.

The locations of adjustment screws are indicated clearly on the schematic diagram. Alignment adjustments should be made only in the sequence given in the chart.

For all alignments, connect the outputmeter across the voice coil. With the volume control turned fully clockwise tune for a maximum reading.

BATTERIES

The battery portion of this receiver contains two Eveready No. 746 "A" batteries of 4½ volts, and two Eveready No. 482 "B" batteries of 45 volts each. The set is so designed that these batteries will all last the same length of time.

It is a good idea to take the receiver to your dealer when purchasing replacement batteries. He will connect the batteries correctly. If you do it yourself, first MAKE SURE THAT THE POWER SWITCH IS COMPLETELY TURNED OFF.

When removing the batteries, first unscrew clamps, and then remove battery plugs. Be sure not to pull on the cables, but on the plugs themselves.

Place the new "A" and "B" batteries in position shown on diagram below and replace clamps.

The blue and white cable, coming from the chassis, has 2-prong plugs which are then plugged into the "A" batteries. The red and black cable has two 3-prong plugs, both of which are plugged into the "B" batteries.

9			106	106MC	SAME	B	SAME	T4, T5, T6	Adjust for maximum negative DC voltage
10			Repeat Steps 8 and 9 as required						

ALIGNMENT NOTES

Alignment should be attempted only if the proper meters and a signal generator are at your disposal. Insulated alignment tools are necessary. Output meters should include:

(A) a low range AC Voltmeter

(B) a 0-20 volt DC vacuum tube Voltmeter

The signal generator must cover the frequencies of 455 kc, 600 kc, 1500 kc, 10.7 mc, 90 mc and 106 mc.

During alignment the line voltage feeding the receiver power supply should be kept at approximately 117 volts.

The receiver should be allowed to warm up for at least 30 minutes before making any adjustments.

The location of adjustment screws are indicated clearly on the schematic diagram. Alignment adjustments should be made only in the sequence given in the chart.

ALIGNMENT NOTES

Alignment should be attempted only if the proper meters and a signal generator are at your disposal. Insulated alignment tools are necessary. Output meters should include:

(A) a low range AC Voltmeter

(B) a 0-20 volt DC vacuum tube Voltmeter

The signal generator must cover the frequencies of 455 kc, 600 kc, 1500 kc, 107 mc, 90 mc and 106 mc.

During alignment the line voltage feeding the receiver power supply should be kept at approximately 117 volts.

The receiver should be allowed to warm up for at least 30 minutes before making any adjustments.

The location of adjustment screws are indicated clearly on the schematic diagram. Alignment adjustments should be made only in the sequence given in the chart.

BIAS ADJUSTMENT

This adjustment is made at the factory and will normally not require adjustment in the field. However, if for any reason it does require adjustment, proceed as follows:

(1) Connect a 20,000 ohm per volt or a vacuum tube voltmeter between the junction of the two 47,000 ohm 2A3 grid resistors and ground (positive side of meter to ground).

(2) Adjust bias control (screwdriver adjustment inside of power supply chassis) until meter reads exactly—62 volts.

Improper adjustment of this control will impair the tone quality of the receiver and may shorten the lives of the 2A3 tubes.

ALIGNMENT CHART

(Follow Sequence as Indicated)

STEP	CIRCUIT ALIGNED	RECEIVER		SIGNAL GENERATOR		OUTPUT METER		TRIMMER OR SLUG ADJUST	PROCEDURE

71404	Coil—Antenna coil complete with adjustable core and stud (L1, L2)
71401	Coil—Oscillator coil complete with adjustable core and stud (L3, L4)
71168	Control—Volume control and power switch (R9, S1)
†72953	Cord—Drive cord. (approx. 52" overall length required)
72283	Grommet—Rubber grommet to mount tuning condenser (3 required)
*73886	Indicator—Station selector indicator
*73885	Plate—Dial back plate complete with pulleys, less dial
71162	Plug—Battery shorting plug—3 prong male
30550	Plug—4 prong male plug for battery cable
	Resistor—Fixed, composition, 470 ohms, ±20%, ½ watt (R4)
	Resistor—Fixed, composition, 68,000 ohms, ±20%, ½ watt (R2)
	Resistor—Fixed, composition, 220,000 ohms, ±20%, ½ watt (R1)
	Resistor—Fixed, composition, 1 megohm, ±20%, ½ watt (R5)
	Resistor—Fixed, composition, 2.2 megohm, ±20%, ½ watt (R6)
	Resistor—Fixed, composition, 3.3 megohm, ±20%, ½ watt (R3)
	Resistor—Fixed, composition, 10 megohm, ±20%, ½ watt (R7, R8)
*73887	Shaft—Tuning knob shaft
70377	Shield—Shield for 1A7GT tube
71163	Socket—Battery shorting socket—3 contact female
37605	Socket—Tube socket
70390	Spring—Drive cord spring
71403	Transformer—First I.F. transformer (T1)
71400	Transformer—Second I.F. transformer (T2)
71047	Transformer—Output transformer (T3)
33726	Washer—"C" washer for tuning knob shaft
	SPEAKER ASSEMBLIES 922258-2
71058	Speaker—4" x 6" elliptical P.M. speaker complete with cone and voice coil
	MISCELLANEOUS
70398	Clamp—Dial clamp (2 required)
X1660	Cloth—Grille cloth
*73888	Dial—Glass dial scale
39002	Foot—Rubber foot (4 required)
70473	Knob—Tuning knob
71164	Knob—Volume control knob
72649	Motif—Decorative motif
38458	Nut—Speed nut to fasten motif
30900	Spring—Retaining spring for knobs
	CV-45 ELECTRIFIER RS-1001
71840	Capacitor—Electrolytic, dual, 2,000 mfd., 6 volts (C3, C4)
71844	Capacitor—Electrolytic, dual, 20 mfd., 150 volts (C1, C2)
35069	Fastener—Push fastener for bottom cover
71838	Reactor—Filter reactor
71839	Rectifier—Rectifier complete with mounting bracket
72787	Resistor—1.2 ohms, ½ watt (R3)
12453	Resistor—27 ohms, ¼ watt (R1)
30788	Resistor—4,700 ohms, 1 watt (R2)
71841	Socket—3 contact female socket
31027	Socket—4 contact female socket for battery cable
37605	Socket—Tube socket
71837	Transformer—Power transformer, 117 volt, 60 cycle (T1)

*This is the first time this Stock No. has appeared in Service Data.
†Stock No. 72953 is a reel containing 250 ft. of cord.

CV-45, Ch. RS-1001

Alignment Procedure

Output Meter Alignment.—Connect the meter across the voice coil and turn the receiver volume control to maximum.

Test Oscillator.—Connect the low side of the test oscillator to the receiver chassis, and keep the output low to avoid AVC action.

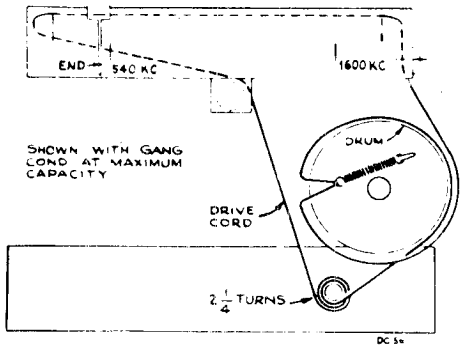
Pre-Setting Dial.—With gang condenser in full mesh, the pointer should be set at the left-hand end dial calibration mark.

Steps	Connect high side of test oscillator to—	Tune test oscillator to—	Turn radio dial to—	Adjust for maximum output
1	1N5GT grid in series with .1 mfd.	455 kc.	Quiet point near 600 kc.	T-2 2nd I.F. trans.
2	1A7GT grid in series with .1 mfd.			T-1* 1st I.F. trans.
3	Antenna lead in series with 220 mmfd.	1600 kc.	1600 kc. mark	C12A
4		540 kc.	540 kc. mark	L3
5		Repeat Steps 3 and 4.		
6		1400 kc.	1400 kc. signal	C11A
7		600 kc.	600 kc. signal	L2
8		Repeat Steps 6 and 7.		

*Do not readjust T-2.

Critical Lead Dress

1. Keep output plate capacitor dressed close to the chassis.
2. Keep lead from lug A of second IF transformer down and dressed close around the 1H5GT tube socket.
3. Dress 1N5GT plate lead close to chassis.
4. Dress C1 down and away from the antenna coil.
5. Dress C3 and C5 away from each other.
6. Dress the lead from 2nd. IF transformer to the volume control clear of other components.



Dial Indicator and Drive Mechanism Showing Alignment Check Points

NOTE:—

When using the electrifier, remove the shorting plug on the chassis (adjacent to the 1A7GT tube) and replace it with a similar plug, attached to the electrifier. Also connect the remaining plug attached to the electrifier, in place of the normal battery plug. The receiver will operate in the normal manner, using the same control for turning the set on and off.

Do not plug electrifier into a DC outlet.

Power Line Operation

115 volts, d. c. or 50 to 60 cycles a. c. .....18 watts

or

Battery Operated .....VS 050 Battery
(Average life—100 hrs. intermittent service)

Loudspeaker (92577-1)

Size and type .....4 in. PM dynamic
Voice coil impedance .....3.4 ohms at 400 cycles

Power Output

Undistorted—150 milliwatts Maximum—250 milliwatts
(Output is slightly lower on battery operation)

Cabinet Dimensions

Height 9½ in. Width 11 in. Depth 5 in.

Weight

5 lb. less battery 8 lb. 2 oz. with battery

AC-DC Operation

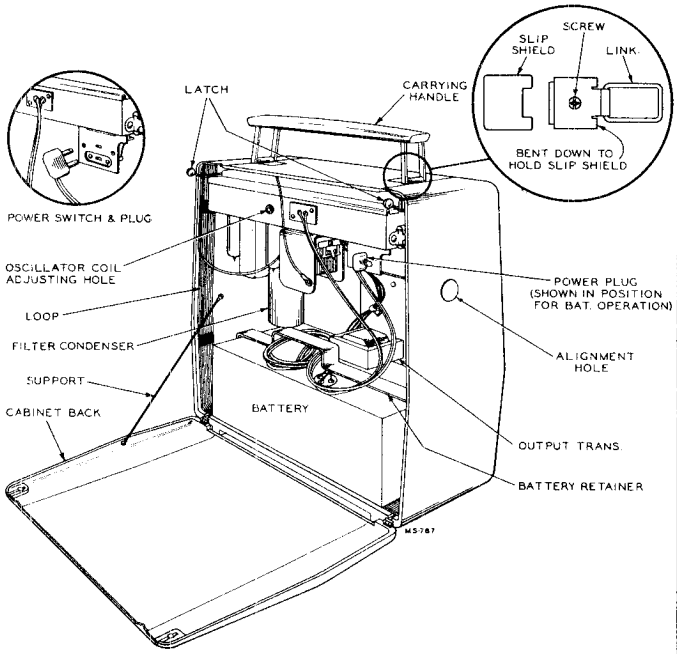
This receiver will operate on 115 volts, d. c. or 50 to 60 cycles a. c.

A power cord is stored inside the cabinet. To open the cabinet, push upward on the two metal ball catches at the top rear of the cabinet. Remove the plug of the power cord from its socket on the chassis and insert the plug into a convenient electrical outlet. A slot in the bottom of the back cover allows the back to be closed with the cord passing through.

Note: If reception is not obtained on d. c., reverse plug in outlet receptacle. This may also reduce hum on a. c. operation.

When returning to battery operation replace the plug in the socket provided on the chassis, roll up the cord and place under the raised portion of the battery holder bracket.

Note: Make certain that the plug is fully inserted (base of plug touching chassis) to assure proper operation of the Batt-Line switch.



Cabinet Hinges

The cabinet hinges may be readily removed, they are secured to the cabinet and back by force fit. To remove back from cabinet—pull straight outward on both hinges at the same time.

To Remove Chassis

1. Pull off the volume control knob
2. Close tuning condenser (dial at 54) to prevent possible damage to tuning condenser.
3. Unsolder the loop leads.
4. Remove the plug from the battery.
5. Remove the two screws holding the bottom edge of the speaker and the screw holding dial back-plate to cabinet.
6. Remove the two slip shields beneath the handle. They may be removed by pushing straight toward the top center of the case. The chassis mounting screws are then accessible.
7. Remove the two screws at the top of the cabinet while supporting the chassis with one hand.

Note: When re-installing, replace speaker holding screws first but do not securely tighten until the two screws at the top of the cabinet have been tightened.

Ch. RC-1059B, RC-1059C

Alignment Procedure

Cathode Ray Alignment is the preferable method. Connections for the oscilloscope are shown on the schematic diagram.

Output Meter Alignment.—If this method is used, connect the meter across the voice coil and turn the receiver volume control to maximum.

Test Oscillator.—For all alignment operations, connect the low side of the test oscillator to the receiver chassis and keep the oscillator output as low as possible to avoid A.V.C. action.

Battery operation of the receiver is preferable during alignment; on a. c. operation an isolation transformer (117v./117v.) may be necessary for the receiver if the test oscillator is also a. c. operated.

Note: Battery or substitute must be in place for ant. alignment (step 5).

Alignment Tabulation

Step	Connect high side of test oscillator to—	Test oscillator output—	Turn receiver dial to—	Adjust for maximum peak output
1	Disconnect loop—remove chassis—remove bottom plate, connect a 10,000 ohm resistor from C1 stator terminal to tuning condenser frame.			
2	Stator terminal of C1 thru 01 mf. capacitor	455 kc	55	*Top and bottom T2 (2nd. I-F. trans.) *Top and bottom T1 (1st. I-F trans.)
3	Remove the 10,000 ohm resistor. Replace bottom cover and install chassis in cabinet. Re-connect loop.			
4	Short wire placed near receiver (for radiated signal)	1600 kc	160	†C5 (osc.)
5		1400 kc	140	†C2 (ant.)
6		600 kc	60	*L2 (osc.) while rocking gang
7		Repeat steps 4, 5 and 6		

NOTES:

*The magnetite cores of L2 and T2 and T1 do not have visible adjusting screws. The cores have screw driver slots to permit adjustment (use non-metallic screwdriver).

†Adjustable thru hole in side of case.

CAUTION.—

Do not remove any tubes from the chassis with the set operating and the plug connected to the power line. Damage to tubes may result.

Critical Lead Dress

1. Dress output plate bypass C20 capacitor against chassis.
2. Dress output plate lead to output transformer against chassis.
3. Dress audio coupling capacitor C14 (volume control to grid of 1U5) away from chassis, away from audio limiting resistor R8 and to permit adjustment of second I.F. Transformer.
4. Dress all exposed leads away from each other, and away from chassis to prevent short circuits.
5. Dress all filament and ground leads against chassis.
6. Dress filament bypass capacitor C23 and accompanying compensating resistor R15 (volume control to 1U4) against volume control.
7. Dress power line cord away from line-battery switch mechanism.
8. Dress all capacitors and wiring away from oscillator coil.
9. Dress 4 mmf. neutralizing capacitor C7 against A.V.C. bypass capacitor C8 (1U4 filament to first I.F. trans.).

Note: These instruments are designed to be operated with a battery in position inside the cabinet. Reception will be below normal unless the battery is in its normal location.

The position of the battery pack affects the loop inductance. Therefore, when the battery is removed, the loop inductance will change (increase) and the sensitivity will be slightly worse because of improper electrical tracking of the loop circuit with the heterodyne oscillator.

Where a battery is temporarily unavailable, a sheet of aluminum 8½" long x 3⅝" wide and from .020 to .050" thick may be placed in the cabinet in the position occupied by the battery so that it is lying flat down on the bottom. This sheet of aluminum has an effect on the loop inductance similar to the effect caused by the battery and will, therefore, return the performance of the loop to approximately the same as obtained when a battery is installed. If aluminum is not available, brass may be substituted with approximately the same performance. DO NOT USE STEEL OR IRON since the performance will be adversely affected. If desired, the sheet of aluminum may be waxed to the inside bottom of the case. DO NOT PLACE ANY WAX, CEMENT OR OTHER MATERIAL ON THE LOOP WINDINGS.

73784	Capacitor—Tubular, 0.1 mfd., 200 volts (C10)
70617	Capacitor—Tubular, 0.1 mfd., 400 volts (C21)
73127	Capacitor—Electrolytic, comprising 1 section of 50 mfd., 150 volts, 1 section of 30 mfd., 150 volts and 1 section of 160 mfd., 25 volts (C19A, C19B, C19C)
73935	Clip—Mounting clip for I-F transformer (2 required)
73114	Coil—Oscillator coil complete with adjustable core for RC 1059B (L2, L3)
*74405	Coil—Oscillator coil complete with adjustable core for RC 1059C (L2, L3)
*74285	Control—Volume control and power switch (R7, S2)
70022	Cord—Power cord and plug
*74282	Dial—Dial scale and back plate assembly less cushions
72283	Grommet—Rubber grommet to mount tuning condenser (3 required)
*74284	Knob—Tuning knob complete with indicator window
28452	Plate—Mounting plate for electrolytic capacitor
73275	Plug—5 prong male plug for battery cable
73237	Resistor—Wire wound, 33 ohms, 150 MA (R20)
	Resistor—Fixed, composition, 1000 ohms, ±10%, ½ watt (R3, R5, R15)
	Resistor—Fixed, composition, 1200 ohms, ±10%, ½ watt (R14)
	Resistor—Fixed, composition, 2200 ohms, ±10%, ½ watt (R18)
73132	Resistor—Wire wound, 2200 ohms, 7 watts (R17)
	Resistor—Fixed, composition, 15,000 ohms, ±10%, ½ watt (R16)
	Resistor—Fixed, composition, 39,000 ohms, ±10%, ½ watt (R9)
	Resistor—Fixed, composition, 100,000 ohms, ±20%, ½ watt (R1)
	Resistor—Fixed, composition, 100,000 ohms, ±10%, ½ watt (R8)
	Resistor—Fixed, composition, 220,000 ohms, ±20%, ½ watt (R11)
	Resistor—Fixed, composition, 1 megohm, ±20%, ½ watt (R13)
	Resistor—Fixed, composition, 2.7 megohms, ±10%, ½ watt (R4)
	Resistor—Fixed, composition, 4.7 megohms, ±20%, ½ watt (R12)
	Resistor—Fixed, composition, 4.7 megohms, ±10%, ½ watt (R6)
	Resistor—Fixed, composition, 6.8 megohms, ±10%, ½ watt (R2)
	Resistor—Fixed, composition, 10 megohms, ±10%, ½ watt (R21)
	Resistor—Fixed, composition, 15 megohms, ±20%, ½ watt (R10)
73103	Shield—Tube shield for 1U5 tube
73117	Socket—Tube socket
14270	Spring—Retaining spring for tuning knob
71039	Switch—"Line-Battery" switch (S1)
73129	Transformer—First I-F transformer (T1)
73130	Transformer—Second I-F transformer (T2)
71047	Transformer—Output transformer (T3)
	SPEAKER ASSEMBLIES
	92577-1
73123	Speaker—4" P.M. speaker complete with cone and voice coil
	MISCELLANEOUS
*74287	Back—Case back—less hinges
73147	Ball—Metal ball with groove for back cover latching mechanism (2 required)
*74292	Button—Plug button for L.H. case side
Y2099	Case—Case complete with loop, metal front, decorative ring, and emblem—less latch mechanism, hinges, handle, handle mounting plate and case back (L1)
*74302	Channel—Carrying handle under channel
*74457	Cushion—Rubber cushion for under-side of carrying handle
70425	Clip—Spring clip for volume control knob
73549	Emblem—"RCA Victor" emblem
*74293	Front—Decorative metal front for case
*74288	Handle—Carrying handle less links and under channel
74180	Hinge—Cabinet hinge (2 required)
*74290	Knob—Volume control knob—less spring clip
*74303	Link—Carrying handle link (2 required)
73141	Loop—Antenna loop (L1)
73145	Nut—Hex nut with groove for back cover latching mechanism (2 required)
*74289	Plate—Carrying handle mounting plate (2 required)
*74294	Ring—Decorative ring for front of case
*74291	Screw—#4-40 x 3/8" flat head cross recessed machine screw for mounting flexible drop support (2 required)
*74295	Screw—#4-40 x 7/16" flat head cross recessed machine screw for mounting latch mechanism to case side
*74304	Screw—#4 x 5/16" flat head thread cutting screw for handle (2 required)
*74301	Screw—8 x 3/8" pan head cross recessed thread cutting screw for holding speaker (2 required) or dial plate to case
*74364	Shield—Slip shield for handle mounting plate (2 required)
73148	Spring—Extension spring for back cover latching mechanism—L.H.
73146	Spring—Extension spring for back cover latching mechanism—R.H.
73483	Support—Flexible drop support for back cover

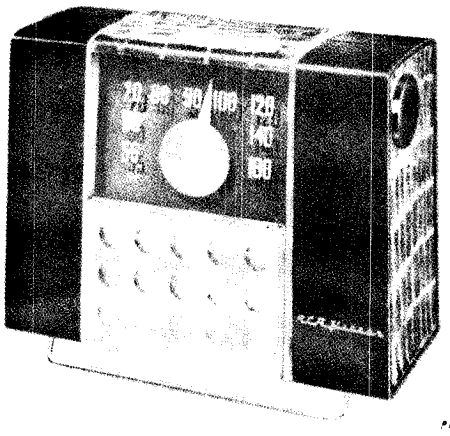
MODEL 9BX56,
Ch. RC-1068



Specifications

Tuning Range ..... 540-1600 kc.
Intermediate Frequency ..... 455 kc.

Tube Complement

(1) RCA 1R5 ..... Converter
(2) RCA 1U4 ..... I.F. Amplifier
(3) RCA 1U5 ..... Det.—A.V.C.—A.F. Amp.
(4) RCA 3V4 ..... Output
(A selenium rectifier is used)

Power Supply Rating

Power Line Operation
115 volts d.c. or 50 to 60 cycles a.c. ..... 17 watts
or
Battery Operation
1 RCA VS 065 "A" Battery ..... 7.5 v., 60 ma.
1 RCA VS 016 "B" Battery ..... 67.5 v., 10 ma.
(Battery life—approx. 40 hrs. intermittent service)

Power Output

A.C. operation ..... 150 mw. undistorted, 250 mw. max.
Batt. operation ..... 70 mw. undistorted, 180 mw. max.

Loudspeaker (92584-1)

Size and type ..... 4 in. PM dynamic
Voice coil impedance ..... 3.2 ohms @ 400 cycles

Dial Drive Ratio ..... 6:1 (3 turns of knob)

Cabinet Dimensions

Height $8\frac{3}{8}$ in. Width $10\frac{1}{2}$ in. Depth 5 in.

Weight $5\frac{1}{2}$ lbs. (less batteries) $6\frac{1}{4}$ lbs. (with batteries)

To Open Cabinet:

The back is secured to the cabinet with two clip catches at the top and two hinges at the bottom. To open—while facing the front of the receiver, with the handle in the upright position grip the sides of the cabinet with both hands and push the top of the back to the rear with both thumbs.

To Remove Back:

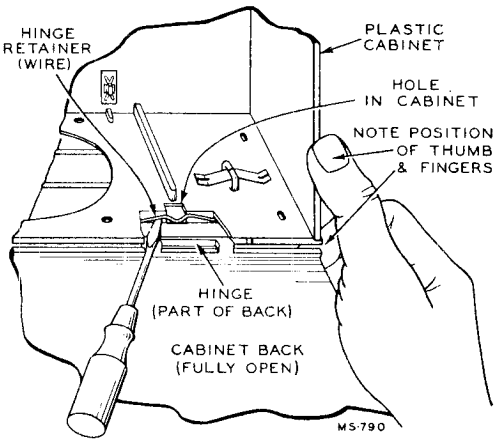
Open the cabinet as explained above. With the back fully open, grip the cabinet as illustrated. Insert a screwdriver under one hinge retainer and pry the center of the retainer out of the opening in the cabinet while maintaining pressure on the back with the fingers and on the cabinet with the thumb. Repeat this procedure with the other hinge retainer. Pull straight to the rear.

To Remove Cabinet Foot:

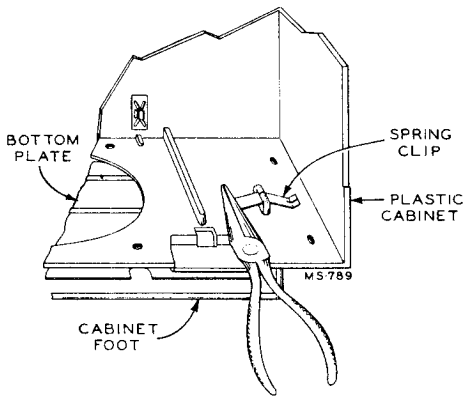
Open the cabinet. Grip the end of the spring clip with long nose pliers as illustrated and pull toward the center of the cabinet. Repeat this procedure with the other clip.

To Remove Chassis:

1. Remove knobs (pull off).
2. Open cabinet.
3. Unsolder loop leads.
4. Disconnect batteries and speaker.
5. Remove the two screws which hold the dial back plate to the cabinet.
6. Remove the TWO SCREWS AT THE BOTTOM EDGE OF THE REAR CHASSIS APRON.
7. Pull chassis to rear.



Removal of Cabinet Back



Removal of Cabinet Foot

MODEL 9BX56,Ch. RC-1068

Alignment Procedure

Cathode Ray Alignment is the preferable method. Connections for the oscilloscope are shown on the schematic diagram.

Output Meter Alignment.—If this method is used, connect the meter across the voice coil and turn the receiver volume control to maximum.

Test Oscillator.—For all alignment operations, connect the low side of the test oscillator to the receiver chassis and keep the oscillator output as low as possible to avoid AVC action.

Battery operation of the receiver is preferable during alignment; on a.c. operation an isolation transformer (117v./117v.) may be necessary for the receiver if the test oscillator is also a.c. operated.

Dial Pointer Position.—There are two score marks on the dial back plate—with the tuning condenser fully meshed (closed) the pointer should be set to the LEFT HAND MARK.

The RIGHT HAND MARK is for 1600 kc.

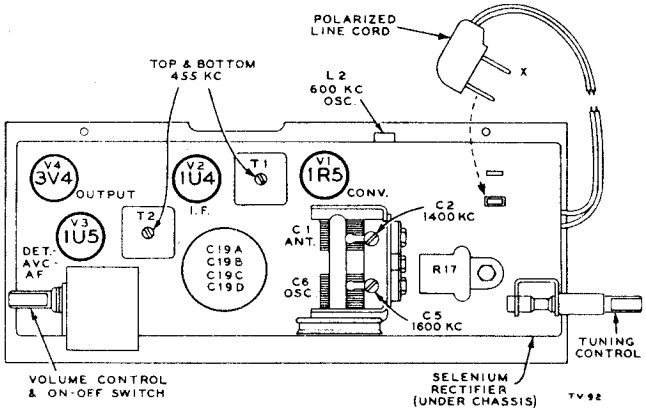
The dial is not easily removed. A reproduction of the dial is illustrated on another page. It is suggested that a tracing be made of it for use in alignment.

Step	Connect high side of test oscillator to—	Test oscillator output—	Turn receiver dial to—	Adjust for maximum peak output
1	Disconnect loop—remove chassis—connect a 1000 ohm resistor from C1 stator terminal to tuning condenser frame.			
2	Stator terminal of C1 through a 39 mmf. capacitor	455 kc.	Quiet point near 160	*Top and bottom T2 (2nd I-F trans.) *Top and bottom T1 (1st I-F trans.)
3	Remove the 1000 ohm resistor. Replace but do not fasten chassis in cabinet. Re-connect loop.			
4	Short wire placed near receiver (for radiated signal)	1630 kc.	Max. clockwise	†C5 (osc.)
5		1400 kc.	140	†C2 (ant.)
6		600 kc.	60	*L2 (osc.) while rocking gang
7		Repeat steps 4, 5 and 6		
8	Fasten chassis to cabinet.			

NOTES:

* The magnetite cores of L2, T2 and T1 do not have visible adjusting screws. The cores have screw driver slots to permit adjustment (use non-metallic screwdriver).

† C5 and C2 are more readily accessible if the chassis is not fully inserted into the cabinet. However the chassis should be near its proper position because its position affects the inductance of the loop.



Tube and Trimmer Locations

Power Line Operation:

A power cord is stored inside the cabinet. Open the cabinet and remove the plug of the power cord from its socket on the chassis and insert the plug into a convenient electrical outlet. A slot in the right-hand end of the cabinet allows the back to be closed with the cord passing through.

NOTE: If reception is not obtained on DC, reverse plug in outlet receptacle. On AC operation this may reduce hum.

When returning to battery operation replace the plug in the socket provided on the chassis, with the cord extending toward the back.

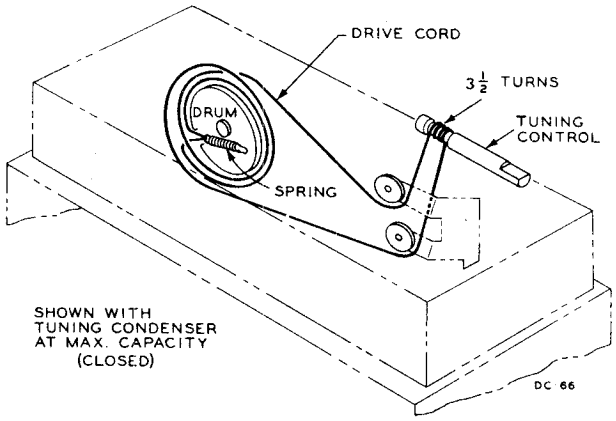
NOTE: Make certain that the plug is fully inserted (base of plug touching chassis) to assure proper operation of the Batt-Line switch.

CAUTION.—

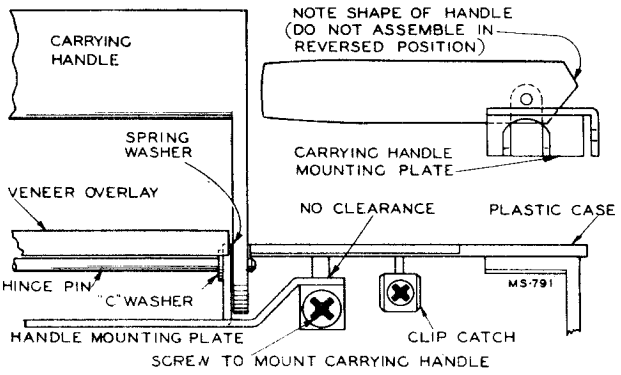
Do not remove any tubes from the chassis with the set operating and the plug connected to the power line. Damage to tubes may result.

Critical Lead Dress

1. Dress 1R5 plate lead and 1U4 grid lead down against chassis.
2. Dress all filament and ground leads against chassis.
3. Dress the 4 mmf. neutralizing capacitor C7 against the 1U4 tube socket with short lead at the plate end.
4. Dress .002 mf. capacitor C14 down against chassis and away from other wiring.
5. Dress .05 mf. capacitor C9 down over top of C14.
6. Dress capacitors C10 and C22 away from oscillator coil so that pressure is not exerted on the side of the coil.
7. Dress all wiring away from the selenium rectifier.
8. Dress .003 mf. capacitor C8 as near chassis as possible.



Dial Drive Cord



Carrying Handle Assembly

STOCK No.	DESCRIPTION
*74320	Shaft—Tuning knob shaft
38904	Socket—2 contact socket for power cord
73117	Socket—Tube socket
72540	Spring—Drive cord spring
71039	Switch—"Line-Battery" change switch (S1)
73129	Transformer—First I-F transformer (T1)
73130	Transformer—Second I-F transformer (T2)
35969	Washer—"C" washer for tuning knob shaft
	SPEAKER ASSEMBLIES 92584-1 RL 108 B5
*74415	Connector—3 contact male connector for speaker
*74411	Speaker—4" P.M. speaker complete with cone and voice coil less output transformer and connector
71047	Transformer—Output transformer (T3)
	MISCELLANEOUS
*74328	Back—Cabinet back complete with two hinges, two top retainers and two hinge retainers
*74327	Board—Antenna loop lead terminal board complete with retaining clip
*74346	Button—Dial drop door release button
Y2108	Cabinet—Cabinet including veneer overlay with drop door catch, loop and loop supports—less drop door, handle, foot, trim strips, dial, clip catches, protective bottom plate and back (L1)
*74339	Catch—Cabinet back clip catch (fastens to cabinet) (2 required)
*74345	Catch—Drop door catch assembly
*74338	Clip—Spring clip for holding cabinet foot (2 required)
*74334	Dial—Polystyrene dial scale
*74330	Door—Drop door for front of cabinet
73549	Emblem—"RCA Victor" emblem
*74331	Foot—Cabinet mounting foot—less protective plate
*74349	Handle—Carrying handle—less mounting plate and hinge pin
73490	Knob—Volume control knob or tuning knob
*74326	Loop—Antenna loop (L1)
*74412	Nut—Speed nut for speaker mounting (4 required)
*74337	Nut—Speed nut for mounting dial (4 required)
*74340	Nut—Speed nut for mounting veneer overlay (4 required)
*74336	Nut—Spring nut to fasten cabinet trim strip (2 required for each strip)
*74329	Overlay—Veneer overlay for top of cabinet including drop door catch and release button
*74351	Pin—Carrying handle hinge pin
*74344	Plate—Protective bottom plate for cabinet—less foot
*74350	Plate—Mounting plate for carrying handle
*74325	Screen—Speaker screen
*74348	Screw—#4 x 3/16" self tapping round head screw (cross-recessed) for mounting drop door catch (2 required)
*74341	Screw—#4 x 5/16" self tapping round head (cross-recessed) screw for cabinet back clip catch
*74342	Screw—#8 x 7/16" self tapping round head (cross-recessed) screw for carrying handle mounting plate (2 required)
*74335	Spring—Drop door release spring for front of cabinet (2 required)
14270	Spring—Retaining spring for knobs
*74347	Spring—Coil spring for drop door release button
*74332	Strip—Trim strp—R.H.
*74333	Strip—Trim strip—L.H.
*74353	Washer—"C" washer for carrying handle hinge pin
*74352	Washer—Spring washer for carrying handle hinge pin (2 required)
*74343	Washer—Spring washer for dial drop door (2 required)

* This is the first time that this Stock No. has appeared in Service Data.
‡ Stock No. 72953 is a reel containing 250 feet of cord.

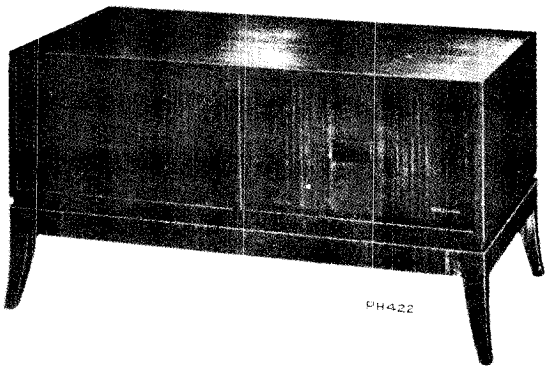
MODEL 9W102,
Ch. RC-618D



FOR RECORD CHANGER INFORMATION REFER TO RP 168 SERIES SERVICE DATA

Specifications

Tuning Range
Standard Broadcast (AM) .....540-1600 kc.
Frequency Modulation (FM) .....88-108 mc.
Intermediate Frequencies .....AM—455 kc., FM—10.7 mc.

Tube Complement

(1)	RCA 6J6	Mixer and Oscillator
(2)	RCA 6BA6	I-F Amplifier
(3)	RCA 6AU6	Driver
(4)	RCA 6AL5	Ratio Detector
(5)	RCA 6AV6	A-F Amplifier
(6)	RCA 6V6GT	Output
(7)	RCA 6AV6	AM Det.—AVC—Ph. Inv.
(8)	RCA 6V6GT	Output
(9)	RCA 6X5GT	Rectifier
(10)	RCA 6BF6	Phono Pre-amplifier

Dial Lamps (2) .....Type No. 51, 6-8 volts, 0.2 amp.
Jewel Lamp .....Type No. 51, 6-8 volts, 0.2 amp.

Tuning Drive Ratio .....18:1 (9 turns of knob)

Power Supply Rating .....115 volts, 60 cycles, 90 watts

Loudspeaker (92569-5W)
Size and type .....12 in. PM
Voice coil impedance .....3.2 ohms at 400 cycles

Power Output
Undistorted 6 watts .....Maximum 7 watts

Cabinet Dimensions
Height 19⅞" Width 38¾" Depth 20"

Weight .....71 lbs.

Record Changer (RP-168A-1)
Turntable speed .....45 r.p.m.
Record capacity .....Up to 10 RCA 7 in. fine groove
Pickup .....Crystal (medium output)

Description

Model 9W102 is identical electrically with Models 9W101 and 9W103. It uses a vertical type of dial. The chassis differs mechanically from that used in 9W101 and 9W103 in that the volume control and range switch shafts are combined as a dual knob control (a drive cord couples the volume control to the volume control knob shaft). The second I-F transformer is stamped 970435-6 and is identical to that used in 9W101 and 9W103 except for having a copper plated shield can to reduce feedback to the loop. **Refer to Service Data on Models 9W101, 9W103, 9W105 for additional information.**

(Supplementary Information on 9W101, 9W103 and 9W105 contained in this publication.)

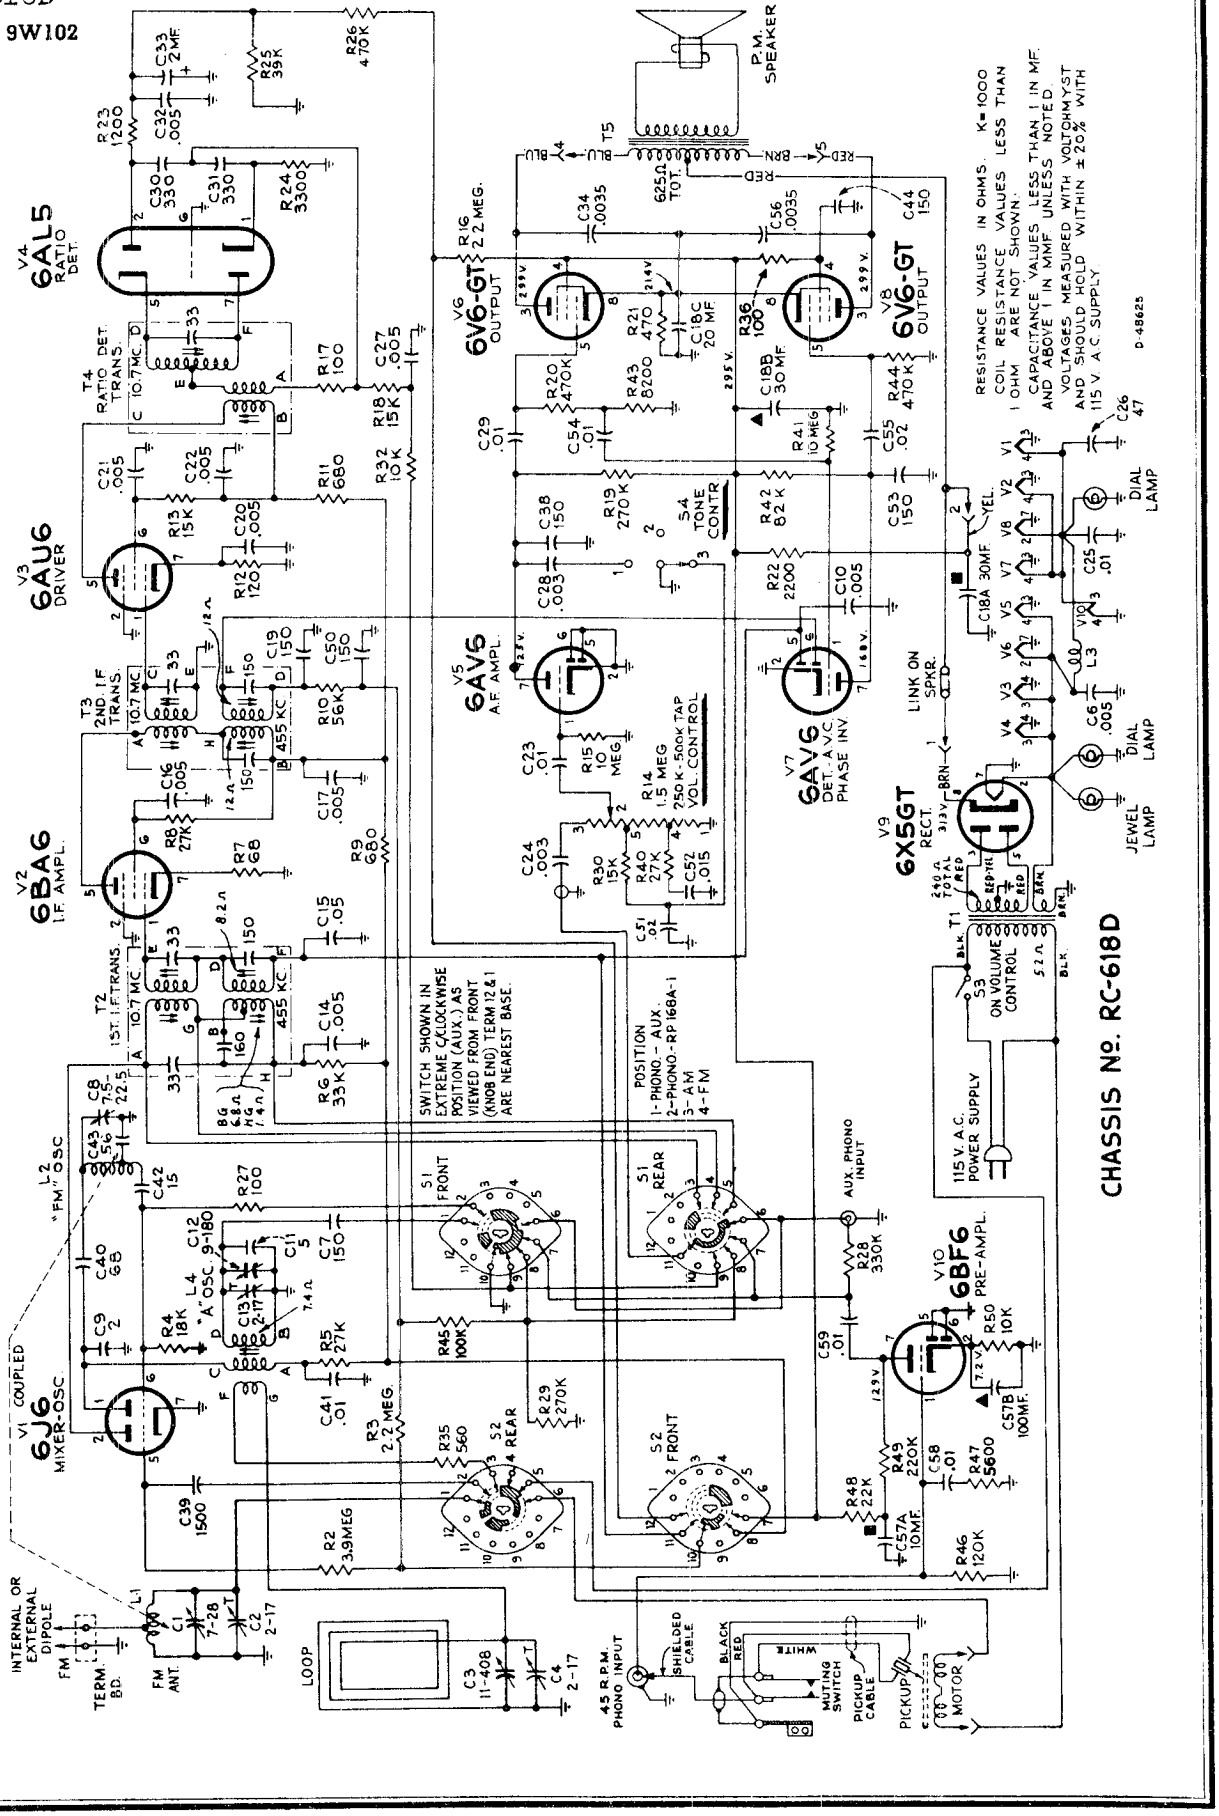
MODEL 9W102,
Ch. RC-618D



©John F. Rider

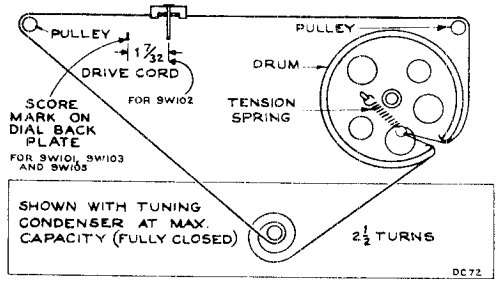
MODELS 9W102, Ch. RC-618D;
9W101, 9W103, Ch. RC-618B, Rev;
9W105, Ch. RC-618C, Rev.

Alignment Procedure

Identical to that given in 9W101, 9W103, 9W105 Service Data Except

After the chassis is installed in the cabinet, recheck the adjustment of C4 (AM Ant.) at 1400 kc. and L4 (AM Osc.) at 600 kc. Two holes in the right hand side of the radio compartment drawer permit access to these adjustments.

The dial indicator should be set to the SPECIFIED POSITION on the dial back plate with the tuning condenser at max. capacity.



Dial Indicator and Drive Mechanism

9W101, 9W103, 9W105 (RC-618B, RC-618C) SUPPLEMENTARY INFORMATION

Added Capacitor:

A capacitor (150 mmf.—C44) has been added between the screen grid terminal of V8 (6V6GT) socket and chassis as shown in the illustration below. This was done to eliminate spurious audio oscillation.

Correction to Simplified Schematics:

The simplified schematic diagrams (phono position) on page 7 of 9W101, 9W103, 9W105 Service Data show C34 and C56 connected to ground. They should be shown connected to the cathodes of the 6V6GT tubes as shown in the illustration below.

Change in Wiring:

To improve FM stability one dial lamp is now connected to pin #2 of V9 (6X5GT). Previously both were connected to pin #2 of V8 (6V6GT).

Substitute Speaker:

Speakers stamped 92569-1WX have been used as a substitute for 92569-5W speakers in Model 9W101; 92569-1WX speakers have a 2.2 ohm voice coil; 92569-5W speakers have a 3.2 ohm voice coil.

Changes in Parts List:

CHASSIS ASSEMBLIES

Add:

48125 Capacitor—Ceramic, 150 mmf. (C44) [same as C7, C19, C38, C50, C53]

SPEAKER ASSEMBLY
92569-1WX
(Used on Model 9W101)

13867 Cap—Dust cap
36145 Cone—Cone and voice coil assembly
5039 Plug—4 prong male plug for speaker
71145 Suspension—Metal cone suspension
37899 Transformer—Output transformer (T3)
NOTE: When replacing complete speaker order Stock No. 73635 (92569-5W).

MISCELLANEOUS

Add:

37396 Grommet—Rubber grommet for mounting speaker (3 required)—for Model 9W103

Correction:

73896 Loop—Loop antenna complete for Models 9W101 and 9W103 (previously listed for 9W101 and 9W105)

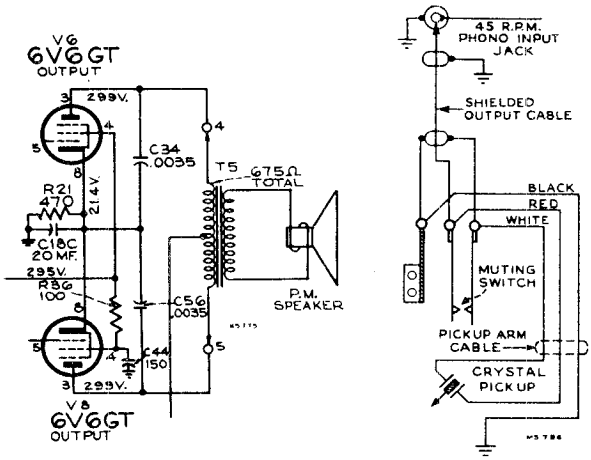
Pickup Arm Cable:

The RP-168A-1 record changer pickup arm cable now being used is a three wire cable (RED-WHITE-BLACK). In some instruments the black wire is omitted or a shielded wire may be used as shown in 9W101, 9W103, 9W105 Service Data. The latest connection diagram is given below.

I.F. Transformer Substitution:

In some chassis I.F. transformers stamped 970435-2 have been used as a substitute for 2nd. I.F. transformers stamped 970435-5.

The 455 Kc. windings of 970435-2 transformers use resonating capacitors of 235 mmf. each, the d.c. resistance of each winding is, 8.2 ohm, the transformer indicated in the schematic diagram is stamped 970435-5.



Output Tubes Circuit Pickup Arm Cable
Models 9W101, 9W103, 9W105

Incorrect Color Code on Capacitor:

Some ceramic capacitors C11 (5 mmf.) have been used which have a color code of BLACK-GREEN-BLACK. The capacitor is correct, but the color code is incorrect. The normal color code of this capacitor is GREEN-BLACK-WHITE.

Record Changer Mounting Screws:

The original mounting screws used a cover which screwed into the top of the mounting screw. The screws now being used have a plug-in type of cover.

Change in Parts List:

MISCELLANEOUS

Change:

74209 Cover—Mounting screw cover (threaded type) for RP 168-A-1 record changer (3 required) (used with RCA 74424 screw).

74424 Screw—#8-32 x 1¾" special screw (tapped hole) for RP 168-A-1 record changer (3 required) (used with RCA 74209 cover).

Add:

74579 Bumper—Rubber bumper (black) for front panel of record changer drawer—walnut or mahogany instruments—Models 9W101 and 9W103 (2 required)

74580 Bumper—Rubber bumper (white) for front panel of record changer drawer—blond or limed oak instruments—Models 9W101 and 9W103 (2 required)

74581 Cover—Mounting screw cover (plug-in type) for RP 168-A-1 record changer (3 required) (used with RCA 74582 screw).

74582 Screw—#8-32 x 1¾" special screw (non-tapped hole) for RP 168-A-1 record changer (3 required) (used with RCA 74581 cover).

71928	Capacitor—Tubular, .02 mfd., 200 volts C51
73638	Capacitor—Tubular, .02 mfd., 400 volts C55
71551	Capacitor—Tubular, .05 mfd., 200 volts C15
73747	Capacitor—Electrolytic, 2 mfd., 50 volts C33
74200	Capacitor—Electrolytic, comprising 1 section of 10 mfd., 300 volts and 1 section of 100 mfd., 10 volts....C57A, C57B
73372	Capacitor—Electrolytic, comprising 1 section of 30 mfd., 350 volts, 1 section of 30 mfd., 300 volts and 1 section of 20 mfd., 25 volts C18A, C18B, C18C
73744	Coil—Oscillator coil—A.M. L4
73918	Coil—Antenna coil—F.M. L1
73916	Coil—Oscillator coil—F.M. L2
71942	Coil—Filament choke coil L3
33514	Connector—Phono input connection socket (dual)
5040	Connector—4-contact female connecting socket for speaker cable
30868	Connector—2-contact female connecting socket for record changer motor cable
*74639	Control—Volume control and power switch (R14, S3)
†72953	Cord—Drive cord (approximately 48" overall length required)
73690	Cord—Power cord and plug
16058	Grommet—Rubber grommet to mount R-F shelf (4 required)
72069	Grommet—Rubber grommet for rear mounting feet (2 required)
73895	Indicator—Station selector indicator
*74645	Nut—#8-32 hex retainer nut between R-F shelf and volume control knob shaft
74297	Plate—Dial back plate assembly complete with two (2) drive cord pulleys
*74640	Pulley—Pulley and hub for volume control shaft
	Resistors—Fixed composition resistors:
	68 ohms, ±10%, ½ watt R7
	100 ohms, ±10%, ½ watt R17, R27, R36
	120 ohms, ±10%, ½ watt R12
	470 ohms, ±10%, 2 watts R21
	560 ohms, ±10%, ½ watt R35
	680 ohms, ±20%, ½ watt R9, R11
	1200 ohms, ±5%, ½ watt R23
73637	Resistor—Wire wound, 2200 ohms, 5 watts R22
	Resistors—Fixed composition resistors:
	3300 ohms, ±5%, ½ watt R24
	5600 ohms, ±10%, ½ watt R47
	8200 ohms, ±10%, ½ watt R43
	10,000 ohms, ±10%, ½ watt R32, R50
	15,000 ohms, ±10%, ½ watt R13, R18, R30
	18,000 ohms, ±10%, ½ watt R4
	22,000 ohms, ±10%, ½ watt R48
	27,000 ohms, ±10%, ½ watt R8, R40
	27,000 ohms, ±10%, 1 watt R5
	33,000 ohms, ±10%, ½ watt R6
	39,000 ohms, ±10%, ½ watt R25
	56,000 ohms, ±10%, 1 watt R10
	82,000 ohms, ±10%, ½ watt R42
	100,000 ohms, ±10%, ½ watt R45
	120,000 ohms, ±10%, ½ watt R46
	220,000 ohms, ±10%, ½ watt R49
	270,000 ohms, ±10%, ½ watt R19, R29
	330,000 ohms, ±10%, ½ watt R28
	470,000 ohms, ±10%, ½ watt R20, R26, R44
	2.2 megohms, ±20%, ½ watt R3
	3.9 megohms, ±10%, ½ watt R2
	10 megohms, ±20%, ½ watt R15, R41
	22 megohms, ±20%, ½ watt R16

STOCK No.	DESCRIPTION
73894	Shaft—Tuning knob shaft
73632	Shield—Tube shield—for V2, V5
*74646	Sleeve—Sleeve and pulley assembly (for volume control knob shaft)
72516	Socket—Tube socket, miniature—for V4, V5, V7
73606	Socket—Tube socket, miniature—for V1, V2, V3
31251	Socket—Tube socket, octal, wafer—for V6, V8, V9
73117	Socket—Tube socket, miniature—for V10
31364	Socket—Dial lamp or pilot lamp socket
74038	Spring—Tension spring for drive cord
74202	Support—Polystyrene support for F.M. oscillator coil complete with mounting bracket
73891	Switch—Tone control switch (S4)
*74644	Switch—Selector switch (S1, S2)
73743	Transformer—Ratio detector transformer (T4)
73745	Transformer—First I.F. transformer—dual (T2)
*74642	Transformer—Second I.F. transformer—dual (T3)
*74643	Transformer—Power transformer, 115 volt, 60 cycle (T1)
33726	Washer—"C" washer for tuning knob shaft
	SPEAKER ASSEMBLIES
	Stamped 92569-5W
	RL 103B5
13867	Cap—Dust cap
73934	Cone—Cone and voice coil assembly
5039	Plug—4-prong male plug for speaker
73635	Speaker—12" PM speaker complete with cone and voice coil—less output transformer and plug
71145	Suspension—Metal cone suspension
73636	Transformer—Output transformer (T5)
	Note: If stamping on speaker does not agree with above number, order replacement parts by referring to model number of instrument, number stamped on speaker and full description of part required.
	MISCELLANEOUS
*74649	Antenna—F.M. antenna
74205	Bezel—Dial scale bezel less dial
74054	Bracket—Pilot lamp bracket
71105	Cable—Shielded pickup cable for record changer, complete with pin plug
13103	Cap—Pilot lamp cap
71892	Catch—Door strike and catch
74298	Clamp—Dial clamp (2 required)
X3038	Cloth—Grille cloth (2 required) for mahogany or walnut instruments
X3039	Cloth—Grille cloth (2 required) for oak instruments
30868	Connector—2-contact female connecting socket for motor cable
30870	Connector—2-contact male connecting plug for motor cable
74581	Cover—Mounting screw cover (plug-in type) for mounting record changer (3 required)
*74737	Decal—Control panel function decal for mahogany or walnut instruments
*74738	Decal—Control panel function decal for oak instruments
74273	Decal—Trade mark decal ("Victrola")
*74647	Dial—Glass dial scale
73549	Emblem—"RCA Victor" emblem (metal)
11889	Grommet—Rubber grommet for front apron of chassis (2 required)
73735	Hinge—Drop door hinge (2 required)
71821	Knob—Tuning knob—maroon—for mahogany or walnut instruments
72824	Knob—Tuning knob—brown—for oak instruments
73998	Knob—Volume control knob—maroon—for mahogany or walnut cabinets
73995	Knob—Volume control knob—brown—for oak instruments
73230	Knob—Function switch knob—maroon—for mahogany or walnut instruments
73231	Knob—Function switch knob—brown—for oak instruments
*74845	Knob—Tone control switch knob—maroon—for mahogany or walnut instruments
*74846	Knob—Tone control switch knob—brown—for oak instruments
11765	Lamp—Dial lamp—Mazda 51
*74648	Loop—Antenna loop
74208	Nut—Tee nut for mounting record changer (3 required)
74582	Screw—#8-32 x 1¾" special screw for mounting record changer (3 required)
*74736	Slide—Record changer tray slide
74421	Spring—Conical spring for mounting record changer—upper—RH side (1 required)
74422	Spring—Conical spring for mounting record changer—upper—LH side (2 required)
74423	Spring—Conical spring for mounting record changer—lower (3 required)
30900	Spring—Retaining spring for knobs 71821 and 72824
72845	Spring—Retaining spring for knobs 73995 and 73998
14270	Spring—Retaining spring for knobs 73230 and 73231
73412	Support—Drop door fall support

MODELS 9X561, Ch. RC-1079B;
9X562, Ch. RC-1079C

Lead Dress

Alignment Procedure

1. Dress all heater leads down to chassis and away from all audio grid and plate wiring.
2. Dress power cord down to chassis base and corner.
3. Dress capacitor C18 against back apron.
4. Dress capacitor C13 down to base alongside of shielded lead.
5. Dress output transformer leads down to chassis.
6. Dress capacitors C9 and C15 as direct as possible.
7. Dress dial lamp leads on top of chassis between 12SQ7 and 50L6GT tubes; below chassis, as short as possible to rectifier socket.
8. Dress excess loop leads away from tubes and clear of tuning condenser.

Test-Oscillator. — For all alignment operations, connect the low side of the test-oscillator to the receiver chassis, and keep the oscillator output as low as possible to avoid a-v-c action.

On AC operation an isolation transformer (115 v./115 v.) may be necessary for the receiver if the test oscillator is also AC operated.

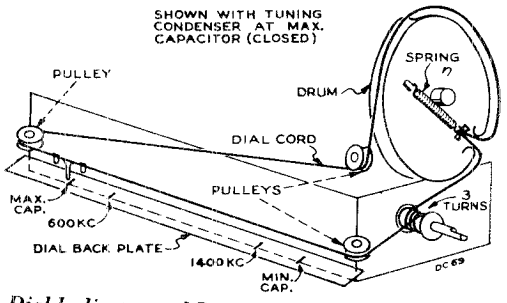
Dial Calibration

With the tuning condenser fully meshed, the dial pointer should be set to the first score mark at the left-hand end of the dial back plate. The four score marks represent: Max. cap. 600 kc 1400 kc min. cap.

Steps	Connect the high side of test-oscillator to—	Tune test-osc. to—	Turn radio dial to—	Adjust the following for max. output
1	12SK7 I-F grid through 0.1 mfd. capacitor	455 kc	Quiet-point 1600 kc end of dial	T2 (top and bottom) 2nd I-F trans.
2	Stator of C1 through 0.1 mfd.			*T1 (top and bottom) 1st I-F trans.
3	Short wire placed near loop to radiate signal	1620 kc	Min. cap.	C4 (osc.)
4		1400 kc	1400 kc	†C2 (ant.)
5		600 kc	600 kc	L3 (osc.) Rock gang
6		Repeat steps 3, 4 and 5.		

*Do not readjust T2 when test oscillator is connected to C1.

†When adjusting C2 (ant. trimmer) it is necessary to have the loop in the same position and spacing as it will have when assembled in the cabinet.



Dial Indicator and Drive Cord

MODELS 9X571, Ch. RC-1079; 9X572, Ch. RC-1079A

Critical Lead Dress

1. Dress all heater leads down to chassis and away from all audio grid and plate wiring.
2. Dress power cord to back apron and away from phono jack.
3. Dress capacitor C18 against back apron.
4. Connect shielded capacitor C13 direct and with a minimum of exposed leads.
5. Dress dial lamp leads on top of chassis around electrolytic capacitor and between 12SQ7 and 50L6GT tubes.
6. Dress output transformer leads down to chassis.
7. Dress excess loop leads away from tubes and clear of tuning condenser.

Test-Oscillator. — For all alignment operations, connect the low side of the test-oscillator to the receiver chassis, and keep the oscillator output as low as possible to avoid a-v-c action.

On AC operation an isolation transformer (115 v./115 v.) may be necessary for the receiver if the test oscillator is also AC operated.

Dial Calibration

With the tuning condenser fully meshed, the dial pointer should be set to the first score mark at the left-hand end of the dial back plate. The four score marks represent: Max. cap. 600 kc 1400 kc min. cap.

Steps	Connect the high side of test-oscillator to—	Tune test-osc. to—	Turn radio dial to—	Adjust the following for max. output
1	12SK7 I-F grid through 0.1 mfd. capacitor	455 kc	Quiet-point 1600 kc end of dial	T2 (top and bottom) 2nd I-F trans.
2	Stator of C1 through 0.1 mfd.			*T1 (top and bottom) 1st I-F trans.
3	Short wire placed near loop to radiate signal	1620 kc	Min. cap.	C4 (osc.)
4		1400 kc	1400 kc	†C2 (ant.)
5		600 kc	600 kc	L3 (osc.) Rock gang
6		Repeat steps 3, 4 and 5.		

*Do not readjust T2 when test oscillator is connected to C1.

†When adjusting C2 (ant. trimmer) it is necessary to have the loop in the same position and spacing as it will have when assembled in the cabinet.

9X642, Ch. RC-1080A

ALIGNMENT PROCEDURE

Cathode Ray Alignment is the preferable method. Connections for the oscilloscope are shown on the schematic diagram.

Output Meter Alignment.—If this method is used, connect the meter across the voice coil and turn the receiver volume control to maximum.

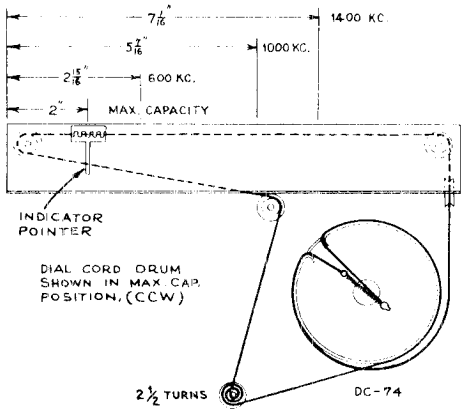
Test Oscillator.—Connect low side of test oscillator to common wiring in series with a .1 mf. capacitor. If the test oscillator is a. c. operated it may be necessary to use an isolation transformer for the receiver during alignment and the low side of the test oscillator connected directly to common wiring at the electrolytic capacitor. Keep the oscillator output low to prevent a-v-c action.

Step	Connect high side of sig. gen. to—	Sig. gen. output	Turn radio dial to—	Adjust for peak output
1	Pin No. 8 of 12SA7 tube	455 kc	Quiet point near 600 kc	Top and bottom cores of T1
2				Top and bottom cores of T2
3	"External Antenna" terminal through 100 mmf. capacitor	1,400 kc	1,400 kc	C6 Osc. C5 R.F. C4 Ant.
4		Shunt C5 with 22,000 ohm resistor		
		600 kc	600 kc	L4 Osc. (Rock gang)
5		Remove 22,000 ohm resistor from C5		
		600 kc	600 kc	L2 R.F.
6		Repeat steps 3, 4 and 5		

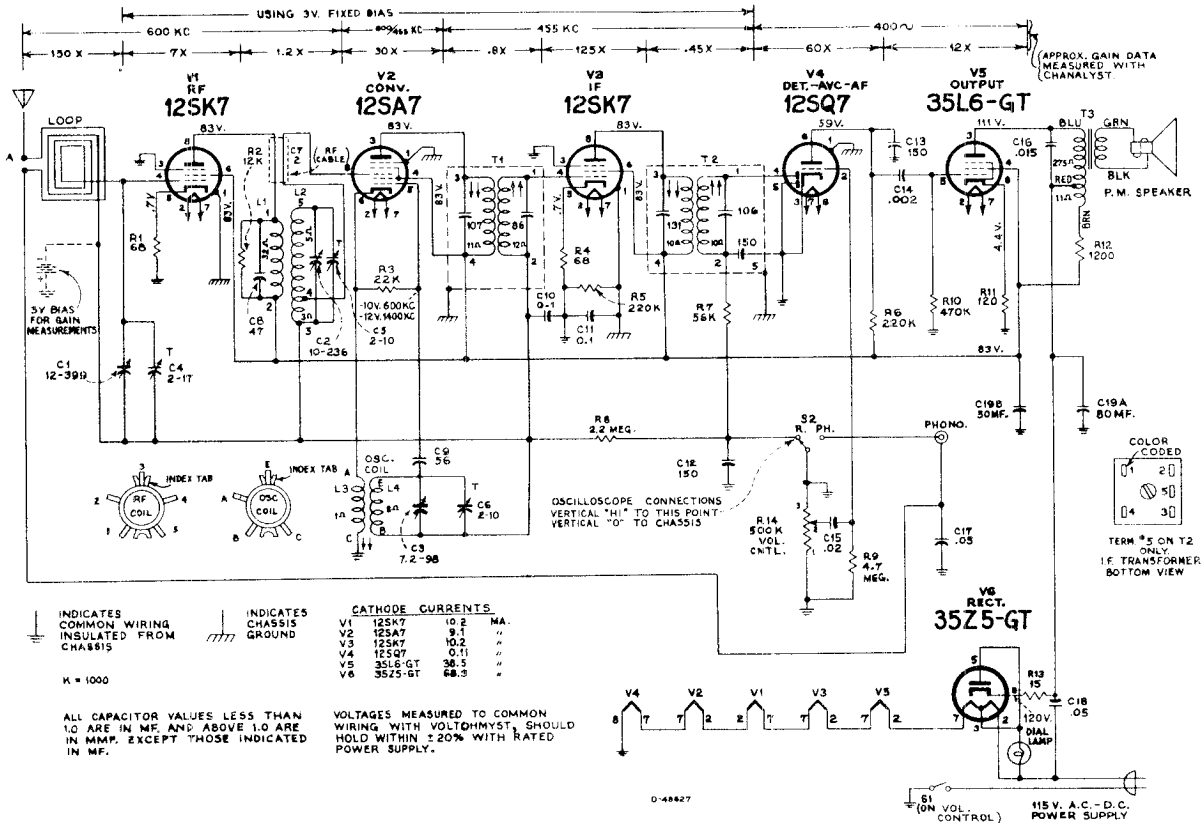
The position of the loop antenna in relation to the chassis affects adjustment of C4. The correct position is indicated on the illustration "Tube and Trimmer Locations."

NOTE.—If reception is not obtained on d. c. operation, reverse plug in outlet receptacle. On a.c. operation this may reduce hum.

The position of the speaker is adjustable; the correct position is indicated on the illustration "Tube and Trimmer Locations."



Dial Indicator and Drive Mechanism



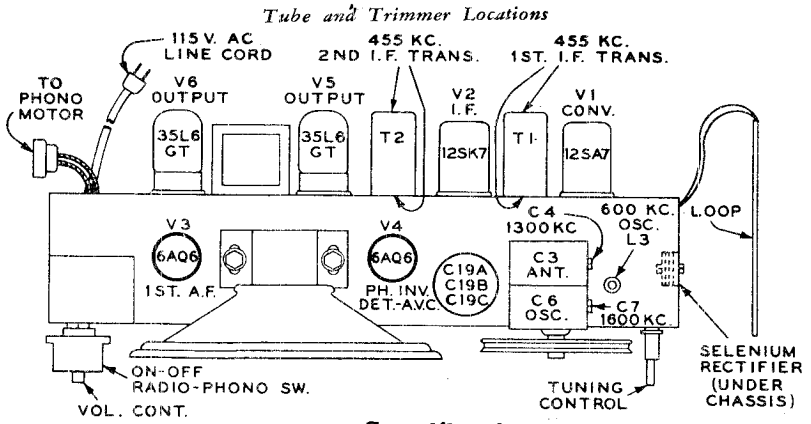
Schematic Diagram

In some chassis an alternate filter capacitor is used which has three sections. The low voltage section (20 mf. 25 volts) is not used. The alternate capacitor is mounted on top of the chassis and is available as Stock No. 73975.

©John F. Rider

MODEL 9Y7, Ch. RC-1057B

Tube and Trimmer Locations



Alignment Procedure

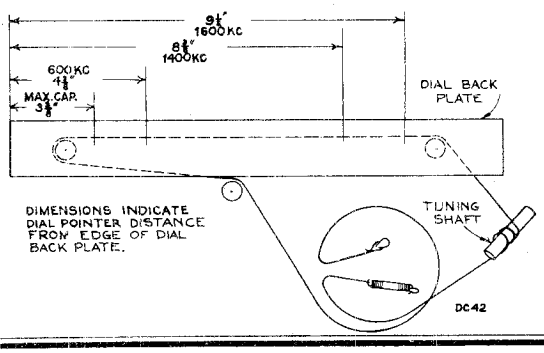
Output Meter.—Connect meter across speaker voice coil. Turn volume control to maximum.

Test Oscillator.—Connect low side of test oscillator to common wiring in series with a .1 mf. capacitor. If the test oscillator is a.c. operated it may be necessary to use an isolation transformer for the receiver during alignment and the low side of the test oscillator connected directly to common wiring at the electrolytic capacitor. Keep the oscillator output low to prevent a-v-c action.

Dial Pointer Adjustment.—Rotate tuning condenser fully counterclockwise (plates fully meshed). Adjust indicator pointer so that it is 3⅜" from the left hand edge of the dial back plate.

Steps	Connect the high side of test-oscillator to—	Tune test-osc. to—	Turn radio dial to—	Adjust the following for max. output
1	I.F. grid, in series with .1 mfd.	455 kc	Quiet point 1,600 kc end of dial	Pri. & Sec. 2nd I.F. transformer
2	Converter grid in series with .1 mfd.			Pri. & Sec. 1st I.F. transformer
NOTE.—ANTENNA LOOP AND RECORD CHANGER MUST BE IN CABINET FOR THE FOLLOWING				
3	Short wire placed near loop for radiated signal	1,620 kc	Extreme R. H. end (gang open)	C7 (osc.)
4		1,400 kc	1,400 kc	C4 (ant.)
5		600 kc	600 kc	Osc. Coil L3 Rock gang
6	Repeat steps 3, 4, & 5 if necessary			

Dial Indicator and Drive Mechanism



Specifications

Tuning Range ..... 540-1600 kc
Intermediate Frequency ..... 455 kc
Tube Complement

1. RCA-12SA7 ..... Converter
2. RCA-12SK7 ..... I-F Amplifier
3. RCA-6AQ6 ..... A-F Amplifier
4. RCA-6AQ6 ..... 2nd Det.-Ph. Inv.
5. RCA-35L6GT } Push-Pull Output
6. RCA-35L6GT }

A selenium rectifier is used.

Power Supply Rating ..... 115 volts, 60 cycles a.c., 60 watts.
Dial Lamps (2) ..... Mazda type 51, 6-8 volts, 0.2 amp.

Loudspeaker (92573-1K)
Size and type ..... 5" x 7" P.M.
Voice coil impedance ..... 3.4 ohms at 400 cycles

Power Output
Undistorted ..... 2.2 watts
Maximum ..... 3.0 watts

Cabinet Dimensions
Height 9 13/16" Width 16¼" Depth 14⅜"

Tuning Drive Ratio ..... 10½:1 (5¼ turns of knob)

Record Changer (RP-168A-1)
Turntable speed ..... 45 r.p.m
Records used ..... Long playing—7 in.
Record capacity ..... 8 records
Pickup ..... Crystal (medium output)

Service Hints

The two 6AQ6 tubes and the dial lamps are accessible by removing the sloping panel in the front of the record changer compartment.

When re-installing the chassis in the cabinet the dial lamps should be positioned to give maximum illumination of the dial without direct light of the lamps being visible from the front of the cabinet.

The chassis mounting board should be flush against the front of the cabinet.

The position of the speaker is adjustable. When correctly positioned, it should set firmly against the front of the cabinet but with no undue strain on the speaker.

CAUTION.—CLOSE TUNING CONDENSER PLATES COMPLETELY (C-C-W) BEFORE REMOVING OR RE-INSTALLING CHASSIS.

Controls

73037	Transformer—Second I.F. transformer (T2)
73008	Transformer—Output transformer (T3)
33726	Washer—"C" washer for tuning knob shaft
*74029	Washer—Fibre washer for tuning knob shaft
70406	Washer—Spring washer for volume control
34457	Washer—Spring washer for tuning knob shaft
	SPEAKER ASSEMBLIES 92573-1K
72728	Cone—Cone and voice coil assembly
74454	Gasket—Rubber gasket for speaker
72727	Speaker—5" x 7" P.M. speaker complete with cone and voice coil
	MISCELLANEOUS
74225	Bezel—Dial scale bezel less dial
*74209	Cover—Cover for record changer mounting screw (3 required)
*74273	Decal—Trademark decal (Victrola)
*74224	Dial—Polystyrene dial scale
*74237	Escutcheon—Tuning control escutcheon for blonde instruments
*74236	Escutcheon—Tuning control escutcheon for mahogany or walnut instruments
*74235	Escutcheon—Power—radio—phono switch escutcheon for blonde instruments
*74234	Escutcheon—Power—radio—phono switch escutcheon for mahogany or walnut instruments
72894	Foot—Rubber foot (4 required)
72692	Hinge—Cabinet lid hinge (2 required)
*74223	Knob—Power, radio and phono switch knob—tan—for blonde instruments
*74222	Knob—Power, radio and phono switch knob—maroon—for walnut or mahogany finish instruments
*74221	Knob—tuning knob—tan—for blonde instruments
*74220	Knob—Tuning knob—maroon—for walnut or mahogany finish instruments
*74219	Knob—Volume control knob—tan—for blonde instruments
*74218	Knob—Volume control knob—maroon—for walnut or mahogany finish instruments
11765	Lamp—Dial lamp
*74208	Nut—Tee nut for mounting record changer (3 required)
71095	Nut—Speed nut for dial scale bezel (8 required)
74192	Plug—3 prong male plug for shielded pickup cable
74424	Screw—#8-32 x 1¾" special head screw for mounting record changer (3 required)
74421	Spring—Conical spring for mounting record changer—upper—R. H. side (1 required)
74422	Spring—Conical spring for mounting record changer—upper—L. H. side (2 required)
74423	Spring—Conical spring for mounting record changer—lower (3 required)
14270	Spring—Retaining spring for knobs
71824	Stud—Stud and screw to mount lid hinge (1 set)
30688	Support—Cabinet lid support

† Stock No. 72953 is a reel containing 250 feet of cord.

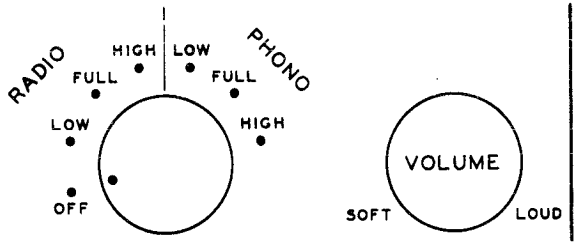
Specifications

Tuning Range ..... 540-1600 kc
Intermediate Frequency ..... 455 kc

Tube Complement
(1) RCA 12SA7 ..... Converter
(2) RCA 12SK7 ..... I-F Amplifier
(3) RCA 12SQ7 ..... Det.—A.V.C.—A-F Amplifier
(4) RCA 50L6GT ..... Output
(5) RCA 35Z5GT ..... Rectifier

Power Supply Rating
115 volts a.c., 60 cycles ..... 45 watts total

Power Output
Undistorted ..... 1.1 watts
Maximum ..... 1.75 watts



Controls

Dial Lamps (2) ..... Mazda type 1490, 3.2 volts, .16 amp.

Loudspeaker (92586-2W)
Size and Type ..... 8 in. PM
Voice Coil Impedance ..... 3.2 ohms at 400 cycles

Cabinet Dimensions
Height .... 28" Width .... 18½" Depth .... 14¼"

Weight ..... 36 lbs.

Tuning Drive Ratio ..... 9 to 1 (4½ turns of knob)

Record Changer RP168A-1

Power Supply

Although this model employs an AC-DC receiver chassis, the instrument is not suitable for use on DC, as this would damage the motor in the record changer.

Replacement Parts

Stock No.	DESCRIPTION
	CHASSIS ASSEMBLIES
	RC 1079 D
74655	Back—Chassis back and loop assembly (L1)
74653	Capacitor—Variable tuning capacitor (C1, C2, C3, C4)
71924	Capacitor—Ceramic, 56 mmf. (C5)
71614	Capacitor—Ceramic, 120 mmf. (C11)
73501	Capacitor—Ceramic, 150 mmf. (C14, C7)
74678	Capacitor—Electrolytic comprising 2 sections of 120 mfd, 150 volts and 1 section of 40 mfd, 25 volts (C16A, C16B, C16C)
73186	Capacitor—Tubular, paper, .001 mfd, 400 volts (C9)
73961	Capacitor—Tubular, paper, .003 mfd, 200 volts (C10)
72573	Capacitor—Tubular, paper, .003 mfd, 400 volts (C21)
72791	Capacitor—Tubular, paper, .005 mfd, 400 volts (C17)
71923	Capacitor—Tubular, paper, .01 mfd, 200 volts (C12)
72827	Capacitor—Tubular, paper, .01 mfd, 400 volts (C15)
71928	Capacitor—Tubular, paper, .02 mfd, 200 volts (C13, C20)
73553	Capacitor—Tubular, paper, .05 mfd, 400 volts (C8, C18, C6, C19)
73935	Clip—Mounting clip for I.F. transformer
74448	Coil—Oscillator coil (L2, L3)
36422	Connector—3 contact female connector for pickup cable (J1)
30368	Connector—2 contact female connector for motor cable (P3)
*74827	Control—Volume control (R10)
†72953	Cord—Drive cord (approx. 43" overall)
73693	Grommet—Power cord strain relief (1 set)
72283	Grommet—Rubber grommet for mounting tuning capacitor (3 required)
74658	Indicator—Station selector indicator
71116	Lamp—Dial lamp—Mazda 1490
74651	Plate—Dial back plate complete with three (3) pulleys
18469	Plate—Bakelite mounting plate for electrolytic
72313	Resistor—Fuse type, 33 ohms (R16)
	Resistors—Fixed composition:
	82 ohms, ±10%, ½ watt (R17)
	150 ohms, ±10%, ½ watt (R14)
	1,000 ohms, ±10%, 1 watt (R15)
	18,000 ohms, ±10%, ½ watt (R19)
	22,000 ohms, ±10%, ½ watt (R2)
	27,000 ohms, ±10%, ½ watt (R9)
	56,000 ohms, ±10%, ½ watt (R4)
	120,000 ohms, ±10%, ½ watt (R3)
	220,000 ohms, ±10%, ½ watt (R6, R7, R12, R18)
	470,000 ohms, ±10%, ½ watt (R13)
	680,000 ohms, ±10%, ½ watt (R8)
	1 megohm, ±10%, ½ watt (R1)
	3.3 megohm, ±10%, ½ watt (R5)
	10 megohm, ±10%, ½ watt (R11)
*74825	Shaft—Tuning knob shaft and pulley
31251	Socket—Tube socket, octal
74663	Socket—Dial lamp socket assembly complete with two (2) sockets (miniature bases) and leads
74038	Spring—Tension spring for drive cord
*74826	Switch—Function switch (S1)
73036	Transformer—First I.F. transformer (T1)
73037	Transformer—Second I.F. transformer (T2)
74677	Transformer—Output transformer (T3)
33726	Washer—"C" washer for tuning knob shaft
	SPEAKER ASSEMBLIES
	92586-2W
	RL 105 C2
74758	Cone—Cone and voice coil assembly
74679	Speaker—8" P.M. speaker complete with cone and voice coil NOTE: If stamping on speaker does not agree with above speaker number, order replacement parts by referring to model number of instrument and full description of part required.
	MISCELLANEOUS
*74832	Bottom—Bottom cover for record changer compartment (2 required)
*74833	Bracket—Lamp bracket (2 required)
*74830	Clamp—Dial clamp (2 required)
X1756	Cloth—Grille cloth
74192	Connector—3 contact male connector for pickup cable (P1)
74581	Cover—Plug-in cover for record changer mounting screws (3 required)
*74831	Cushion—Rubber cushion for dial clamp
74682	Decal—Function switch decal for mahogany or walnut instruments
*74835	Decal—Function switch decal for oak instruments
74273	Decal—Trade mark decal
*74829	Dial—Dial scale
74674	Emblem—"RCA Victor" emblem
74828	Knob—Function switch knob—tan—for oak instruments
74681	Knob—Function switch knob—maroon—for mahogany or walnut instruments
74666	Knob—Volume control or tuning knob—maroon—for mahogany or walnut instruments
74247	Knob—Volume control or tuning knob—tan—for oak instruments
74208	Nut—Tee nut for mounting record changer
73770	Pull—Drawer pull
74582	Screw—No. 8-32 x 1¾" special head screw for mounting record changer (3 required)
74835	Slide—Slide mechanism assembly for record changer drawer
74422	Spring—Conical spring for mounting record changer (upper LH) (2 required)
74421	Spring—Conical spring for mounting record changer (upper RH) (1 required)
74423	Spring—Conical spring for mounting record changer (lower) (3 required)

Alignment Procedure

Critical Lead Dress

1. Dress all heater leads down to chassis and away from all audio grid and plate wiring.
2. Dress power cord to back apron and away from phono jack.
3. Dress capacitor C18 against back apron.
4. Connect shielded capacitor C13 direct and with a minimum of exposed leads.
5. Dress dial lamp leads on top of chassis around electrolytic capacitor and between 12SQ7 and 50L6GT tubes.
6. Dress output transformer leads down to chassis.
7. Dress excess loop leads away from tubes and clear of tuning condenser.

Test-Oscillator. — For all alignment operations, connect the low side of the test-oscillator to the receiver chassis, and keep the oscillator output as low as possible to avoid a-v-c action.

An isolation transformer (115 v./115 v.) may be necessary for the receiver if the test oscillator is also AC operated.

Dial Calibration

With the tuning condenser fully meshed, the dial pointer should be set to the first score mark at the left-hand end of the dial back plate. The four score marks represent: Max. cap., 600 kc, 1400 kc and min. cap.

Steps	Connect the high side of test-oscillator to—	Tune test-osc. to—	Turn radio dial to—	Adjust the following for max. output
1	12SK7 I-F grid through 0.1 mfd. capacitor	455 kc	Quiet-point 1600 kc end of dial	T2 (top and bottom) 2nd I-F trans.
2	Stator of C1 through 0.1 mfd.			*T1 (top and bottom) 1st I-F trans.
3	Short wire placed near loop to radiate signal	1630 kc	Min. cap.	C4 (osc.)
4		1400 kc	1400 kc	†C2 (ant.)
5		600 kc	600 kc	L3 (osc.) Rock gang
6	Repeat steps 3, 4 and 5.			

*Do not readjust T2 when test oscillator is connected to C1.

†When adjusting C2 (ant. trimmer) it is necessary to have the loop in the same position and spacing as it will have when assembled in the cabinet.

Care of Sapphire

The record changer sapphire is protected by a permanent metal guard. LINT MAY COLLECT TO CLOG THE OPENING IN THE GUARD AT THE SAPPHIRE POINT AND CAUSE POOR RECORD REPRODUCTION. This may require occasional cleaning of the guard opening — clean by carefully brushing with a small soft brush.

Record Separators

In the out of cycle position the record separator knives or discs are normally concealed inside the center post. During service, the position of the star wheel on the underside of the record changer may be accidentally shifted; this may cause the separator knives to be extended when they should be concealed.

If the separator knives are thus extended — turn the power on so that the turntable is revolving, gently press fingers against the extended knives until they disappear inside the center post — **DO THIS ONLY WHILE MECHANISM IS OUT OF CYCLE.**

Landing Adjustment "A"

If the pickup lands inside the starting grooves — turn screw "A" slightly clockwise. If pickup lands outside the starting grooves — turn screw "A" slightly counterclockwise.

Pickup Height Adjustment "B"

During cycle the pickup arm must rise high enough to clear a stack of eight records on the turntable, but not high enough to cause the top of the arm to touch records resting on the record supports.

If pickup does not clear a stack of eight records — or if pickup arm touches records on record supports — turn screw "B" slightly.

Record Changer (RP-168-1 modified or RP-168B-1)

Turntable speed ..... 45 r.p.m.
Records used ..... Long playing—7 in.
Record capacity ..... Up to 10 records
Pickup ..... Crystal (medium output)
Pickup arm assembly RMP129-2

Service Hints

The tubes and the dial lamps are accessible by removing the panel in the front of the record changer compartment.

The chassis metal mounting plate should be flush against the front of the cabinet.

The position of the speaker is adjustable. When correctly positioned, it should set firmly against the front of the cabinet but with no undue strain on the speaker.

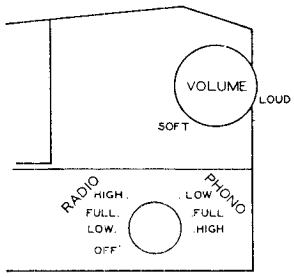
Care of Sapphire

The record changer sapphire is protected by a permanent metal guard. LINT MAY COLLECT TO CLOG THE OPENING IN THE GUARD AT THE SAPPHIRE POINT AND CAUSE POOR RECORD REPRODUCTION. This may require occasional cleaning of the guard opening—clean by carefully brushing with a small soft brush.

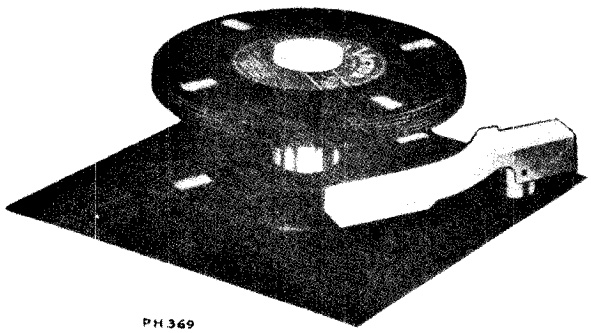
Record Separators

In the out of cycle position the record separator knives or discs are normally concealed inside the center post. During service, the position of the star wheel on the underside of the record changer may be accidently shifted; this may cause the separator knives to be extended when they should be concealed.

If the separator knives are thus extended—turn the power on so that the turntable is revolving, gently press fingers against the extended knives until they disappear inside the center post—**DO THIS ONLY WHILE MECHANISM IS OUT OF CYCLE.**



Controls



PH369

This instrument incorporates either a RP168-1 (modified) or a RP-168B-1 record changer and a RMP129-2 pickup arm assembly. Refer to Service Data RP-168 Series, 3rd edition, for information on record player.

Alignment Procedure

Output Meter.—Connect meter across speaker voice coil. Turn volume control to maximum.

Test Oscillator.—Connect low side of test oscillator to common wiring in series with a .1 mf. capacitor. If the test oscillator is a.c. operated it may be necessary to use an isolation transformer for the receiver during alignment and the low side of the test oscillator connected directly to common wiring at the electrolytic capacitor. Keep the oscillator output low to prevent a-v-c action.

Dial Pointer Adjustment.—Rotate tuning condenser until the plates are fully open. Adjust indicator pointer to 1630 kc (extreme high frequency end of the scale).

©John F. Rider

MODEL 9Y51,
Ch. RC-1077

LEAD DRESS

1. Dress all heater leads and pilot light leads down to chassis and as far as possible from all audio grid and plate wiring.
2. Dress all exposed leads away from each other and away from chassis to prevent short circuits.
3. Dress lead from R.F. section of gang to V1 pin 7 direct but away from chassis base to reduce capacity, also away from fuse resistor.
4. Dress lead from oscillator section of gang to oscillator coil direct but away from chassis base to reduce capacity.
5. Connect capacitor C20 with short leads between gang frame and mounting bracket.
6. Dress output transformer leads down to base.
7. Dress loop antenna leads away from gang plates and tubes.
8. Dress 33-ohm limiting resistor away from chassis.

Pickup Landing Adjustment "A"

The pickup point should land half-way between the outer edge of the record and the first music groove.

If the pickup lands inside the starting grooves—turn screw "A" slightly clockwise. If pickup lands outside the starting grooves—turn screw "A."

Pickup Height Adjustment "B"

During cycle the pickup arm must rise high enough to clear a stack of eight records on the turntable, but not high enough to cause the top of the arm to touch records resting on the record supports.

If pickup does not clear a stack of eight records—turn screw "B" slightly clockwise. If pickup arm touches records on record supports—turn screw "B."

Steps	Connect the high side of test to—	Tune test-osc. to—	Turn radio dial to—	Adjust the following for max. output
1	I.F. grid, in series with .1 mfd.	455 kc	Quiet point 1,600 kc end of dial	Pri. & Sec. 2nd I.F. transformer
2	Converter grid in series with .1 mfd.			Pri. & Sec. 1st I.F. transformer
NOTE.—ANTENNA LOOP AND RECORD CHANGER MUST BE IN CABINET FOR THE FOLLOWING				
3	Short wire placed near loop for radiated signal	1,630 kc	Extreme R. H. end (gang open)	C4 (osc.)
4		1,400 kc	1,400 kc	C2 (ant.)
5		600 kc	600 kc	Osc. Coil L3 Rock gang
6	Repeat steps 3, 4, & 5 if necessary

Replacement Parts

STOCK No.	DESCRIPTION
	CHASSIS ASSEMBLIES RC 1077
*74700	Bracket—Drive cord pulley bracket (L. H.) complete with one (1) pulley and one (1) terminal board.
*74705	Bracket—Drive cord pulley bracket (R. H.) complete with two (2) pulleys less long bracket.
*74704	Capacitor—Variable tuning capacitor—less bracket..C1, C2, C3, C4
71924	Capacitor—Ceramic, 56 mmf. C5
74884	Capacitor—Ceramic, 68 mmf. C11
39630	Capacitor—Mica, 120 mmf. C14
39632	Capacitor—Mica, 150 mmf. C20
74678	Capacitor—Electrolytic, comprising 2 sections of 120 mfd., 150 volts and 1 section of 40 mfd., 25 volts C16A, C16B, C16C
72792	Capacitor—Tubular, .001 mfd., 200 volts C7
73186	Capacitor—Tubular, .001 mfd., 400 volts C9
71926	Capacitor—Tubular, .005 mfd., 200 volts C12
72791	Capacitor—Tubular, .005 mfd., 400 volts C17
70602	Capacitor—Tubular, .0025 mfd., 400 volts C10
72827	Capacitor—Tubular, .01 mfd., 400 volts C15
71928	Capacitor—Tubular, .02 mfd., 200 volts C13
73553	Capacitor—Tubular, .05 mfd., 400 volts C6, C8, C18, C19
73935	Clip—Mounting clip for I. F. transformer
74448	Coil—Oscillator coil L2, L3
36422	Connector—3 contact female connector (phono input socket) J1
30868	Connector—2 contact female connector for motor cable....P3
*74702	Control—Volume control R10
†72953	Cord—Drive cord (approx. 49" overall length required)
74454	Gasket—Rubber gasket for between speaker and cabinet
73693	Grommet—Power cord strain relief (1 set)
72283	Grommet—Rubber grommet to mount variable capacitor (3 required)
*74703	Loop—Antenna loop L1
18469	Plate—Bakelite mounting plate for electrolytic capacitor
72313	Resistor—Fuse type, 33 ohms R16
	Resistor—Fixed composition resistors:
	150 ohms, ±10%, ½ watt R14, R17
	270 ohms, ±10%, ½ watt R1
	1,000 ohms, ±10%, 1 watt R15
	22,000 ohms, ±10%, ½ watt R2
	56,000 ohms, ±10%, ½ watt R9
	82,000 ohms, ±10%, ½ watt R4
	220,000 ohms, ±10%, ½ watt R12
	270,000 ohms, ±10%, ½ watt R6, R7
	470,000 ohms, ±10%, ½ watt R13
	2.2 megohm, ±10%, ½ watt R3, R8
	3.3 megohm, ±10%, ½ watt R5
	10 megohm, ±10%, ½ watt R11
*74701	Shaft—Tuning knob shaft and pulley
73584	Shield—Tube shield for 12AV6
70827	Socket—Tube socket, octal, wafer
73117	Socket—Tube socket
72998	Socket—Dial lamp socket and lead
74038	Spring—Drive cord spring
*74676	Switch—Function switch S1
74677	Transformer—Output transformer T3
73488	Transformer—First I.F. transformer T1
73037	Transformer—Second I.F. transformer T2
33726	Washer—"C" washer for tuning knob shaft
	SPEAKER ASSEMBLIES Stamped 92585-1
*74706	Speaker—5" x 7" elliptical P. M. speaker **Note:** If stamping on speaker does not agree with above number, order replacement parts by referring to model number of instrument, number stamped on speaker and full description of part required.
	MISCELLANEOUS
Y2137	Cabinet—Plastic cabinet—maroon
*74713	Clamp—Dial clamp (2 required)
73508	Clip—Spring clip for knob
*74719	Clip—Spring clip for radio compartment back panel (2 required)
74192	Connector—3 contact male connector for shielded pickup cable
74682	Decal—Function switch decal
74273	Decal—Trade mark decal
74722	Dial—Dial scale
74674	Emblem—"RCA Victor" emblem
72894	Foot—Rubber foot (4 required)
*74707	Grille—Metal grille
74210	Knob—Reject knob
*74710	Knob—Volume control or tuning knob
*74711	Knob—Function switch knob
72692	Hinge—Cabinet lid hinge (2 required)
74709	Indicator—Station selector indicator
71116	Lamp—Dial lamp
*74940	Lever—"Start-Reject" actuating lever
*74720	Lid—Cabinet lid
*74717	Mask—End mask for dial (2 required)
*74708	Motif—Decorative motif for front of cabinet
*74623	Mounting—One set of hardware consisting of 3 rubber grommets, 3 flat washers, and 3 eyelets to mount record changer
*74715	Panel—Radio compartment back panel
*74721	Plate—Dial back plate, less dial
74212	Nut—Speed nut for reject knob
*74712	Nut—Speed nut for "Start-Reject" actuating lever
72765	Nut—Speed nut to fasten motif (1 required) or to fasten dial (2 required)
73728	Screen—Ventilation screen (2 7/16" x 1¼") (2 required)
*74716	Screw—#6-32 x ¼" cross-recessed oval head machine screw for lid support (4 required) or radio compartment back panel (3 required)
14270	Spring—Retaining spring for function switch knob
*74718	Spring—Return spring for "Start-Reject" actuating lever
71824	Stud—Stud and screw to mount lid hinge (1 set) (2 required)
*74714	Support—Lid support

† Stock No. 72953 is a reel containing 250 feet of cord.

* This is the first time this stock number has appeared in Service Data.

REL MODELS 646B, 647B AND 648B FM BROADCAST RECEIVERS
88 TO 108 MC.

These receivers are single superheterodyne units of orthodox circuit and design. As with all VHF receiving equipment, performance is dependent on correct installation, particularly the associated antenna and lead-in system.

The nominal impedance at the antenna terminals (marked A - A) is 150 ohms. Both 70 and 300 ohm lines may be used here without serious mismatch consequences. Whether or not the ground terminal (marked G) is used depends on local conditions. Because of uncertainties in this connection and because the input circuit coupling is fairly tight, the latter is not precisely tracked at the factory. For very weak signals or for technical use at any one frequency, this circuit may be trimmed by adjusting C1. This is accessible at the top of the chassis and is located as shown in the tube layout sketch.

For convenience in tuning and rough measuring the circuits are adjusted so that one small division of the TUNE meter corresponds to a frequency shift of about 20 kilocycles, and so that the steps of the RF GAIN control are roughly ten to one each. Indications on the SIGNAL meter are approximately linear. Both these meters may be supplemented externally by use of the connections on the rear terminal board. The TUNE meter is 25-0-25 microamperes, and the SIGNAL is 0-1 milliampere.

To use external meters, remove the strap between terminals 4 and 5 and the ground bus from terminal 5, then connect the TUNE meter between terminals 5 and 1 (ground) and the SIGNAL meter between terminal 4 and 1. If only one of these meters are connected externally, the terminal for the second meter must be connected to terminal 1.

Terminals are provided for connecting an external signal to the audio amplifier input and selecting this signal by means of the switch on the front panel. Terminal 2 is high and terminal 1 is ground. These terminals represent an AC impedance of about one megohm and 30 micro-microfarads. For the 646B about 2V. RMS input is required for full audio amplifier output.

The 646B and 647B receivers are designed for operation at 115 volts. They should not be operated permanently on lines higher than 125 volts. The 648 receiver requires at least 5.8 volts DC at the indicated terminals. They are connected for negative ground. If the vehicle has a positive ground system the vibrators must be reoriented according to the legend on the top of the Vibrapacks.

The maximum audio output of the 646B receiver is ten watts into either 500 or 8 ohms (mismatch up to 2 to 1 here is not generally aurally serious). The maximum output of the 647B receiver is + 18 DBM into 600 or 150 ohms. This receiver is connected for 600 ohm load; to use with 150 ohm load the output transformer should be restrapped by replacing strap from 5 to 6 by a strap from 4 to 6 and another from 5 to 7. The maximum audio output of the 648B receiver is 4 watts into 6 ohms.

ALIGNMENT PROCEDURE

The following alignment procedure is for use only by competent service men having the proper equipment. Re-alignment is very seldom needed and is usually only required after some major part has been replaced because of damage to the receiver.

The equipment required for re-aligning this receiver is an output meter and a modulated source of radio frequency (a signal generator or microvolter). This source of radio frequency must be accurately calibrated in frequency and must have a method of varying the output.

All alignments must be made with the volume control turned full on and with the signal input from the generator reduced to as low a value as possible while still giving a sufficient output to be easily read on the output meter.

Connect the output meter, through a .5 M.F. condenser and a resistance of such a value as to make the total meter resistance approximately 10,000 ohms, to the two small pins of the speaker plug. The output meter remains connected during the entire alignment procedure.

Connect the signal generator to the grid cap of the 6A7 tube through a .1 M.F. condenser. Connect the ground of the generator to the ground lead of the receiver. With the wave switch on broadcast position and the dial set to about 1000 K.C., feed in a 456 K.C. signal. Adjust the trimmers on top of the first and second I.F. transformers until the maximum output is obtained. This aligns the I.F.

Leaving the signal generator connected to the grid cap of the 6A7, turn the wave switch to the right hand (short wave) position. Set the dial and the signal generator to 15.0 M.C. Tune in the signal by adjusting the 15.0 M.C. oscillator trimmer. The signal will he heard at two different settings of the trimmer. The proper setting is the one where the signal is heard when the trimmer is the loosest. Also when the dial of the receiver is turned the signal will be heard again at about 14.0 M.C. If the signal is heard at about 16.0 M.C. on the dial instead of 14.0 M.C. the wrong setting has been used and should be corrected.

Set the wave switch on broadcast position and turn the dial to the extreme high frequency end. Feed a 1680 K.C. signal to the receiver antenna post through a .00025 M.F. mica condenser. Adjust the 1680 K.C. broadcast oscillator trimmer for maximum output. Set the generator to 1500 K.C. and tune in this signal on the receiver. Then adjust the 1500 K.C. broadcast antenna trimmer and the 1500 K.C.broadcast preselector trimmer for maximum output. Set the generator to 600 K.C. and adjust the 600 K.C. broadcast oscillator pad to maximum output **while tuning the receiver back and forth across the signal** from the generator. This completes the alignment of the broadcast band.

The police band is aligned by feeding a 4.0 M.C. signal to the receiver antenna lead through the .00025 condenser. Turn the wave switch to the center position and tune the receiver to this signal. Adjust the 4.0 M.C. police antenna trimmer for best output.

The short wave band is aligned in the same way using a 15 M.C. signal and adjusting the 15 M.C. short wave antenna trimmer after having turned the wave switch to the right hand position.

DESCRIPTION

This receiver is an 8 tube alternating current operated superheterodyne.

The tubes used are a 6A7 as oscillator modulator, a 6D6 as I.F. amplifier, a 6H6G as A.V.C. and audio rectifier, a 6Y7G as audio voltage amplifier, an 80 as a power rectifier, a 6G5 as tuning indicator and two type 6V6G tubes as push pull audio power amplifiers.

This receiver is made to cover 3 tuning bands, the standard broadcast band which ranges from 1680 K.C. to 535 K.C., the middle or police band which has a frequency range of from 5.4 M.C. to 1.7 M.C. and high frequency or foreign band which is from 19 M.C. to 5.0 M.C.

TUNING RANGE: 538 to 1625KC; 5.3 to 10.25MC; and 11.5 to 15.9MC covers regular American Broadcast stations, the high fidelity broadcast experimental stations, Amateurs, Aircraft and all regular International Short Wave Stations.

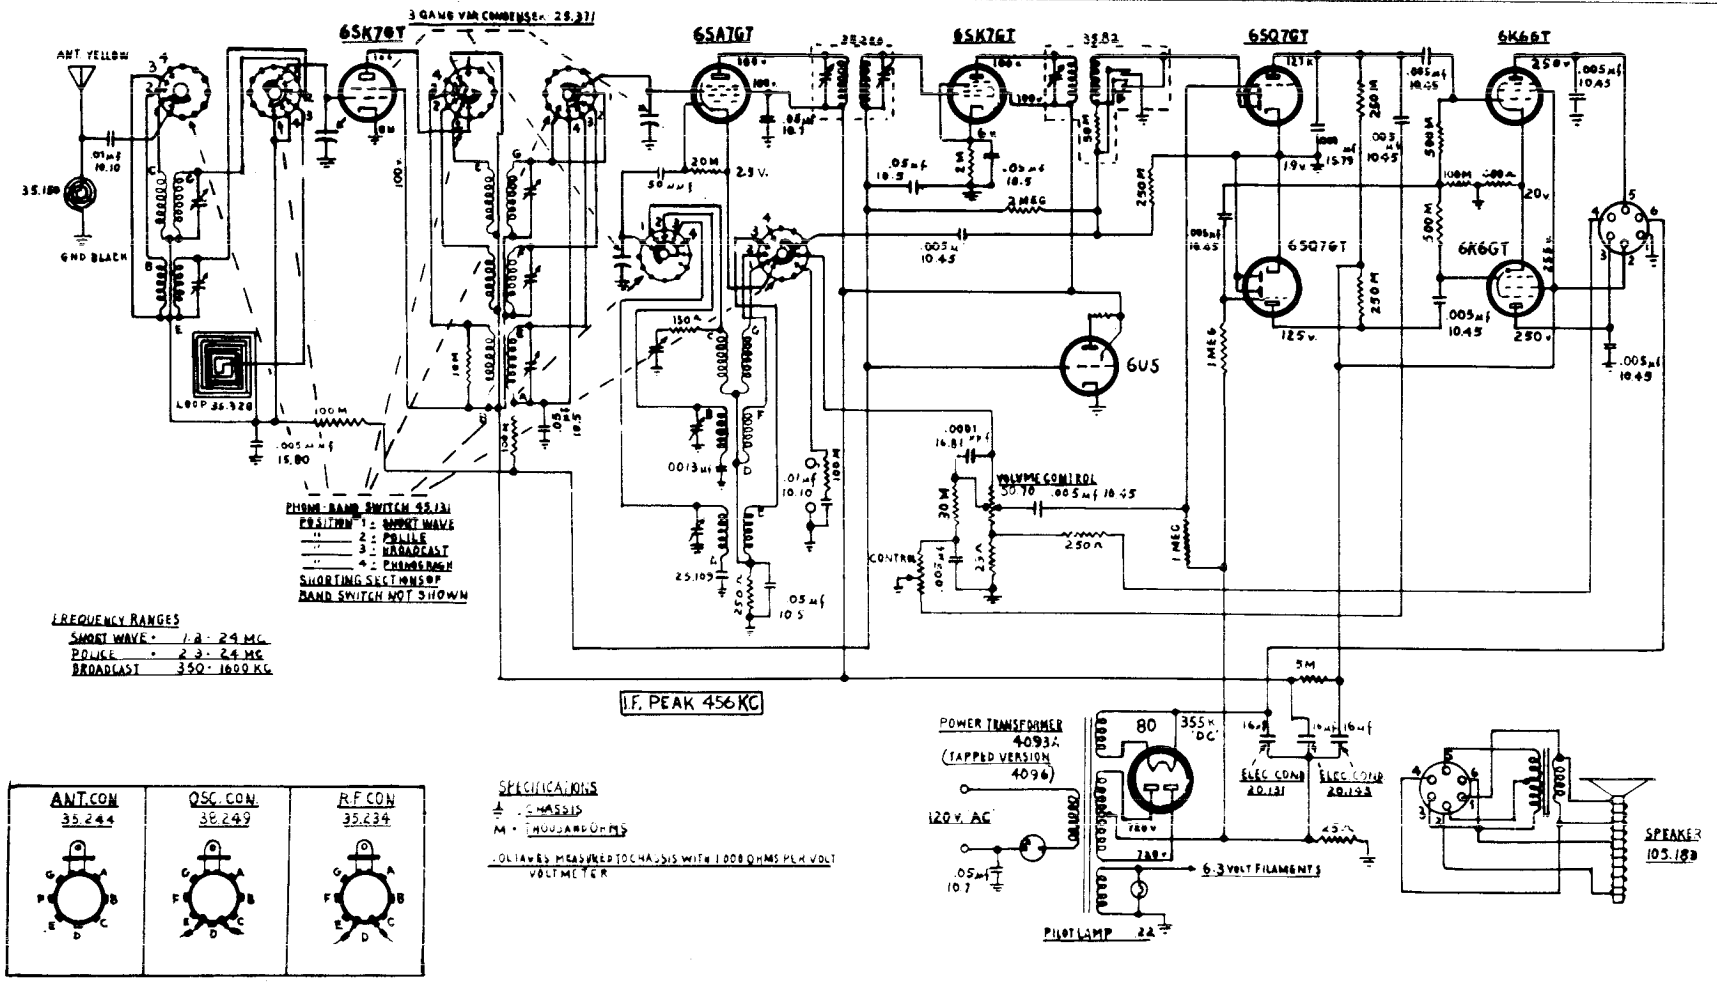
BAND SPREAD TUNING

Band Spread Tuning which is the feature of this series, allows ease of tuning on IMPORTANT International Short Wave Stations, particularly the 19-20 and 25 meter bands and 31-40 and 49 meter bands.

DIAL LAMP: Chassis uses one 6-8 Volt, 150M.A. Lamp. When replacing Dial Lamp use only similar Lamp or damage will result.

MODELS JS-188, JS-189, JS-190

©John F. Rider



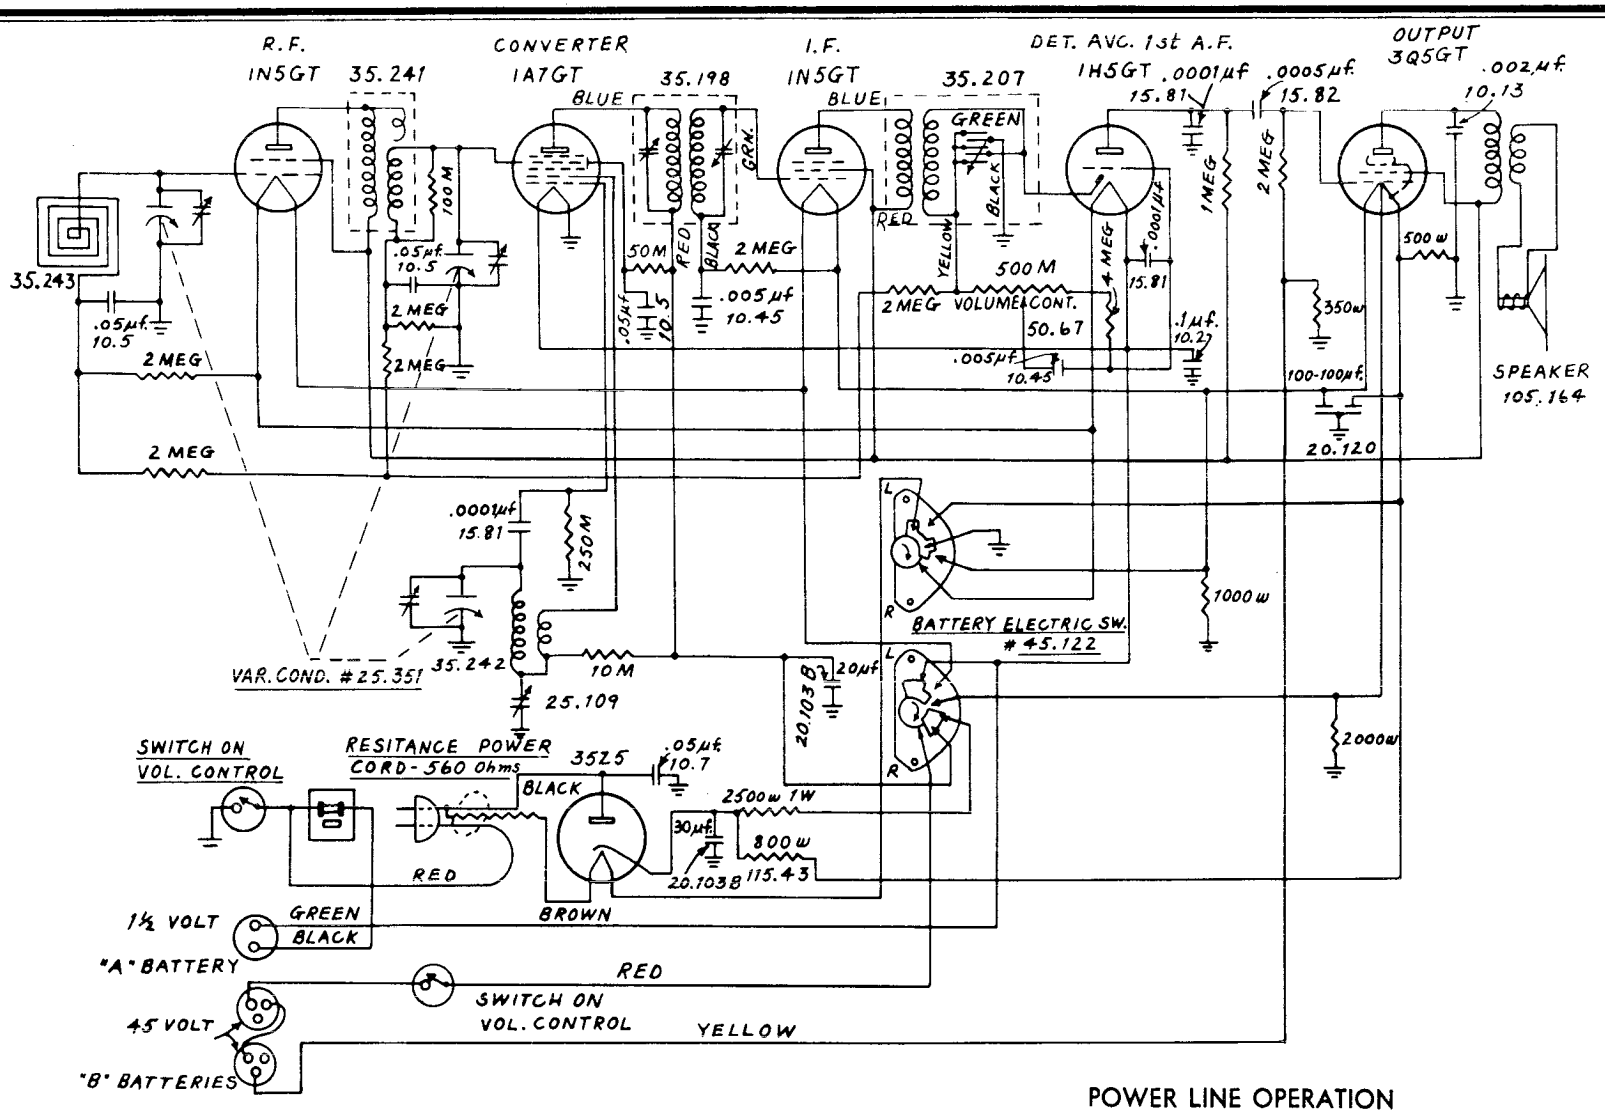
This model is a 9 tube (including tuning eye) three wave band Superheterodyne Receiver designed to operate on 105-125 Volts, 50-60 cycles Alternating Current (AC) only.

TUNING RANGE: 550 to 1600 kilocycles (KC) (Domestic Broadcast), 2.3 to 7.0MC (Megacycles) (Police Call Band), 7.5 to 24.MC (Megacycles) (International Short Wave).

DIAL LAMP: This model uses a 6-8 Volt, 250 M.A. dial lamp. When replacing this lamp use similar type or damage will result.

CAUTON: When Dial Lamp burns out, REPLACE AT ONCE.

©John F. Rider



This Six-tube Receiver is designed to operate on self-contained Battery Power Unit or 115 volts, 40 to 60 cycles, Alternating Current (AC) or 115 volts Direct Current (DC)

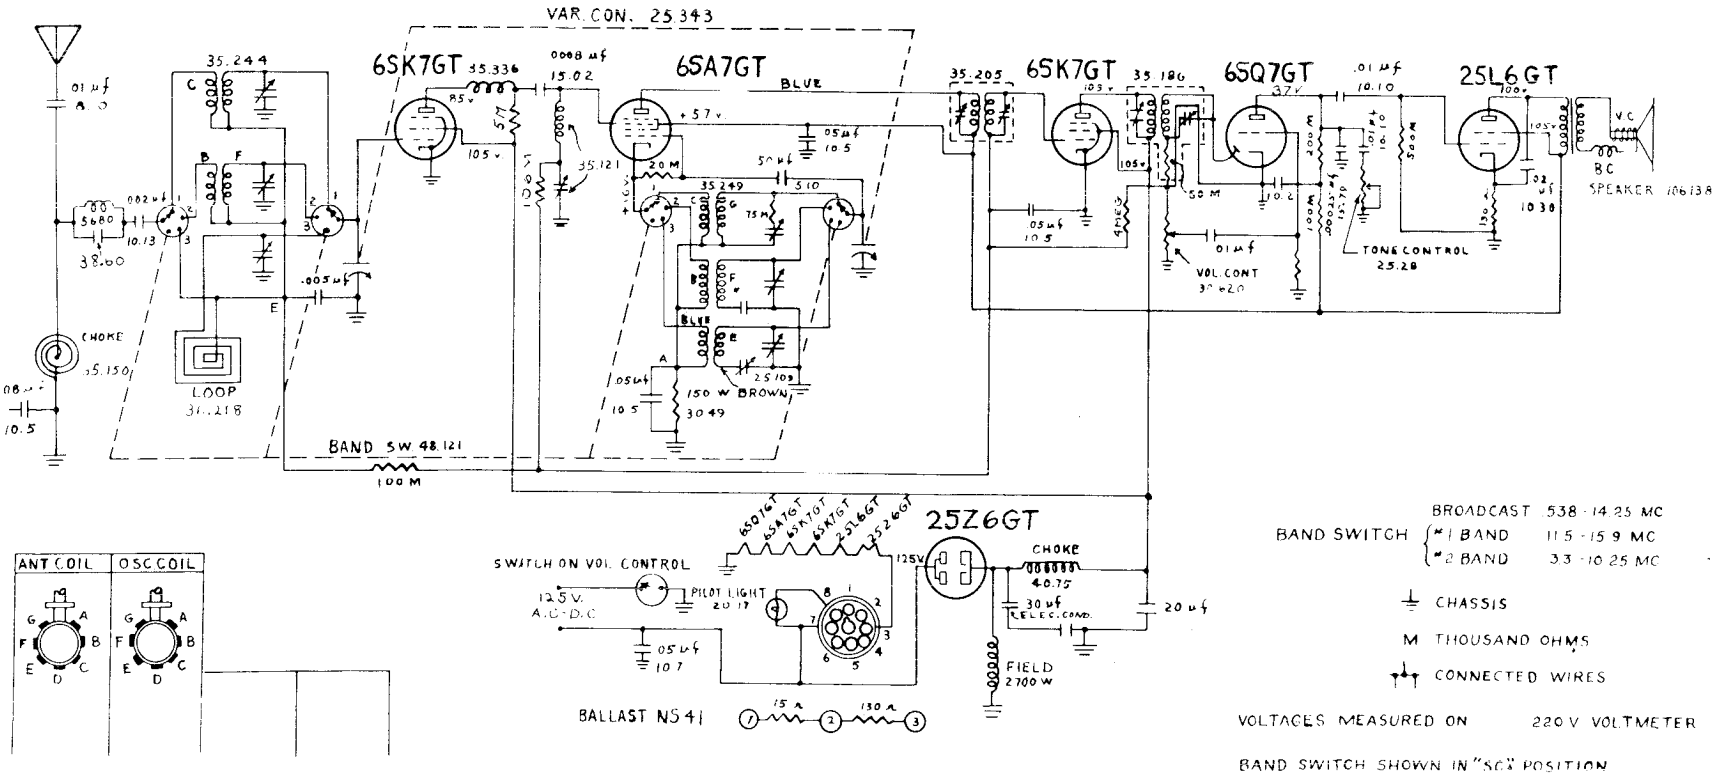
The tuning range, 540 to 1600 Kilocycles (555 to 187 meters) covers the regular broadcast and experimental high-fidelity broadcast stations.

POWER LINE OPERATION

Release catch at top and drop rear cover of case. Remove Power Cord Plug from receptacle (automatically disconnecting batteries), uncoil Power Cord to its full length and close cover, allowing Cord to pass through notch in case. Insert Power Cord Plug into electric outlet and operate receiver as described above.

Allow 20 seconds for tubes to heat. If receiver fails to operate on D.C., or hums slightly on A.C., reverse Power Cord Plug.

©John F. Rider



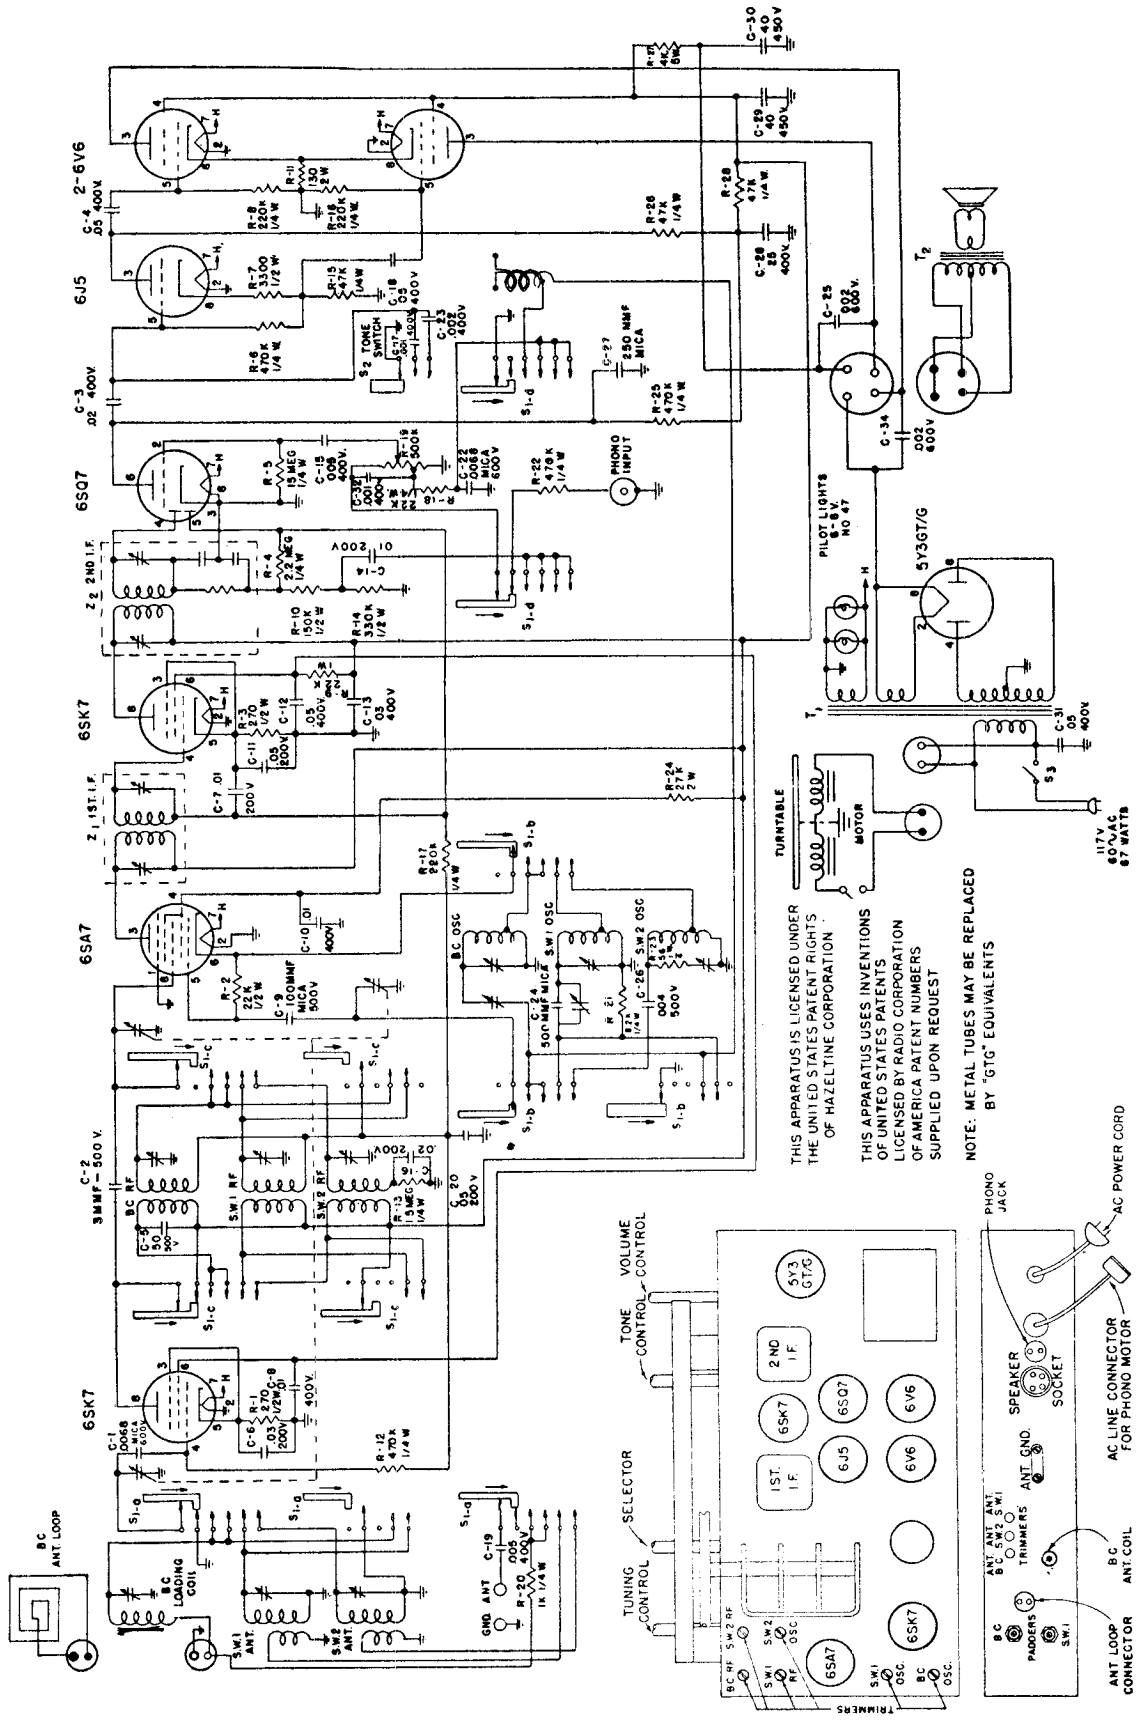
This is a 6 tube Plus Ballast AC-DC, 3 Wave Band Receiver.

TUNING RANGE: 538 to 1625KC; 5.3 to 10.25MC; and 11.5 to 15.9MG covers regular American Broadcast stations, the high fidelity broadcast experimental stations, Amateurs, Aircraft and all regular International Short Wave Stations.

SHORT WAVE RECEPTION: An external aerial is absolutely necessary for good reception on all Short Wave Bands. In installing an Antenna to be used with this receiver, every precaution should be observed to keep interfering noises at the minimum.

For connection to the Antenna, a YELLOW wire is brought out from the rear of the receiver.

MODEL M8



©John F. Rider

©John F. Rider

POWER SOURCE:

This receiver may be operated from either an AC or DC line, between 105 and 125 volts. On AC lines the frequency must be 50 to 60 cycles.

TUBE COMPLEMENT:

1 12BE6 — AM converter.
1 12BA6 — AM intermediate frequency amplifier.
1 12AT6 — AM demodulator and AVC; AM-FM 1st audio amplifier.
1 14F8 — FM oscillator-mixer-Super Regenerative I.F. amp.
1 35B5 — Audio output amplifier.
1 35W4 — Power rectifier.

INSTALLATION:

1. Antenna Connection.

AM—A self contained loop antenna is provided, which will give satisfactory reception on the standard broadcast band without requiring any additional external antenna. However, if stronger signals are desired from weak or distant stations an external antenna may be connected to the wire extending from the loop.

FM—A self contained line antenna system is provided for reception of stations appearing in the FM band. To use this line antenna a short wire jumper should be connected between the two outside screw terminals of the FM antenna panel, which is mounted on the broadcast loop antenna form. Should poor reception conditions make it necessary, an FM dipole antenna may be connected to the left hand and center screw terminals of the FM antenna panel. In such a case, the line antenna link should be disconnected.

2. Ground.

This set has been designed to operate without an external ground, and the use of any ground connection is not recommended.

3. Power Connection.

After making certain that the power circuit is rated between 105 and 125 volts extend the line cord to its full length and insert the plug into the nearest convenient outlet. If the supply is DC, and the set fails to operate, it may be necessary to reverse the plug connection to secure operation of the set.

SERVICE ADJUSTMENTS:

Alignment or adjustment of the various circuits of this receiver can only be made by a skilled radio technician with the proper equipment.

NOTE: Points A, B, C, D, E, and F are noted on the circuit diagram.

AM Equipment:

Equipment Required:
a) Broadcast Band Signal Generator.
b) Output Meter.

1. Set band switch at AM. Advance volume control to full volume setting.
2. Connect output meter across voice control at points "E" and "F".
3. Connect the "high" side of the Signal Generator to point "A" through a .01 mfd condenser. Connect the "ground" side to point "B". Adjust the Signal Generator to 455 kc and with the receiver switched on, adjust the first and second I.F. transformers for peak output as shown on the output meter. The signal injected into the receiver should be as small in magnitude as possible, consistent with a useful deflection on the output meter.
4. Connect the "high" side of the Generator to the antenna terminal with a 200 mmf condenser inserted in series. Connect the "ground" side of the Generator to point "B".
5. Tune receiver to 150 on the dial. Adjust Signal Generator to 1500 kc. Adjust BC oscillator and BC antenna trimmers for maximum output. Use a weak signal for final adjustment.

FM Equipment:

Equipment Required:
a) 21.75 kc oscillator.
b) FM Signal Generator for 88 to 108 megacycle range.
c) Output meter.

1. Connect output meter across points "E" and "F".
2. With set switched on and volume control at maximum, feed modulated 21.75 mc signal into terminals "C" and "D".
3. Adjust tank coil for maximum response on output meter.
4. Disconnect 21.75 kc oscillator and connect FM signal generator to points "C" and "D".
5. Set receiver dial to 88 megacycles and adjust Signal Generator for same frequency. Adjust spacing of FM oscillator coil for maximum signal response.
6. Tune receiver to 108 megacycles and adjust Signal Generator to same frequency. Adjust FM oscillator trimmer for maximum signal response.
7. Repeat operation 5 and 6.
8. Tune receiver to 90 megacycles and adjust Signal Generator for same frequency. Adjust spacing of the FM antenna coil for maximum signal response with minimum background noise. Slowly rock tuning control while performing this adjustment.
10. Repeat operations 8 and 9.

ALIGNMENT PROCEDURE

Correct alignment is of extreme importance in all-wave receivers. The receivers are properly aligned at the factory with precision equipment and realignment should not be attempted by the service technician until all other causes of faulty operation are corrected.

In order to properly realign the receiver the following equipment is necessary:

1. A signal generator which will provide an accurately calibrated signal at any frequency from 456 kilocycles to 18 megacycles. The generator should have adjustable signal output.

2. An output audio voltmeter of the low voltage type to be connected across the moving coil of the speaker. This should be capable of providing a readable deflection for relatively low output levels to avoid the effects of overload.

3. An insulated or non-metallic screw driver for the adjustment of trimmers.

I F ALIGNMENT 456 KC

1. Connect the output meter (low scale) across the loud speaker voice coil. Turn the wave band switch to broadcast position. Turn the volume control to its maximum position.

2. Connect the test oscillator ground to chassis and the "hot" lead from the test oscillator to the grid of the 6L7 converter tube through a series .1 Mfd. condenser. Set test oscillator to 456 KC.

3. Adjust I F alignment screws of second I F transformer adjacent to 6F6 power tube to maximum output, reducing output of test oscillator to keep the meter reading on scale as alignment proceeds.

4. Adjust alignment of first I F transformer, (directly behind tuning condenser) to maximum output as described above.

5. Readjust these trimmers for accurate alignment. Always use the lowest possible output from the test oscillator to preclude the possibility of automatic volume control action confusing proper adjustment.

NOTE: Since coils are used in series it is absolutely necessary to align the high frequency bands first, in the order indicated.

FOREIGN BAND 5.7 TO 18.5 MEGACYCLES

1. With test oscillator connected to the antenna and ground terminals through a 400 ohm resistor set oscillator at 16 megacycles.

2. Set the dial scale to 16 megacycles and adjust the oscillator trimmer condenser (C 4) to a resonance using the counterclockwise or low capacity point.

3. Adjust input circuit trimmer (C 5) to maximum response, rocking the gang condenser back and forth a degree or two to obtain proper maximum.

POLICE OR MIDDLE BAND 1.75 TO 5.8 MEGACYCLES

1. With the test oscillator connected as above set the oscillator and dial to 5.5 megacycles.

2. Adjust oscillator trimmer condenser (C 6) for maximum response using the counterclockwise or low capacity point.

3. Adjust input circuit trimmer (C 7) to maximum response rocking the gang condenser as described above.

BROADCAST BAND 535 TO 1800 KC

1. With test oscillator connected to antenna and ground through a 200 Mfd. condenser set oscillator and receiver dial to 1600 kilocycles.

2. Adjust broadcast oscillator trimmer (C 8) to obtain maximum response.

3. Adjust antenna circuit trimmer (C 9) for maximum output.

4. Adjust preselector trimmer (C 10) for maximum output.

5. Set test oscillator and dial to 600 kilocycles and tune in the signal, then adjust broadcast band padding condenser (C 11) for maximum output. This padder is mounted on the aluminum coil deck near the panel and is adjusted through a hole provided in the back of the chassis pan. Rock the condenser back and forth a degree or two in order to obtain proper maximum.

6. Repeat the 1600 KC adjustments described above for greater accuracy.

2 TURNS
FOR PROFESSIONAL SERVICEMEN
To calibrate receiver connect the output of the signal generator to a 1 turn loop coupled to the loop antenna. Connect the lowside of the signal generator through a 1/10mfd. condenser to receiver chassis. Adjust the signal generator to 455 kilocycles and adjust both I. F. transformers for maximum signal. Open the receiver variable condenser for minimum capacity. Set signal generator at 1700 kilocycles. Peak oscillator section of receiver condenser for maximum signal. Next set signal generator at 1500 kilocycles. Tune in this signal. Adjust R. F. section of receiver variable condenser for maximum signal strength. Keep the signal generator output as low as possible when making all these measurements.

Model 1-819

The Lafayette Model 1-819 is an AM-FM receiver. This receiver may be operated on either AC or DC, 105-125 volts, 50-60 cycles.

FM . . . . 88 to 108 MC.
AM . . . . 540 to 1700 KC.

Antenna Connections:

Your Lafayette 1-819 is a sensitive receiver. It is equipped with built-in AM and FM antennae so that in primary listening areas an outside antenna is not necessary. WHEN LISTENING TO FM BY USING THE BUILT-IN ANTENNA, KEEP THE ELECTRIC LINE CORD EXTENDED TO ITS FULL LENGTH.

For weak or distant stations there are provisions made in the rear for antenna connections. A terminal strip with two screw connections for the lead-in wires from the FM antenna, also a wire coming out the back of the receiver for an external AM antenna.

When using the built-in antenna on FM, the lug coming out between the two screw connections on the terminal strip in the rear, must be connected to the screw connection marked "ANT." When using an external FM antenna disconnect this wire and connect external antenna lead-in wires to the two screw connections.

Station Selector:

The knob on the extreme right hand side of the cabinet operates the tuning condenser on both AM and FM and simultaneously moves the indicating pointer. Ease and accuracy in tuning is made possible due to a reduction drive.

Band Switch:

The second knob from the right is the AM-FM band switch. This is a two position switch. When the switch is in the counterclockwise position, AM (Standard Broadcast) stations may be tuned in. When the switch is in the clockwise position, FM (Frequency Modulation) stations may be tuned in.

Volume Control and Power Switch:

The third knob from the right is the volume control and power switch. When the control is in the extreme counterclockwise position the power is "OFF." From this position, a slight clockwise rotation will turn the power "ON." By further rotation in this direction volume may be increased to any degree until the full output of the receiver is obtained.

Tone Switch:

The fourth knob from the right is the tone switch. For normal operation the switch should be clockwise. For increased bass response turn switch fully counterclockwise.

Notes:

Since this receiver has a loop-tenna on AM which has a directional effect, it may be necessary at times to turn the receiver for best reception. This set will operate properly only after the tubes are sufficiently heated. This may take two minutes after the power switch is turned "ON." If the receiver is being operated on DC (Direct Current) and no signals are heard after two minutes, reverse the line cord plug in the power outlet. Should noticeable hum be detected when operating on AC (Alternating Current), reverse the line cord plug in the power outlet.

Servicing of the Lafayette Model 1-819

(For Use of Radio Technician):

Should your Lafayette Model 1-819 become inoperative for any reason, we suggest you contact your local Lafayette Radio and Television Dealer for servicing. The following information is for the use by the radio serviceman.

Alignment of the receiver will, in most cases, be unnecessary unless an RF or IF transformer is replaced or the adjustment has been tampered with. The IF slugs are slotted for a small size fiber screwdriver. Do not put excessive pressure on the aligning tool or the threads in the coil-form will be stripped and adjustments will be impossible.

IF Alignment:

Set bandswitch to AM position. Connect the signal generator, modulated at 400 cycles, through a 0.01 Mfd condenser to the grid of the 12AT7 converter tube. Connect the low side of the generator through a 0.1 Mfd condenser to the receiver chassis. Adjust the signal generator to 455 KC. Tune primary and secondary slugs of T3 & T5, AM-IF Transformers, for maximum output.

For FM alignment set bandswitch to FM position and leave generator connected to the grid of the 12AT7 converter tube. Adjust generator to 10.7 MC. Connect 20,000 ohm per volt or VTVM meter as in note "1" of schematic diagram. Tune primary of T1, bottom slug, and both primary and secondary of T2 & T4 for maximum indication on meter. To align secondary of Ratio Detector Transformer connect meter as in note "2" of schematic diagram. Tune top slug through positive and negative indication and then slowly return until meter reads zero. This is in the center of the "S" curve.

RF Alignment:

Set bandswitch to AM position. Connect signal generator, modulated at 400 cycles, to external antenna lead and to ground through a 0.1 Mfd condenser and adjust to 1700 KC. Set dial pointer to 1700 KC and tune signal for maximum output with oscillator trimmer. Next set generator to 1500 KC and tune in this signal on the receiver. Then adjust RF trimmer for maximum output.

Set bandswitch to FM position. Connect in series with each generator lead a carbon 150 ohm resistor and connect to rear antenna terminal board. Adjust generator and dial pointer to 108 MC. Peak oscillator trimmer for maximum signal output. Next set generator to 105 MC and tune in this signal on receiver. Then peak RF trimmer for maximum output. No adjustment is necessary at the low end because a special compensated fixed padder is used. Set the generator to 94 MC and tune the FM antenna coil for maximum.

In all the IF and RF adjustments it is important to keep the signal generator output as low as possible. It is extremely necessary in making the RF adjustments, that the fundamental oscillator signal be tuned in and not the image frequency. This can be checked by the use of a calibrated wavemeter.

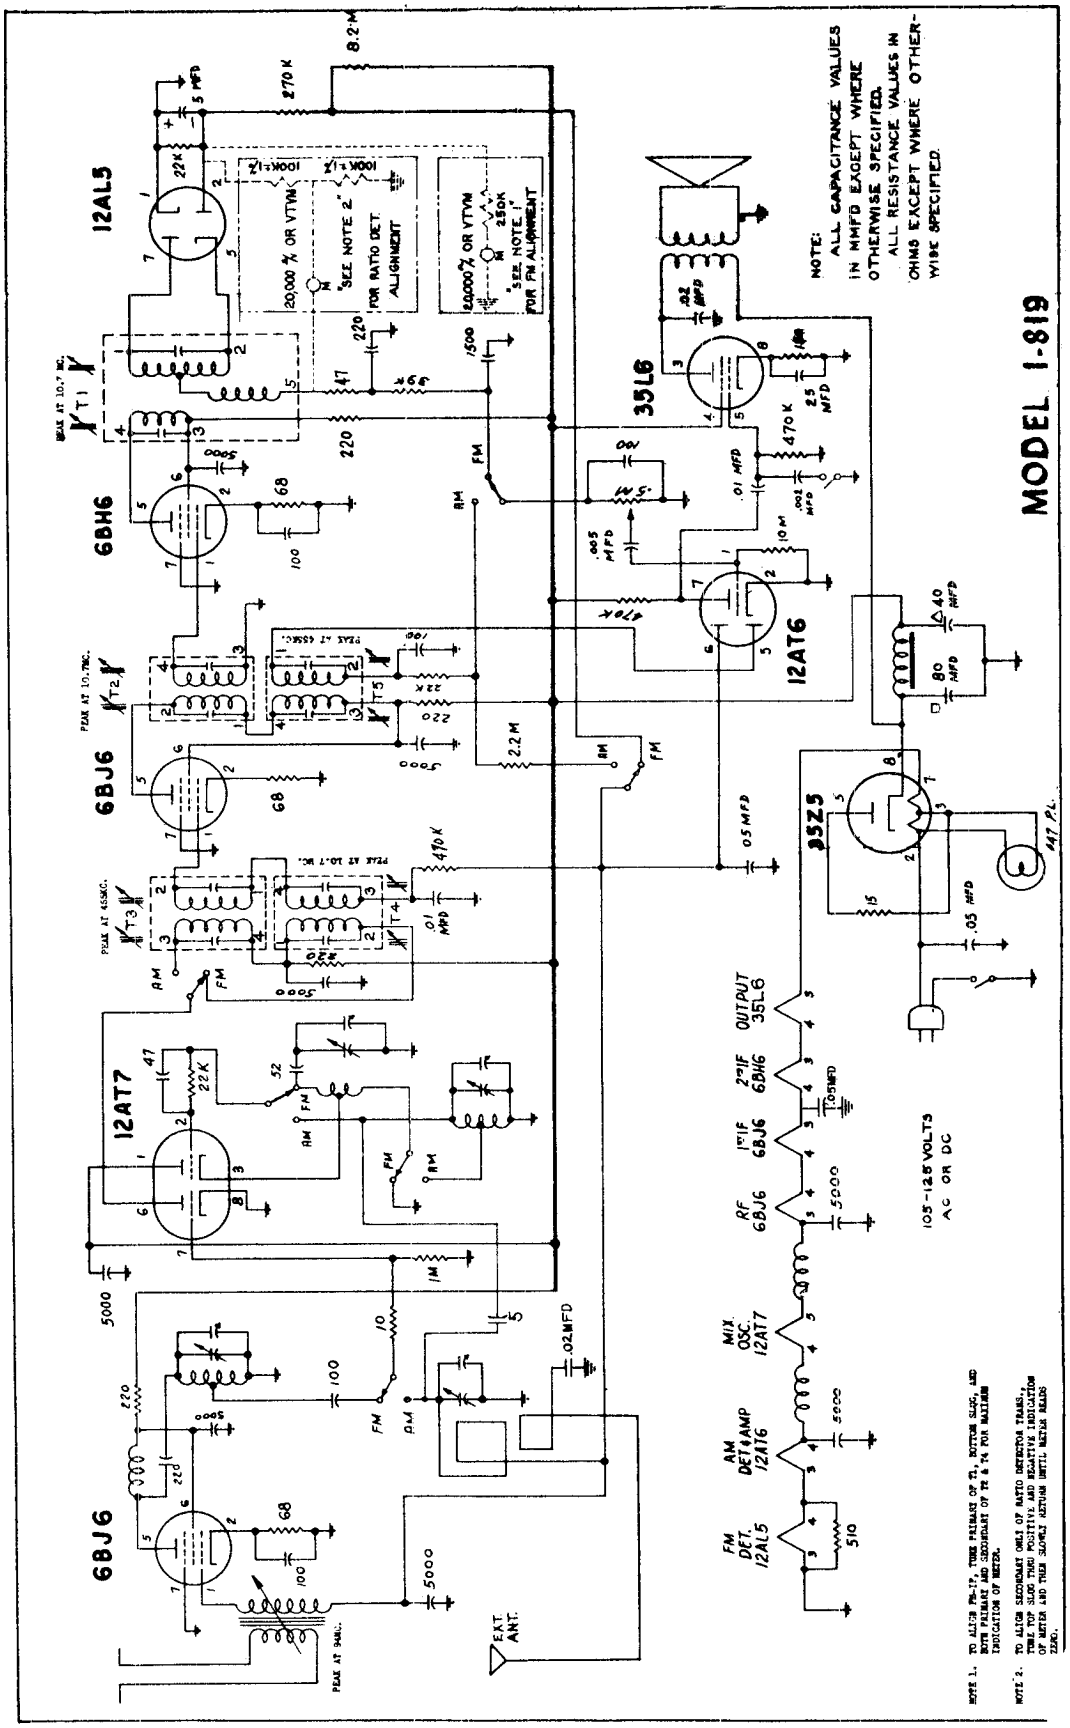
MODEL 1-819



©John F. Rider

This Receiver features the latest in A. M. - F. M., Receiver Design. Eleven (11) tubes plus a Rectifier are used in the A. M. — F. M. superheterodyne circuit. separate antennas are supplied for A. M. and F. M. An automatic frequency control tube is used to stabilize the F. M. and simplify tuning.

TUBE COMPLEMENT:

1 Type 6BA6 — F. M. R F. Amplifier
1 Type 7F8 — F. M. Converter
1 Type 7Q7 — A. M. Converter
1 Type 6C4 — Automatic Frequency Control
1 Type 7AH7 — I. F. Amplifier
1 Type 6SH7 — Detector Driver (F.M.)
1 Type 6SQ7 — 1st Audio Amplifier, A. M. Detector
1 Type 7A6 — Ratio Detector
1 Type 7F7 — 2nd Audio Amplifier and phase inverter
2 Type 7C5 — Beam power output.
1 Type 5Y3/GT — Rectifier.

1. OPERATING CONTROLS:

1) The "ON-OFF" power switch and Tone Control is the knob at the extreme left of the set. Turn this control in a clockwise direction until the switch clicks and the dial becomes illuminated. Turning this control further in the same direction will change the tone.

2) The Volume Control is the second knob from the left. Turning this control in a clockwise direction will increase the volume.

3) The Band Switch is the third knob from the left. The extreme counterclockwise position of this knob is for phonograph operation. The center position is for F.M. reception. The extreme clockwise position is for A. M. reception.

4) The Tuning Control is the extreme right hand knob. Turning this knob in either direction will move the dial pointer and select the stations on the A. M. or F. M. Bands.

2. ANTENNAS:

In most cases it will not be necessary to use external antennas, since the receiver is equipped with a loop antenna for AM reception and an indoor type folded dipole antenna for FM reception.

When inadequate reception is obtained from a desired station, it may be necessary to reposition the antennas to favor that station. On AM, the loop should be turned so that the edge faces toward the station desired. On FM, the entire cabinet should be positioned so that the back is broadside to the direction from which the signals are transmitted.

For the reception of weak or distant stations, or for the operation of the receiver in unfavorable locations, provisions are made for the use of external antennas. The folded dipole should be disconnected when an external FM antenna is employed.

Do not disconnect the AM loop when an external antenna is used on standard broadcast.

3. SERVICE NOTES:

Failure of the Receiver to operate may be due to:

1) All tubes not firmly in sockets.
2) No current at power socket.
3) Band Switch in wrong position.
4) Speaker not plugged in.
5) Antennas not attached.
6) Defective fuse in Receiver.

4. ALIGNMENT PROCEDURE FOR A. M.:

Equipment Required:

a) Broadcast Band Signal Generator.
b) Output Meter.

1. Set band switch to AM, advance volume control to full volume setting.

2. Connect output meter across voice coil.

3. Connect the Signal Generator across the broadcast band antenna (Rear) section of the variable condenser. The "high" side of the Generator should connect to the stator section and the "ground" side to the chassis. Adjust the Signal Generator to 455 kc and with the receiver switched on, adjust the first and second I. F. transformers for peak output as shown on the output meter. The signal injected into the receiver should be as small in magnitude as possible, consistent with a useful deflection on the output meter.

4. Connect the "high" side of the Generator to the antenna terminal with a 200mmf condenser inserted in series. Connect the "ground" side of the Generator to the chassis. Tune receiver to 60 on the dial, adjust Signal Generator to 600kc. Adjust the BC antenna coil for maximum deflection on the output meter. Use a weak signal.

©John F. Rider

MODEL 1-1205

5. Tune receiver to 160 on the dial. Adjust Signal Generator to 1600kc. Adjust BC oscillator and BC antenna trimmers for maximum output.

6. Repeat operations 4 and 5.

5. *ALIGNMENT PROCEDURE FOR F. M.:*

NOTE: *Points A. B. C. D. E. F. G. and H are noted on circuit diagram. Points C, and D have been brought out to the unused contacts of the speaker socket at the rear of the chassis.*

Equipment Required:

a) High frequency Signal Generator with 88-108 Mc tuning range.

b) Signal Generator capable of delivering .1 Volt at 10.7mc.

c) Audio output meter.

d) D. C. vacuum tube voltmeter with zero center scale.

e) Tuning wand.

Disable A.F.C. during alignment of F.M. circuits by short circuiting point "B" to chassis.

A. Ratio Detector Alignment:

1. Connect V.T.V.M. across point "C" and ground, (Detector Voltage).

2. Feed 10.7mc unmodulated R.F. Signal into 6SH7 grid (point A) through .01 ufd. condenser. This signal should be .1 volt.

3. Adjust primary of Ratio Detector (T-5) for maximum voltage indication on V. T. V. M.

4. Connect zero centered V. T. V. M. across point "D" and ground.

5. Adjust secondary of Ratio Detector (T-5) for zero indication.

6. Tune 10.7mc Signal Generator higher in frequency (about 200kc) until maximum voltage reading is obtained on V. T. V. M.; note this voltage, then tune signal generator lower in frequency until maximum voltage of the opposite polarity is obtained. Note this voltage, then if necessary re-adjust primary of the Det. (T-5) until the voltages are about equal on either the high or low side of 10.7 mc.

B. 10.7 I. F. ALIGNMENT:

1. Shunt a 1,000-ohm carbon resistor across the primary of the detector (T-5) (Points G and H).

2. Connect output meter across speaker voice coil.

3. Volume and tone controls at maximum clockwise position.

4. Connect 10.7mc (modulated 30%) signal generator through .01ufd. condenser across point "F" and ground.

5. Adjust secondary, then primary of (T-3) for maximum audio output. (Reduce input signal to maintain output at .5-watt level.)

6. Connect 10.7mc 30% modulated signal generator across point "E" and ground.

7. Adjust secondary, then primary of (T-1) for maximum audio output. (Reduce input signal to maintain output at .5-watt level.)

8. Remove 1000-ohm shunting resistor from across primary of (T-5).

C. OSCILLATOR AND R. F. ALIGNMENT:

1. Connect V. T. V. M. across point "C" and ground, (detector voltage).

2. Connect 108mc signal generator to FM antenna terminals. If generator impedance is low, put one 150-ohm carbon resistor in series with each of the generator leads. Tune receiver dial to 108 mc.

3. Adjust FM oscillator trimmer (C-51) for maximum V. T. V. M. reading.

4. Adjust FM R.F. trimmer (C-52) for maximum V. T. V. M. reading. During alignment reduce input signal to maintain Detector voltage at 2.V.

5. Repeat steps 3 and 4.

6. Feed a 90mc signal into antenna terminals (as in C-2), tune receiver dial to signal.

7. Test R. F. coil with tuning wand and if necessary adjust spacing of FM R.F. coil (L-4) for maximum V.T.-V.M. reading at 90mc. During alignment reduce input signal to maintain Detector voltage at 2.V.

8. Repeat steps 2 and 4 if necessary.

9. Remove A.F.C. shorting jumper.

TO REPLACE BATTERIES

Unscrew the two bolts holding the loop to the chassis and loosen the metal bar holding the "B" batteries in place. Pull the battery plugs out and replace new batteries in the same relative position. Use 2 Eveready # 746 (or equivalent) and 2 Eveready #482 (or equivalent).

Batteries are considered to be poor or defective when they measure 1/3 less terminal voltage than the normal value thus the 90 volt "B" batteries should read better than 60 volts and the 9 volts "A" batteries should read better than 6 volts. These voltage measurements are to be taken after the set has been playing in the battery position for approximately one quarter hour. Use a voltmeter with low drain to read voltages (a 1000 ohm per volt meter or better)

TO OPERATE THIS SET ON A 120 VOLT POWER LINE.

Disconnect the set from the power line. Take voltage selector plug (behind loop under loop mounting bracket) and insert into the 120 volt jack (red) black

TO OPERATE THIS SET ON A 220 VOLT POWER LINE

Disconnect the set from the power line. Take voltage selector plug (behind loop under loop mounting bracket) and insert it into the 220 volt jack (red).

CAUTION:

NEVER PLUG THIS SET INTO A 220 VOLT POWER LINE WHEN THE VOLTAGE SELECTOR PLUG IS IN THE 120 VOLT POSITION (BLACK JACK) OTHERWISE PERMANENT DAMAGE WILL RESULT. DO NOT PUT THE LINE CORD OR OTHERWISE CHANGE IT'S CHARACTERISTICS OR DAMAGE WILL OCCUR.

DO NOT CHANGE TUBES WHILE THE SET IS TURNED ON SINCE DAMAGE CAN BE CAUSED BY SO DOING.

SPECIFICATIONS

Power Supply -- 105-125 Volts, AC-DC, 35 Watts
Power Output
Undistorted 1.1 Watts, Maximum - 2.36 Watts
Tuning Range Broadcast Band 54-1600 Kc
Speaker
Voice Coil Impedance 3.2 Ohms

Note: In some sets C13, condenser was connected from the plate to the screen grid of the output tube instead of from plate to cathode.
Some sets do not have the B+ bypass condenser C7, (from the screen lug of the 12SA7 tube socket to chassis).

Difference between 6011 and 6012:

Model 6011 has a walnut cabinet. Model 6012 has an ivory cabinet.
Chassis 132.816 has walnut pushbuttons. Chassis 132.816A has ivory pushbuttons.

MODELS 6011, Ch. 132.816;
6012. Ch. 132.816A

MODELS 6011, Ch. 132.816;

ALIGNMENT PROCEDURE

PRELIMINARY:

Output meter connection ..... Across Speaker Voice Coil
Output meter reading to indicate 50 mw (Standard output) ..... .4 Volt
Generator modulation ..... 30% 400 Cycles
Position of volume control ..... Fully Clockwise
Position of dial pointer with variable condenser fully closed ..... *See Note Below

POSITION OF VARIABLE	GENERATOR FREQUENCY	DUMMY ANTENNA	GENERATOR CONNECTION HIGH SIDE	GENERATOR CONNECTION GROUND LEAD	ADJUST TRIMMERS IN ORDER SHOWN	TRIMMER FUNCTION
Open	455 Kc	.05 mfd.	Mixer grid	Floating ground	T2-T1	IF
1400 Kc	1400 Kc	200 mmf.	Ant. Clip	Floating ground	C-2, C-1	Osc. Ant.

IMPORTANT ALIGNMENT NOTES

1. *To Set Pointer: With variable condenser completely closed set pointer at right hand edge of rectangular notch cut in lower edge of dial backing plate near right hand end. The inverted v in lower edge of dial backing plate near left hand end is the 1400 Kc calibration mark.
2. Place set loop in the same position and at the same distance with respect to the back of the chassis as it would be when the set is mounted in the cabinet, during alignment of the RF stage. (1-1/16" from back of chassis to front of long loop strip).
3. If a standard test loop is used with the signal generator for alignment of the receiver the black wire will be left in the antenna clip. When the generator lead is connected to ant. clip the black wire is removed from the clip.
4. The alignment procedure should be repeated in the original order for greatest accuracy. Always keep the output from the signal generator at its lowest possible value to make the A. V. C. action of the receiver ineffective.

INSTRUCTIONS FOR SETTING UP PUSH BUTTONS:

Allow the receiver to remain on for ten to fifteen minutes before making the push button adjustments. Each of the push buttons should be set to a desired station in the following manner:

1. Make a list of the four local stations for which push button tuning is desired and punch out the corresponding call letters from the call letter sheets.
2. Lift each button and insert a call letter tab into the slot at the side of the button, centering it in the front opening.
3. Lift a push button and insert a screw driver in the slotted screw head just below the button. Press down and loosen the locking screw by turning it to the left about two turns.
4. While holding the screw all the way down with the screw driver, tune in the desired station by hand with the tuning knob. Turning the tuning knob back and forth slightly either side of the station while holding the screw down will help to obtain a precise setting.
5. Tighten the screw, keeping it pushed all the way down while tightening it.
6. Check for accuracy by moving the pointer off the station about an inch and retuning it by depressing the push button set up for that station. If the setting is not accurate, repeat the foregoing procedure.
7. Follow the same procedure for each of the remaining buttons.
8. Should you desire to change your selection of stations, the old call letters can be removed from the buttons by pushing them out with a penknife, nail file or eraser on a pencil and repeating steps 3 to 8.

Police	Open	7.2 MC	.01 mfd.	Converter grid	C39	Osc.
Police	2.5 (rock)	2.5 MC	400 ohm	Ant. Term.	C42	Padder
Police	6.0	6.0 MC	400 ohm	Ant. Term.	C40,C41	RF, Antenna
SW	Open	23.5 MC	400 ohm	Ant. Term.	C43	Osc.
SW	21	21.0 MC	400 ohm	Ant. Term.	C44,C45	RF, Antenna

IMPORTANT ALIGNMENT NOTES

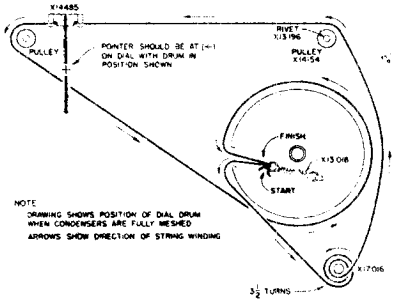
The alignment must be done in the order given.

The entire alignment Procedure should be repeated step by step in the original order for greatest accuracy.

Always keep the output power from the generator at its lowest possible value to prevent the AVC of the receiver from interfering with accurate alignment.

During alignment of the "BC" Band Padder and both "SW" Band converter (RF) trimmers, the tuner should be rocked through resonance to assure alignment.

Power Output Undistorted.....10 Watts Maximum...13 Watts



DIAL STRING HOOKUP

Moto-Matic Tuner for use on Models 7216, 7217, 7218, 7222; Ch. 100.184, 100.185, 100.186

REFER TO INDIVIDUAL CHASSIS SERVICE MANUAL FOR OTHER DATA

The Moto-Matic Tuner is used on Models 100.184, 100.185 and 100.186. It is an electrically driven device for automatically tuning the receiver to any one of fifteen preselected frequencies. The receiver can be tuned either automatically or manually without the need of turning a switch.

The operating mechanism of this tuning device consists of fifteen sets each of keys: station selector cams and pawls. In addition it has two mult-contact control switches.

The back switch, mounted on the rear of the tuner, has four sets of contacts. From front to rear, they are:

1. REVERSING: for reversing the direction of motor rotation.
2. POWER: for opening and closing the motor power supply line.
3. MUTE: for killing the audio system to prevent noises during automatic tuning.
4. A.F.C.: for cutting out A.F.C. during automatic tuning.

The side switch, mounted on the right end of the tuner, has two sets of contacts. From the top down, they are:

1. A.F.C.: for cutting out A.F.C. during manual tuning and during setting up.
2. POWER: for opening and closing the motor and automatic light power supply line.

With the tuner in the manual tuning position all switch contacts are in the position shown in figure 1. As a button is pressed in, its pawl is pulled against a station selector cam. It will be noted that these cams have two different heights, that is, a high and a low side. If the pawl comes to rest against the high side of the cam, the reversing contacts on the back switch are closed to the front for one direction of motor rotation. If the pawl comes to rest against the low side of the cam, the reversing contacts close to the back for the other direction of motor rotation. The direction of rotation will always be such as to bring the notch on the cam around to the pawl by the shortest route.

The motor drives the mechanism to the proper position for the desired station. Then the pawl falls into the notch on the selector cam and causes the bakelite cam to set the back switch contacts in new positions. The Power contacts open, shutting off the motor. The Mute contacts open allowing the signal to come in. The A.F.C. contacts open and A.F.C. puts the finishing touch to the automatic tuning operation.

A friction clutch in the gear train, driving the cam shaft, acts as a buffer and absorbs the shock of the sudden stop when the pawl falls into the notch on station selector cam.

The flywheel on the back end of the tuning shaft provides a "spinner" action while tuning manually.

TROUBLE CHART

The following service chart lists the most typical troubles, gives the most likely causes, and indicates the figures and paragraphs in which information may be found to aid in correcting the troubles. While this chart is necessarily incomplete, its careful study will enable the serviceman to diagnose most of the service complaints he receives on the Moto-Matic Tuner.

No reference is made to failures of the Moto-Matic Tuner when such failures are due to broken leads, loose connections, etc. It must be borne in mind, however, that certain indications are common to both radio and tuner troubles. For examples, Automatic Frequency Control may not be functioning because of improper contact adjustment of the tuner switches or because of an electrical defect in the chassis. Therefore, when servicing the tuner, check the possibilities of radio troubles causing the same symptoms.

BUTTON DOES NOT STAY IN OR DOES NOT RELEASE

COMPLAINT	PROBABLE CAUSE	FOR REMEDY SEE
Button will not stay in when pushed in.	Kickout pointer tip improperly adjusted.	Section 34.
	Kickout spring bent down too far.	Section 35.
	Insufficient tension in key stop bar return spring.	Section 35.
	Jammed or stuck key stop bar.	
	Star wheel stuck or not moving freely on tuning shaft.	Section 37.
	Bent or sprung key stop bar.	
Depressed button does not release when another button is pushed in.	Kickout tip jams against star wheel.	Section 36.
	Stuck or jammed pawl.	Sections 25, 26 and 36.
	Stuck or jammed key.	
Depressed button will not release when tuning knob is turned.	Kickout tip not engaging star wheel.	Section 34.
	Also check those listed for previous fault.	Section 36.

POINTER DOES NOT MOVE WHEN BUTTON IS PUSHED

Motor hums but does not run.	Reversing contacts on back switch not closing.	Secs. 1 & 3 or 1 & 9
	Motor stalled due to mechanical overload and clutch not slipping.	Secs. 20 and 22.
	Defective motor.	
	Low line voltage or improper frequency	Section 49.
Motor runs but pointer does not move.	Clutch slipping.	Sections 20, 21 & 22.
	Pointer drive gear slipping on shaft or out of mesh.	Section 52.
	Pointer loose on cord.	
	Pointer sticking on guide rail due to rust.	
Motor does not hum and tuner does not move with button in.	Power contacts on back switch not closing	Secs. 1,4,5, or 1,10,11.
	Power contacts on side switch not closing	Sections 14, 15 & 18.
	Bakelite back switch operating cam binding on contact arms or out of position.	Section 13.

©John F. Rider

POINTER MOVES BUT DOES NOT TUNE STATION PROPERLY

COMPLAINT	PROBABLE CAUSE	FOR REMEDY SEE
Pointer stops at wrong point.	Improper setting-up of mechanism.	Sections 44, 45, 46 and 47.
	Not locked up tight.	
Pointer stops at proper point, but	Mute contacts on back switch not opening. (No noise will be heard in this case).	Secs. 1 & 5 or 1 & 11
	Tuning backlash.	See "Tuning Backlash" below.
(A) No signal is heard.	Gang condenser drive gears out of mesh or slipping on shaft.	Section 52.
	Flexible coupling slipping on shaft.	
	Station not broadcasting or signal too weak as in daytime or during period of fading.	
(B) Signal is not heard clearly.	A.F.C. contacts on back or side switch not opening.	1,5,17,57 or 1,11,17, 57.
	A.F.C. not functioning.	Sections 55 to 57.
	Weak signal or no aerial.	Section 44.
(C) Wrong station comes in.	Desired signal off, weak or faded.	Section 44.
	Not set up properly.	Sections 44, 45, 46 and 47.
	Set off calibration.	Sections 51 and 54.
(D) Motor continues to run.	Pawl does not fall far enough into station selector cam to cut power off.	Burrs on pawl or cam. Sticking pawl.
	Power contacts on back switch not adjusted properly.	Sections 1, 4, 5 or 1, 10, 11
Pointer stops at a different place each time for a certain button.	Mechanism not locked up tight.	Sections 31 and 44g.
	Dial pointer slipping on cord.	Section 53g.
	Left end bearing bracket loose.	Sections 54 and 60.
	Pointer drive gears slipping out of mesh or on shaft.	Sections 52.
	Loose set screw.	
Pointer stops off station occasionally.	Pointer backlash. (Note pointer backlash will cause apparent rather than actual mistuning.)	Section 60.
	Pawl does not fall far enough into station selector cam.	Sec. 1 & 5a, 1& 11a, and 24
Pointer goes to end of dial and motor stalls and hums, or continues to run by slipping the clutch.	Station selector cam turned around beyond its normal operating range.	Section 27.
	Reversing contacts on back switch not adjusted properly.	Secs. 1 & 3 or 1 & 9.
	Bakelite cam binding on contact arm or out of position.	Section 13.
Motor continues to operate, moving the pointer back and forth over a short distance, after tuning to the approximate frequency to which the button is set.	Reversing contacts on back switch are not adjusted properly - set too close.	Secs. 1 & 3 or 1 & 9.
Motor starts before button is pushed in far enough to catch.	Side switch power contacts are being closed too soon.	Section 16.
Motor starts in the wrong direction then corrects itself as the button is pushed the rest of the way in.		
Intermittent operation of motor, lights, etc.	Insufficient contact pressure or dirty contacts on back or side switch.	Sections 3a, 4b and 15 or 9a, 10b and 15.
	Loose silver contact in contact blade of switches.	
	Bakelite cam binding on contact arms or out of position.	Section 13.
Tuning backlash. (Note: the high tuning ratio greatly exaggerates the effect of most of these conditions.)	Clutch slips.	Sections 21 and 22.
	Play between gang condenser drive gears due to insufficient compression in thrust spring in flexible coupling.	Sections 41 and 42.
	Play between gears due to improper setting of anti-backlash springs.	Section 40.
	Play between gear and stud.	
	Gear stud loose.	
	Gang condenser sways.	Section 59.
	Loose set screw in coupling or gear.	
	Loose or worn bearings.	
	Friction roller rotates relative to tuning shaft.	
Calibration incorrect.	Dial pointer or gang condenser drive gears jump teeth, slip on cam shaft or out of mesh.	Sections 42 and 52.
	Loose set screw in gear or coupling.	
	Dial pointer slips on dial cord.	Section 53g.
	Left end bearing bracket loose.	Sections 54 and 60.
	Excessive pointer backlash.	Section 60.

Moto-Matic Tuner

MANUAL TUNING DIFFICULTIES

COMPLAINT	PROBABLE CAUSE	FOR REMEDY SEE
36t tunes very broadly	A.F.C. contacts on side switch not closing.	Section 17.
Tuning knob sticks and catches in going from automatic to manual tuning.	Burrs on tip of kickout arm and star wheel.	Sections 38 and 61.
	Adjustable tip of kickout arm set improperly.	Section 34.
Pointer does not move when tuning knob is turned, although works OK in automatic position.	Oil or grease on drive rubber on friction wheel.	Section 58.
	Jammed bar and arm assembly.	
	Insufficient tension in bar and arm assembly return spring.	Section 58.
Pointer does not move when tuning knob is tuned.	Bent tuning shaft.	
	Oil or grease on drive rubber of friction wheel.	Section 58.
	Jammed bar and arm assembly.	
	Insufficient pressure between friction wheel and friction roller.	Section 58
	Gear driving dial cord drum is out of mesh or slipping on shaft.	Section 52.
	Slipping clutch.	Sections 21 and 22.

DIFFICULTIES OCCURRING DURING SET-UP BUT NOT IN NORMAL OPERATION

Set tunes very broadly.	A.F.C. contacts on side switch not closing when set-up knob is out and a button is in.	Sec. 17 & Fig. 7.
Button does not release when set-up knob is worked in or out.	Kickout spring set too far from kickout arm.	Section 35.
Visual tuning indicator off or flickers on and off. (This applies only to chassis with visual indicator wired to side switch. See section 14.)	Improper adjustment of side switch.	Section 15.
Automatic light off or flickers on and off.	Loose silver contact on contact blade.	
Mechanism locks up during setting up of a station.	Was not completely unlocked.	Section 30.
	Defective locking mechanism.	Section 32.
	Station selector cam sticking.	Section 32.
	Turning the set-up knob too suddenly.	Section 32.

MISCELLANEOUS TUNER TROUBLES

During automatic tuning visual tuning indicator light is on or flickers on and off. (Applies only to chassis with visual indicator wired to side switch. See section 14.)	Improper adjustment of side switch.	Sections 14 and 15.
	Loose silver contact in switch blade.	
Dial and automatic lights go out and set is killed momentarily when a button is pushed in or released.	Both reversing contacts on back switch closed at once and shorting 6 volt winding of power transformer.	Section 3a or 9a.
	Short operating arm of side switch grounding against friction roller assembly at point C.	Figure 5A.
Gears noisy during automatic tuning.	Motor pinion and first reduction gear not meshing properly.	Section 39.
	Too much compression in anti-backlash springs in gears.	Section 40.
	Burrs, bent teeth, and other irregularities on gears, especially the higher speed ones.	
Black ground lead near 6H6 tube under chassis heats up and smokes.	Short operating arm of side switch grounding against friction roller assembly at point C.	Figure 5A.
	A short between hot B-V. line and chassis.	
	Tuning shaft bearing stop out of place and grounding power blade of side switch.	Section 48.
Slight hum when button is depressed - not heard when button is released.	Poor or defective discriminator tube.	Change discriminator (6H6) tube.
Short in wiring when turning set-up knob.	Tuning shaft bearing stop out of place grounds power blade of side switch.	Section 48.
Signals are heard when tuning from one station to another automatically.	Mute contact on back switch not closing or making poor contact.	Sections 4b or 10b.
Set noisy electrically when starting and stopping during automatic-tuning.	Set used with insufficient antenna or mute contacts on back switch closing too late and opening too soon.	Reduce spacing between mute contacts on Back Switch. (Figure 4)
Mechanism reaches a definite stop before the pointer reaches either end of the dial.	The cam assembly stop pin and the gang condenser stops are not set so they reach their respective stop points at approximately the same time.	Section 51.
Band indicator hangs up when changing ranges.	Knot on band indicator cord jams against visual tuning indicator light bulb.	
	Torsion spring slipped out of place.	
	Link on range switch over dead center.	

ADJUSTMENT OF THE BACK SWITCH

THE SUCCESSFUL OPERATION OF THE ENTIRE MECHANISM DEPENDS TO A LARGE DEGREE ON THE CORRECT ADJUSTMENT OF THE BACK SWITCH: For this reason it is highly important that all contacts be set exactly right.

1 Two different types of Back Switches, and associated Bakelite Operating Cams, have been used. To determine whether the Switch is of the early or later type, notice the shape of the Bakelite Cam. The shape of the Bakelite Cam used on early units is shown in figure 1A; on later units it is shaped as in figure 1B. The various operating positions of the early type are shown in figures 1A, 2A, 3A and 4A. The positions of the later type are shown in figures 1B, 2B, 3B and 4B. Details of the correct settings for the early type are explained in sections 2 to 6. Details of the correct settings for the later type are explained in sections 8 to 12. MINOR ADJUSTMENTS OF THE BACK SWITCH TO SECURE THESE SETTINGS MAY BE MADE BY BENDING THE VARIOUS BLADES OF THE SWITCH.

EARLY TYPE BACK SWITCH

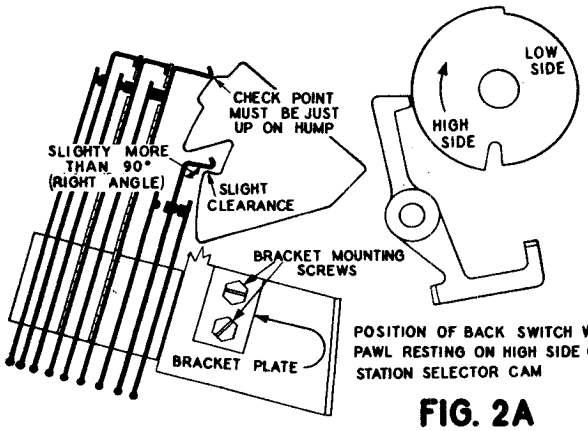
2 Run the dial pointer to 530 KC. Turn the power off. With the mechanism in the manual position, the Back Switch Operating Arms should clear the Bakelite Cam by the amounts indicated in figure 1A. Push any button so that the Pawl falls on the high side of the Station Selector Cam. The Reversing Contacts Operating Arm should clear the Bakelite Cam as indicated in figure 2A. IF THESE CLEARANCES ARE APPROXIMATELY CORRECT, PROCEED WITH SECTION 3. However, if the clearances are not as shown, slight discrepancies can be corrected by bending the Arms, but if the entire switch seems to be out of position, loosen the Bracket Mounting Screws (Figure 2A) and move the entire Back Switch assembly to give the proper clearances.

3 Release any depressed buttons. Move the Bakelite Cam up and down by hand to make sure that the Reversing Contacts make and break properly as follows. These are the three short switch blades nearest the Bakelite Cam.

a. With the Bakelite Cam down as in figure 2A, the center contact should make with the front contact, while with the Bakelite Cam pulled up as in figure 3A, the center contact should make with the Back Reversing Contact. After the instant of closing the blades should move slightly to show adequate contact pressure. IMPORTANT: Make sure that the center contact is not touching both the front and back contacts at any one time, since this may short circuit the 6-volt winding of the power transformer. If the Reversing Contacts do not make or break properly, bend the switch blades to secure proper operation.

b. With the dial pointer at 530 KC. push each button and make sure that the Reversing Contacts Operating Arm does not touch the Bakelite Cam. See figure 2A. The Pawl, in every case, should rest on the High Side of the Station Selector Cam.

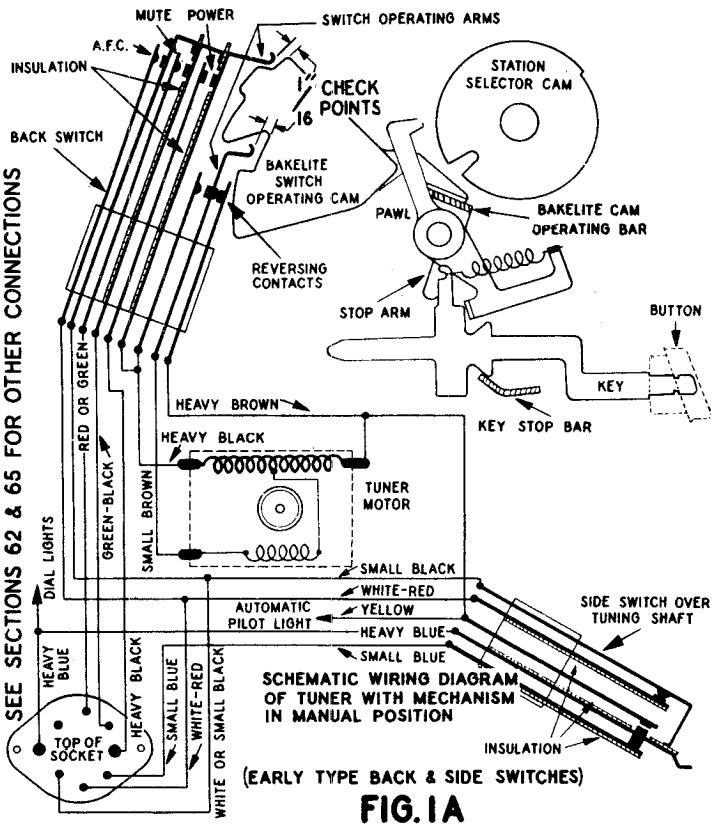
c. Now pull out the Set-up Knob and run the pointer to the high frequency end of the dial by turning the Set-up Knob clockwise. Push each button to make sure that the center contact closes with the back Reversing contact. See figure 3A. In every case the Pawl should rest on the Low Side of its cam.



POSITION OF BACK SWITCH WITH PAWL RESTING ON HIGH SIDE OF STATION SELECTOR CAM

FIG. 2A

4 Turn the Tuning Knob to release the depressed button. This puts the Bakelite Cam in the position shown in figure 1A. so the Power, Mute and A.F.C. contacts of the Back Switch can be checked as follows:



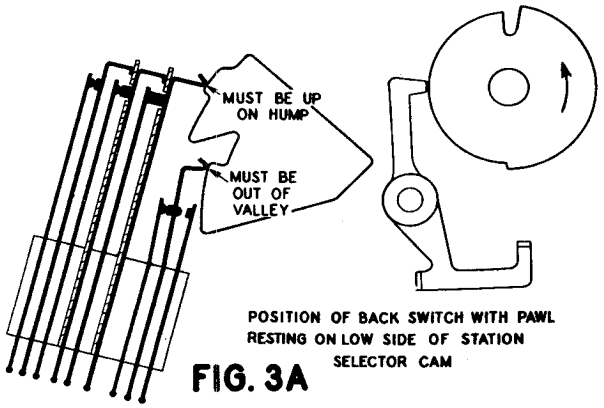
SCHEMATIC WIRING DIAGRAM OF TUNER WITH MECHANISM IN MANUAL POSITION

(EARLY TYPE BACK & SIDE SWITCHES)

FIG. 1A

a. The long Mute blade should barely hold the thin bakelite strip against the Power blade, and the long A.F.C. blade should barely hold the thin bakelite strip against the Mute blade.

b. All three sets of contacts should be open approximately 1/64 to 1/32 of an inch. Move the Bakelite Cam up and down by hand and observe the action of the contacts. As the Bakelite Cam is moved up (to the position of figures 2A or 3A) all three sets of contacts should close. After the instant of closing the blades should move slightly to show adequate contact pressure.



POSITION OF BACK SWITCH WITH PAWL RESTING ON LOW SIDE OF STATION SELECTOR CAM

FIG. 3A

5 To finish checking the setting; pull out the Set-up Knob, unlock the Cam Assembly by turning the Set-up Knob clockwise as far as it will go. A slight click should be heard as the mechanism is unlocked. Then procsed as follows:

a. Run the dial pointer to the low frequency end of the dial. Push any button so that the Pawl Falls on the High Side of the Station Selector Cam. The upper Back Switch Operating Arm should rest just up on the "Hump" of the Bakelite Cam, at the "Check Point" shown in figure 2A. If the Operating Arm is not in this position, bend the Arm slightly to secure such setting. If the Operating Arm is down off the "Hump", the Power, Mute or A.F.C. contacts may remain closed after a station is tuned in. If

©John F. Rider

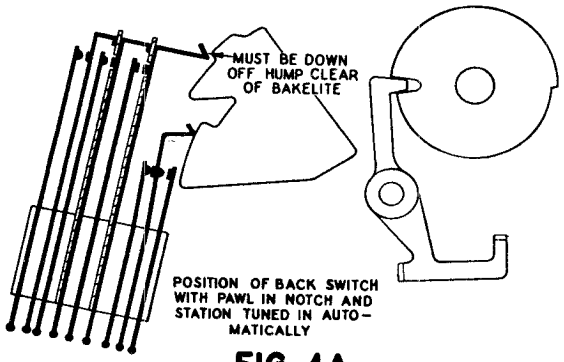


FIG. 4A

the Operating Arm is farther up on the "Hump", the Power contacts may open and cut the power off before the Pawl falls completely into the Notch.

b. Turn the Set-up Knob until the Pawl of the depressed button falls into the Notch on the Station Selector Cam. The Power, Mute and A.F.C. contacts should now be open at least 1/64 inch as shown in Figure 4A.

c. Repeat step 5a. with each of the other buttons then repeat step 5b. with each button. Due to slight variations in the Pawls, it may not be possible to adjust for all buttons so that the Back Switch Operating Arm comes exactly at the "Check Point" but make sure that the Power, Mute and A.F.C. contacts are open at least 1/64 of an inch for each button when the Pawl is in the Notch. Notice, too, that the bending of any switch blade or operating arm may throw out a preceding adjustment. For this reason it is well to check through the entire adjustment procedure a second time.

6 Lock up the Cam Assembly by turning the Set-up Knob as far counter-clockwise as possible. Turn on the power and check the operation of the unit.

REPLACING EARLY TYPE BACK SWITCH

7 If it is necessary to replace the early type Back Switch with the later type, since we stock only the later type, part number 10054112564, it will also be necessary to change the Bakelite Cam to the later type, part number 10054112563. To make this change proceed as follows:

a. File off the two rivets holding the Bakelite Cam to its arm.

b. Put the new Cam in place and secure with two 6/32 machine screws.

c. Remove the two screws holding the Back Switch to its bracket and transfer the wires from the old switch to corresponding terminals on the new switch.

d. Fasten the new switch in place and adjust as described in sections 8 to 12.

LATER TYPE BACK SWITCH

8 Run the dial pointer to 530 KC. Turn the power off. Push any button so that the Pawl falls on the High Side of the Station Selector Cam. The Back Switch Operating Arms should clear the Bakelite Cam by the amounts indicated in figure 2B. IF THE CLEARANCES ARE APPROXIMATELY CORRECT, PROCEED WITH SECTION 9. However, if the clearances are not as shown, slight discrepancies can be corrected by bending the Arms, but if the entire switch seems to be out of position, loosen the Bracket Mounting Screws (see figure 2B) and move the entire Back Switch assembly to give the proper clearances.

9 Move the Bakelite Cam up and down by hand to make sure that the Reversing Contacts make and break properly as follows. These are the three short switch blades nearest the Bakelite Cam.

a. With the Bakelite Cam down as in figure 2B, the center contact should make with the front contact, while with the Bakelite Cam pulled up as in figure 3B, the center contact should make with the back Reversing Contact. After the instant of closing the blades should move slightly to show adequate contact pressure. IMPORTANT: Make sure that the center contact is not touching both the front and back contacts at any one time, since this may short circuit the 6-volt winding of the power transformer. If the Reversing Contacts do not make or break, bend the switch blades to secure proper operation.

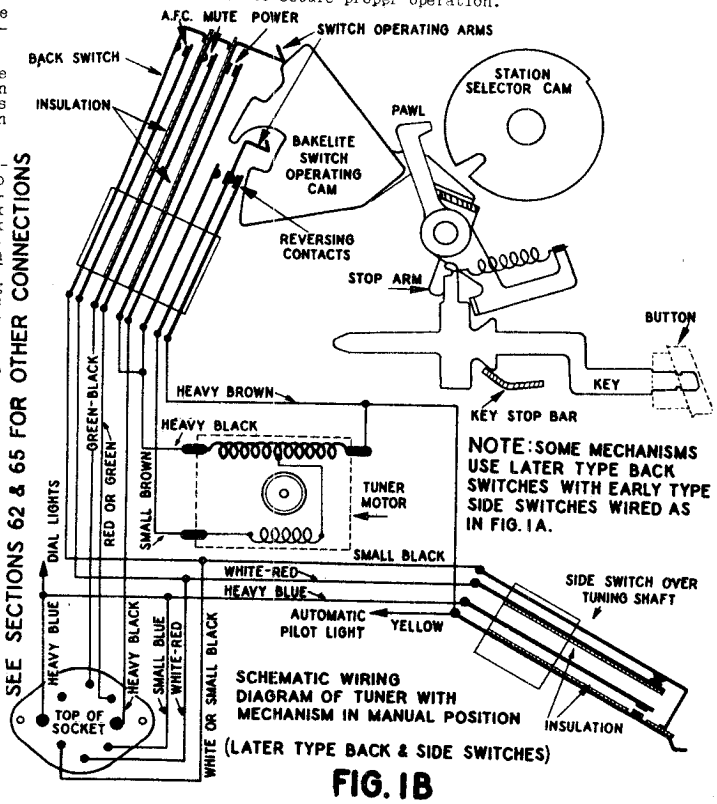

FIG. 1B

b. With the dial pointer at 530 KC. push each button and make sure that the Reversing Contacts Operating Arm does not touch the Bakelite Cam. See figure 2B. The Pawl, in every case, should rest on the High Side of the Station Selector Cam.

c. Now pull out the Set-up Knob and run the pointer to the high frequency end of the dial by turning the Set-up Knob clockwise. Push each button to make sure that the center contact closes with the back Reversing Contact. In every case the Pawl should rest on the Low Side of the cam. See figure 3B.

10 With the Pawl still resting on the Low Side of the Station Selector Cam, the Power, Mute and A.F.C. contacts of the Back Switch are to be checked as follows:

a. Leave the Bakelite Cam in the Position of figure 3B. The long Mute blade should barely hold the thin bakelite strip against the Power blade, and the long A.F.C. blade should barely hold the thin bakelite strip against the Mute blade.

b. Move the Bakelite Cam up and down by hand and observe the action of the contacts. With the Bakelite Cam up as shown in figure 4B all three sets of contacts should be open approximately 1/32 of an inch. As the Bakelite Cam is moved down (to the position of figure 3B) all three sets of contacts should close. After the instant of closing the blades should move slightly to show adequate contact pressure.

MUST CLEAR BAKELITE
CHECK POINT MUST BE OUT OF VALLEY
POSITION OF BACK SWITCH WITH PAWL RESTING ON LOW SIDE OF STATION SELECTOR CAM

FIG. 3B

SIDE SWITCH ADJUSTMENT

14 There are two general types of Side Switches, namely the early type with five blades and the later type with only four blades. The Side Switch change was made after the Back Switch change, so that there are units equipped with the early Side Switch but with later type Back Switch.

The extra blade in the early Side Switch was used to switch the Visual Tuning Indicator light on during Manual tuning and off during Automatic Tuning. With the later Side Switch this light remains on during both Manual and Automatic tuning. In addition, with the later side switch the 6 volt line and Motor-Automatic light circuit wires were reversed. See figure 1A and 1B for circuit difference.

15 With the power off, adjust to secure the making and breaking of the contacts as illustrated. FOR EARLY TYPE SIDE SWITCH REFER TO FIGURES 5A, 6A AND 7A. FOR LATER TYPE SIDE SWITCH REFER TO FIGURES 5B, 6B and 7B. After the instant of closing the blades should move slightly to show adequate contact pressure. For some adjustments it may be better to bend the Long or Short Switch Operating Arms instead of the Switch blades.

CONCLUDED ON NEXT PAGE

11 To finish the checking Pull out the Set-up Knob. Unlock the Cam Assembly by turning the Set-up Knob clockwise as far as it will go. A slight click should be heard as the mechanism is unlocked. Then proceed as follows:

a. Push any button. Turn the Set-up Knob until the Pawl drops into the Notch on the Station Selector Cam. The upper Back Switch Operating Arm should rest just up out of the "Valley" on the Bakelite Cam (See "Check Point" on figure 4B), and

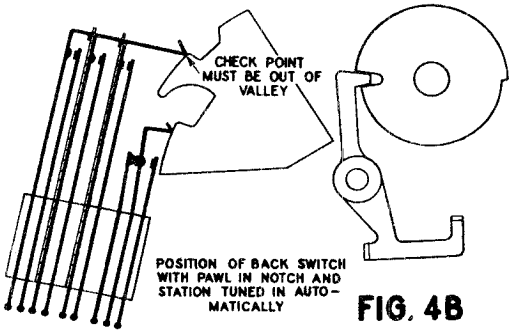

FIG. 4B

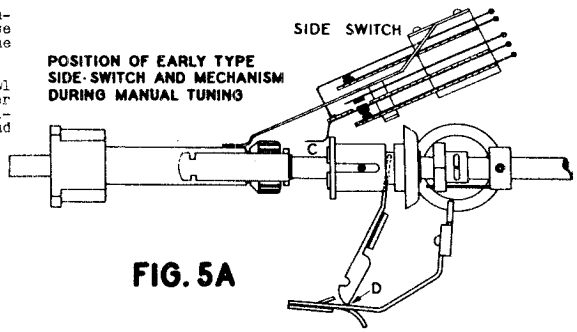

FIG. 5A

the Power, Mute and A.F.C. contacts should be open at least 1/32 of an inch. If the Operating Arm is not out of the "Valley" far enough to open the contacts properly, bend the Operating Arm down slightly. If the Operating Arm is farther out of the "Valley" than indicated by the "Check Point", the Power contacts may open and cut the power off before the Pawl falls completely into the Notch. If the Operating Arm does not come out of the "Valley" far enough, the Power, Mute or A.F.C. contacts may remain closed after a station is tuned in.

b. Repeat the above step for each of the other buttons. This is important. Due to slight variations in the Pawls, it may not be possible to adjust for all buttons so that the Back Switch Operating Arm comes exactly at the "Check Point" of figure 4B, but make sure that the Power, Mute and A.F.C. contacts are open at least 1/32 of an inch for each button, when the Pawl is in the Notch. Notice, too, that the bending of any switch blade or operating arm may throw out a preceding adjustment. For this reason it is well to check through the entire adjustment procedure a second time

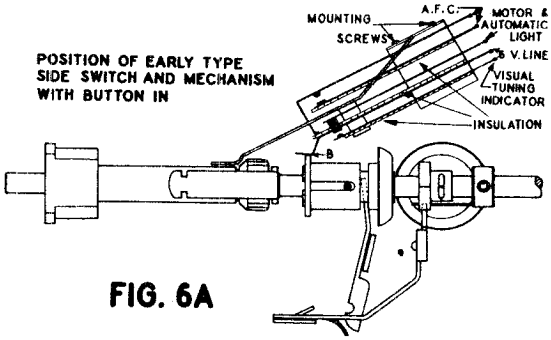

FIG. 6A

12 Lock up the Cam Assembly by turning the Set-up Knob as far counter-clockwise as possible. Turn the power on and check the operation of the unit.

BAKELITE SWITCH OPERATING CAM

13 The Bakelite Cam may stick because of improper adjustment of the Back Switch. The clearances shown in figures 1A or 1B should be maintained. This prevents too much pressure by the Back Switch Operating Arms against the Bakelite Cam. See paragraph 4a or 10a. Other causes for the Bakelite Cam to stick are; rough edges on the Bakelite, and insufficient tension in the Bakelite Cam Return Spring (figure 13). Tension in the Return Spring may be increased, if found necessary, by simply cutting off a few turns and forming a new hook on the end.

The Stop Arm (figure 1B) on the bar carrying the Bakelite Cam, should hit against the Rubber Stop (figure 14). This keeps the Bakelite Cam from jumping too high and catching over the Reversing Contact Arm. If this Rubber Stop is missing, a couple of turns of friction tape around the shaft will serve the same purpose.

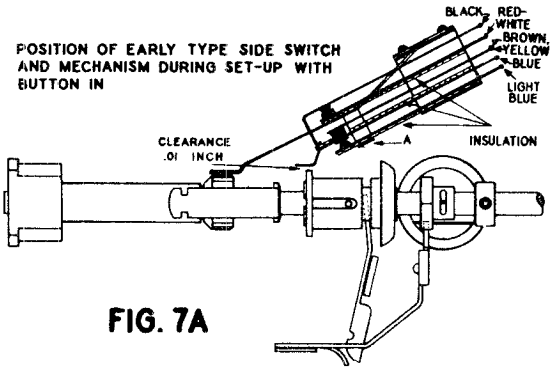

FIG. 7A

©John F. Rider

16 IT IS IMPORTANT THAT THE MOTOR CONTACTS ON THE SIDE SWITCH DO NOT CLOSE UNTIL AFTER THE REVERSING CONTACTS OF THE BACK SWITCH CLOSE. To secure such sequence of contact closing, the bakelite ring on the Friction Roller Assembly (figure 13) should not come farther forward, under the Short Operating Arm of the Side Switch, than shown at point B, figure 6. If loosening the Switch Mounting Screws does not permit enough movement of the switch to secure this positioning, it may be necessary to bend the Short Switch Operating Arm.

17 Care must be taken that the Automatic Frequency Control contacts on the Side Switch are open during automatic tuning and closed during manual tuning. If they are open when tuning manually the set will appear to tune broadly. The A.F.C. Contacts must be closed during setting up, or the Station Selector Cams may be set improperly. If the A.F.C. contacts do not open when tuning automatically, mistuning by the mechaanism will result in poor tone quality. In extreme cases of mistuning the station may not be heard at all.

18 When tuning automatically or during set-up, if the automatic Light does not come on and the Motor does not move or the Automatic Light flickers, bend the Side Switch blade, third from the top, down a little. If the blade is bend down too far the light will remain on all the time, even during manual tuning. Also the sequence of contact closing mentioned in section 16 will not be obtained.

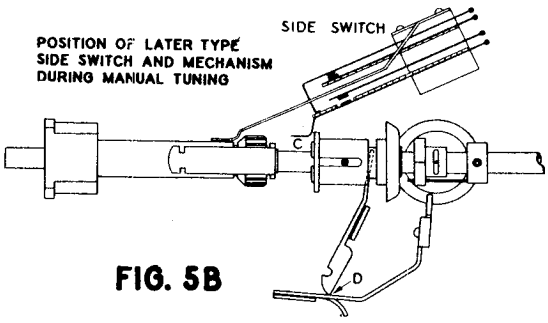

FIG. 5B

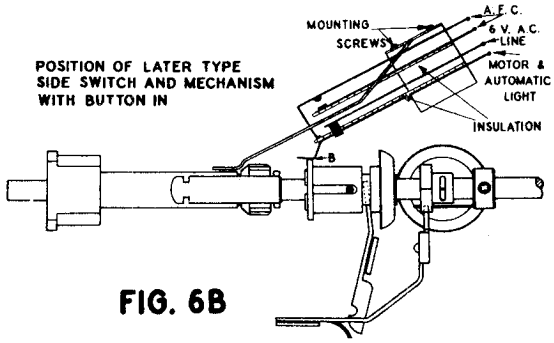

FIG. 6B

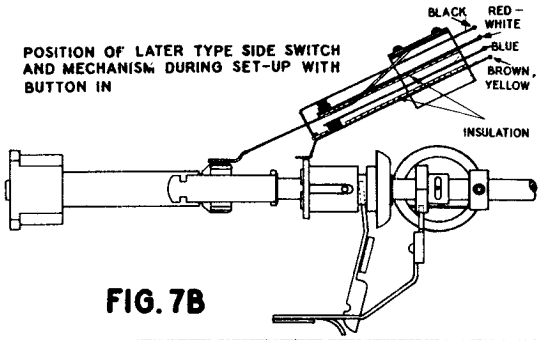

FIG. 7B

19 If the Visual Tuning Indicator Light flickers or goes out during set-up, when a button is pressed, the following may oe the cause. The bakelite ring on the Friction Roller Assembly is probably lifting the Short Side Switch Operating Arm, causing it to open the Visual Tuning Indicator circuit. There should be a very slight clearance, about .01 of an inch, between the bakelite ring and the Operating Arm during set-up, with a button in, as shown in figure 7A. Either the end of the Long Switch Operating should be bent down, so it will press harder against the Set-up Gear, or the lifting hook (A, figure 7A) should be bent up slightly.

CLUTCH

20 The Clutch is purely a friction device. It is a standard anti-backlash gear held on a Collar by a flat, horseshoe shaped Spring Washer as shown in figure 8. The frictional resistance between Spring and Collar and the Gear normally can transmit enough power to drive the Cam Shaft, Dial Pointer and Gang Condenser. If an abnormal load is placed on the Clutch it should slip. If the Clutch becomes locked or stuck so it cannot slip when overloaded, other parts of the mechanism may be damaged because of the absence of the "shock absorber" action of the Clutch.

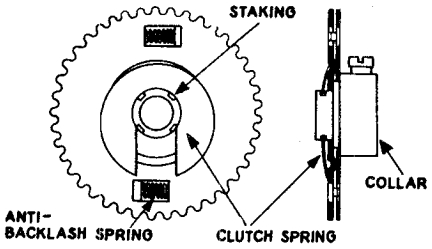

FIG. 8

21 THE CLUTCH MAY SLIP BECAUSE IT IS FULL OF OIL OR GREASE OR THE HORSESHOE SHAPED SPRING HAS CRACKED OR WEAKENED. If oil or grease is present, wash it off with carton tetrachloride or similar cleaning fluid. The Spring can be slipped out and replaced without any dismantling of the mechanism. NOTICE THAT THE SET SCREW IN THE CLUTCH MUST BE SO POSITIONED, IF THE CLUTCH IS MOVED OR REPLACED, THAT IT WILL NOT JAM AGAINST THE SET-UP CROWN GEAR. Sometimes the Clutch may slip because the Pawl, although falling far enough into the Notch on its Station Selector Cam to prevent the shaft from rotating, does not fall far enough to operate the Back Switch and cut the power off. Check the Back Switch adjustment as outlined in sections 4 to 6 if an early type Back Switch is used, or sections 10 to 12 if the later type Back Switch is used. Also remove any rough edges from Pawl and Notch with emery cloth or a small oil stone.

22 OVERLOAD ON THE CLUTCH MAY ARISE FROM ANY ONE OR COMBINATION OF THE FOLLOWING CAUSES:

a. Binding of the Dial Pointer against the Dial, Dial Frame or cabinet, or rough, rusty or bent Dial Pointer Guide Rail.

b. Dial Pointer drive cable too tight.

c. Jammed or stuck dial cord guide pulley or pulleys.

d. Crossed dial cord on the Drum. Re-thread the dial cord correctly as shown in figure 11 and section 53.

e. Dial Cord Drum binding against Driver Gear or stuck on shaft.

f. The Pointer Driver Gear (figure 15) out of mesh and binding against the Drum Gear. Set Driver Gear to mesh with center of face of gear on Drum and check end play in Cam Shaft (See section 52.)

g. Misalignment or tight Cam Shaft Bearings. Loosen the screws holding the End Bearing Bracket (figures 10 and 15). Hold the Knurled Gears (figure 10) out of mesh by compressing the Flexible Coupling. Rotate the Cam Shaft back and forth a few times to permit the bearings to realign themselves. Then tighten the screws, taking care not to shift the Brackets while doing so. Be sure that both Right End Bearing Bracket Mounting Screws are tight, otherwise dial calibration cannot be maintained. Binding or tightness in the inner bearings is usually the result of sprung End Brackets, which should be straightened.

h. Cam Shaft sprung or bent. In most cases it will be necessary to replace the whole unit.

i. Collar on left end of Cam Shaft (figure 14) binding against Left End Bracket. Push the Cam Shaft as far to the left

©John F. Rider

as it will go. Loosen the Collar Set Screw and reset the Collar so it will have from .006 to .010 of an inch clearance between it and the Left End Bracket.

j. Set-up Crown Gear assembly binding (Fig. 13).

k. Gang Condenser Drive Gears out of mesh and binding (figure 10).

l. Thrust Spring in Flexible Coupling compressed too much. The Thrust Spring should exert just enough pressure on the Condenser Drive Gears (Fig. 10) to prevent backlash.

m. Extension Shaft out of line and binding (Fig. 10).

n. Tight, jammed or sticking Gang Condenser.

If correcting the above conditions does not stop the clutch from slipping replace the Clutch Spring, part number 10054111138. In extreme cases it may be necessary to replace entire Clutch Assembly as indicated below.

23 TO REMOVE THE CLUTCH PROCEED AS FOLLOWS:
a. Remove the L shaped horizontal brace on the back of the Dial Frame. This is the part supported by the brackets screwed to the sides of the chassis.

b. Take the Side Switch Mounting Screws out and swing the switch out of the way.

c. Drive out the pin through the Friction Roller Assembly (Figure 13). Pull out the pin in the Star Wheel. Loosen the set screws in the Star Spring Collar and Flywheel. The Tuning Shaft can now be pulled out. (NOTE that there is a groove around the tuning shaft. The Set Screw of the Star Spring Collar fits into this groove, thus fixing the lateral position of the shaft with respect to the End Bracket.)

d. Take the Set-up Knob off. Remove the Tuning Shaft Bearing and pull the Sleeve and Set-up Gear out of the End Bracket.

e. Take the Retaining Ring off the Set-up Crown Gear Stud and remove the Crown Gear Assembly.

f. Remove the Right End Bearing and Bracket (Figure 10).

g. Take the Knurled Crown Gear off the Extension Shaft (Figure 10).

h. Loosen the Clutch Set Screw, disassemble the Clutch and slide the Collar and Gear Sections off the Cam Shaft to the right.

PAWLS

24 If a Pawl does not fall completely into the Notch on the Station Selector Cam, check the setting of the Back Switch. It is probable that the Power contacts are opening too soon. Notice that in order to fall into the Notch, the Pawl must work against the bar carrying the Bakelite Cam. Anything that makes this Bar operate hard should be corrected. See that the end of the Pawl and Notch on the Station Selector Cam are smooth and free from burrs. Then try closing up the Power contacts on the Back Switch a little more, but only after checking the above points. This may be done by bending the Power blade so the Power contacts are closer together, when the Bakelite Cam is in the position shown in figure 4. DO NOT CHANGE THE OUTLINE OF THE PAWL OR CAM NOTCH.

25 The Pawls can sometimes be made to jam when two Station Selector Cams are set to one station, especially if both Cams are not set exactly to the same frequency and an attempt is made to push one button, then the other button. The Motor will hum or the Clutch will slip until the button is released. What actually happens is this: When such a button is pushed that its Pawl, in falling directly into the Notch on the Station Selector Cam, binds against the high-side wall of the Notch, the Bakelite Cam assumes the position shown in figure 3. The Motor drives the Station Selector Cam tighter against the Pawl and prevents it from falling farther into the Notch. The jammed Pawl may be released by pushing another button and no damage is done. It is possible, with close adjustments of the Back Switch Contacts, to make the Pawls jam as indicated above even when they are set exactly to the same frequency. FOR THIS REASON THE SETTING OF TWO OR MORE BUTTONS TO ONE FREQUENCY ON DEMONSTRATOR SETS IS NOT RECOMMENDED AS GOOD PRACTICE

26 A similar condition may exist when the set is tuned to a station manually, and then the button set for that station is pushed.

STATION SELECTOR CAMS

27 The Cam Assembly is designed to operate through slightly less than 180°. The Cams though, can be rotated all the way around. Obviously then, it is possible to set a Cam so that its Notch will not pass under the Pawl. If a Cam were so set and the button pushed in, the Pointer would run to the end of the Dial and the Motor would continue to operate. This occurs because the Notch has not come around so the Pawl could fall in and cut the power off. TO CORRECT SUCH FAULT: Turn the power off. Pull out the Set-up Knob. Unlock the Cam Assembly by turning the Set-up Knob clockwise as far as it will go. A slight click should be heard as the mechanism is unlocked. Then push in the offending button. Rotate the Set-up Knob to run the Dial Pointer clear to the very end of the Dial in one direction then in the other. The Cam should now be in the proper position, ready to be set up to a station.

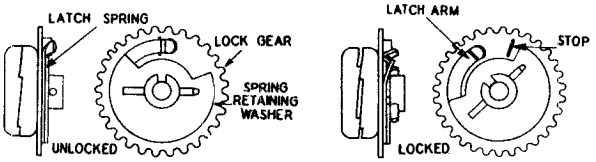
28 A similar condition is when a Cam is set to bring the Pointer to the very end of the Dial. The Pawl may lack just a very little bit of falling in far enough to cause the power to be cut off. Reset the Cam so the Pawl can fall in before the Cam Assembly Stop Pin (Figure 14) hits the stop.

KEYS

29 It is quite unlikely that the Keys will require any adjustment. Their failure to work properly will usually be due to improper adjustment or operation of some other part or parts of the mechanism.

CAM ASSEMBLY LOCK

30 Refer to figure 9. The left saw-tooth section of the Lock, the Spring Retaining Washer and the Latch Spring are keyed to the Cam Shaft. The right saw-tooth section of the Lock and Lock Gear (Figure 13) are free to turn on the Cam Shaft, subject to certain limits. These limits are complete engagement of the teeth on the two sections of the Lock in one direction, and a stop on the Lock Gear in the other direction. Rotating the right half of the Lock counter-clockwise (by turning the Set-up Knob clockwise) will cause the two saw-tooth sections to assume the meshed or unlocked position shown in figure 9A. It should relieve the pressure on the Station Selector Cams and Friction Washers enough so that they can be turned on the Cam Shaft quite freely. In this position the flat Latch Spring Arm should be hooked over the Stop on the Lock Gear (Figure 9A). The Cam Assembly may then be rotated within its working range, by the use of the Set-up Knob, without causing the mechanism to lock up.



CAM ASSEMBLY LOCK

FIG. 9A **FIG. 9B**

31 The Cam Assembly will be locked up if the Set-up Knob is turned after the Cam Assembly Stop Pin (Figure 14) reaches the Back Stop on the Left End Bracket. This occurs because the Latch Arm slips over the Stop on the Lock Gear and permits expansion of the lock as shown in figure 9B. When fully unmeshed the lock has expanded about .030 of an inch. The stop on the Lock Gear would be against the stop portion of the Spring Retaining Washer, and only the tips of the teeth on the saw-tooth sections would be touching each other. The pressure exerted on the Station Selector Cams will depend upon the amount the saw-tooth sections are unmeshed. When unmeshed (locked up) as far as possible, with the Stop on the Lock Gear against the Stop on the Retaining Washer, if there is still insufficient pressure being exerted to keep the Station Selector Cams from slipping, proceed as follows: Unlock the Cam Assembly and slip a horseshoe shaped shim, about .01 on an inch thick, down between the left Station Selector Cam and the Bushing (Figure 14). Do not make this shim too thick or the mechanism will tend to lock up while attempting to set up stations.

32 Locking up of the mechanism during set-up may be due to a Station Selector Cam not turning freely enough because of dirt, grit, etc. between the Cams and the Friction Spacer Washers. This may also result from defective Latch parts or a quick sudden turn of the Set-up Knob. TO REMOVE THE LATCH SPRING OR THE LOCK GEAR, first remove the Clutch as outlined in section 23. Then remove the Reduction Gears. Unlock the Assembly and pull out the pin through the Cam Shaft, to the right of the Lock (Figure 14). The Retaining Washer, Latch Spring and Lock Gear may now be slid off the right end of the Cam Shaft.

BAR AND ARM ASSEMBLY

33 The lower end of the Arm should rest right on the "hump" of the Kickout as shown at D in figures 5, with the mechanism in the manual tuning position. If the adjustment is correct any movement of the Arm, either forward or backwards, should allow the Kickout Arm to rise. This setting can usually be secured by moving the Friction Wheel in or out on the Motor Shaft, thus sliding the Friction Roller Assembly (Figure 13) backward or forward on the Tuning Shaft. The amount of adjustment possible by this method is limited by the movement of the Friction Wheel possible without causing it to interfere with the

©John F. Rider

Star Wheel, or the Motor Pinion becoming disengaged from the First Reduction Gear. Further adjustment, if necessary, may be made by bending the Arm slightly, preferably at its upper end. THE ADJUSTMENT SHOULD NOT BE CARRIED OUT TO THE DETRIMENT OF THOSE ADJUSTMENTS REQUIRED FOR THE SIDE SWITCH AS INDICATED IN SECTIONS 15 AND 19.

KEY STOP BAR AND KICKOUT ARM

34 The Adjustable Tip on the Kickout Arm in engaging the Star Wheel (Figure 6) determines the position of the Key Stop Bar (Figures 1B and 13), which holds the buttons in. If the Tip on the Kickout is set too low, the Key Stop Bar swings up so far that the buttons are hard to release. If the Tip is set too high the buttons will not stay depressed, since the Key Stop Bar (Figure 1B) cannot come up far enough to catch and hold the keys in. Therefore, the Adjustable Tip on the Kickout Arm should be set as high as possible and still allow the buttons to stay in.

35 Failure of buttons to stay depressed may also be due to: the Kickout Spring (Figure 13) being bent down too far (it should clear the Kickout Arm by about 1/16 of an inch when the mechanism is in the automatic position); insufficient tension in the Return Spring on the Key Stop Bar; or the Key Stop Bar is sprung down in the middle. Also see section 37.

36 If a button will not release when another is pushed, the Key Stop Bar may be jammed or sprung, or held from normal movement by the Kickout Arm being caught on the Star Wheel; or a Pawl may be sticking in its Station Selector Cam.

STAR WHEEL

37 The Star Spring Collar (Figure 13) should be set so that the spring holds the Star Wheel in such position that the Pin is midway between the ends of the slot in the Star Wheel hub. At the same time the set screw in the Collar should be in the groove around the tuning shaft, to locate the tuning shaft in the End Bracket. Within the limits of movement allowed by the Slot and Pin, the Star Wheel should turn quite freely on the Tuning Shaft except as restrained by the Spring. Otherwise the Tip of the Kickout Arm may sometimes engage one of the points of the Star Wheel and hold the Key Stop Bar down, thus preventing the Key from catching and staying depressed. (Sections 34 to 36 and Figure 6.)

38 All edges and corners of the Star Wheel must be smooth and free from burrs. If not, the Tip of the Kickout Arm (Figure 13) may catch and prevent the buttons from staying in or being released.

MOTOR

39 The Motor is mounted on the Right End Bracket by two Mounting Screws (Figure 13) through oversize holes in the Bracket. The size of the holes permit adjusting the meshing of the Motor Pinion and the First Reduction Gear for minimum noise. Noisy operation may be caused by either too tight or too loose meshing of the Gears. Too tight meshing will also load up the drives because of binding. See section 49 for details on "Universal" type motor.

ANTI-BACKLASH GEARS

40 There are two types of Anti-backlash Gears used in the Moto-Matic Tuner. One type is made up of two spur gear sections and two small coil springs. Such gears are used in the gear reduction train driving the Cam Shaft (Figure 13), the Clutch (Figure 8) and the Pointer Drive Gear (Figure 15). The springs in these gears should be compressed by displacing the two gear sections one or two teeth with respect to each other. DISPLACEMENT OF THE GEAR SECTION FACING YOU SHOULD ALWAYS BE CLOCKWISE WITH RESPECT TO THE OTHER GEAR SECTION. Too little compression in the springs cause play and backlash. Too much compression causes binding, tending to load up the driver, and noisy operation. The First Reduction Gear (next to the motor pinion, Figure 13) uses light springs, part number 85815; the Second Reduction Gear (nest to the Clutch, Figure 13) uses heavier springs, part number 10054112465; the Clutch and Pointer Drive Gear use still heavier springs, part number 1005489086. The correct displacement between sections of these gears, when equipped with the proper springs, should be not less than one nor more than two teeth.

41 The other type of gear is used to drive the Gang Condenser (Figure 10). The teeth of such gears are so shaped that, when the gears are kept tightly meshed together, backlash is prevented.

FLEXIBLE COUPLING

42 This device permits some misalignment of the Gang Condenser Shaft and the Extension Shaft (Figure 10), without causing binding in the bearings supporting the shafts. Inside of it is a coiled compression spring which keeps the Knurled Gears in mesh and prevents backlash. TO ADJUST THIS SPRING: Set the Coupling so the end of the Gang Condenser Shaft is flush with the inside edge of the back coupling collar. Tighten the set screw in the back coupling collar. Put the Knurled Gears in mesh, then compress the spring in the Coupling slightly and tighten the set screw in the front collar of the coupling. There now should be just enough thrust by the compressed coil spring to keep the Knurled Gears in mesh and free from backlash. If not, loosen the front set screw in the coupling, compress the spring a little more and retighten the set screw.

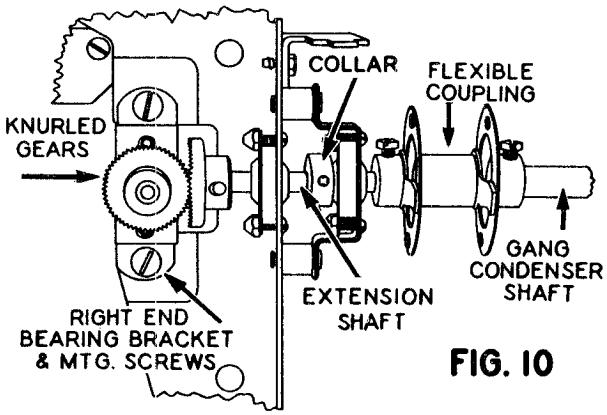


FIG. 10

GANG CONDENSER DRIVE

43 A few of the early chassis used a single section coupling. Later sets use a double section coupling, part number 10054112450, as shown in figure 10. This latter type is more flexible than the former and consequently, causes less binding when the Extension and Gang Condenser shafts are badly out of line. Only the later type is carried in stock. Therefore, if it is necessary to replace the older type, it will also be necessary to use Spring, part number 10054112490, and Extension Shaft, part number 10054112488, with the new coupling. Or in place of the new shaft, the old shaft may be used by cutting off 11/16 of an inch and chamfering the end like the piece which was cut off. The new shaft should be 2 3/16 inches long.

SETTING UP

44 THE FOLLOWING POINTS MUST BE OBSERVED DURING THE SETTING UP AND USE OF THE AUTOMATIC MECHANISM IF BEST RESULTS ARE TO BE OBTAINED.

ON MODEL 100.186 THE TONE CONTROL BROADENS THE TUNING WHEN IN THE TREBLE POSITION, MAXIMUM CLOCKWISE, THEREFORE THIS POSITION POSITIVELY MUST NOT BE USED DURING SET-UP.

a. Use a GOOD antenna.

b. Allow the set to warm up for twenty minutes before setting it up.

c. Set up the buttons from left to right, that is, the right hand buttons should be the last to be set up.

d. Avoid setting buttons on weak or fading signals.

e. Tune carefully when setting up.

f. After a button is set up, do not push that button again until the mechanism is locked. To do so will spoil the setting of that button.

g. Lock up tight. Continue to force the Set-up Knob in a counter-clockwise direction even after it seems to reach a definite stop. If you do not use force, the setting of the buttons may change.

45 Detailed, illustrated instructions for setting up the Moto-Matic Tuner are included with each receiver. In brief, the setting up procedure is as follows:

a. Pull off the Tuning Knob. This reveals the Set-up Knob (Figure 13). Pull the Set-up Knob out. Unlock the mechanism by turning the Set-up Knob clockwise until a slight click is heard.

b. Push in a button. After the Pointer has stopped moving, grasp the Set-up Knob and tune in the station to which the button is to be set.

©John F. Rider

c. Push in another button. After the pointer has stopped moving, again grasp the Set-up Knob and tune in the Station to which this button is to be set.

d. Continue to push in buttons and tune in the stations until as many are set up as desired. Then release the last button set up, by pushing the Set-up Knob part way in.

e. Pull the Set-up Knob back out. Lock up the Cam Assembly by turning the Set-up Knob counter-clockwise as far as it will go. Continue to force the Set-up Knob in a counter-clockwise direction even after it seems to reach a definite stop. If you do not use force, the settings of the buttons may change.

f. Push in the Set-up Knob and replace the Tuning Knob.

46 Occasionally a unit may be encountered in which it is difficult to set up accurately, the extreme right hand buttons. In such case, they should be set to stations at the low frequency end of the dial, or used to locate short wave bands.

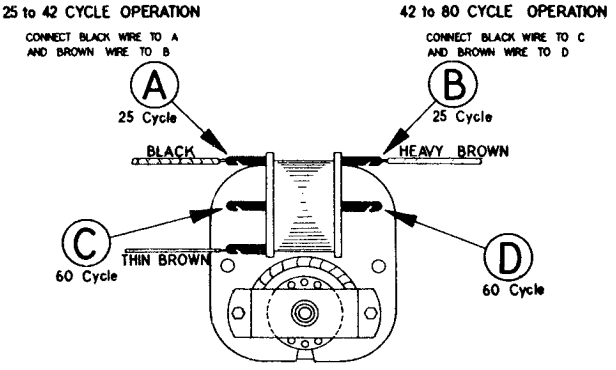
47 In case of complaint that a button set for some frequency, does not tune to that point within 10 K.C., or more, after locking up, it usually develops that the Station Selector Cam has inadvertently been moved before it was locked. This may come about by turning the Set-up Knob slightly when releasing the button, preparatory to locking the mechanism. Another possibility, if the Back Switch is not adjusted properly, is that by pushing a second button the motor will start before the pawl falls clear of the first cam, thus causing this cam to be shifted slightly before it is locked in place.

48 A short may occur in the unit due to the Tuning Shaft Bearing Stop (Figure 13) getting out of place. It then catches on the Set-up Gear. When the gear is turned counter-clockwise it forces the Bearing Stop against the hot blade of the Side Switch. Solder the Bearing Stop in place.

UNIVERSAL MODELS CONNECTIONS

49 The tuner motor may not operate if the line voltage drops very much below 105 volts. The motor used in the 60 cycle models will only operate properly on 50 to 60 cycles. Special motors, used in 25 to 80 cycle models, can be connected for operation on other frequencies as shown below:

MOTOR CONNECTIONS FOR TUNER MOTOR USED ON 25-80 CYCLES UNIVERSAL MODELS.



50 The connections for the Light Ray Tuner transformer, both standard 60 cycles, and universal 25 to 80 cycle types are shown on the various chassis service manuals.

DIAL MECHANISM AND CALIBRATION

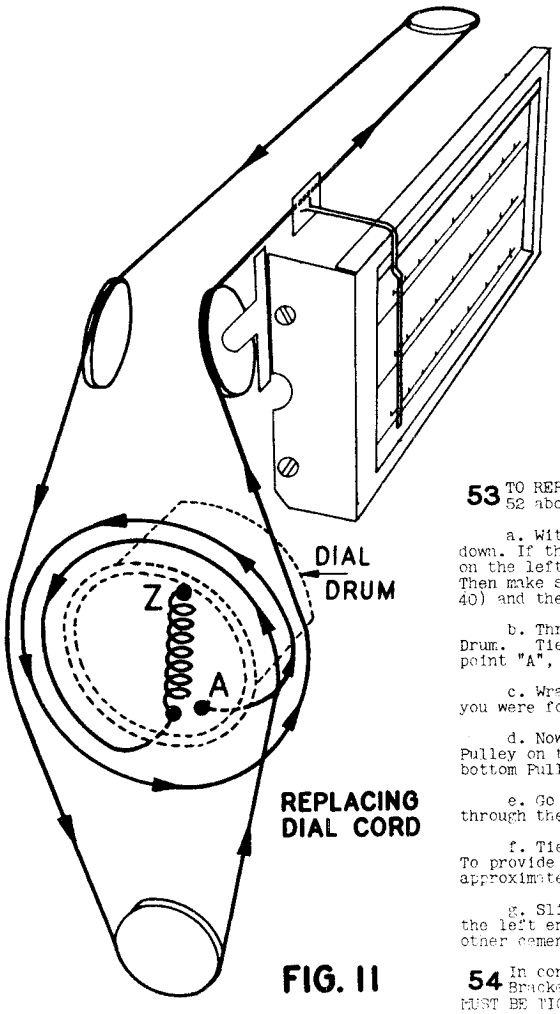


FIG. 11

51 The Cam Assembly Stop Pin, located on the left end of the Cam Assembly (Figure 14), allows approximately 180° of rotation of the Assembly and provides a strong, positive stop for the mechanism during locking and unlocking. It also protects the less rugged stops on the Gang Condenser. This Pin should strike the Stop just before the Gang Condenser is in full mesh or fully open. If it does not, to establish the correct relation between these two sets of stops: Loosen the set screw in the Knurled Condenser Drive Gear (Figures 10 and 15) on the Cam Shaft. Turn the Cam Assembly until the Stop Pin on it points to the back and is resting against the Stop on the Left End Bracket (Figure 14). Close the Gang Condenser to full mesh, then open it up just the least bit to relieve the Condenser Stop and tighten the set screw in the Knurled Gear. This allows the heavy Cam Assembly Stop Pin to reach its Stop first in each direction, since its working arc is slightly less than that of the Gang Condenser. See chassis service manual for complete calibration instructions.

52 The Knurled Gear (Figure 10) driving the Gang Condenser should be set on the Cam Shaft so that the center of its face engages the Crown Gear on the Extension Shaft. The dial Drive Gear, located on the left end of the Cam Shaft, (Figure 15) should engage the center of the face of the gear on the Dial Cord Drum. Check the end play in the Cam Shaft to see that these two sets of gears will not become unmeshed. If there is excessive end play in the Cam Shaft, move the collar (Figure 14) in closer to the Left End Bracket. There should be approximately .010 of an inch play between the Collar and Bracket.

53 TO REPLACE THE DIAL CORD: First check the points outlined in sections 51 and 52 above, then refer to figure 11 and proceed as follows:

a. With the Gang Condenser closed, the holes in the Dial Cord Drum should be down. If they are not, loosen the set screw in the Pointer Drive Gear (Figure 15) on the left end of the Cam Shaft, and rotate the Dial Cord Drum so that they are. Then make sure that the anti-backlash springs are compressed one tooth (section 40) and the gears are meshing properly before tightening the set screw.

b. Thread one end of the Dial Cord through the front hole of the two on the Drum. Tie a knot near the end of the inside of the Drum. This is the starting point "A", figure 11.

c. Wrap one and one quarter turns around the Drum counter-clockwise as though you were following the threads of a left hand screw.

d. Now go up over the front Pulley on the left end of the Dial; around the Pulley on the right end; over the back Pulley on the left end; down around the bottom Pulley and up to the front of the Drum.

e. Go around the Drum three quarters of a turn counter-clockwise and up through the back hole.

f. Tie the Tension Spring on and hook it over the hook on the Drum at "Z". To provide proper tension in the Dial Cord the extended spring should measure approximately 1 1/4 inch in length over all, when the Cord system is equalized.

g. Slip the Pointer clip under the Cord, set the Pointer at the last mark on the left end of the Dial Scale, close the clip and put on a drop of household or other cement on the Cord and clip junction.

54 In connection with Calibration, notice that movement of the Left End Bearing Bracket (Figure 15) changes the Pointer setting. BOTH SCREWS IN THIS BRACKET MUST BE TIGHT.

©John F. Rider

CHECKING A.F.C.

55 In order to determine if the Automatic Frequency Control System is working, either of the following methods may be employed without removing the chassis from the cabinet.

a. Select a local station whose signal is fairly strong and which operates on a frequency below 1000 KC. Tune manually to a frequency slightly above that of the selected station, but close enough to the signal that it can be heard somewhat distorted.

b. Open the A.F.C. (two upper) contacts on the Side Switch, by reaching into the back of the set with a pointed stick and forcing the contacts apart.

c. A.F.C. should then pull the signal in clearly and hold it, while the contacts remain open.

d. Now tune below the station frequency a few KC. and open the A.F.C. contacts again. Again A.F.C. should pull the signal in clearly.

56 The same check on Automatic Frequency Control action can be made from the front of the set by proceeding as follows:

a. Pull off the Tuning Knob. Pull out the Set-up Knob. Unlock the mechanism by turning the Set-up Knob clockwise until a slight click is heard.

b. Push a button in. After the pointer stops, tune in a fairly strong station below 1000 KC. Then detune until the signal is somewhat distorted.

c. Now, push the Set-up Knob in and leave it in. This also releases the depressed button. Push the same button in again. This should open the A.F.C. contacts on the Side Switch, and allow A.F.C. to bring the signal in clearly.

d. Pull the Set-up Knob out. Push the same button in again. Detune the other side of the station and repeat paragraph c.

57 If Automatic Frequency Control does not appear to be working: First make sure that the A.F.C. contacts on the Back and Side Switches (Figure 1 to 7) are open when a station is tuned in automatically and that the A.F.C. contacts on the Side Switch are closed when tuning manually or setting up the mechanism. Then check the Discriminator, Control, R.F., Mixer, and I.F. tubes. Re-align the I.F., Broadcast and discriminator trimmers as explained in the chassis service manuals before attempting to locate a fault in the chassis.

MANUAL TUNING

58 There should be sufficient traction between the Friction Roller and the Friction Wheel (Figure 13) to provide positive movement of the mechanism when the Tuning Knob is turned, providing there is no mechanical overload in the system. If the Dial Pointer fails to move when tuning manually, first, try washing the Rubber Ring on the Friction Wheel with carbon tetrachloride to remove any oil or grease. The traction between the Friction Roller and Friction Wheel may be increased slightly by sliding the Friction Wheel out farther on the Motor Shaft. The contact pressure between the Friction Wheel and Roller can be increased by shortening the Return Spring on the Bar and Arm Assembly (Figure 13). However, shortening this spring makes the buttons harder to push in.

59 Because of the exceptionally high tuning ratio used in this unit, the compounding effect on any slight lost motion is such that every precaution must be taken to keep backlash within satisfactory limits. Backlash will be at a minimum with proper adjustment of the various gears, as outlined in sections 40 and 41. Considerable lost motion will result if the Gang Condenser sways because of too loose mounting or because it turns too stiffly. Assuming the Clutch is in good working condition, it will only slip if mechanically overloaded.

60 In case of excessive Pointer backlash, check the following points; BOTH screws in the Left End Bearing Bracket must be tight. See that the Pointer Drive Gear (Figure 15) is not slipping on the Cam Shaft, that the anti-backlash springs in the gear are compressed at least one tooth, and that it does not slip out of mesh with the gear on the drum. The Dial Cord should be tight enough to extend the Tension Spring in the Drum so it measures about 1 1/4 inches long. See that the Pointer does not slip on the Cord and slides freely on the Guide Rail.

61 If the Tuning Shaft turns only a part of a revolution then catches, with a button depressed, it is probably due to burrs or rough edges on the Star Wheel or Adjustable Tip of the Kickout Arm (Figure 13). Or it may be that the buttons are too hard to release, because of improper adjustment of the Kickout Arm tip. See sections 35 and 37.

CHANGING MECHANISM

62 The early production sets have the Moto-Matic Tuner wired directly to the chassis. Later sets are equipped with a socket and plug to facilitate removal of the mechanism. The socket on the later mechanism is mounted about four inches from the right end, and facing the rear, on the horizontal reinforcing member on the back of the Dial Assembly. It is connected in as shown in figures 1A or 1B, depending upon the type of Side Switch (See Section 14.)

63 To change the Moto-Matic Tuner and Dial Assembly, part number 10054112727, it is only necessary to unsolder the green and the green-black wires to the volume control, take the volume control off the bracket, slip the Visual Tuning Indicator Light socket off, pull the above mentioned plug, loosen the set screw in the Flexible Coupling (Figure 10) and take out the four screws holding the assembly to the chassis. If the assembly has no plug on it see section 65.

When installing the new Moto-Matic Tuner and Dial Assembly see section 51 for dial calibration instructions, and section 42 for information on adjusting the tension in the spring in the flexible coupling.

64 To change the Moto-Matic Tuner, part number 10054111350, only, it is necessary to remove the Dial Cord from the Drum (Figure 11), take out the four screws holding the two End Bearing Brackets to the frame, pull out the plug and take out the four screws holding the unit to the frame. The two front screws holding the unit to the frame can be reached by removing the second or third and the sixth or seventh button shells in the bottom row. If the unit has no plug on it see section 65.

When installing the new Moto-Matic Tuner, see section 22g for alignment of the End Bearings, sections 51 to 53 for restringing the dial cord and dial calibration, and section 42 for information on adjusting the tension in the spring in the flexible coupling.

65 If it is necessary to put one of the later mechanism, having the socket, on an early chassis, the Plug (Figure 12), part number 10054112736, must be wired to the chassis. The plug is provided with seven color coded wires of sufficient length to connect to the proper points on the under side of the chassis. Disconnect an old wire and connect the corresponding new wire, following the colors for identification, before disconnecting the next old wire. However, some of the cable wires may have a different color than the original chassis wires. Briefly the cable wires are:

Black (Heavy)	To grounded side of 6 volt winding of power transformer.
Blue (Heavy)	To other terminal of 6 volt winding of power transformer.
Light Blue	To one leg of the Reactance Dimmer Coil (The Visual Tuning Indicator Light is connected to the other leg.)
White - Red	On models 100.184 and 100.185 to A.V.C. cathode (the one with the white-green wire attached to it) of the 6H6 tube. On model 100.186 to the ungrounded cathode of the discriminator (6H6) tube.
Small Black or White	On models 100.184 and 100.185 to other cathode of the 6H6 tube - the one with the brown wire attached to it. On model 100.186 to ground.
Green - Black	On model 100.184 to ground. On models 100.185 and 100.186 to one end of the audio input choke - the end connected to the control grid of one of the 6V6 output tubes with a green-black wire.
Green or Red	On model 100.184 to the control grid of the 6L6 output tube. On models 100.185 and 100.186 to the other end of the audio input choke - the end connected to the control grid of the other 6V6 output tube with a green wire.

SPECIAL TOOLS

66 A special spring adjuster tool, part number 10054117468, list price $0.75 may be obtained from the factory for adjusting the Back and Side switch blades, although a pair of duck-bill pliers or a screw driver can be used.

67 Wrenches can also be supplied by the factory for the fluted (Bristol) set screws used in various parts of the Moto-Matic Tuner. For the #6 (small) set screws, the wrench is part number 10054112483, and for the #8 (large) set screw, the wrench is part number 1005412484. These wrenches have a list price of 7 cents each.

HOW TO ORDER PARTS FOR THE "MOTO-MATIC TUNER" USED ON CHASSIS HAVING IDENTIFICATION NUMBER 100.184 ; 100.185 OR 100.186 .

1. Use Purchase Order Form 5284.
2. On the Purchase Order always give the following information:
   (1) PART NUMBER and DESCRIPTION for each part ordered, as given in this parts list, regardless of number printed on part itself. When no part number is assigned, order by description and rating Also give PRICE of part (indicate if no selling).
   (2) THE IDENTIFICATION NUMBER, WHICH IS 100.184 ; 100.185 OR 100.186 THIS NUMBER IS FOUND ON THF LEFT REAR CORNER OF THE CHASSIS.
3. ORDERING INSTRUCTIONS.
   Send Purchase Orders DIRECT to Stewart-Warner Corp., 1828 Diversey Pkwy., Chicago, Ill.

PARTS LIST-SOURCE NO. 100

Wherever the word "right" or "left" appears in the following list, it is understood that you are standing in front of the mechanism.

The Identification Numbers are to assist you in identifying parts shown on figures 13, 14 and 15 or to indicate in which figure the part can be seen. The identification is NOT TO BE USED in place of the part number, when ordering parts.

PART NUMBER	IDENTIFICATION NO.	DESCRIPTION
10054111591	1	Arm (long) side switch operating
10054111627	2	Bar & Arm Assembly
10054111526	3	Bearing - on tuning shaft
10054111176	4	Bracket - left end of mechanism
10054111547	5	Bracket - with studs (right end of mechanism)
10054111569	6	Bracket - pust button escutcheon support
10054111162	7	Bushing - left end of cam shaft
10054112428		Button Body - for tuner
10054112545		Button Cap - for push button
10054111878		Button Window - celluloid for push button
10054112547		Button Reinforcing Disc - for push button
10054111633		Button retaining spring - inside push button
10054111577		Button Washer - in push button
10054111576		Button Washer - in push button
10054111617 / 10054112563	8	Cam - bakelite for back switch operation (with arm) / Cam - bakelite-less operating arm
10054111625	9	Cam Shaft - with cams and right end bracket
10054111168	10	Cams - station selector
10054111146	11	Clutch - collar, spring & gear
10054111160	12	Collar - retaining (less set screw) left end of cam shaft
10054111161		Collar - retainer for pawls
10054111616	13	Collar & Spring - for star wheel
10054111882		Collar - inside of locking cam
10054111137		Drive Ring - rubber (on friction wheel)
10054111693	14	Escutcheon - metal, for push button
10054111310	15	Flywheel -with set screws
10054111549	16	Friction Roller - on rear end of tuning shaft
10054111169	17	Friction Spacer - between cams
10054111402 / 10054111137	18	Friction Wheel - (on motor shaft) with rubber ring / Drive ring rubber (on frict.wheel)
10054111145	19	Gear - and pinion (reduction)
10054111157	20	Gear - crown & pinion, for "Setting-up"
10054111523	21	Gear - set up (on tuning shaft)
10054112726		Housing - with keys
10054112522	22	Key stop bar - kickout assembly
10054111632	23	Knob - for setting up
10054111408		Lock - saw tooth adjacent to cam (left half)-Fig. 14
10054111548	24	Lock - saw tooth with gear (right half)
10054112727	25	Moto-Matic Tuner-complete with all dials-ready to mount on chassis
10054111350	26	Moto-Matic Tuner only, less dial frame assembly
10054111380	27	Motor - 6 volt 60 cycles
10054112354		Motor - 6 volt 25 to 80 cycles
10054111491	28	Pawl & Bushing - single unit
10054111634		Pawls & Shaft - (assembly)
10054111148	29	Pin - cam shaft, left end
10054111409		Pin - for friction roller-Fig.13
10054111410		Pin - in star wheel
10054111411	30	Pin - cam shaft - right end
10054111883		Pin - inside of lock
10054111557		Retainer - over left end of pawl shaft (brass)
10054111152		Retaining Ring-for reduction gears
10054111153		Retaining Ring-for crown gear
1005475032		Screw - #4 for kickout tip - Per C
1005485040		Screw - #6 Hex.hd.for mtg. frame - Per C
1005488707		Screw - Binder Hd. for mtg. push button escutcheon - Per dz.
10054111673		Screws - (through back switch)
10054111968		Screw - side switch mtg.-Fig.6
1005485827		Set Screw - on clutch collar-Fig.8
10054111554		Set Screw - #4 headless (for pawl collar)
10054111403		Set Screw - #8 for set up knob - Figure 13
10054111588		Set Screw - for collar and star spring mtg. (6/32)
10054112138		Set Screw - 8/32 round head
10054111166		Shaft - for pawls
10054111405		Shaft - for key stop bar
10054111406		Shaft - for bar & arm assembly
10054111590	31	Shaft - tuning
1005485815		Spring - between reduction gear sections (next to motor)
1005489086		Spring - coil between sections of clutch gear - Fig. 8
10054112465		Spring - between reduction gear sections (next to clutch)
10054111138		Spring - horseshoe shaped on clutch
10054111151		Spring - key stop bar shaft retainer
10054111528		Spring - coil (inside of lock)
10054111552		Spring - flat, with tongue, on lock (latch spring)-Fig.9
10054111555		Spring - for key and pawls
10054111609	32	Spring - kickout
10054111933	33	Spring - coil,key stop bar return
10054112568	34	Spring - bakelite cam return
10054111440	35	Star Wheel - on tuning shaft
10054111674	36	Switch - side (above tuning shaft)
10054112564	37	Switch - back, later type
10054112521	38	Tip - adjustable on kickout arm
1005476999		Washer - lock,for kickout tip Per C
1005477113		Washer - flat,for kickout tip Per C
10054111169	17	Washer - friction spacer (between cams)
10054111553		Washer - spring retainer on lock mechanism - Figure 9
10054112483		Wrench - for #6 fluted set screw
10054112484		Wrench - for #8 fluted set screw

DIAL MECHANISM AND MISCELLANEOUS PARTS LIST

Wherever the word "right" or "left" appears in the following list, it is understood that you are standing in front of the mechanism. The Identification Numbers are to assist you in identifying parts shown in figures 13, 14 and 15 or to indicate in which figure the part can be seen. The identification is NOT TO BE USED in place of the part number, when ordering parts.

PART NUMBER	IDENTIFICATION NO.	DESCRIPTION
10054111930		Band Indicator & frame assem.
10054111894	39	Bearing Assembly-self aligning, on right end of cam shaft & supports gang extension shaft
10054111601		Bearing - self aligning
10054111692		Bearing Retainer-plate, copper
10054112658		Belt - for range switch drive
10054111261		Bolt - chassis mtg.(#14X1-1/4)

MODEL 7216,
Ch. 100.184

The 100.184 automatic tuning superheterodyne receiver has a frequency range extending from 525 KC. to 18,100 KC. The intermediate frequency is 465 KC.

The receiver is designed for use with either a conventional single wire type or a special noise reducing doublet. A 465 KC. wave trap is connected in series with the antenna input to prevent code interference from stations operating in the vicinity of 465 KC.

A conventional superheterodyne circuit is used with the exception that maximum efficiency and stability are insured by the use of a separate oscillator and a specially constructed R.F. bridge. The bridge has the distinct advantages of being extremely compact and may be removed by the disconnecting of only a few leads. This means a great saving of time in the servicing of any part of the R.F. unit.

Since the R.F. and I.F. systems are typical of the superheterodyne it will not be necessary to discuss their function other than stating that the filtered automatic volume control voltage is applied to both the R.F. and 1st detector and the I.F. stages.

The second I.F. stage is followed by a new type of I.F. transformer in order that the A.F.C. voltage may be obtainable. The A.F.C. discriminator is coupled through the third (discriminator) I.F. transformer directly to the 2nd I.F. stage. The third (or discriminator) I.F. transformer secondary is connected directly to the diode plates of the 6H6 tube, which performs the triple function of a linear second detector, A.V.C. and discriminator. The audio component of the output of this tube is supplied to the volume control and amplified in the usual manner. The A.V.C. voltage is taken off at the same point of the diode load resistor network and supplied to the R. F. 1st dectector and 1st I.F. tubes while the A.V.C. voltage for the 2nd I.F. tube is taken off at another point on this same network.

The center tap of the secondary of the third I. F. transformer is connected to the high side of the primary of this transformer, through a coupling condenser. Since the ends of the secondary are connected directly to the diode plates of the 6H6 discriminator tube, this connection serves to introduce the proper voltages to each of the diode plates and thus satisfies the first conditions for an A.F.C. system.

The two rectified voltages appearing between each of the diode plates and its respective cathode are arranged to buck each other.

This is accomplished by connecting both diode load resistors to the center tap of the 3rd I.F. transformer. Thus when the cathode of one 6H6 is grounded a voltage will appear between the second cathode and ground if the frequency coming through the I.F. stage is not 465 KC. (indicating improperly tuned receiver). This voltage may be either positive or negative depending upon whether the frequency coming through the I.F. system is above or below 465 KC. This voltage is known as the control voltage and is filtered and applied to the grid of the control tube which in turn supplies either more or less lagging current to the tank circuit of the oscillator. The amount of lagging current flowing in the oscillator coil will determine the amount of apparent inductance added to the coil. The amount of inductance added or subtracted will in turn correct the frequency of oscillator as near as possible so that the frequency going through the I.F. system will be nearly 465 KC; thus giving a perfectly tuned program even though the station pointer may not be set to the exact frequency of the incoming signal.

Another important feature of this receiver is the "Moto-Matic" Electric Tuner, which automatically tunes the receiver to the desired station. Since this feature is extremely important from a service angle we have prepared a separate manual on the "Moto-Matic" Electric Tuner, which covers in detail the service procedure for this unit. This manual also contains a complete itemized and pictorial parts list of "Moto-Matic" tuner parts. Specify Part Number 10059112932 when ordering this booklet.

MODEL 7216,
Ch. 100.184

A.F.C. ALIGNMENT

IMPORTANT:- The following adjustment must be made after every re-adjustment of the I.F. and broadcast band trimmers.

The A.F.C. discriminator should be adjusted as follows:

1. Be sure no buttons are depressed. Loosely couple the output of the signal generator to the 6L7 control grid by clipping the signal generator output lead to the insulation on the control grid wire, or connect to the grid clip through a 50 mmfd. mica condenser. BE SURE THE RANGE SWITCH IS IN THE BROADCAST (COUNTER-CLOCKWISE) POSITION.

2. Adjust the signal generator to resonance with I.F. system by tuning the signal generator dial for maximum output meter deflection. Be sure that the receiver dial is at some point where it has no tuning effect on the generator signal. Switch off the modulation.

3. With the signal generator connected and operating as in #2, connect antenna and manually tune in powerful local station in region of 1000 KC. or lower. (Avoid stations around 930 KC. which might beat with second harmonic of test oscillator.)

4. Adjust receiver tuning dial to obtain zero beat between the test oscillator and the incoming signal. (A very slight adjustment is all that is required. Be careful not to tune off signal.)

5. Refer to the illustration above. It is now necessary to open the A.F.C. contacts and allow the A.F.C. to function. This may be done by placing a piece of smooth cardboard between the A.F.C. contacts as shown in the figure. Be careful not to bend or malform the switch in any way.

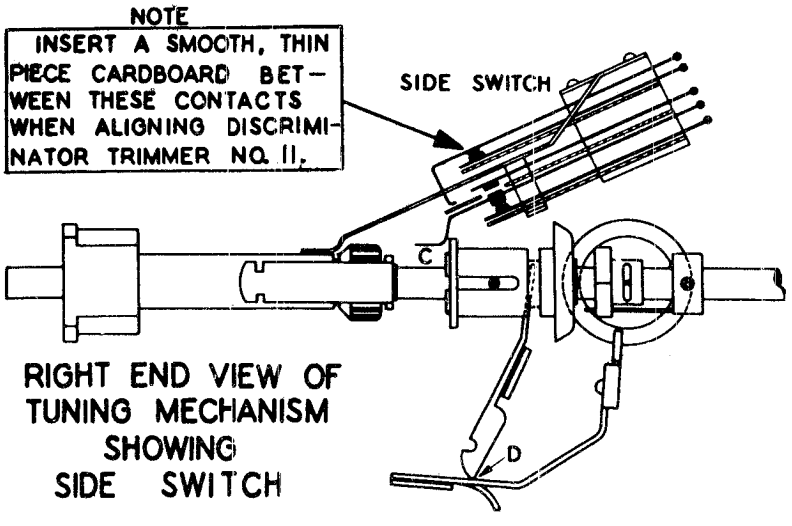
6. Now, adjust the secondary of the discriminator transformer (Trimmer #11) to restore zero beat. NOTE: This trimmer should be adjusted to the point where the frequency of the beat note increases rapidly if the trimmer is turned in either direction. Other zero beat points may be found with the trimmer all the way in or all the way out, but these settings are incorrect.

If this operation has been performed correctly, the opening or closing of the A.F.C. contacts on the side switch by inserting or removing the cardboard, should not change the beat note by more than a slight rumble.

NOTE:- Where a second signal generator is available step #3 above may be varied as follows:

Connect second signal generator (set at about 1000 KC.) to antenna and tune in its signal. Switch off modulation and proceed as before.

This method is somewhat preferable to the first as the zero beat setting is more easily determined when both signals are unmodulated.



NOTE
INSERT A SMOOTH, THIN PIECE CARDBOARD BETWEEN THESE CONTACTS WHEN ALIGNING DISCRIMINATOR TRIMMER NO. 11.

ALIGNMENT PROCEDURE

Before attempting to align the receiver check to see that the dial pointer is opposite the last scale division on the low frequency end of the dial when the gang condenser is in full mesh. Also when the gang condenser is in full mesh the stop pin on the left side of the tuner should be resting against the back stop. If after examination it is found that the gang is in full mesh and the stop pin is against the back stop, but the pointer is set to the wrong position, it will only be necessary to loosen the set screw on the dial drive gear at the left side of the mechanism. Then grasp the large drum on the same side of the tuner and turn it until the pointer is set correctly. Now retighten the set screw in the gear being careful to see that the gear is meshing properly.

On the other hand if the stop pin does not rest against the back stop with the gang condenser in full mesh, loosen the set screw on the gang condenser side of the flexible coupler. Then turn the tuning knob until the stop pin rests against the back stop on the tuner. Now tighten the set screw in the flexible coupler and proceed to set the pointer to its correct position by the method described in the previous paragraph.

Output meter connections.....Across voice coil leads

Output meter reading to indicate 0.5 watt output.....1.42 volts

Average sensitivity in microvolts for 0.5 watt output.....15 Microvolts

Generator ground connection.....Receiver Chassis

Connection of generator output lead.....See chart below

Generator modulation.....30%, 400 cycles

Position of volume control.....Maximum clockwise

HOW TO TEST THE A.F.C. SYSTEM

Connect the antenna and tune in a powerful local station. The setting of the tone control does not affect this test. Remove the cardboard that you placed between the A.F.C. contacts on the side switch when aligning. The A.F.C. is now off.

Next, detune the receiver dial until the music or speech becomes somewhat distorted. Now place a piece of smooth cardboard between the A.F.C. contacts on the side switch as shown in the illustration at the top of this page. This allows A.F.C. to function and it should improve the quality of the program.

Similarly detune the receiver dial in the opposite direction, with the cardboard removed from between the A.F.C. contacts (contacts closed). Then place the cardboard between the contacts again and check for improved quality of reception.

It will be noted that the correction for mistuning afforded by the A.F.C. system is not as marked at stations near the low frequency end of the dial scale as it is at the higher broadcast frequencies. This is characteristic of A.F.C. systems. However, if opening the A.F.C. contacts on the side switch (by inserting the piece of cardboard betweeen the contacts) has no effect on the signal, or if it corrects for mistuning in one direction only, check the receiver as follows:

1. Re-align I.F. broadcast band, and discriminator trimmers.
2. Check all the tubes in the receiver. Defective 6H6 and 6J7 tubes, also the R.F. 1st Detector, and I.F. tubes may cause poor A.F.C. action.
3. If the above procedure fails to remedy the defect in A.F.C. action, check the entire A.F.C. circuit itself for possible troubles.

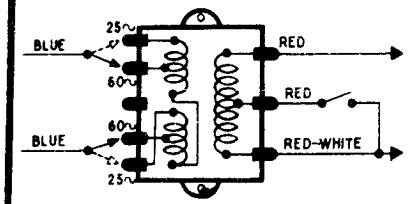
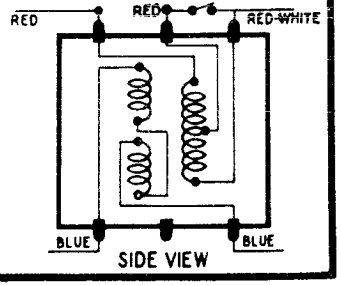
LIGHT RAY TUNER CONNECTIONS FOR UNIVERSAL 25 to 80 CYCLE



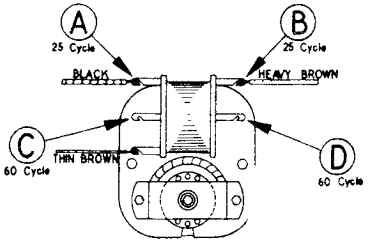
LIGHT RAY TUNER CONNECTIONS 50 to 60 CYCLES



CONNECTIONS FOR UNIVERSAL TUNER MOTOR USED ON 25 TO 80 CYCLE MODELS.

25 to 42 CYCLE OPERATION
CONNECT BLACK WIRE TO A AND BROWN WIRE TO B

42 to 80 CYCLE OPERATION
CONNECT BLACK WIRE TO C AND BROWN WIRE TO D



NOTE These sets are designed for 105 to 125 volt A.C. operation. To convert these sets for operation at other voltages, it is necessary to replace the power transformer with the Universal voltage transformer #10010112333 listed under "Replacement Parts" on Page 6. Sets already equipped with this transformer can be identified by the square metal cover on the top of the power transformer. Voltage taps are brought out, enabling operation at voltages of 90 to 140 and 180 to 260 volts.

MODEL 7216,
Ch. 100.184

NOTE: The frequency rating of your receiver is indicated on the label affixed to the rear of the chassis. The models marked "50 to 60 cycles" are already connected for 50 to 60 cycle operation, and cannot be operated at a lower frequency. THE MODELS MARKED "25 TO 80 CYCLES" ARE CONNECTED FOR OPERATION AT 25 CYCLES. For operation at other frequencies, the connections to the "Moto-Matic Tuner" motor and the "Light Ray" tuner transformer must be changed. Illustrations showing these connections are found on Page 8 of this manual.

In the event that you wish to convert a "50 to 60 cycle" model to a "25 to 80 cycle" model, it will be necessary to replace the power transformer, tuner motor and "Light Ray" tuner transformer. These parts are listed under "Replacement Parts" on Page 6.

NOTE: Certain types of metal tubes used in this set may be replaced with the equivalent glass tubes, provided the proper shield assembly is used. These types are listed in the table below:

Metal Tube	Equivalent Glass Tube	Tube Shield Assembly Required
6C5	6C5-G	10054112921
6F5	6F5-G	10054112921
6H6	6H6-G	10054112921
6K7	6K7-G	10054112921
6L7	6L7-G	10054112921

The 6J7 control tube cannot be replaced with the equivalent glass tube, so a metal tube is required when replacing this tube. The 6L6 must also be replaced with a metal tube. The 5U4-G tube never requires a shield.

MODEL 7217,
Ch. 100.185

GENERAL INFORMATION & SERVICE HINTS

The 100.185 automatic tuning superheterodyne receiver has a frequency range extending from 525 KC. to 18,100 KC. The intermediate frequency is 465 KC.

The receiver is designed for use with either a conventional single wire type or a special noise reducing doublet. A 465 KC wave trap is connected in series with the antenna input to prevent code interference from stations operating in the vicinity of 465 KC.

A conventional superheterodyne circuit is used with the exception that maximum efficiency and stability are insured by the use of a separate oscillator and a specially constructed R.F. bridge. The bridge has the distinct advantages of being extremely compact and may be removed by the disconnecting of only a few leads. This means a great saving of time in the servicing of any part of the R.F. unit.

Since the R.F. and I.F. systems are typical of the superheterodyne it will not be necessary to discuss their function other than stating that the filtered automatic volume control voltage is applied to both the R.F. and 1st detector and the I.F. stages.

The second I.F. stage is followed by a new type of I.F. transformer in order that the A.F.C. voltage may be obtainable. The A.F.C. discriminator is coupled through the third (discriminator) I.F. transformer directly to the 2nd I.F. stage. The third (or discriminator) I.F. transformer secondary is connected directly to the diode plates of the 6H6 tube, which performs the triple function of a linear second detector, A.V.C. and discriminator. The audio component of the output of this tube is supplied to the volume control and amplified in the usual manner. The A.V.C. voltage is taken off at the same point of the diode load resistor network and supplied to the R. F. 1st dectector and 1st I.F. tubes while the A.V.C. voltage for the 2nd I.F. tube is taken off at another point on this same network.

The center tap of the secondary of the third I. F. transformer is connected to the high side of the primary of this transformer, through a coupling condenser. Since the ends of the secondary are connected directly to the diode plates of the 6H6 discriminator tube, this connection serves to introduce the proper voltages to each of the diode plates and thus satisfies the first conditions for an A.F.C. system.

The two rectified voltages appearing between each of the diode plates and its respective cathode are arranged to buck each other.

This is accomplished by connecting both diode load resistors to the center tap of the 3rd I.F. transformer. Thus when the cathode of one 6H6 is grounded a voltage will appear between the second cathode and ground if the frequency coming through the I.F. stage is not 465 KC. (indicating improperly tuned receiver). This voltage may be either positive or negative depending upon whether the frequency coming through the I.F. system is above or below 465 KC. This voltage is known as the control voltage and is filtered and applied to the grid of the control tube which in turn supplies either more or less lagging current to the tank circuit of the oscillator. The amount of lagging current flowing in the oscillator coil will determine the amount of apparent inductance added to the coil. The amount of inductance added or subtracted will in turn correct the frequency of oscillator as near as possible so that the frequency going through the I.F. system will be nearly 465 KC; thus giving a perfectly tuned program even though the station pointer may not be set to the exact frequency of the incoming signal.

Another important feature of this receiver is the "Moto-Matic" Electric Tuner, which automatically tunes the receiver to the desired station. Since this feature is extremely important from a service angle we have prepared a separate manual on the "Moto-Matic" Electric Tuner, which covers in detail the service procedure for this unit. This manual also contains a complete itemized and pictorial parts list of "Moto-Matic" tuner parts. Specify Part Number 10059112932 when ordering this booklet.

ALIGNMENT PROCEDURE

Before attempting to align the receiver check to see that the dial pointer is opposite the last scale division on the low frequency end of the dial when the gang condenser is in full mesh. Also when the gang condenser is in full mesh the stop pin on the left side of the tuner should be resting against the back stop. If after examination it is found that the gang is in full mesh and the stop pin is against the back stop, but the pointer is set to the wrong position, it will only be necessary to loosen the set screw on the dial drive gear at the left side of the mechanism. Then grasp the large drum on the same side of the tuner and turn it until the pointer is set correctly. Now retighten the set screw in the gear being careful to see that the gear is meshing properly.

On the other hand if the stop pin does not rest against the back stop with the gang condenser in full mesh, loosen the set screw on the gang condenser side of the flexible coupler. Then turn the tuning knob until the stop pin rests against the back stop on the tuner. Now tighten the set screw in the flexible coupler and proceed to set the pointer to its correct position by the method described in the previous paragraph.

Output meter connections	Across voice coil leads
Output meter reading to indicate 0.5 watt output	1.42 volts
Average sensitivity in microvolts for 0.5 watt output	15 Microvolts
Generator ground connection	Receiver Chassis
Connection of generator output lead	See chart below
Generator modulation	30%, 400 cycles
Position of volume control	Maximum clockwise

HOW TO TEST THE A.F.C. SYSTEM

Connect the antenna and tune in a powerful local station. The setting of the tone control does not affect this test. Remove the cardboard that you placed between the A.F.C. contacts on the side switch when aligning. The A.F.C. is now off.

Next, detune the receiver dial until the music or speech becomes somewhat distorted. Now place a piece of smooth cardboard between the A.F.C. contacts on the side switch as shown in the illustration at the top of this page. This allows A.F.C. to function and it should improve the quality of the program.

Similarly detune the receiver dial in the opposite direction, with the cardboard removed from between the A.F.C. contacts (contacts closed). Then place the cardboard between the contacts again and check for improved quality of reception.

It will be noted that the correction for mistuning afforded by the A.F.C. system is not as marked at stations near the low frequency end of the dial scale as it is at the higher broadcast frequencies. This is characteristic of A.F.C. systems. However, if opening the A.F.C. contacts on the side switch (by inserting the piece of cardboard betweeen the contacts) has no effect on the signal, or if it corrects for mistuning in one direction only, check the receiver as follows:

1. Re-align I.F. broadcast band, and discriminator, trimmers.
2. Check all the tubes in the receiver. Defective 6H6 and 6J7 tubes, also the R.F. 1st Detector, and I.F. tubes may cause poor A.F.C. action.
3. If the above procedure fails to remedy the defect in A.F.C. action, check the entire A.F.C. circuit itself for possible troubles.

MODEL 7217,
Ch. 100.185

A.F.C. ALIGNMENT

IMPORTANT:- The following adjustment must be made after every re-adjustment of the I.F. and broadcast band trimmers.

The A.F.C. discriminator should be adjusted as follows:

1. Be sure no buttons are depressed. Loosely couple the output of the signal generator to the 6L7 control grid by clipping the signal generator output lead to the insulation on the control grid wire, or connect to the grid clip through a 50 mmfd. mica condenser. BE SURE THE RANGE SWITCH IS IN THE BROADCAST (COUNTER-CLOCKWISE) POSITION.

2. Adjust the signal generator to resonance with I.F. system by tuning the signal generator dial for maximum output meter deflection. Be sure that the receiver dial is at some point where it has no tuning effect on the generator signal. Switch off the modulation.

3. With the signal generator connected and operating as in #2, connect antenna and manually tune in powerful local station in region of 1000 KC. or lower. (Avoid stations around 930 KC. which might beat with second harmonic of test oscillator.)

4. Adjust receiver tuning dial to obtain zero beat between the test oscillator and the incoming signal. (A very slight adjustment is all that is required. Be careful not to tune off signal.)

5. Refer to the illustration above. It is now necessary to open the A.F.C. contacts and allow the A.F.C. to function. This may be done by placing a piece of smooth cardboard between the A.F.C. contacts as shown in the figure. Be careful not to bend or malform the switch in any way.

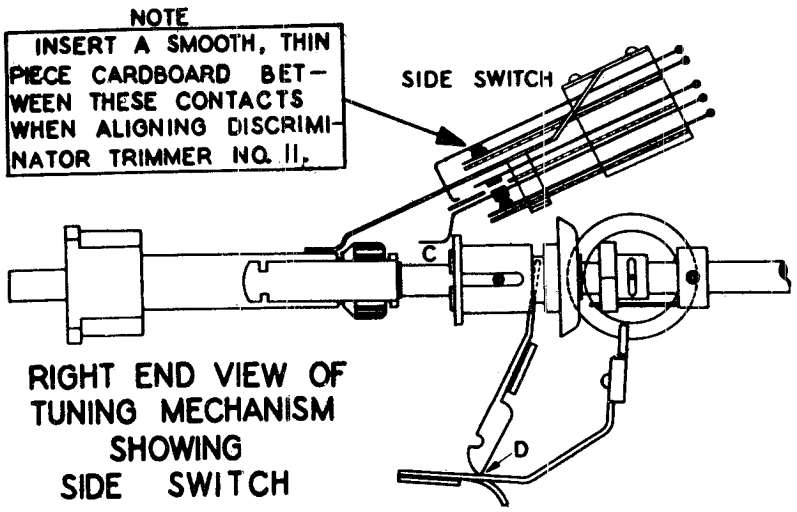
6. Now, adjust the secondary of the discriminator transformer (Trimmer #11) to restore zero beat. NOTE: This trimmer should be adjusted to the point where the frequency of the beat note increases rapidly if the trimmer is turned in either direction. Other zero beat points may be found with the trimmer all the way in or all the way out, but these settings are incorrect.

If this operation has been performed correctly, the opening or closing of the A.F.C. contacts on the side switch by inserting or removing the cardboard, should not change the beat note by more than a slight rumble.

NOTE:- Where a second signal generator is available step #3 above may be varied as follows:

Connect second signal generator (set at about 1000 KC.) to antenna and tune in its signal. Switch off modulation and proceed as before.

This method is somewhat preferable to the first as the zero beat setting is more easily determined when both signals are unmodulated.



NOTE
INSERT A SMOOTH, THIN PIECE CARDBOARD BETWEEN THESE CONTACTS WHEN ALIGNING DISCRIMINATOR TRIMMER NO. 11.

NOTE: The frequency rating of your receiver is indicated on the label affixed to the rear of the chassis. The models marked "50 to 60 cycles" are already connected for 50 to 60 cycle operation, and cannot be operated at a lower frequency. THE MODELS MARKED "25 TO 80 CYCLES" ARE CONNECTED FOR OPERATION AT 25 CYCLES. For operation at other frequencies, the connections to the "Moto-Matic Tuner" motor and the "Light Ray" tuner transformer must be changed. Illustrations showing these connections are found on Page 8 of this manual.

In the event that you wish to convert a "50 to 60 cycle" model to a "25 to 80 cycle" model, it will be necessary to replace the power transformer, tuner motor and "Light Ray" tuner transformer. These parts are listed under "Replacement Parts" on Page 6.

NOTE: Certain types of metal tubes used in this set may be replaced with the equivalent glass tubes, provided the proper shield assembly is used. These types are listed in the table below:

Metal Tube	Equivalent Glass Tube	Tube Shield Assembly Required
6C5	6C5-G	10054112921
6H6	6H6-G	10054112921
6K7	6K7-G	10054112921
6L7	6L7-G	10054112921

The 6J7 control tube cannot be replaced by a glass tube, so a metal tube must be used for replacement purposes. The 6V6 tubes may be replaced with 6V6-G glass tubes, and these tubes require no shield. The 5U4-G rectifier tube is never shielded.

NOTE These sets are designed for 105 to 125 volt A.C. operation. To convert these sets for operation at other voltages, it is necessary to replace the power transformer with the Universal voltage transformer #1001012333 listed under "Replacement Parts" on Page 6. Sets already equipped with this transformer can be identified by the square metal cover on the top of the power transformer. Voltage taps are brought out, enabling operation at voltages of 90 to 140 and 180 to 260 volts.

DIAL DRIVE AND MISCELLANEOUS PARTS

(FOR COMPLETE LIST OF PARTS SEE MOTO-MATIC TUNER MANUAL)

10054111930	Band indicator - and frame assembly
10054112658	Belt - for range switch drive
10054111261	Bolt - chassis mtg. (#14 X 1-1/4)
10054111260	Bushing - rubber (for chassis mtg.)
10054111892	Bushing - hard rubber, Moto-Matic Tuner to chass.
10054111658	Clip - for pulley retaining
10054110762	Cord - for band ind. (2 ft. required) Per Ft.
10054111302	Cord - dial drive (6 ft. lengths)
10044112922	Escutcheon - for dial (with glass)
10044111227	Escutcheon - around push button opening
10054111865	Frame - dial, with scale
10039111496	Knob - tuning or volume
10039111497	Knob - range or tone
10054111197	Lever - for band indicator (on shaft)
10054111370	Link & Lever - for range switch drive (used in early production)
10054112633	Plug - for mechanism connecting (8 prong)
10054110496	Plug - speaker (4 prong)
10041111859	Pointer - for dial, with slider
10054111622	Pulley - dial cord drive
10054111630	Pulley & Bracket - for band indicator
10054112628	Pulley - on range switch shaft under chassis
1005484214	Retaining Ring - for dial drum shafts
10054F9837	Retaining Spring - for retaining escut. to cab.
10040111222	Scale - dial
10054110716	Screw - band indicator pivot
10054111116	Screw - #5 X 5/8, Moto-Matic Tuner
1005485827	Set Screw - 8/32 square head
10054111403	Set Screw - 8/32 fluted head
10054112138	Set Screw - 8/32 slotted head
10054111373	Shaft - for range switch
10054112921	Shield - for use with glass tubes
10018854427	Socket - octal base
10018110501	Socket - 4 prong (for spkr.)
10054110627	Socket - dial lamp & automatic lamp
10054111008	Socket - Light Ray tuner lamp
10054112630	Socket & Bracket - for elect. conn. to mech.
10054111232	Spring - torsion for band indicator
10054111862	Spring - drive cord tension
10054112490	Spring - in flexible coupler
10054111676	Stud - lower left idler pulley
10054112667	Stud - for pulley mtg. (for top pulleys)
10054112005	Tabs - station call letters (6 sheets)
1005485066	Terminal Strip - G.D.A.
10054G7568	Washer - embossed (for mtg. electrolytic cond.)
10054F9746	Washer - (paper) for back of knobs
10054F9027	Washers - spring for range shaft
10054111262	Washer - flat steel mtg. (15/16" O.D.)
10044112925	Name Label for Dial Escutcheon

MOTO-MATIC TUNER PARTS

(FOR COMPLETE LIST OF PARTS SEE MOTO-MATIC TUNER MANUAL)

10054112727	Moto-Matic Tuner - complete with all dials ready to mount on chassis
10054111350	Moto-Matic Tuner only, less dial frame assem.
10054112428	Button Body - for tuner
10054112545	Button Cap - for push button
10054111878	Button Window - celluloid for push button
10054112547	Button Reinforcing Disc - for push button
10054111633	Button Retaining Spring - inside push button
10054111577	Button Spring - in push button
10054111576	Button Washer - in push button
10054112563	Cam - bakelite - less operating arm
10054111146	Clutch - bushing, spring and gear
10054111137	Drive Ring - rubber
10054111380	Motor - 6 volt, 60 cycles
10054112354	Motor - 6 volt, 25 to 80 cycles
10054112736	Plug - with cable for tuner connection
10054111138	Spring - horseshoe shaped on clutch
10054111674	Switch Side - mult. contact (above tuning shaft)
10054112564	Switch Back - (multiple contact)
10054112521	Tip - adjustable for key stop and kickout arm
10054112483	Wrench - for fluted head set screws #6
10054112484	Wrench - for fluted head set screws #8
10054117458	Spring Benders
10059112927	Instruction Book

MODELS 7218, 7222,
Ch. 100.186

The 100.186 automatic tuning superheterodyne receiver has a frequency range extending from 525 KC. to 18,100 KC. The intermediate frequency is 465 KC.

The receiver is designed for use with either a conventional single wire type or a special noise reducing doublet. A 465 KC. wave trap is connected in series with the antenna input to prevent code interference from stations operating in the vicinity of 465 KC.

A conventional superheterodyne circuit is used with the exception that maximum efficiency and stability are insured by the use of a separate oscillator and a specially constructed R.F. bridge. The bridge has the distinct advantages of being extremely compact and may be removed by the disconnecting of only a few leads. This means a great saving of time in the servicing of any part of the R.F. unit.

Since the R.F. and I.F. systems are typical of the superheterodyne it will not be necessary to discuss their function other than stating that the filtered automatic volume control voltage is applied to both the R.F. and 1st detector and 1st I.F. stages.

A selectivity control is combined with the tone control switch. When this switch is in the maximum clockwise (brilliant) position, the response curve of the I.F. amplifier is broadened.

The second I.F. stage is followed by a new arrangement of I.F. transformers in order that the A.F.C. system may be introduced. The A.F.C. discriminator is coupled through the third (discriminator) I.F. transformer directly to the 2nd I.F. stage. The third I.F. transformer also contains a special "pick-up" coil which is inductively coupled to the primary of that transformer. This pick-up coil introduces the intermediate frequency voltage in the 4th I.F. transformer which in turn is applied to the diode plates of a 6H6 linear 2nd detector and A.V.C. tube. The audio component is now supplied to the volume control and amplified in the usual manner.

Returning again to the third (or discriminator) I.F. transformer we find that the ends of its secondary are connected to the diode plates of a 6H6 discriminator tube. The center tap of the secondary of the third I.F. is connected to the high side of the primary of the 3rd I.F. through a coupling condenser. This connection serves to introduce the proper voltages to each of the diode plates of the discriminator tube and thus satisfies the first conditions for an A.F.C. system.

The two rectified voltages appearing between each of the diode plates and its respective cathode are arranged to buck each other.

This is accomplished by connecting both diode load resistors to the center tap of the 3rd I.F. transformer. Thus when the cathode of one 6H6 is grounded a voltage will appear between the second cathode and ground if the frequency coming through the I.F. stage is not 465 KC. (indicating improperly tuned receiver). This voltage may be either positive or negative depending upon whether the frequency coming through the I.F. system is above or below 465 KC. This voltage is known as the control voltage and is filtered and applied to the grid of the control tube which in turn supplies either more or less lagging current to the tank circuit of the oscillator. The amount of lagging current flowing in the oscillator coil will determine the amount of apparent inductance added to the coil. The amount of inductance added or subtracted will in turn correct the frequency of oscillator as near as possible so that the frequency going through the I.F. system will be nearly 465 KC; thus giving a perfectly tuned program even though the station pointer may not be set to the exact frequency of the incoming signal.

Another important feature of this receiver is the "Moto-Matic" Electric Tuner, which automatically tunes the receiver to the desired station. Since this feature is extremely important from a service angle we have prepared a separate manual on the "Moto-Matic" Electric Tuner, which covers in detail the service procedure for this unit. This manual also contains a complete itemized and pictorial parts list of "Moto-Matic" tuner parts. Specify Part Number 10059112932 when ordering this booklet.

MODELS 7218, 7222,
Ch. 100.186

Certain types of metal tubes used in this set may be replaced with the equivalent glass tubes, provided the proper shield assembly is used. These types are listed in the table below:

Metal Tube	Equivalent Glass Tube	Tube Shield Assembly Required
6C5	6C5-G	10054112921
6H6	6H6-G	10054112921
6K7	6K7-G	10054112921
6L7	6L7-G	10054112921

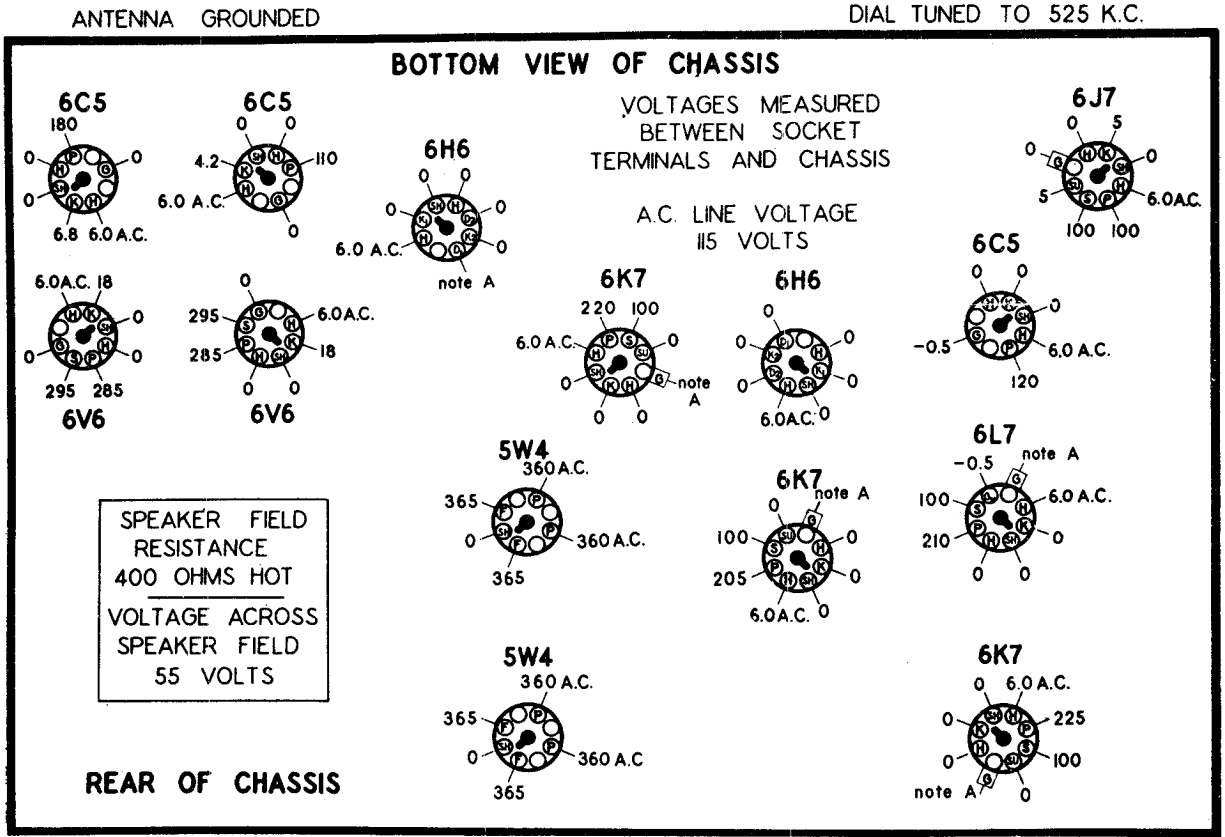
The 6J7 control tube cannot be replaced by a glass tube, so a metal tube must be used for replacement purposes. The 6V6 tubes may be replaced with 6V6-G glass tubes, and these tubes require no shield. 5W4-G glass tubes may be substituted for the 5W4 metal tubes, and no shield is required.

The frequency rating of your receiver is indicated on the label affixed to the rear of the chassis. The models marked "50 to 60 cycles" are already connected for 50 to 60 cycle operation, and cannot be operated at a lower frequency. THE MODELS MARKED "25 TO 80 CYCLES" ARE CONNECTED FOR OPERATION AT 25 CYCLES. For operation at other frequencies, the connections to the "Moto-Matic Tuner" motor and the "Light Ray" tuner transformer must be changed. Illustrations showing these connections are found on Page 8 of this manual.

In the event that you wish to convert a "50 to 60 cycle" model to a "25 to 80 cycle" model, it will be necessary to replace the power transformer, tuner motor and "Light Ray" tuner transformer. These parts are listed under"Replacement Parts" on Page 6.

SOCKET VOLTAGES

ANTENNA GROUNDED — DIAL TUNED TO 525 K.C.



IMPORTANT: Use a high resistance voltmeter of 1000 ohms per volt.

NOTE A: The bias for the control grids of the 6L7 1st Det., 6K7 R.F., 6K7 1st I.F. and 6K7 2nd I.F. tubes, also the voltage on the 6H6 A.V.C. diode, is -4 volts measured across resistor number 76.

A.F.C. ALIGNMENT

IMPORTANT:- The following adjustment must be made after every re-adjustment of the I.F. and broadcast band trimmers.

The A.F.C. discriminator should be adjusted as follows:

1. Be sure no buttons are depressed. Loosely couple the output of the signal generator to the 6L7 control grid by clipping the signal generator output lead to the insulation on the control grid wire, or connect to the grid clip through a 50 mmfd. mica condenser. BE SURE THE RANGE SWITCH IS IN THE BROADCAST (COUNTER-CLOCKWISE) POSITION.

2. Adjust the signal generator to resonance with I.F. system by tuning the signal generator dial for maximum output meter deflection. Be sure that the receiver dial is at some point where it has no tuning effect on the generator signal. Switch off the modulation.

3. With the signal generator connected and operating as in #2, connect antenna and manually tune in powerful local station in region of 1000 KC. or lower. (Avoid stations around 930 KC. which might beat with second harmonic of test oscillator.)

4. Adjust receiver tuning dial to obtain zero beat between the test oscillator and the incoming signal. (A very slight adjustment is all that is required. Be careful not to tune off signal.)

5. Refer to the illustration above. It is now necessary to open the A.F.C. contacts and allow the A.F.C. to function. This may be done by placing a piece of smooth cardboard between the A.F.C. contacts as shown in the figure. Be careful not to bend or malform the switch in any way.

6. Now, adjust the secondary of the discriminator transformer (Trimmer #18) to restore zero beat. NOTE: This trimmer should be adjusted to the point where the frequency of the beat note increases rapidly if the trimmer is turned in either direction. Other zero beat points may be found with the trimmer all the way in or all the way out, but these settings are incorrect.

If this operation has been performed correctly, the opening or closing of the A.F.C. contacts on the side switch by inserting or removing the cardboard, should not change the beat note by more than a slight rumble.

NOTE:- Where a second signal generator is available step #3 above may be varied as follows:

Connect second signal generator (set at about 1000 KC.) to antenna and tune in its signal. Switch off modulation and proceed as before.

This method is somewhat preferable to the first as the zero beat setting is more easily determined when both signals are unmodulated.

HOW TO TEST THE A.F.C. SYSTEM

Connect the antenna and tune in a powerful local station. BE SURE THE TONE SWITCH IS IN THE MAXIMUM COUNTER-CLOCKWISE POSITION. Remove the cardboard that you placed between the A.F.C. contacts on the side switch when aligning. The A.F.C. is now off.

Next, detune the receiver dial until the music or speech becomes somewhat distorted. Now place a piece of smooth cardboard between the A.F.C. contacts on the side switch as shown in the illustration at the top of this page. This allows A.F.C. to function and it should improve the quality of the program.

Similarly detune the receiver dial in the opposite direction, with the cardboard removed from between the A.F.C. contacts (contacts closed). Then place the cardboard between the contacts again and check for improved quality of reception.

It will be noted that the correction for mistuning afforded by the A.F.C. system is not as marked at stations near the low frequency end of the dial scale as it is at the higher broadcast frequencies. This is characteristic of A.F.C. systems. However, if opening the A.F.C. contacts on the side switch (by inserting the piece of cardboard between the contacts) has no effect on the signal, or if it corrects for mistuning in one direction only, check the receiver as follows:-

1. Re-align I.F. broadcast band, and discriminator trimmers.
2. Check all the tubes in the receiver. Defective 6H6 and 6J7 tubes, also the R.F. 1st Detector, and I.F. tubes may cause poor A.F.C. action.
3. If the above procedure fails to remedy the defect in A.F.C. action, check the entire A.F.C. circuit itself for possible troubles.

Ch. 100.186

ALIGNMENT PROCEDURE

Before attempting to align the receiver check to see that the dial pointer is opposite the last scale division on the low frequency end of the dial when the gang condenser is in full mesh. Also when the gang condenser is in full mesh the stop pin on the left side of the tuner should be resting against the back stop. If after examination it is found that the gang is in full mesh and the stop pin is against the back stop, but the pointer is set to the wrong position, it will only be necessary to loosen the set screw on the dial drive gear at the left side of the mechanism. Then grasp the large drum on the same side of the tuner and turn it until the pointer is set correctly. Now retighten the set screw in the gear being careful to see that the gear is meshing properly.

On the other hand if the stop pin does not rest against the back stop with the gang condenser in full mesh, loosen the set screw on the gang condenser side of the flexible coupler. Then turn the tuning knob until the stop pin rests against the back stop on the tuner. Now tighten the set screw in the flexible coupler and proceed to set the pointer to its correct position by the method described in the previous paragraph.

Output meter connections.....Across voice coil leads
Output meter reading to indicate 0.5 watt output.....1.0 volts
Average sensitivity in microvolts for 0.5 watt output.....15 Microvolts
Generator ground connection.....Receiver Chassis
Connection of generator output lead.....See chart below
Generator modulation.....30%, 400 cycles
Position of volume control.....Maximum clockwise

-IMPORTANT-

1.-TONE CONTROL MUST BE IN SHARP POSITION (COUNTER-CLOCKWISE)
2.-ALLOW RECEIVER TO WARM UP 15 MINUTES BEFORE ALIGNING.
3.-SEE THAT NO BUTTONS ARE DEPRESSED WHEN ALIGNING RECEIVER.

TYPE OF DUMMY ANT. IN SERIES WITH SIG.GEN.	POINT TO CONNECT OUTPUT OF SIGNAL GENERATOR.	SIGNAL GENERATOR FREQUENCY	RANGE SWITCH POSITION	RECEIVER DIAL SETTING	TRIMMER NUMBER (see diag. next page)	TRIMMER DESCRIPTION	TYPE OF ADJUSTMENT
.1 MFD CONDENSER	CONTROL GRID OF 6L7 TUBE	465 KC.	BROADCAST (Counter-clockwise)	ANY POINT WHERE IT DOES NOT AFFECT THE SIGNAL	1-2	1ST I.F.	Adjust for maximum output. Then repeat adjustment. The tone control switch must be in the SHARP-POSITION (Counter-clockwise),or the alignment will be incorrect.
					3-4	2ND I.F.

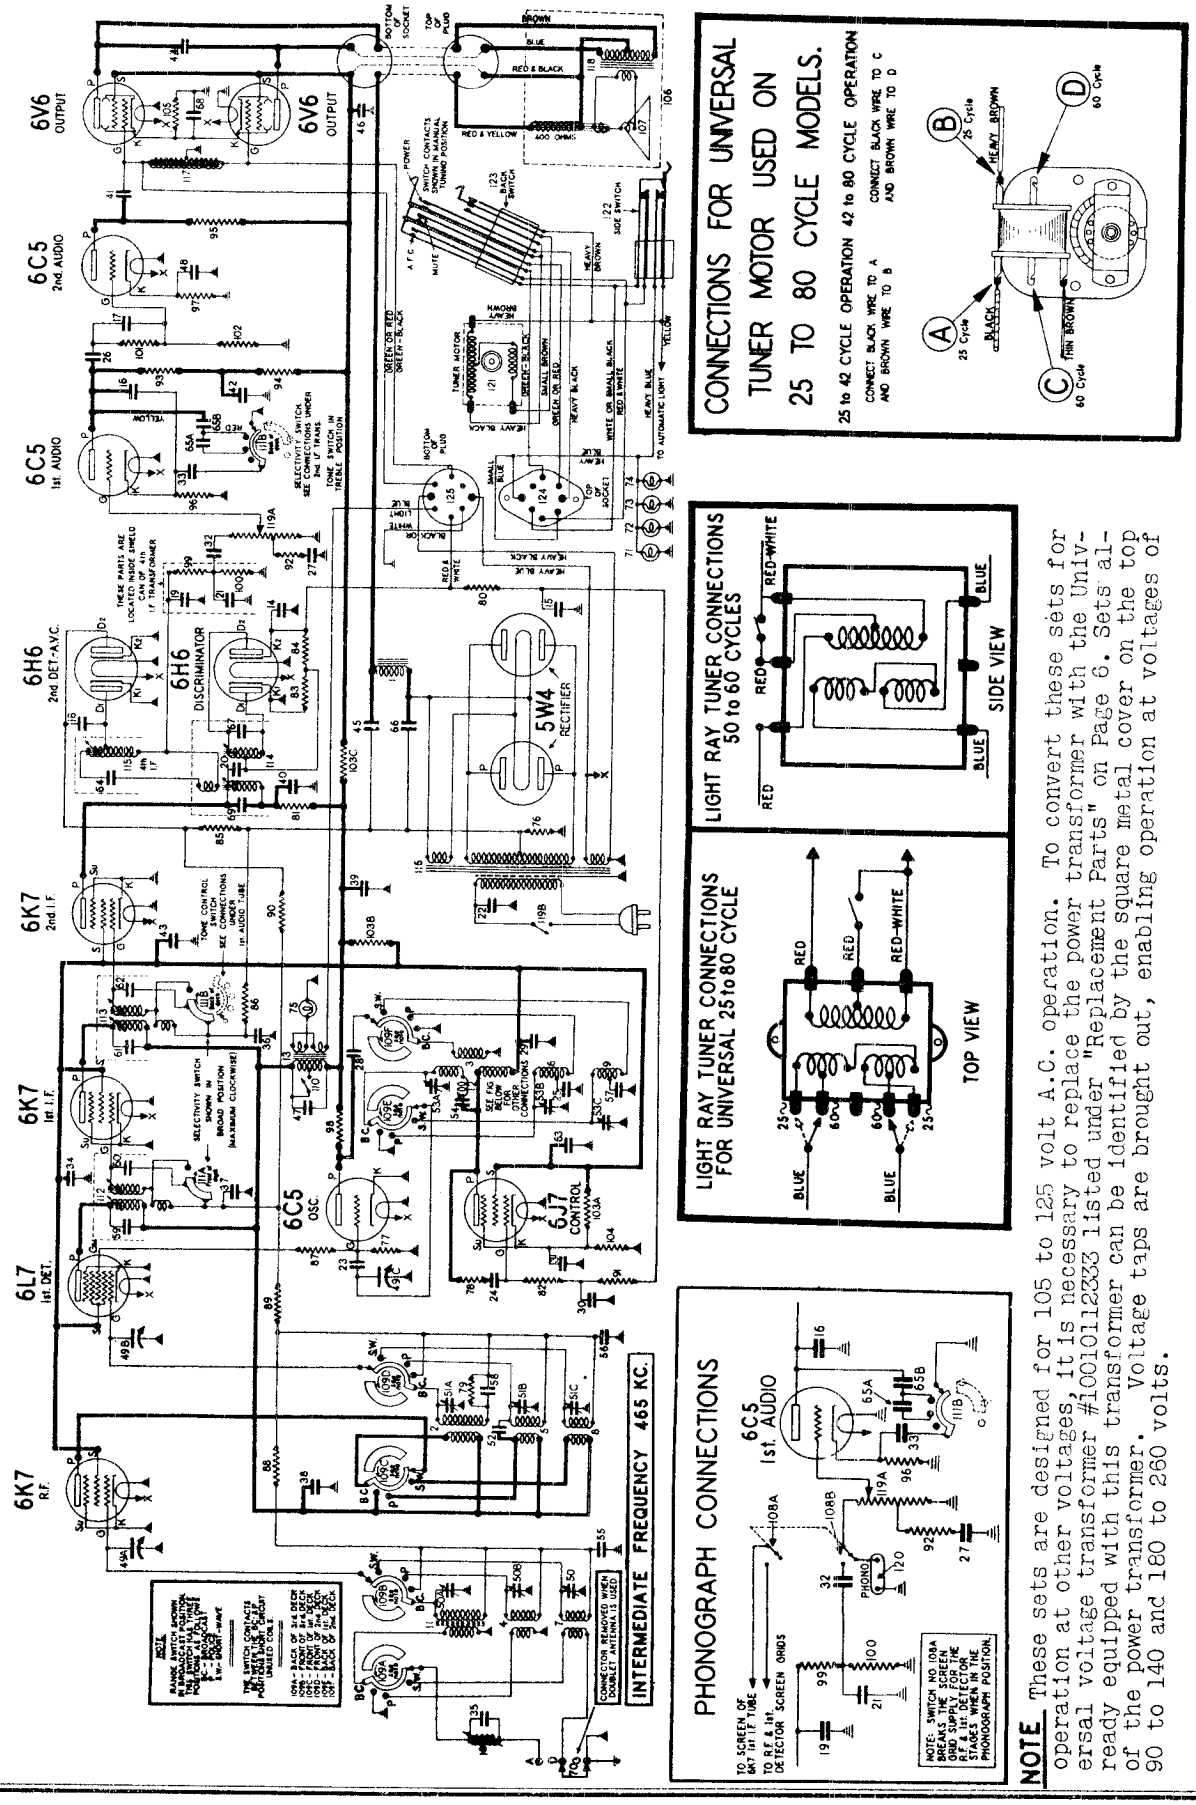
MODELS 7218, 7222,
Ch. 100.186



NOTE These sets are designed for 105 to 125 volt A.C. operation. To convert these sets for operation at other voltages, it is necessary to replace the power transformer with the Universal voltage transformer #10010112333 listed under "Replacement Parts" on Page 6. Sets already equipped with this transformer can be identified by the square metal cover on the top of the power transformer. Voltage taps are brought out, enabling operation at voltages of 90 to 140 and 180 to 260 volts.

MODEL 8021,
Ch. 132.868

ALIGNMENT PROCEDURE

PRELIMINARY:

Output meter connection	Across speaker voice coil
Output meter reading to indicate 50 MW (Standard Output)	.4 volt
Generator modulation	30 % 400 cycles
Position of volume control	Fully clockwise
Set dial pointer	Last mark left end dial, variable condenser closed
Set band switch	To left for AM alignment; to right for FM alignment

AM ALIGNMENT

Position of Variable	Generator Frequency	Dummy Antenna	Generator Connection High Side	Generator Connection Ground Lead	Adjust Trimmers In Order Shown For Max. Output	Trimmer Function
Open	455 Kc	.05 Mfd.	Mixer Grid	Chassis	(1) (2) (3) (4)	I. F.
1400 Kc	1400 Kc		*Test loop	Test loop	(11)	Oscillator
1400 Kc	1400 Kc		*Test loop	Test loop	(12)	Antenna
**600 Kc	600 Kc		*Test loop	Test loop	Check point	Antenna

*Connect generator lead to a Standard Hazeltine Test Loop, Model 1150, placed two feet from the set loop, or three turns of wire about six inches in diameter, placed about one foot from the set loop. Or the generator can be connected with the high side lead to the green lead on the set loop and the ground lead to the chassis.

**With a generator signal of 600 Kc, tune the set to the point where maximum output is obtained, which should be approximately 600 Kc on the dial. Adjust antenna section plates of variable for maximum output.

The alignment procedure should be repeated in the original order for greatest accuracy.

Always keep the output from the signal generator at its lowest possible value to make the A. V. C. action of the receiver ineffective.

FM ALIGNMENT

DETECTOR AND IF ALIGNMENT USING SIGNAL GENERATOR AND OSCILLOSCOPE

1.—Connect FM Generator, High Side, to grid of 2nd IF tube through .005 mfd. dummy.

2.—Set generator frequency to 10.7 Mc modulated either 60 cycles or 400 cycles, 250 Kc sweep (125 Kc deviation).

3.—Connect vertical input of scope across volume control of receiver (Grounded terminal to chassis, ungrounded terminal to high side of the control).

4.—Set scope switch for internal syncronization and set horizontal oscillator to 2 X frequency of modulating voltage of generator. (120 or 800 cycles).

5.—Turn variable condenser fully open, and band switch to right (FM).

6.—Adjust frequency vernier of horizontal oscillator on scope until the pattern becomes stationary.

7.—Adjust detector primary slug No. 5 for maximum vertical sweep of the scope pattern.

8.—Adjust detector secondary slug No. 6 to center the cross over point of the pattern. Pattern should look like figure 1, with the same amount of curve on both ends, and the cross-over point in the center.

9.—Connect generator, high side, to grid of 12BE6 converter tube (socket pin No. 7).

10.—Adjust IF slugs 7, 8, 9, and 10 for the greatest vertical sweep of the pattern, consistent with linearity. (If the IF slugs are adjusted for maximum sweep of the pattern, the pattern may become non-linear. Therefore, adjustment should be made for the greatest sweep which can be obtained and still have all four ends of the "X" pattern similar in size and shape.

11.—Check the alignment of the IF and detector circuits by varying the signal generator frequency above and below the center frequency of 10.7 Mc. If the receiver is perfectly aligned, two smaller "X" patterns of similar size and shape will result, one on either side of the center frequency. See figure 2.

RF

Position of Variable	Generator Frequency	Dummy Antenna	Generator Connection High Side	Generator Connection Ground Lead	Adjust Trimmers In Order Shown	Trimmer Function
108 Mc	108 Mc	★ 300 Ohm	Ant. Terminal	Ant. Terminal	(14)	Oscillator
88 Mc	88 Mc	★ 300 Ohm	Ant. Terminal	Ant. Terminal	(13)	Oscillator

Repeat the above oscillator adjustments until proper coverage is obtained on both ends of band since the two adjustments effect each other.

105 Mc	105 Mc	300 Ohm	Ant. Terminal	Ant. Terminal	(17) (18)	RF and Ant.
91 Mc	91 Mc	300 Ohm	Ant. Terminal	Ant. Terminal	(15) (16)	RF and Ant.

Repeat "RF and Ant." adjustments until proper tracking is obtained at both 91 and 105 Mc, since tracking the set at one frequency affects the track at the other frequency.

All RF trimmers are adjusted for maximum output, measured with output meter across speaker voice coil.

For RF alignment, use FM generator signal modulated with 400 cycles 45 Kc sweep (22.5 Kc deviation).

★The 300 ohm dummy should be made up of two 150 ohm resistors, one placed in each lead at the receiver antenna terminals.

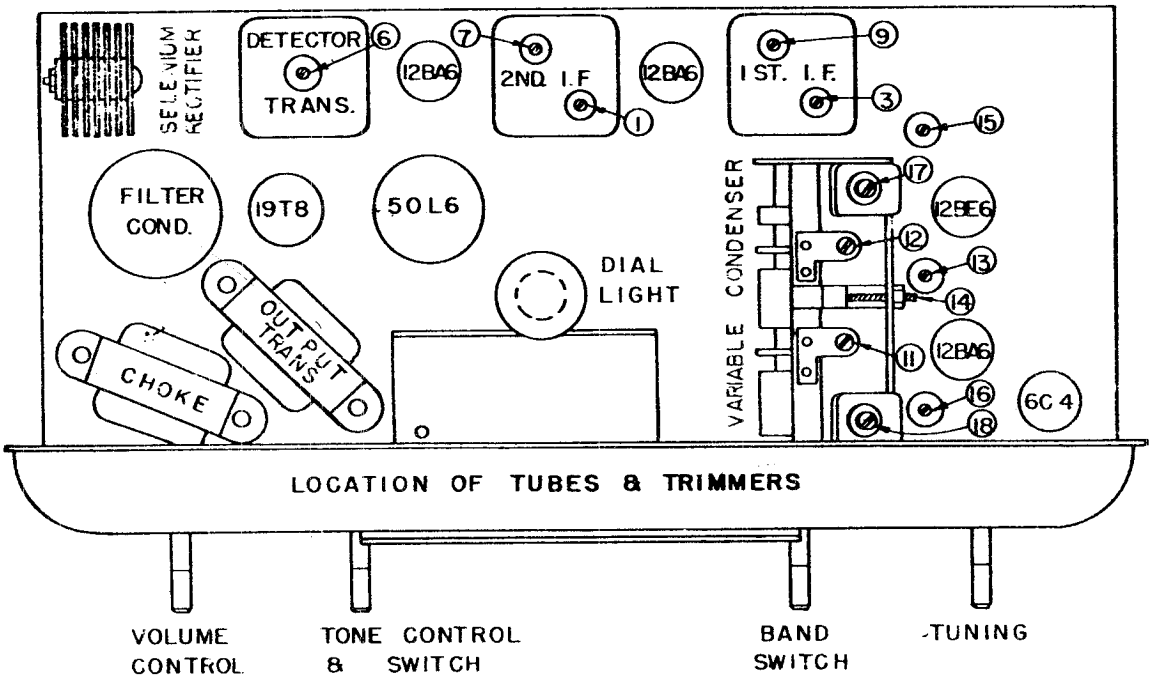
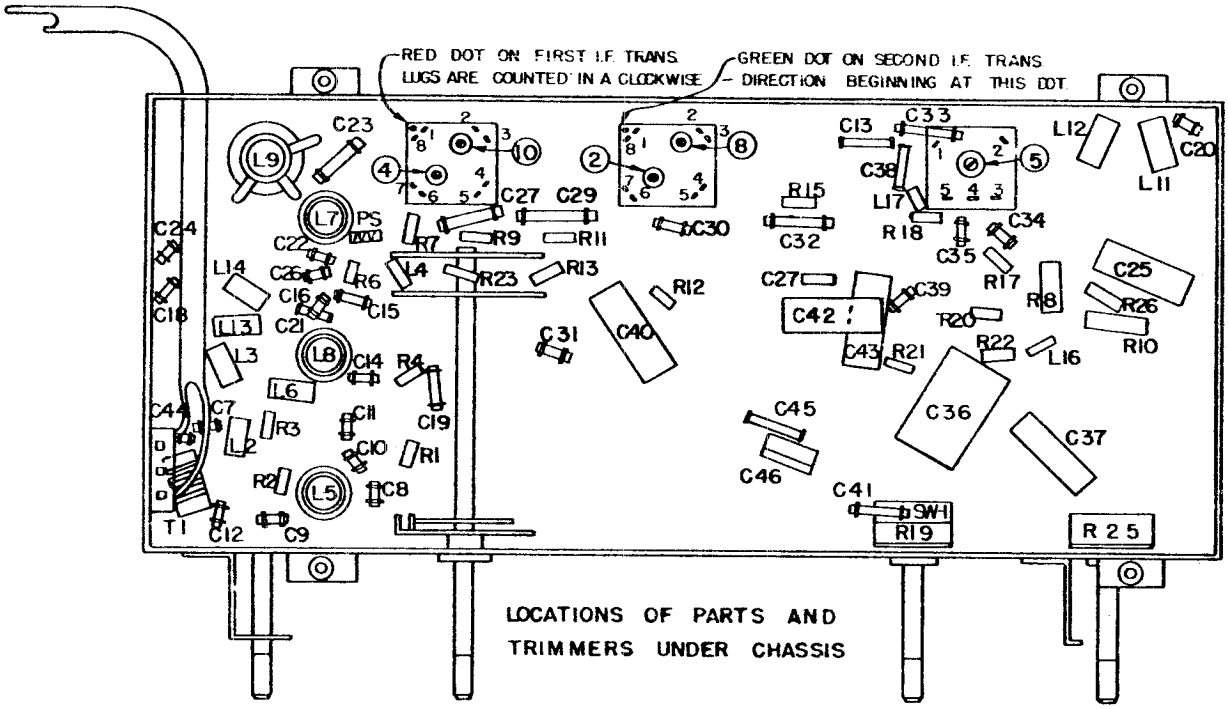
MODEL 8021,
Ch. 132.868





NOTE: On some sets of this model, a separate condenser was used as a bypass on the 50L6 cathode, and the low voltage section of Part No. N21744 was not used. This was done to prevent Hum due to coupling between the high and low voltage sections of N21744. This coupling was caused by improper sequence of winding of the sections in some of the N21744 condensers.

MODEL 8021,
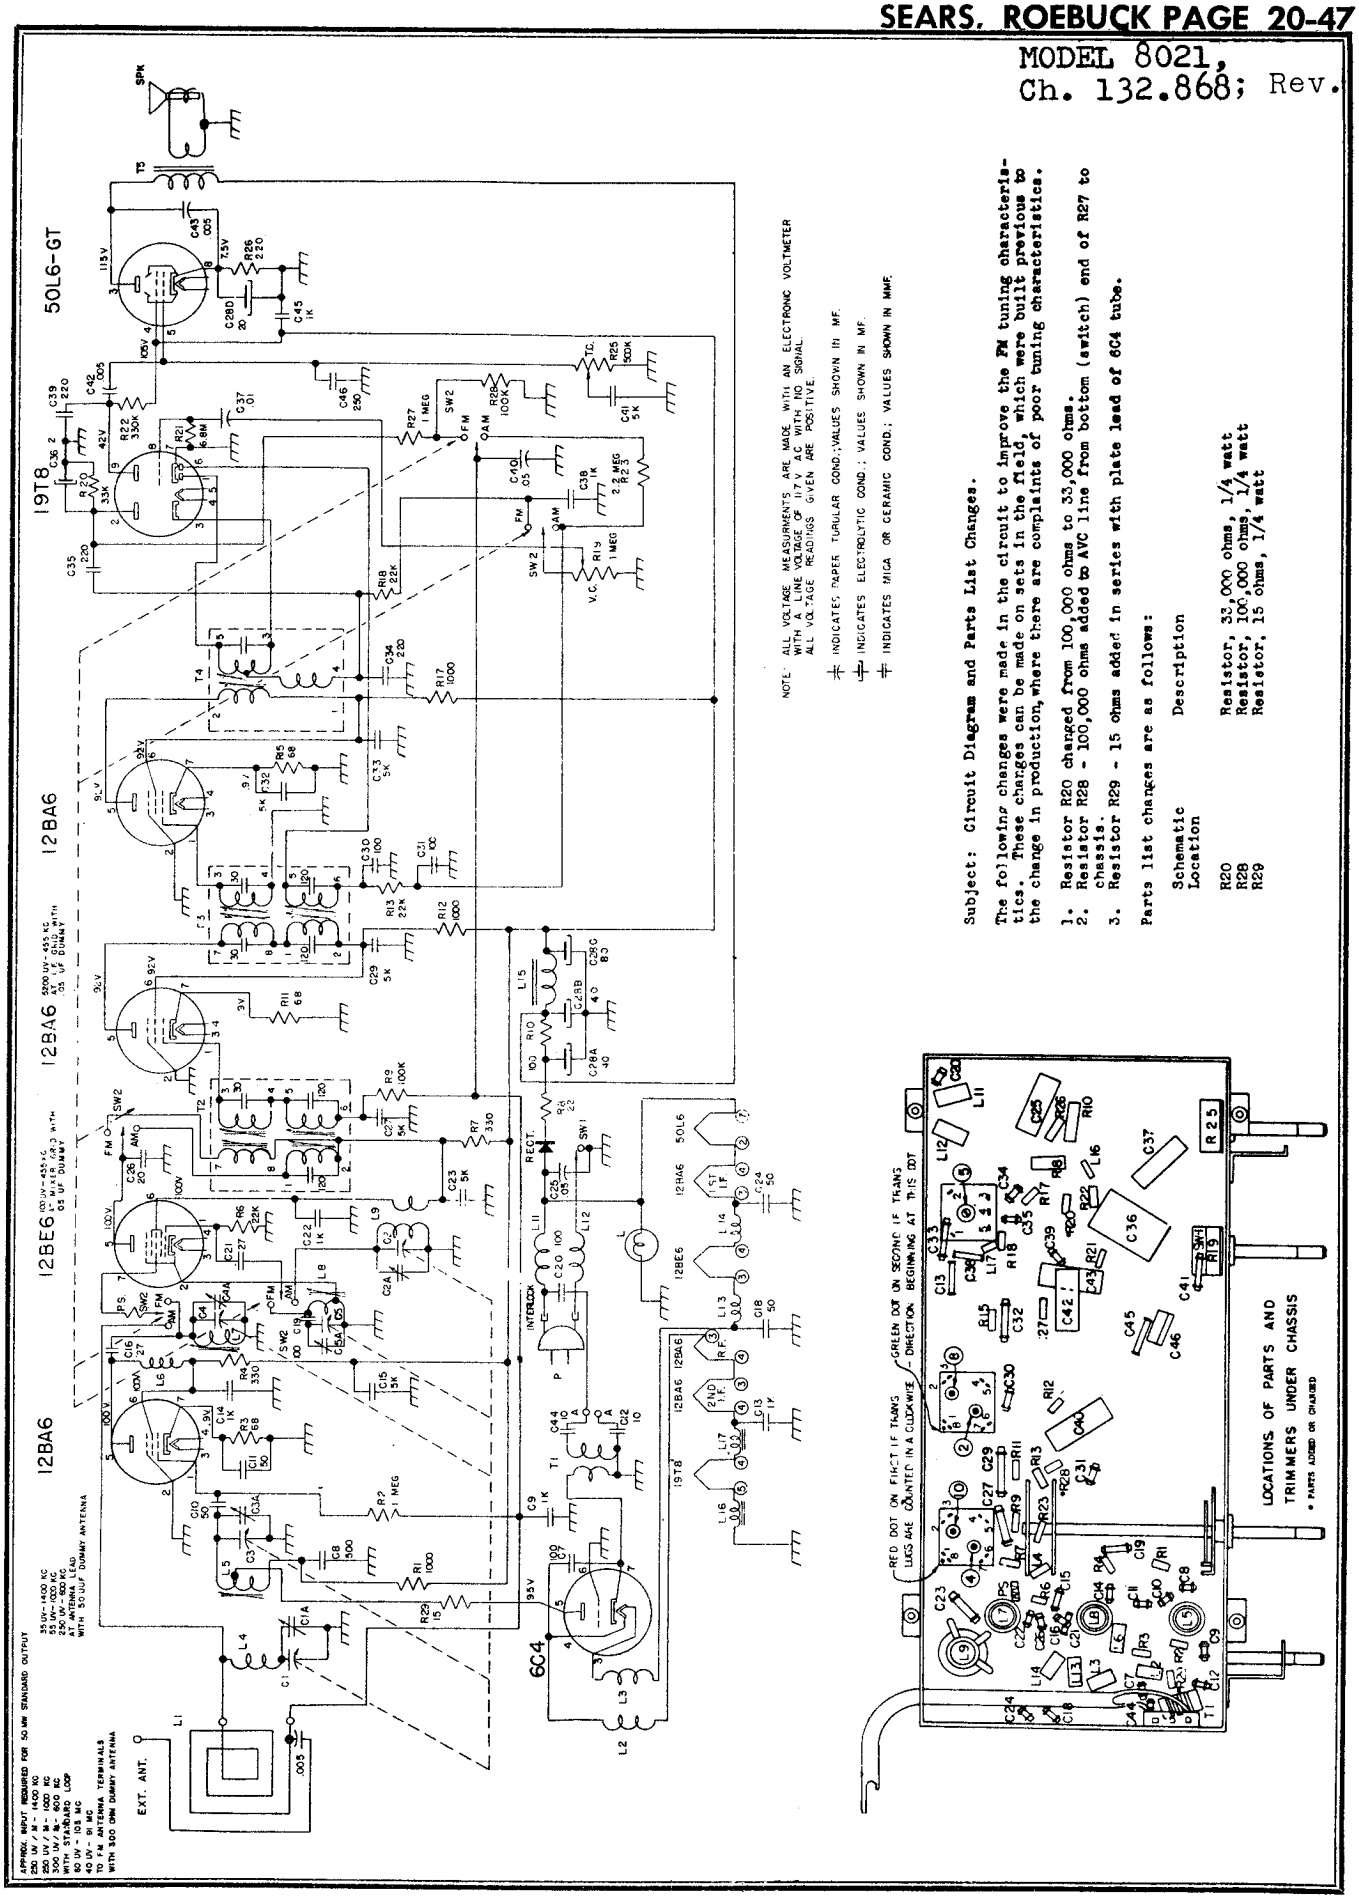
Ch. 132.868; Rev.



Subject: Circuit Diagram and Parts List Changes.

The following changes were made in the circuit to improve the FM tuning characteristics. These changes can be made on sets in the field, which were built previous to the change in production, where there are complaints of poor tuning characteristics.

1. Resistor R20 changed from 100,000 ohms to 33,000 ohms.
2. Resistor R28 - 100,000 ohms added to AVC line from bottom (switch) end of R27 to chassis.
3. Resistor R29 - 15 ohms added in series with plate lead of 6C4 tube.

Parts list changes are as follows:

Schematic Location	Description
R20	Resistor, 33,000 ohms, 1/4 watt
R28	Resistor, 100,000 ohms, 1/4 watt
R29	Resistor, 15 ohms, 1/4 watt

MODEL 8022,
Ch. 478,206

ALIGNMENT PROCEDURE

PRELIMINARY:

Output meter connection . . . . . Across speaker voice coil
Output meter reading to indicate 500 MW (Standard Output). . . . . 1.27 volt
Generator modulation . . . . . 30% - 400 cycles
Position of volume control . . . . . Fully clockwise
Set Dial Pointer . . . . . 1 3/32" from center of left shaft, variable condenser closed
Set band switch . . . . . To left for AM alignment; to right for FM alignment

AM ALIGNMENT

POSITION OF VARIABLE	GENERATOR FREQUENCY	DUMMY ANTENNA	GENERATOR CONNECTION HIGH SIDE	GENERATOR CONNECTION GROUND LEAD	ADJUST TRIMMERS IN ORDER SHOWN FOR MAX. OUTPUT	TRIMMER FUNCTION
Open	455 Kc	.05 Mfd	Mixer grid	Chassis	T8, T12, T11	I. F.
1620 Kc	1620 Kc		*Test loop	Test loop	T1	Oscillator
1400 Kc	1400 Kc		*Test loop	Test loop	T3	Antenna
**600 Kc	600		*Test loop	Test loop	Check point	Antenna

* Connect generator lead to a Standard Hazeltine Test Loop. Model 1150, placed two feet from the set loop, or three turns of wire about six inches in diameter, placed about one foot from the set loop.

**With a generator signal of 600 Kc, tune the set to the point where maximum output is obtained, which should be approximately 600 Kc on the dial. Adjust antenna section plates of variable for maximum output.

The alignment procedure should be repeated in the original order for greatest accuracy.

Always keep the output from the signal generator at its lowest possible value to make the A. V. C. action of the receiver ineffective.

FM ALIGNMENT

DETECTOR AND IF ALIGNMENT USING SIGNAL GENERATOR AND OSCILLOSCOPE

1. Connect vertical input of scope across volume control of receiver (Grounded terminal to chassis, ungrounded terminal to high side of the control).
2. Connect FM Generator, High Side, to grid of 2nd IF tube through .01 mfd. dummy, Low Side, to chassis.
3. Connect sweep voltage of generator to horizontal terminals of scope.
4. Set generator frequency to 10.7 Mc modulation either 60 cycles or 400 cycles, 250 Kc sweep (125 Kc deviation).
5. Set volume control to maximum, variable condenser fully open, band switch to right (FM).
6. Adjust detector primary slug *T9 for maximum vertical sweep of the scope pattern.
7. Adjust detector secondary slug *T10 for symmetry of the pattern. Pattern should look like Fig. 1, with the same amount of curve on both ends
8. Connect generator, high side, to mixer coil as in Fig. 6, low side to chassis.
9. Short A. V. C. to chassis at junction of R21 and R16.
10. Disconnect the negative lead of C19 from pin #2 of 19T8.
11. Connect vertical input of scope across R22. (Grounded terminal to chassis, ungrounded terminal to high side of resistor.)
12. Adjust IF slugs T7, T6, T5, for greatest vertical sweep of the pattern. Stagger tune (detune) slightly so that pattern looks like Fig. 7.
13. Resolder the negative lead of condenser disconnected after alignment is completed.

NOTE: A double trace pattern, as in Fig. 2 or Fig. 3 for detector alignment, or Fig. 4 for IF alignment, may be caused by a slight out of phase condition between the sweep voltage to the horizontal terminals of the scope and the modulation on the generator signal. To correct this condition, connect a condenser of about .005 mf. across the horizontal input terminals of the scope and a 1 megohm variable resistance in series with the lead to the ungrounded terminal. Adjust the resistance until the two traces coincide.

DETECTOR ALIGNMENT USING SIGNAL GENERATOR AND VTVM

POSITION OF VARIABLE	GENERATOR FREQUENCY	DUMMY ANTENNA	GENERATOR CONNECTION HIGH SIDE	GENERATOR CONNECTION GROUND LEAD	ADJUST TRIMMERS IN ORDER SHOWN FOR MAX. OUTPUT	TRIMMER FUNCTION
Open	10.7 Mc	.01 Mfd.	2d IF grid	Chassis	*T9, *T10	Detector

* T9 is adjusted for maximum A. V. C. voltage. A vacuum tube voltmeter or a 20,000 ohm per volt voltmeter with a low V. range can be used to measure the A. V. C. voltage. Connect negative lead to junction of R21 and R16 on band switch and positive lead to the chassis.

© John F. Rider

* T10 is adjusted for zero reading of a vacuum tube voltmeter or a 20,000 ohm per volt voltmeter, connected as shown in Fig. 5. Rock this adjustment through the zero point to see that the voltage is positive on one side of the zero point and negative on the other.

NOTE: If a 10.7 Mc FM generator is not available for alignment of detector, an unmodulated signal of 10.7 Mc from an accurately calibrated conventional AM type generator can be used. (Voltmeter alignment only).

I.F. alignment using signal generator and V. T. V. M. not recommended.

RF

POSITION OF VARIABLE	GENERATOR FREQUENCY	DUMMY ANTENNA	GENERATOR CONNECTION HIGH SIDE	GENERATOR CONNECTION GROUND LEAD	ADJUST TRIMMERS IN ORDER SHOWN FOR MAX. OUTPUT	TRIMMER FUNCTION
Open	109 Mc	300 Ohm	Ant. Term.	Ant. Term.	T2	Oscillator
Closed	87.5 Mc	300 Ohm	Ant. Term.	Ant. Term.	Spacing of LC-11	Oscillator
Repeat the above oscillator adjustments until proper coverage is obtained on both ends of band since the two adjustments effect each other.						
106 Mc	106 Mc	300 Ohm	Ant. Term.	Ant. Term.	T4***	RF
90 Mc	90 Mc	300 Ohm	Ant. Term.	Ant. Term.	Spacing of LC-12	RF

Repeat "RF and Ant." adjustments until proper tracking is obtained at both 90 and 106 Mc, since tracking the set at one frequency effects the tracking at the other frequency.

All RF trimmers are adjusted for maximum output, measured with output meter across speaker voice coil.

For RF alignment, use FM generator signal modulated with 400 cycles 45 Mc sweep (22.5 Kc deviation).

NOTE: On sets which use LF-33 A in place of LF-33, the trimmer locations are reversed.

***On sets where T4 has been eliminated (Fig. 6) adjust R. F. by spacing of LC-12 at 106 Mc. and check for tracking at 90 Mc.

ALIGNMENT PROCEDURE

PRELIMINARY:

Output meter connection ..... Across speaker voice coil
Output meter reading to indicate 500 MW (Standard Output) ..... 1.27 volt
Generator modulation ..... 30% 400 cycles
Position of volume control ..... Fully clockwise
Set Dial Pointer ..... 1-3/32" from center of left shaft, variable condenser closed
Set band switch ..... To left for AM alignment; to right for FM alignment

AM ALIGNMENT

POSITION OF VARIABLE	GENERATOR FREQUENCY	DUMMY ANTENNA	GENERATOR CONNECTION HIGH SIDE	GENERATOR CONNECTION GROUND LEAD	ADJUST TRIMMERS IN ORDER SHOWN FOR MAX. OUTPUT	TRIMMER FUNCTION
Open	455 Kc	.05 Mfd.	Mixer grid	Chassis	1, 2, 3, 4	I.F.
1620 Kc	1620 Kc		*Test loop	Test loop	11	Oscillator
1400 Kc	1400 Kc		*Test loop	Test loop	12	Antenna
**600 Kc	600 Kc		*Test loop	Test loop	Checkpoint	Antenna

*Connect generator lead to a Standard Hazeltine Test Loop, Model 1150, placed two feet from the set loop, or three turns of wire about six inches in diameter, placed about one foot from the set loop.

**With a generator signal of 600 Kc, tune the set to the point where maximum output is obtained, which should be approximately 600 Kc on the dial. Adjust antenna section plates of variable for maximum output.

©John F. Rider

MODELS 8024, 8025,
Ch. 478.206-1

The alignment procedure should be repeated in the original order for greatest accuracy.

Always keep the output from the signal generator at its lowest possible value to make the A. V. C. action of the receiver ineffective.

FM ALIGNMENT

DETECTOR AND IF ALIGNMENT USING SIGNAL GENERATOR AND OSCILLOSCOPE

1. Connect vertical input of scope across volume control of receiver (grounded terminal to chassis, ungrounded terminal to high side of the control).
2. Connect FM Generator, High Side, to grid of 2nd IF tube through .01 mfd. dummy, Low Side, to chassis.
3. Connect sweep voltage of generator to horizontal terminals of scope.
4. Set generator frequency to 10.7 Mc modulated either 60 cycles or 400 cycles, 250 Kc sweep (125 Kc deviation.
5. Set volume control to maximum, variable condenser fully open, band switch to right (FM).
6. Adjust detector primary slug #5 for maximum vertical sweep of the scope pattern.
7. Adjust detector secondary slug #6 for symmetry of the pattern. Pattern should look like Fig. 1, with the same amount of curve on both ends.
8. Connect generator, high side, to mixer coil as in Fig. 7, low side to chassis.
9. Short A. V. C. to chassis at junction of R15 and R19.
10. Disconnect the negative lead of C22 from pin #2 of 6T8.
11. Connect vertical input of scope across R14. (Grounded terminal to chassis, ungrounded terminal to high side of resistor.)
12. Adjust IF slugs 7, 8, 9, 10 for greatest vertical sweep of the pattern. Stagger tune (detune) slightly so that pattern looks like Fig. 4.
13. Resolder the negative lead of condenser disconnected after alignment is completed.

NOTE: A double trace pattern, as in Fig. 2 or Fig. 3 for detector alignment, or Fig. 5 for IF alignment, may be caused by a slight out of phase condition between the sweep voltage to the horizontal terminals of the scope and the modulation on the generator signal. To correct this condition, connect a condenser of about .0005 mf. across the horizontal input terminals of the scope and a 1 megohm variable resistance in series with the lead to the ungrounded terminal. Adjust the resistance until the two traces coincide.

DETECTOR ALIGNMENT USING SIGNAL GENERATOR AND VTVM

POSITION OF VARIABLE	GENERATOR FREQUENCY	DUMMY ANTENNA	GENERATOR CONNECTION HIGH SIDE	GENERATOR CONNECTION GROUND LEAD	ADJUST TRIMMERS IN ORDER SHOWN	TRIMMER FUNCTION
Open	10.7 Mc	.01 Mfd.	2d IF grid	Chassis	#*5, #*6	Detector

#*5 is adjusted for maximum A. V. C. voltage. A vacuum tube voltmeter or a 20,000 ohm per volt voltmeter with a low V. range can be used to measure the A. V. C. voltage. Connect negative lead to junction of R15 and R19 on band switch and positive lead to the chassis.

#*6 is adjusted for zero reading of a vacuum tube voltmeter or a 20,000 ohm per volt voltmeter, connected as shown in Fig. 6. Rock this adjustment through the zero point to see that the voltage is positive on one side of the zero point and negative on the other.

NOTE: If a 10.7 Mc FM generator is not available for alignment of detector, and unmodulated signal of 10.7 Mc from an accurately calibrated conventional AM type generator can be used. (Voltmeter alignment only.)

I.F. alignment using signal generator and V.T.V.M. not recommended.

RF

POSITION OF VARIABLE	GENERATOR FREQUENCY	DUMMY ANTENNA	GENERATOR CONNECTION HIGH SIDE	GENERATOR CONNECTION GROUND LEAD	ADJUST TRIMMERS IN ORDER SHOWN	TRIMMER FUNCTION
Open	109 Mc	300 Ohm	Ant. Term.	Ant. Term.	#13	Oscillator
Closed	87.5 Mc	300 Ohm	Ant. Term.	Ant. Term.	Spacing of L-5	Oscillator

Repeat the above oscillator adjustments until proper coverage is obtained on both ends of band since the two adjustments effect each other.

106 Mc	106 Mc	300 Ohm	Ant. Term.	Ant. Term.	#14	RF
90 Mc	90 Mc	300 Ohm	Ant. Term.	Ant. Term.	Spacing of L-3	RF

Repeat "RF and Ant." adjustments until proper tracking is obtained at both 90 and 106 Mc, since tracing the set at one frequency effects the tracking at the other frequency.

All RF trimmers are adjusted for maximum output, measured with output meter across speaker voice coil.

For RF alignment, use FM generator signal modulated with 400 cycles 45 Kc sweep (22.5 Kc deviation).

SCHEMATIC DIAGRAM FOR 135.243

Tube sockets are viewed from under side of chassis. Voltage readings shown at socket prongs are to floating ground and are taken with a 20,000 ohm per volt meter, with radio phono switch in radio position and with line voltage at 117 volts. Where no reading is given the voltage is zero or too low to read. Symbols are in accordance with A.S.A. standards Z32.5 and Z32.10 unless otherwise stated. K=1,000 ohms. M=1,000,000 ohms.

ALIGNMENT PROCEDURE

PRELIMINARY:

Output meter connection ..... Across speaker voice coil
Output meter reading to indicate 200 MW (Standard output)..... .8 volt
Generator modulation ..... 30% 400 cycles
Position of volume control ..... Fully clockwise

POSITION OF VARIABLE	GENERATOR FREQUENCY	DUMMY ANTENNA	GENERATOR CONNECTION HIGH SIDE	GENERATOR CONNECTION GND. LEAD	ADJUST TRIMMERS IN ORDER SHOWN	TRIMMER FUNCTION
Open	455 Kc	.05 Mfd	Mixer Grid	Fltg. Gnd.	A1 - A2	I. F.
Open	1620 Kc		Test Loop	Test Loop	A3	Oscillator
1400 Kc	1400 Kc		Test Loop	Test Loop	A4	Antenna
600 Kc	600 Kc		Test Loop	Test Loop	** Check Point	Antenna

IMPORTANT ALIGNMENT NOTES

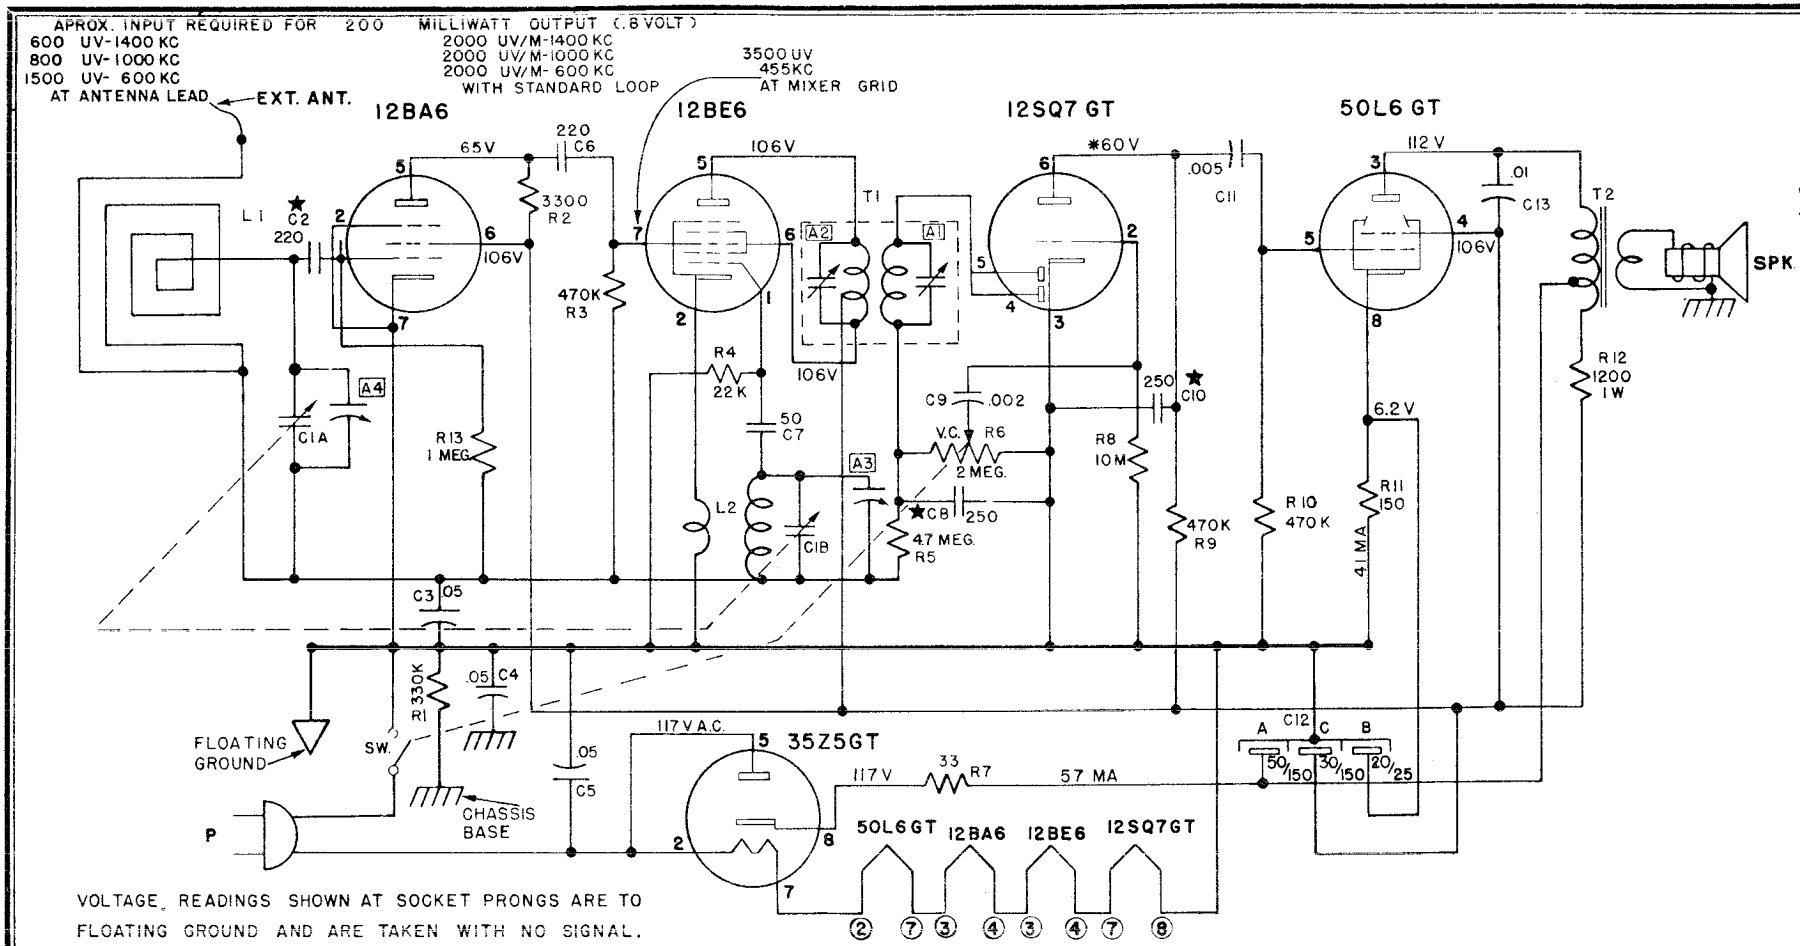
* Connect generator lead to a test loop placed a short distance from the set loop, or connect high side to green lead on set loop through a 200 mmf. condenser and ground lead to floating ground of receiver.

** Check sensitivity at 600 Kc. If low, adjust antenna section plates of variable for maximum output at 600 Kc.

The alignment procedure should be repeated in the original order for greatest accuracy. Always keep the output from the signal generator at its lowest possible value to make the A. V. C. action of the receiver ineffective.

©John F. Rider

© John F. Rider



VOLTAGE READINGS SHOWN AT SOCKET PRONGS ARE TO FLOATING GROUND AND ARE TAKEN WITH NO SIGNAL.

AC LINE VOLTAGE AT 117 VOLTS.

* MEASURED WITH VACUUM TUBE VOLTMETER.

CAPACITY OF CONDENSERS LESS THAN .001 MF IS SHOWN IN MMF.

★CERTAIN CONDENSERS VALUES IN EARLY PRODUCTION SETS WERE SLIGHTLY DIFFERENT THAN THOSE SHOWN:
C2 WAS 250 MMFD. — NOW IS 220 MMFD.
C10 WAS 220 MMFD. — NOW IS 250 MMFD.
C8 WAS 50 MMFD. — NOW IS 250 MMFD.
THESE CHANGES WERE MADE FOR EASE OF PRODUCTION AND THE USE OF EITHER VALUE WILL HAVE NO EFFECT ON THE PERFORMANCE OF THE RECIVER.

CHANGES

Condenser Value Changes: C2 was changed from 250 mmf. Mica to 220 mmf. Ceramic
C10 was changed from 220 mmf. Ceramic to 250 mmf. Mica
C8 was changed from 50 mmf. Molded to 250 mmf. Mica

Circuit Change: A few of the first sets produced had a .001 Mfd. 600 Volt Condenser on the Loop Antenna connected from the external antenna winding to A. V. C.

Correction: The Schematic Diagram printed on some of the first Instruction Sheets and Chassis Labels showed R10 connected to B+: this should have been shown connected to floating ground.

Speaker Voice Coil Impedance 3.2 ohms

ALIGNMENT PROCEDURE

PRELIMINARY:

Output meter connection ---------- Across speaker voice coil.
Output meter reading to indicate 500 MW ---------- 1.27 volts.
Generator Modulation ---------- 30%, 400 cycles.
Position of volume control ---------- Fully clockwise.
Set dial pointer ---------- Horizontal, variable condenser closed.
Set band switch ---------- To left for AM alignment, to right for FM alignment.

AM ALIGNMENT

Position of Variable	Generator Frequency	Dummy Ant.	Generator Connection (high)	Generator Connection Ground Lead	Adjust Trimmer In Order Shown For Max. Output	Trimmer Function
Open	455 Kc	.05 mfd.	Mixer Grid	Chassis	A1, A2, A3, A4,	I.F.
Open	1650 Kc		*Test Loop	Test Loop	A5	Oscillator
1400 Kc	1400 Kc		*Test Loop	Test Loop	A6	Antenna
**600 Kc	600 Kc		*Test Loop	Test Loop	Check Point	Antenna

* Connect generator lead to a Standard Hazeltine Test Loop, Model 1150, placed two feet from the set loop, or three turns of wire about six inches in diameter, placed about one foot from the set loop. Or the generator can be connected with the high side lead to the AM antenna screw terminal and the ground lead to the chassis.

** With a generator signal of 600 Kc, tune the set to the point where maximum output is obtained, which should be approximately 600 Kc on the dial. Adjust antenna section places of variable for maximum output.

The alignment procedure should be repeated in the original order for greatest accuracy.

Always keep the output from the signal generator at its lowest possible value to make the A. V. C. action of the receiver ineffective.

FM ALIGNMENT

Detector and I.F. alignment using Signal Generator and Oscilloscope.

1. Connect FM Generator, High side, to grid (pin 1) of 6BA6 2nd I.F. tube through .005 mfd. dummy.
2. Set generator frequency to 10.7 Mc. modulated either 60 cycles or 400 cycles, 250 Kc sweep (125 Kc. deviation).
3. Connect vertical input of scope across volume control of receiver (grounded terminal to chassis, ungrounded terminal to high side of control).
4. Set scope switch for internal synchronization and set horizontal oscillator to 2X frequency of modulating voltage of generator. (120 or 800 cycles)
5. Turn variable condenser fully open, and band switch to right (FM).
6. Adjust frequency vernier of horizontal oscillator on scope until the pattern becomes stationary.
7. Adjust ratio detector primary slug No. A7 for maximum vertical sweep of the scope pattern.
8. Adjust ratio detector secondary slug No. A8 to center the cross over point of the pattern. Pattern should look like Fig. 1, with the same amount of curve on both ends, and the cross over point in the center.
9. Connect generator, high side, to center antenna screw terminal on bottom of chassis.
10. Adjust I.F. slugs A9, A10 and All for the greatest vertical sweep of the pattern, consistent with linearity. If the I.F. slugs are adjusted for maximum sweep of the pattern, the pattern may become non-linear. Therefore, adjustment should be made for the greatest sweep which can be obtained and still have all four ends of the "X" pattern similar in size and shape.
11. Check the alignment of the I.F. and detector circuits by varying the signal generator frequency above and below the center frequency of 10.7 Mc. If the receiver is perfectly aligned, two smaller "X" patterns of similar size and shape will result, one on either side of the center frequency. See Figure 2.

X PATTERN CENTER FREQUENCY

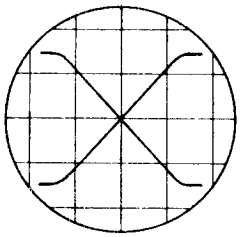

FIG 1

SMALL X PATTERN ABOVE AND BELOW CENTER FREQUENCY

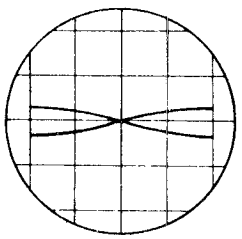

FIG 2

Position of Variable	Generator Frequency	Dummy Ant.	RF Generator Connection High Side Ant. (FM) Terminal	Generator Connection Ground Lead Ground (G) Terminal	Adjust Trimmers In Order Shown	Trimmer Function
Fully Open	108.5 Mc.	*300 ohm	Ant. (FM) Terminal	Ground (G) Terminal	A12	Oscillator
Fully Closed	87.5 Mc.	*300 ohm	Ant. (FM) Terminal	Ground (G) Terminal	† Check Point	Oscillator
105 Mc.	105 Mc.	*300 ohm	Ant. (FM) Terminal	Ground (G) Terminal	**A13	R.F.
91 Mc.	91 Mc.	*300 ohm	Ant. (FM) Terminal	Ground (G) Terminal	† Check Point	R.F.

For R.F. alignment use FM generator signal modulated with 400 cycles 45 Kc. sweep (22.5 Kc.) deviation).

* The 300 ohm dummy should be made up of two 150 ohm resistors, one placed in each lead at the receiver antenna terminals.

**When this trimmer is adjusted the Variable Condenser should be rocked back and forth through the frequency, to prevent erroneous maximum readings, due to oscillator pulling.

© John F. Rider

MODEL 9022,
Ch. 132.871

† The Coils L4 and L5 can be spread or squeezed together if necessary to obtain the proper band coverage and track at the low frequency end of the band. This should not be necessary in most cases, and the high frequency end of the band should always be realigned if the Coils are adjusted.

TECHNICAL INFORMATION FOR SERVICE MEN

AM Tuning range — 540 Kc to 1600 Kc. Intermediate Frequency — 455 Kc. I.F. and R.F. measurements made at 500 milliwatts output — approximately 1.27 volts on a rectifier type voltmeter connected across speaker voice coil.

Approximate input for 500 MW output: I.F. 300 uv; R.F. with standard loop: at 600 Kc, 1200 uv/m. at 1000 Kc, 1050 uv/m; at 1400 Kc, 800 uv/m.

FM Tuning range — 88 megacycles to 108 megacycles. Intermediate Frequency 10.7 megacycles. I.F. and R.F. measurements made at 500 milliwatts output — approximately 1.27 volts on a rectifier type voltmeter connected across speaker voice coil. Approximate input for 500 MW output: I.F. 300 uv; R.F. "Absolute Measurements": 91 megacycles, 125 uv; 105 megacycles, 100 uv.

©John F. Rider

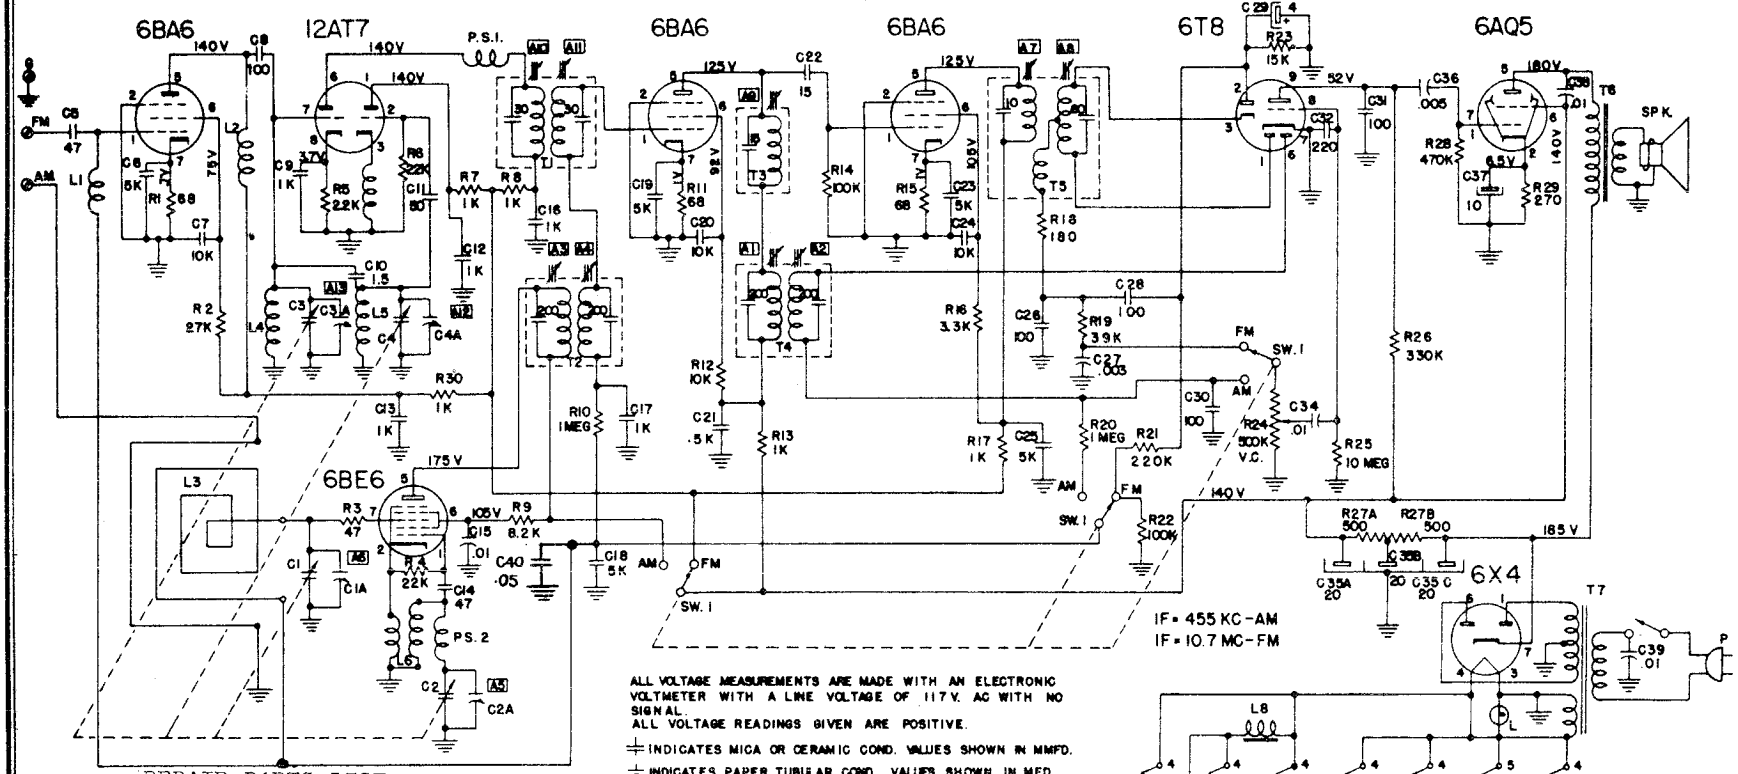
C40 was added after the start of production to reduce hum modulation sometimes noticeable on the AM band with the power plug inserted with a particular polarity. Should hum modulation be encountered on any set manufactured prior to this change, reversing the plug should eliminate it.



ALL VOLTAGE MEASUREMENTS ARE MADE WITH AN ELECTRONIC VOLTMETER WITH A LINE VOLTAGE OF 117 V. AC WITH NO SIGNAL.
ALL VOLTAGE READINGS GIVEN ARE POSITIVE.

ALIGNMENT PROCEDURE

PRELIMINARY:

Output Meter Connection . . . . . Across loud speaker voice coil
Generator ground lead connection . . . . . Floating Ground
Dummy Antenna Value to be in series with generator output . . . . . See chart below
Connection of Generator Output lead . . . . . See chart below
Generator Modulation . . . . . 30%, 400 Cycles
Position of Volume Control . . . . . Fully on

POSITION OF TUNER	GENERATOR FREQUENCY	DUMMY ANTENNA	GENERATOR CONNECTION	TRIMMER ADJUSTMENTS (IN ORDER) SHOWN	TRIMMER FUNCTION
Closed	455 KC	.1 mfd.	12SA7GT Transl.Grid	C11,C8 & C7	I.F.
Open	1620 KC	.0002 mfd.	Loop	C4	Oscillator
1400 KC	1400 KC	.0002 mfd.	Loop	C2	Transl.

IMPORTANT ALIGNMENT NOTES

The alignment must be done in the order given.

The entire Alignment Procedure should be repeated step by step in the original order for greatest accuracy.

Always keep the output power from the generator at its lowest possible value to prevent the AVC of the receiver from interfering with accurate alignment.

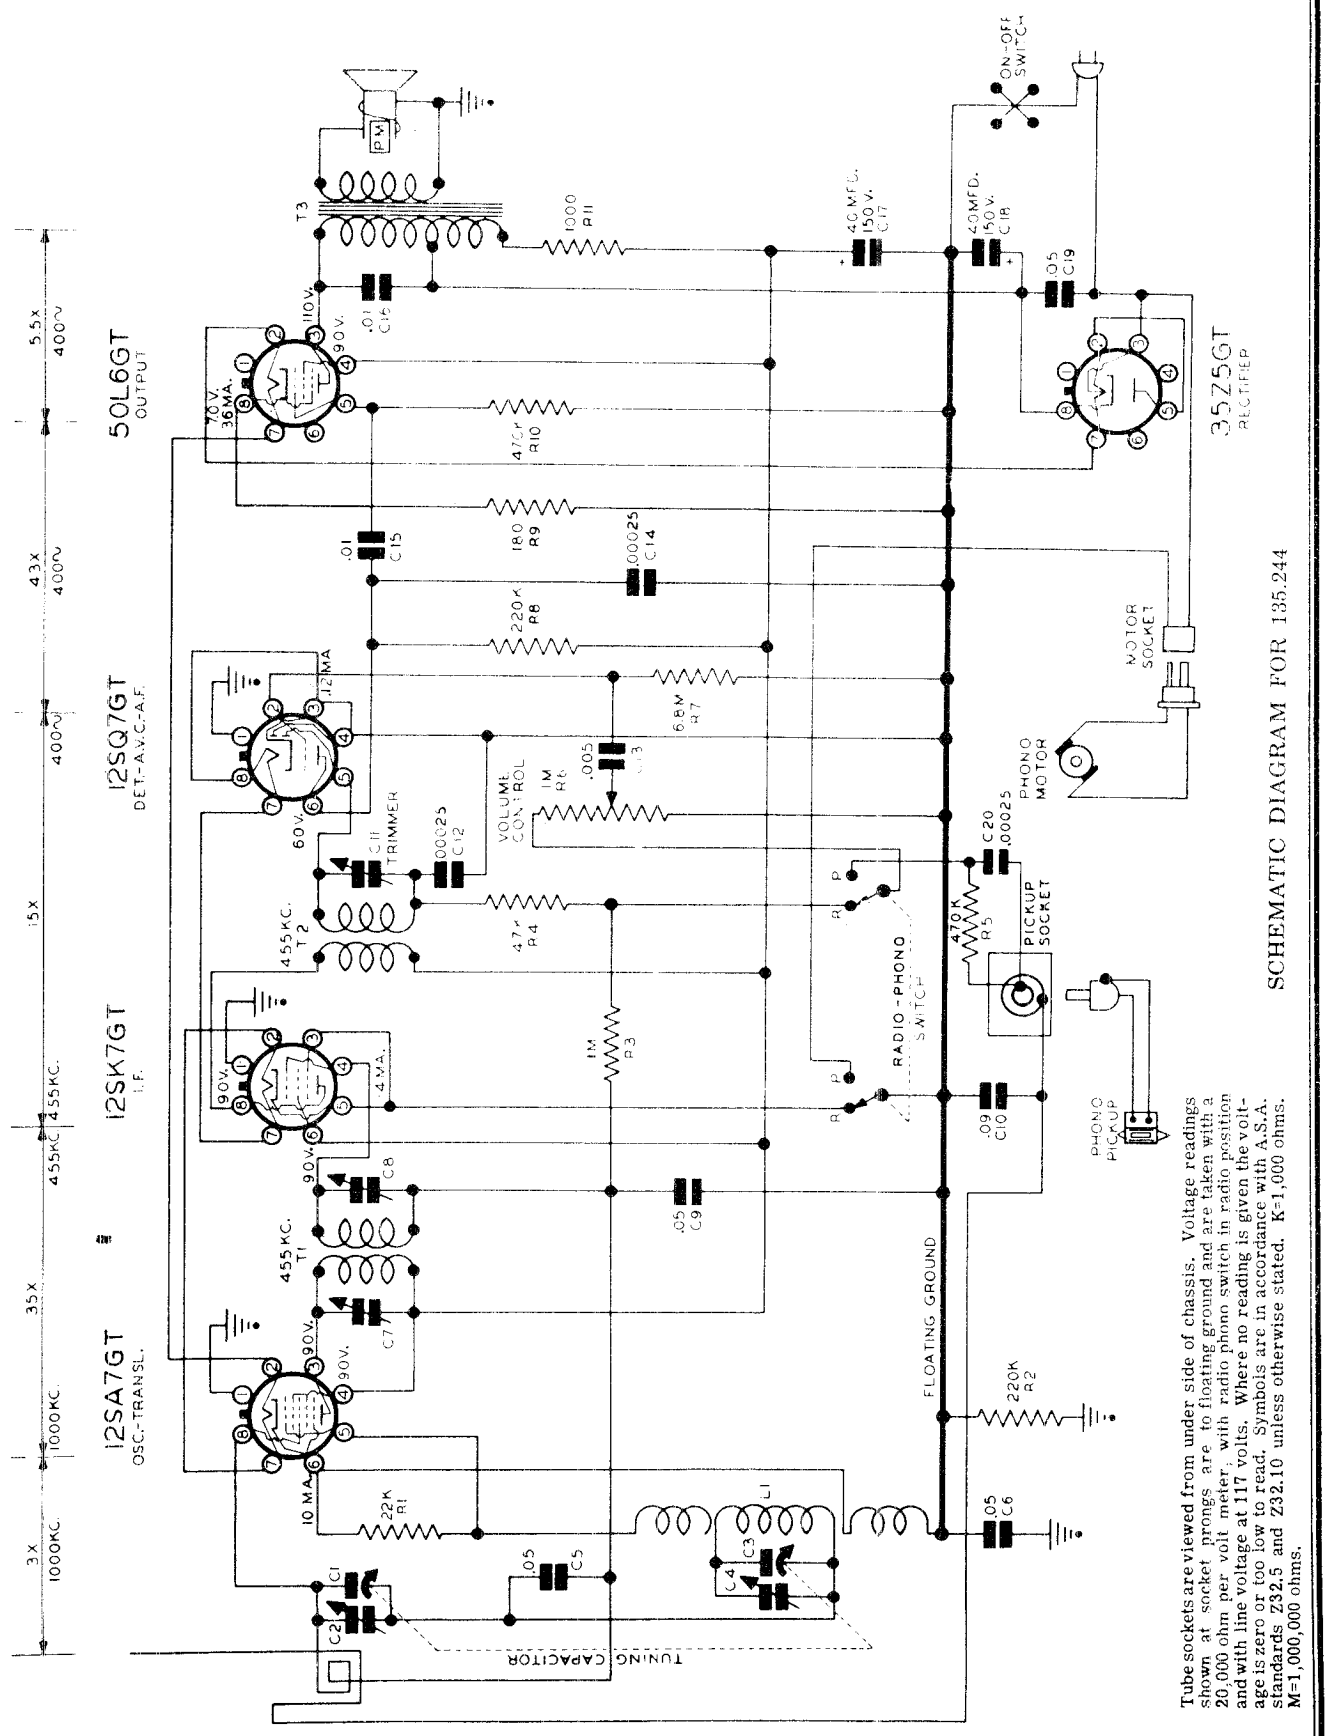
MODEL 9073,
Ch. 135.244



SCHEMATIC DIAGRAM FOR 135.244

Tube sockets are viewed from under side of chassis. Voltage readings shown at socket prongs are to floating ground and are taken with a 20,000 ohm per volt meter, with radio phono switch in radio position and with line voltage at 117 volts. Where no reading is given the voltage is zero or too low to read. Symbols are in accordance with A.S.A. standards Z32.5 and Z32.10 unless otherwise stated. K=1,000 ohms. M=1,000,000 ohms.

ALIGNMENT NOTES:

1. It is recommended that this set be connected to an isolation transformer when aligning on AC.
2. The alignment must be done in the order given above.
3. While making the above adjustments, keep the volume control set for maximum output and the signal generator output attenuated to avoid AVC action.

©John F. Rider

ALIGNMENT PROCEDURE

For Alignment procedure read tabulations from left to right, and make the adjustment marked (1) first, (2) next, (3) third.
IMPORTANT: BEFORE ALIGNING, HAVE LOOP ANTENNA IN THE SAME POSITION IT WILL BE IN WHEN THE SET IS IN THE CABINET. BE SURE THAT IT DOES NOT MOVE WHILE ALIGNING.

When adjusting 1650 kilocycle oscillator trimmer, 455 K.C. R.F. trimmer and 1400 kilocycle antenna trimmer, connect test oscillator to loop external antenna and ground connections with a .0002 Mfd. capacitor in series with antenna lead.

Steps	Set receiver dial to:	TEST OSCILLATOR: Adjust test oscillator frequency to:	TEST OSCILLATOR: Use dummy antenna in series with output of test oscillator consisting of:	TEST OSCILLATOR: Attach output of test oscillator to	Refer to parts layout diagram for location of trimmers mentioned below:
	Any point where no interfering signal is received	Exactly 455 K. C.	0.2 Mfd. Condenser	High side to grid of 6SA7 Tube. Low side to chassis.	Adjust each of the 2nd I.F. transformer trimmer adjustment screws for maximum output, then adjust each of the 1st I.F. transformer trimmer adjustment screws for maximum output.
1	Rotate gang condenser to maximum capacity	Exactly 455 K. C.	.0002 Mfd. Condenser	To loop external antenna and ground connections	Adjust R.F. coil trimmer for minimum 455 K. C. signal.
2	Rotate gang condenser to minimum capacity	Exactly 1650 K. C.	.0002 Mfd. Condenser	To loop external antenna and ground connections	Adjust 1650 K. C. oscillator trimmer for maximum output.
3	Approximately 1400 K. C.	Approx. 1400 K. C.	.0002 Mfd. Condenser	To loop external antenna and ground connections	Adjust 1400 K. C. antenna trimmer for maximum output.

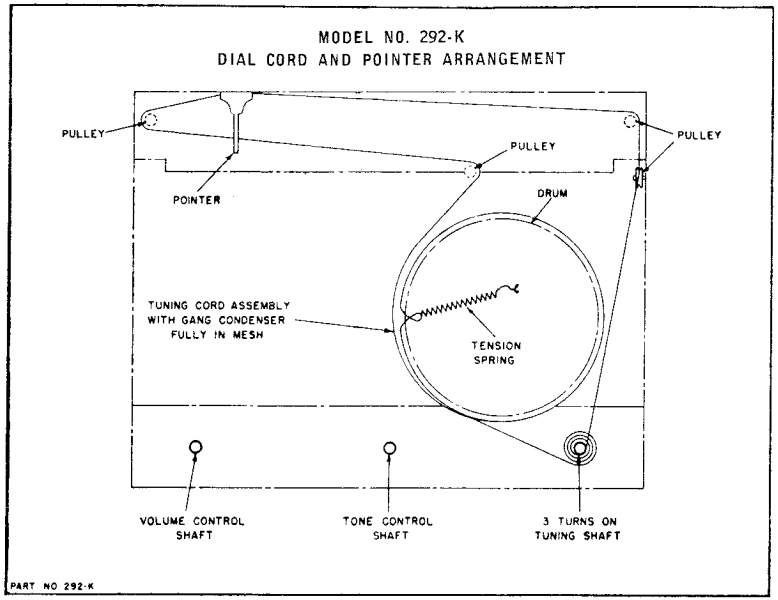
NO. 292-D



VOLTAGE RATING

THIS RADIO IS DESIGNED FOR USE ON 110-120 VOLT, 50-60 CYCLE, ALTERNATING CURRENT (AC) OR 110-120 VOLT DIRECT CURRENT (DC).

SPECIAL INSTRUCTIONS FOR "DIRECT CURRENT" OPERATION:

If the current supply is DIRECT CURRENT, and the radio does not play after it has been turned on for approximately one minute, simply reverse radio power cord plug in electric power receptacle.

THE AM AND FM AERIALS FURNISHED WITH THIS RECEIVER ARE MOUNTED AS AN INTEGRAL PART OF THE RADIO. THEY REQUIRE NO INSTALLATION AND IN AVERAGE LOCATIONS THEY WILL PROVIDE SATISFACTORY RECEPTION.

Only when the radio is located a considerable distance from desired stations or is operated under unusual conditions, such as in steel constructed buildings, etc., will it be necessary to use another aerial.

See the following "AM STANDARD BROADCAST AERIAL" and "FM AERIAL" paragraphs for special aerial instructions.

AM STANDARD BROADCAST AERIAL

The AM Standard Broadcast Aerial, mounted inside of the rear of the cabinet is a loop-type antenna. Because loop aerials are directional, the volume of a weak station, operating in the 535-1730 KC Band, may be improved, or undesired electrical noise may be reduced by placing the radio in a different position. A trial will reveal position for best reception with least interference.

When the volume of the AM Broadcast stations is not satisfactory, improved results can be obtained by attaching a 50 ft. to 75 ft. Outdoor Aerial to the BLUE wire coming out of the rear of the cabinet and a ground to the BLACK wire.

WARNING — DO NOT CONNECT A GROUND TO ANY METAL PART OF THE CHASSIS BECAUSE THIS WILL CAUSE A SHORT AND POSSIBLE DAMAGE.

FM AERIAL

Due to the high frequencies used by FM stations, signals from these stations reach only to the "line of sight." This means that reliable FM reception can usually be expected only when the radio is within 20 to 30 miles from the station transmitter. The actual area serviced by FM stations depends on the height of the station aerial and receiver aerial.

If the radio happens to be located on the edge or just outside of the FM station service area, satisfactory FM reception may not be obtained with the self contained FM aerial furnished with the radio, in which case it will be necessary to install a suitable outdoor FM aerial. This should be the type having a 300 Ohm transmission line, and it must be erected as high as possible.

If an outdoor aerial is required, consult your Sentinel dealer—he can furnish a satisfactory outdoor FM aerial.

TO CONNECT AN OUTDOOR "FM" AERIAL TO THE RADIO:

(1) Disconnect the wire attached to posts marked #1 and #2 mounted on back of loop aerial.

(2) Attach outdoor FM aerial transmission leads to the posts marked #1 and #3.

IMPORTANT — WHEN THE RADIO IS LOCATED TOO CLOSE TO AN FM STATION, the volume may be ample but the signal may be distorted. An outdoor FM aerial would only aggravate this condition. Usually, disconnecting the jumper wire connecting posts #1 and #2 on back of loop will eliminate the distortion.

FUNCTION OF CONTROLS ON RADIO

THE LEFT HAND KNOB is the Volume Control and Off-On Switch.

THE CENTER KNOB is the AM-FM Band Selector Switch.

THE RIGHT HAND KNOB is the Station Selector Knob.

AM STANDARD BROADCAST OPERATING INSTRUCTIONS

Turn "AM-FM" Band Selector Switch Knob to RIGHT hand position. Use section of dial that is calibrated from 535 to 1730 K. C.

FM FREQUENCY MODULATION OPERATING INSTRUCTIONS

Turn "FM-AM" Band Selector Switch Knob to LEFT hand position. Place Volume Control Knob in maximum volume position. Use section of dial that is calibrated from 88 to 108 M.C.

WHEN TUNING FOR FM STATIONS, care must be taken to tune properly, otherwise the brilliant tone and noise-free reception possible from FM stations will not be fully realized. Always carefully tune to the point where the volume is greatest with clearest tone and least background noise.

It will be noticed that FM stations will be heard at two positions that are close together on the dial scale, with a distortion point between the two. As these two clear-tone signals will be substantially equal in tone and volume, either one may be used.

ALIGNMENT PROCEDURE

BE SURE TO MAKE THE ADJUSTMENTS IN THE ORDER GIVEN BELOW.

(A) Connect Output Meter across voice coil of speaker.

(B) Remove jumper wire from terminals #1 and #2 on loop terminal strip.

(C) Connect the hot Signal Generator lead through a 300 Ohm Resistor to the #1 post on terminal strip and the other lead to the post marked #3.

27.75 MC PLATE COIL ADJUSTMENT

(A) Set Signal Generator to deliver a modulated 27.75 MC Signal.

(B) Adjust 27.75 MC Plate Coil Trimmer for maximum reading on Output Meter.

108 MC and 105 MC ADJUSTMENT

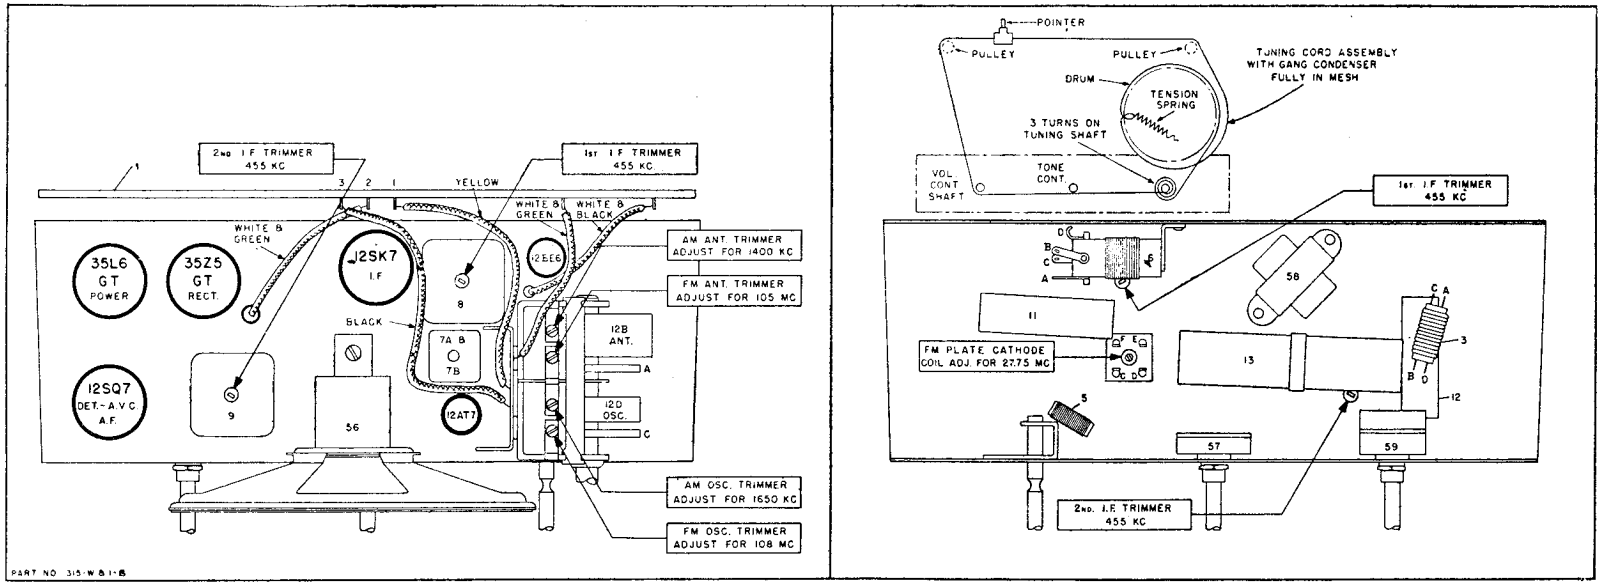
(A) Set Signal Generator to deliver a modulated 108 MC signal.

(B) Tune receiver dial to MINIMUM CAPACITY STOP.

(C) Adjust 108 MC Oscillator Trimmer for maximum reading on Output Meter.

(D) Tune receiver dial and Signal Generator to 105 MC.

(E) Adjust 105 MC Antenna Trimmer for maximum reading on the Output Meter.



©John F. Rider

AM ALIGNMENT PROCEDURE

Be sure to follow procedure carefully and in the order given—otherwise the receiver will be insensitive and the dial calibration incorrect. For alignment procedure read tabulations from left to right. Make the adjustment marked (1) first, (2) next, (3) third.

Before starting alignment:

(a) Check tuning dial adjustment by tuning gang condenser until plates touch maximum capacity stop (completely in mesh) at which point the dial pointer must be exactly even with the last line at the low frequency end of the AM dial calibration. If dial needle does not point exactly to last line move to correct position.

(b) Use an accurately calibrated test oscillator with some type of output measuring device.

(c) Place loop antenna in the same position it will be in when set is in the cabinet.

Steps	Place band switch for operation on:	Set receiver dial to:	TEST OSCILLATOR			Refer to parts layout diagram for location of trimmers mentioned below:
			Adjust test oscillator frequency to:	Use dummy antenna in series with output of test oscillator consisting of:	Attach output of test oscillator to:	
1	AM Band position	Any point where no interfering signal is received	Exactly 455 K. C.	0.2 Mfd. Condenser	High side to AM-Osc. stator plates of tuning condenser (10D). Low side to frame of condenser through .01 Mfd. condenser.	Adjust each of the 2nd 455 K. C. AM I. F. transformer trimmers for maximum output, then adjust each of the 1st 455 K. C. AM I. F. transformer trimmers for maximum output.
2	AM Band position	Exactly 1730 K.C.	Exactly 1730 K.C.		Receiver blue antenna lead Receiver black ground lead	Adjust 1730 K. C. oscillator trimmer for maximum output.
3	AM Band position	Approx. 1400 K. C.	Approx. 1400 K. C.		Receiver blue antenna lead Receiver black ground lead	Adjust 1400 K. C. AM Ant. trimmer for maximum output.

FM ALIGNMENT

The only portion of this receiver which is used during FM reception, other than the AF and Power Supply, is the 12AT7 Dual Triode tube and its associated circuits. One triode of the tube is used for HF Oscillator and covers a band 27.75 MC above the 88 to 108 FM Band. The other triode is used for RF Input, Super-regenerator and Detector. This triode oscillates at 27.75 MC and is quenched by an RC network at about 25 KC.

In tuning this receiver on FM, it will be noticed that two signals will be received with a null point between them. These two signals will be substantially equal in tone and volume and either one can be used. They represent the frequency discrimination which takes place due to the receiver being tuned to one side of the carrier center frequency and this, therefore, is not the spot of greatest quieting. Greatest quieting is found at the null point, at which no frequency discrimination takes place and therefore no audio signal is produced.

The equipment necessary for FM alignment consists of the following:

(A) An Audio Output Meter.

(B) An AM or FM Signal Generator that will supply a 27.75 MC, 105 MC and 108 MC signal. A Signal Generator that only goes up to 30 MC but which has sufficient fourth harmonic present in the carrier could be used for this purpose.

ALIGNMENT PROCEDURE

For alignment procedure read tabulations from left to right, and make the adjustment marked (1) first, (2) next, (3) third.

Before starting alignment:

(A) Check tuning dial adjustment by tuning gang condenser until plates touch maximum capacity stop (completely in mesh) at which point the dial needle must be exactly even with the last line at the low frequency end of the dial calibration. If the dial needle does not point exactly to the last line move to correct position by holding dial needle shank at the point where it attaches to its drum while turning the drum on the gang condenser.

(B) Use an accurately calibrated test oscillator with some type of output measuring device.

(C) THE LOOP MAY BE LEFT IN THE CABINET and the chassis with its mounting board pulled out of the cabinet just far enough for adjustment of the trimmers, or the loop and chassis may be removed from the cabinet and the loop placed in the same position and plane it will be in when both are mounted in cabinet—approximately 1″ space between receiver loop and chassis. Couple test oscillator to receiver loop by: (1) make loop consisting of 5 to 10 turns of No. 20 to No. 30 size wire, wound on a 2″ or 3″ form; (2) connect this loop across output of test oscillator; (3) place test oscillator loop near radio loop. BE SURE THAT NEITHER LOOP MOVES WHILE ALIGNING.

Steps	Set receiver dial to:	TEST OSCILLATOR			Refer to parts layout diagram for location of trimmers mentioned below:
		Adjust test oscillator frequency to:	Use dummy antenna in series with output of test oscillator consisting of:	Attach output of test oscillator to:	
1	Any point where no interfering signal is received	455 K. C.	.02 MFD. See Paragraph (C) Above	High side to rear stator plates of tuning condenser. Low side to frame of condenser through a .02 Mfd. blocking condenser.	Adjust each of the second I. F. transformer trimmers for maximum output—then adjust each of the first I. F. trimmers for maximum output.
2	Exactly 1650 K. C.	Exactly 1650 K. C.	See Paragraph (C) Above	See Paragraph (C) Above	Adjust 1650 K. C. oscillator trimmer for maximum output.
3	Approx. 1400 K. C.	Approx. 1400 K. C.	See Paragraph (C) Above	See Paragraph (C) Above	Adjust 1400 K. C. antenna trimmer for maximum output.

ALIGNMENT PROCEDURE

For alignment procedure read tabulations from left to right, and make the adjustment marked (1) first, (2) next, (3) third.

Before starting alignment:

(A) Check tuning dial adjustment by tuning gang condenser until plates touch maximum capacity stop (completely in mesh) at which point the dial needle must be exactly even with the last line at the low frequency end of the dial calibration. If dial needle does not point exactly to last line move to correct position.

(B) Use an accurately calibrated test oscillator with some type of output measuring device.

(C) WHEN ADJUSTING THE 1650 KC OSCILLATOR TRIMMER, remove chassis from cabinet and disconnect the loop connection wires from the loop. Attach a 1 megohm resistor across these connections and feed output of test oscillator across the 1 megohm resistor.

(D) THE 1400 KC LOOP ANTENNA TRIMMER should be adjusted only after all other adjustments have been made. PLACE LOOP ANTENNA IN THE SAME POSITION IT WILL BE IN WHEN THE SET IS IN THE CABINET — APPROXIMATELY 5/8" SPACE BETWEEN LOOP AND CHASSIS.

When aligning the 1400 KC Antenna Trimmer, couple test oscillator to receiver loop by: (1) make loop consisting of five to ten turns of No. 20 to No. 30 size wire, wound on a 2" or 3" form; (2) connect this loop across output of test oscillator; (3) place test oscillator loop near radio loop. BE SURE THAT NEITHER LOOP MOVES WHILE ALIGNING.

Steps	Set receiver dial to:	TEST OSCILLATOR: Adjust test oscillator frequency to:	TEST OSCILLATOR: Use dummy antenna in series with output of test oscillator consisting of:	TEST OSCILLATOR: Attach output of test oscillator to:	Refer to parts layout diagram for location of trimmers mentioned below:
1	Any point where no interfering signal is received.	455 K. C.	.02 MFD. condenser	High side to rear stator plates of tuning condenser. Low side to frame of condenser through a .02 Mfd. blocking condenser.	Adjust each of the second I.F. transformer trimmers for maximum output—then adjust each of the first I.F. trimmers for maximum output.
2	Exactly 1650 K. C.	Exactly 1650 K. C.	See paragraph (C) above	See paragraph (C) above	Adjust 1650 K. C. oscillator trimmer for maximum output.
3	Approx. 1400 K. C.	Approx. 1400 K. C.	See paragraph (D) above	See paragraph (D) above	Adjust 1400 K. C. antenna trimmer for maximum output.

OUTSIDE AERIAL

If the radio is used in shielded areas or located a great distance from broadcast stations, the volume of some or all stations may not be ample, in which case it would be necessary to ATTACH A 25-50 ft. OUTDOOR AERIAL TO THE BLUE LEAD COMING OUT OF THE REAR OF THE CHASSIS.

GROUND

When a regular aerial is used, best results will be obtained with a ground attached to the black lead coming out of the rear of the chassis. WARNING — DO NOT ATTACH A GROUND DIRECT TO THE RADIO CHASSIS — ANY EXTERNAL GROUND CONNECTION TO ANY METAL PART OF THE CHASSIS WILL CAUSE A SHORT AND POSSIBLE DAMAGE.

DIAL LIGHT

It is normal for the dial light to be dim for approximately 60 seconds after set is turned "on" and then attain normal brilliance—also, on very loud signals the light may fluctuate.

Always use a 6.3 volt .150 ampere dial light, Mazda type 47.

VOLTAGE RATING

THIS RADIO IS DESIGNED FOR USE ON EITHER:

110-120 VOLTS 50-60 CYCLES ALTERNATING CURRENT (AC)

OR

110-120 VOLTS DIRECT CURRENT (DC)

VOLTAGE RATING

THIS RADIO IS DESIGNED FOR USE ON 110-120 VOLT, 50-60 CYCLE, ALTERNATING CURRENT (AC) OR 110-120 VOLT DIRECT CURRENT (DC).

AM STANDARD BROADCAST AERIAL

The AM Standard Broadcast Aerial, mounted inside of the rear of the cabinet is a loop-type antenna. Because loop aerials are directional, the volume of a weak station, operating in the 535-1730 KC Band, may be improved, or undesired electrical noise may be reduced by placing the radio in a different position. A trial will reveal position for best reception with least interference.

When the volume of the AM Broadcast stations is not satisfactory, improved results can be obtained by attaching a 50 ft. to 75 ft. Outdoor Aerial to the BLUE wire coming out of the rear of the cabinet and a ground to the BLACK wire.

WARNING — DO NOT CONNECT A GROUND TO ANY METAL PART OF THE CHASSIS BECAUSE THIS WILL CAUSE A SHORT AND POSSIBLE DAMAGE.

FM AERIAL

Due to the high frequencies used by FM stations, signals from these stations reach only to the "line of sight." This means that reliable FM reception can usually be expected only when the radio is within 20 to 30 miles from the station transmitter. The actual area serviced by FM stations depends on the height of the station aerial and receiver aerial.

If the radio happens to be located on the edge or just outside of the FM station service area, satisfactory FM reception may not be obtained with the self contained FM aerial furnished with the radio, in which case it will be necessary to install a suitable outdoor FM aerial. This should be the type having a 300 Ohm transmission line, and it must be erected as high as possible.

If an outdoor aerial is required, consult your Sentinel dealer—he can furnish a satisfactory outdoor FM aerial.

TO CONNECT AN OUTDOOR "FM" AERIAL TO THE RADIO:

(1) Disconnect the wire attached to posts marked #1 and #2 mounted on back of loop aerial.

(2) Attach outdoor FM aerial transmission leads to the posts marked #1 and #3.

IMPORTANT — WHEN THE RADIO IS LOCATED TOO CLOSE TO AN FM STATION, the volume may be ample but the signal may be distorted. An outdoor FM aerial would only aggravate this condition. Usually, disconnecting the jumper wire connecting posts #1 and #2 on back of loop will eliminate the distortion.

AM STANDARD BROADCAST OPERATING INSTRUCTIONS

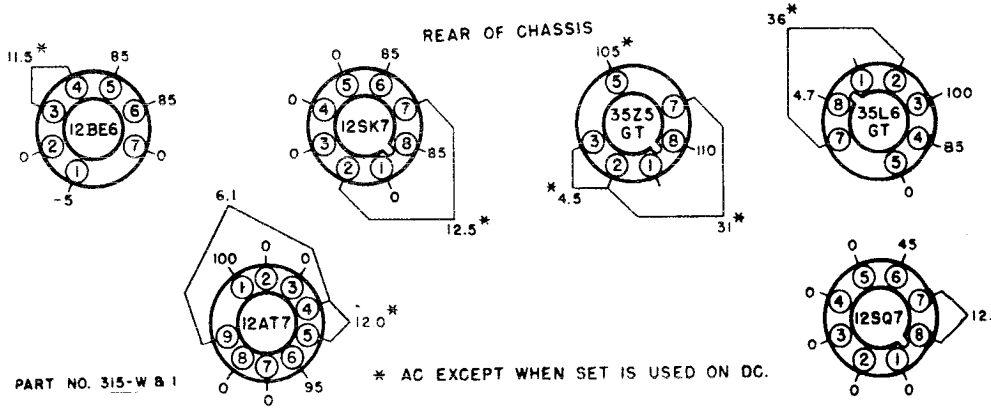
Turn "AM-FM" Band Selector Switch Knob to RIGHT hand position.
Use section of dial that is calibrated from 535 to 1730 K. C.

FM FREQUENCY MODULATION OPERATING INSTRUCTIONS

Turn "FM-AM" Band Selector Switch Knob to LEFT hand position.
Place Volume Control Knob in maximum volume position.
Use section of dial that is calibrated from 88 to 108 M.C.

WHEN TUNING FOR FM STATIONS, care must be taken to tune properly, otherwise the brilliant tone and noise-free reception possible from FM stations will not be fully realized. Always carefully tune to the point where the volume is greatest with clearest tone and least background noise.

It will be noticed that FM stations will be heard at two positions that are close together on the dial scale, with a distortion point between the two. As these two clear-tone signals will be substantially equal in tone and volume, either one may be used.



NOTE:- ALL VOLTAGES EXCEPT HEATERS ARE MEASURED FROM SOCKET CONTACTS TO CHASSIS WITH A 20,000 OHM PER VOLT VOLTMETER. HEATER VOLTAGES ARE MEASURED DIRECTLY ACROSS SOCKET CONTACTS.

VOLTAGE TABLE
(BOTTOM VIEW OF CHASSIS)

©John F. Rider

AM ALIGNMENT PROCEDURE

Be sure to follow procedure carefully and in the order given—otherwise the receiver will be insensitive and the dial calibration incorrect. For alignment procedure read tabulations from left to right. Make the adjustment marked (1) first, (2) next, (3) third.

Before starting alignment:

(a) Check tuning dial adjustment by tuning gang condenser until plates touch maximum capacity stop (completely in mesh) at which point the dial pointer must be exactly even with the last line at the low frequency end of the AM dial calibration. If dial needle does not point exactly to last line move to correct position.

(b) Use an accurately calibrated test oscillator with some type of output measuring device.

(c) Place loop antenna in the same position it will be in when set is in the cabinet.

Steps	Place band switch for operation on:	Set receiver dial to:	TEST OSCILLATOR			Refer to parts layout diagram for location of trimmers mentioned below:
			Adjust test oscillator frequency to:	Use dummy antenna in series with output of test oscillator consisting of:	Attach output of test oscillator to:	
1	AM Band position	Any point where no interfering signal is received	Exactly 455 K. C.	0.2 Mfd. Condenser	High side to AM-Osc. stator plates of tuning condenser (10D). Low side to frame of condenser through .01 Mfd. condenser.	Adjust each of the 2nd 455 K. C. AM I. F. transformer trimmers for maximum output, then adjust each of the 1st 455 K. C. AM I. F. transformer trimmers for maximum output.

FM ALIGNMENT

The only portion of this receiver which is used during FM reception, other than the AF and Power Supply, is the 12AT7 Dual Triode tube and its associated circuits. One triode of the tube is used for HF Oscillator and covers a band 27.75 MC above the 88 to 108 FM Band. The other triode is used for RF Input, Super-regenerator and Detector. This triode oscillates at 27.75 MC and is quenched by an RC network at about 25 KC.

In tuning this receiver on FM, it will be noticed that two signals will be received with a null point between them. These two signals will be substantially equal in tone and volume and either one can be used. They represent the frequency discrimination which takes place due to the receiver being tuned to one side of the carrier center frequency and this, therefore, is not the spot of greatest quieting. Greatest quieting is found at the null point, at which no frequency discrimination takes place and therefore no audio signal is produced.

The equipment necessary for FM alignment consists of the following:

(A) An Audio Output Meter.

(B) An AM or FM Signal Generator that will supply a 27.75 MC, 105 MC and 108 MC signal. A Signal Generator that only goes up to 30 MC but which has sufficient fourth harmonic present in the carrier could be used for this purpose.

©John F. Rider

ALIGNMENT PROCEDURE

BE SURE TO MAKE THE ADJUSTMENTS IN THE ORDER GIVEN BELOW.

(A) Connect Output Meter across voice coil of speaker.

(B) Remove jumper wire from terminals #1 and #2 on loop terminal strip.

(C) Connect the hot Signal Generator lead through a 300 Ohm Resistor to the #1 post on terminal strip and the other lead to the post marked #3.

27.75 MC PLATE COIL ADJUSTMENT

(A) Set Signal Generator to deliver a modulated 27.75 MC Signal.

(B) Adjust 27.75 MC Plate Coil Trimmer for maximum reading on Output Meter.

108 MC and 105 MC ADJUSTMENT

(A) Set Signal Generator to deliver a modulated 108 MC signal.

(B) Tune receiver dial to MINIMUM CAPACITY STOP.

(C) Adjust 108 MC Oscillator Trimmer for maximum reading on Output Meter.

(D) Tune receiver dial and Signal Generator to 105 MC.

(E) Adjust 105 MC Antenna Trimmer for maximum reading on the Output Meter.

ALIGNMENT PROCEDURE
I. F. Alignment 455 KC (Connect to 1R5 Grid) Loop and R. F. Alignment — 1400, 1000 and 600 KC. Dial Pointer Setting—535 KC with fully closed condenser.

SPECIFICATIONS

- Super-het circuit—455 KC I. F.
- Band coverage: 540 KC to 1700 KC.
- Five miniature tubes—plus selenium rectifier 1—1T4 R. F., 1—1R5 Mixer, 1—1T4 I. F., 1—1U5 Det. and 1st audio, 1—3V4 Pr. output (6-tube performance).
- Battery life—approximately 170 hours. Burgess No. F6A60, Eveready No. 753, Ray-O-Vac No. AB994.
- Five-inch P. M. dynamic speaker—1.47 oz. Alnico 5.

MODEL 458RD, Dor-A-fone

The Model 458 Radio Dor-A-fone is a combination radio and communication system. It employs quick heating tubes, making it ready for instant use.

The radio circuit is a straight-forward four-tube superhetrodyne, using the conventional tube lineup; namely, a mixer tube, I. F. tube, detector first audio tube and power output tube. It uses a selenium rectifier which supplies DC voltage to the filaments as well as the plate and screen circuits.

The communication system uses the audio section of the radio in conjunction with a special input transformer and switch. The gain or sensitivity of the communication circuit is fixed at the factory and is not altered by the setting of the volume control located on the front panel.

The extension unit uses a standard 3.2 ohm voice coil speaker housed in a baffle. This extension unit is connected to the master unit by means of a two-conductor cable and the distance between these two units should be sufficient to eliminate feedback, howl, etc. A 50-foot coil of wire is furnished with each unit which is sufficient for many installations. Additional length of wire can be used, but it should be remembered that the sensitivity or volume output of the set will be reduced when too long a wire is used or if the wire is too small which increases the resistance.

Below is pictured the Model 458RD showing the functions of the four push buttons. Figure 2 shows the chassis and tube layout.

Caution, do not change tubes when set is turned on.

To align I. F.'s, connect standard R. F. oscillator—unmodulated—direct to antenna and grd. posts. Set oscillator at 10.7 M. C. Connect negative terminal of 0-1 Milliameter in series with a 5000 ohm resistor to junction point of Resistors R13 and R14. Connect positive terminal of meter in series with 5000 ohm resistor to chassis. Adjust all coils—except top of Ratio Detector Coil T3—to highest meter reading. (AVC Voltage)

For top adjustment of Radio Detector Coil (T3), connect positive meter terminal, in series with a 5000 ohm resistor, to junction point of Resistors R6 and R16 and leave negative meter connection as is. Adjust or balance for Zero Voltage.

Adjust gang trimmers for calibration and maximum sensitivity to F. M. oscillator or F. M. station.

MODEL AF252

Lack of sensitivity and poor tone quality may be due to any one or a combination of causes such as weak or defective tubes or speaker, open resistors or shorted condensers, etc. DO NOT ATTEMPT TO REALIGN THIS RECEIVER UNTIL ALL OTHER POSSIBLE SOURCES OF TROUBLE HAVE BEEN FIRST THOROUGHLY INVESTIGATED AND DEFINITELY PROVED NOT TO BE THE CAUSE.

EQUIPMENT NECESSARY

ALIGNMENT PROCEDURE

1. Signal generator-accurately calibrated that will cover the following frequencies:
   AM BAND - 455 KC, 1400 KC, 1620 KC.
   FM BAND - 21.75 MC, 88 MC, 103 MC, 108 MC.

2. Output indicator; to be connected across the voice coil or primary of the output transformer.

BROADCAST BAND ALIGNMENT - (AM)

1. Set signal generator at 455 KC. Receiver variable condenser plates completely unmeshed.
2. Connect generator to grid of convertor tube through a .1 mfd. condenser.
3. Adjust trimmers T1, T2, T3, and T4 in order for maximum output.
4. Connect generator to external antenna lead on loop.
5. Set generator at 1620 KC. Receiver variable condenser completely unmeshed.
6. Adjust oscillator trimmer T5 for maximum output.
7. Set generator and receiver at 1400 KC.
8. Adjust RF trimmer T6 for maximum output.

FREQUENCY MODULATION BAND ALIGNMENT (FM)

NOTES:- The average noise output of this receiver, when no FM signal is present is approximately 150 milliwatts in 3.2 ohms (4 volts across 3.2 ohms). The output meter range should be set accordingly.

1. Set generator at 21.75 MC, with modulation off.
2. Couple generator to RF grid (pin #8) of 14F8 through a 2 mmfd. condenser.
3. Adjust T7 on IF can for minimum output.
4. Remove jumper between terminals A2 and A3 on loop and connect generator to terminals A1 and A2 through a 300 ohm resistor, ground lead of generator to A1.
5. Set RF trimmer T9 to 1/2 capacity, (lettering on the trimmer should be at right angles to its length.)
6. Turn receiver dial to the market on the extreme right side of the dial back. This corresponds to 108 mc.
7. Set generator at 108 mc.
8. Adjust oscillator trimmer T8 for minimum output.
9. Set generator at 88 mc.
10. Set receiver dial to second marker from the extreme left side of the dial back. This corresponds to 88 mc.
11. Adjust oscillator coil for minimum output. Squeeze turns together to bring frequency lower, separate turns to bring frequency higher. Care must be exercised in this adjustment as a slight movement of the turns of the coil will change the frequency of the oscillator a few magacycles. Make certain that the turns do not touch each other.
12. Repeat steps 6 to 11 inclusive as the adjustment at 88 mc. will affect the adjustment at 108 mc and vice versa.
13. Set generator at 103 mc.
14. Tune receiver to 103 mc.
15. Adjust RF trimmer T9 for minimum output while rocking the variable condenser.

NOTES: Voltage readings are for schematic diagram in this bulletin. Allow 15% + or - on all measurements. Always use meter scale which will give greatest deflection within scale limits. All DC measurements made with 20,000 ohms per volt voltmeter. All AC voltages made with rectifier type voltmeter.

* AC Volts

** Cannot be measured with 20,000 Ohms per volt voltmeter.

*** Band switch on F.M.

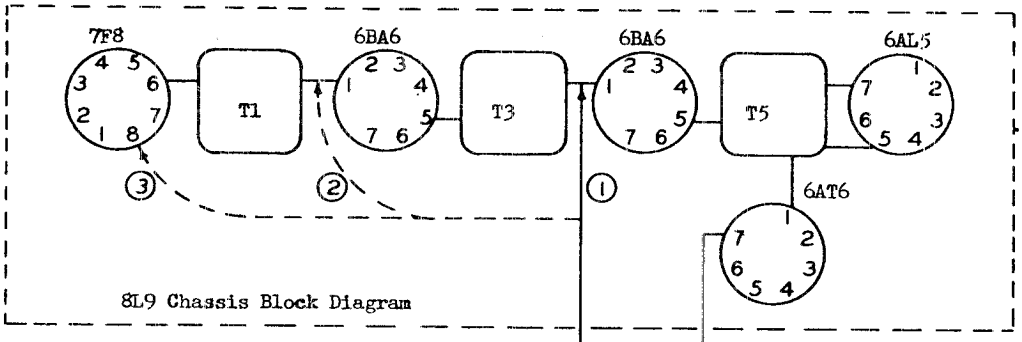
SPECIAL NOTE: F.M. - R.F. mixer may be either 7F8 or 12AT7 tubes.

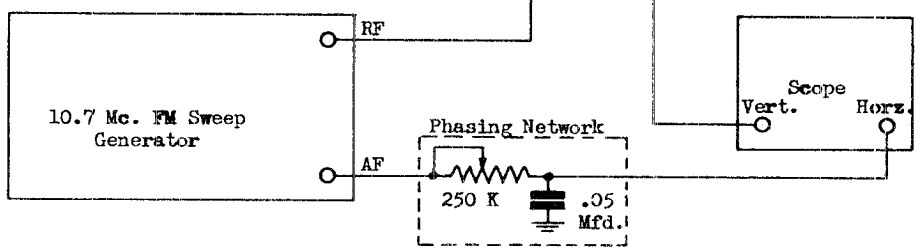
VISUAL I. F.-F. M. ALIGNMENT DATA

WARNING: Do not proceed with any of the following alignment instructions unless it is certain that the AM-IF is in accurate alignment. If not, align the AM-IF system according to the step by step alignment procedure.

1. DESCRIPTION OF CIRCUIT USED:

A 6AL5 is employed as a ratio detector. This tube is preceeded by a 6BA6 ratio detector driver and a stage of amplification at 10.7 Mc. also utilizing a 6BA6 tube. The 2nd section of the 7F8 tube is used as the FM mixer. All IF coupling uses individual slug tuned transformers.





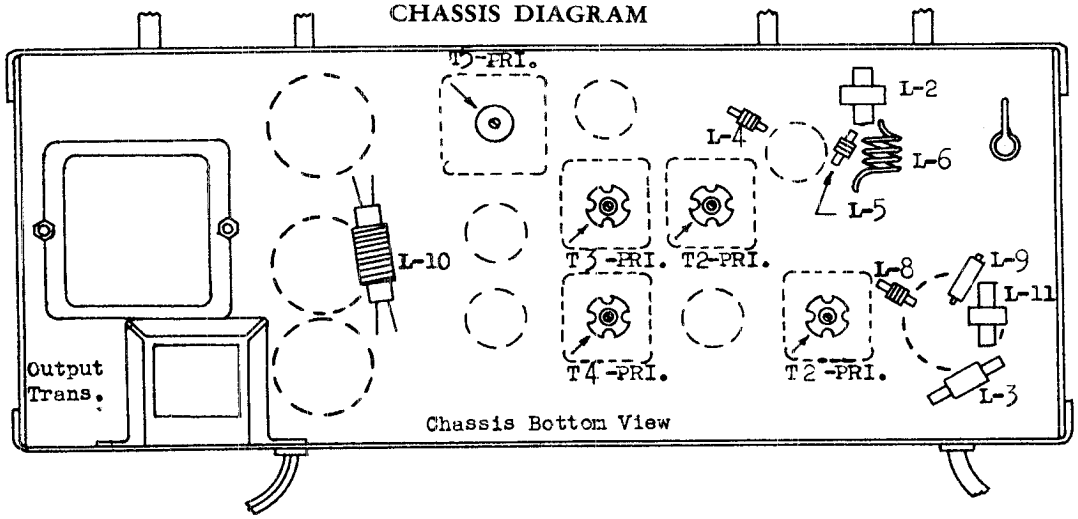
Gen. & Scope Position	Adjust
1	T-5
2	T-3
3	T-1

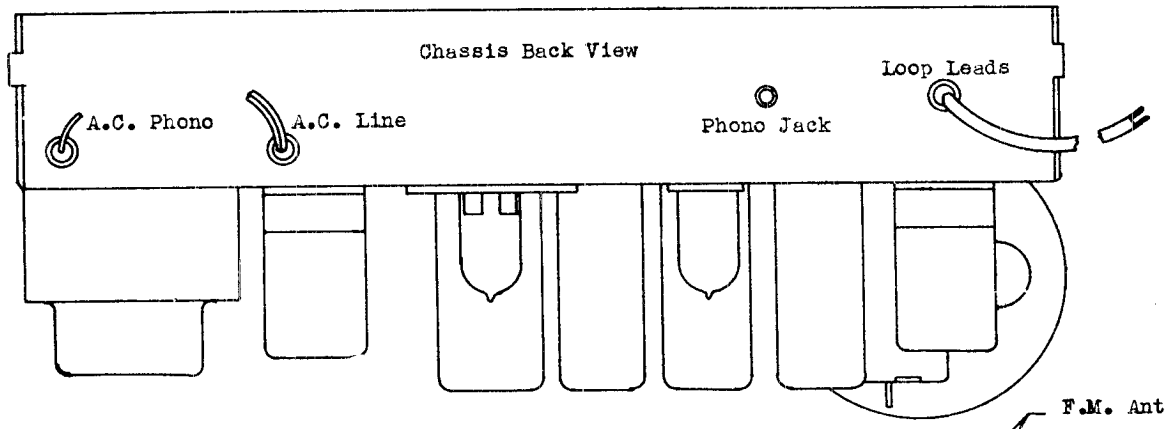
©John F. Rider

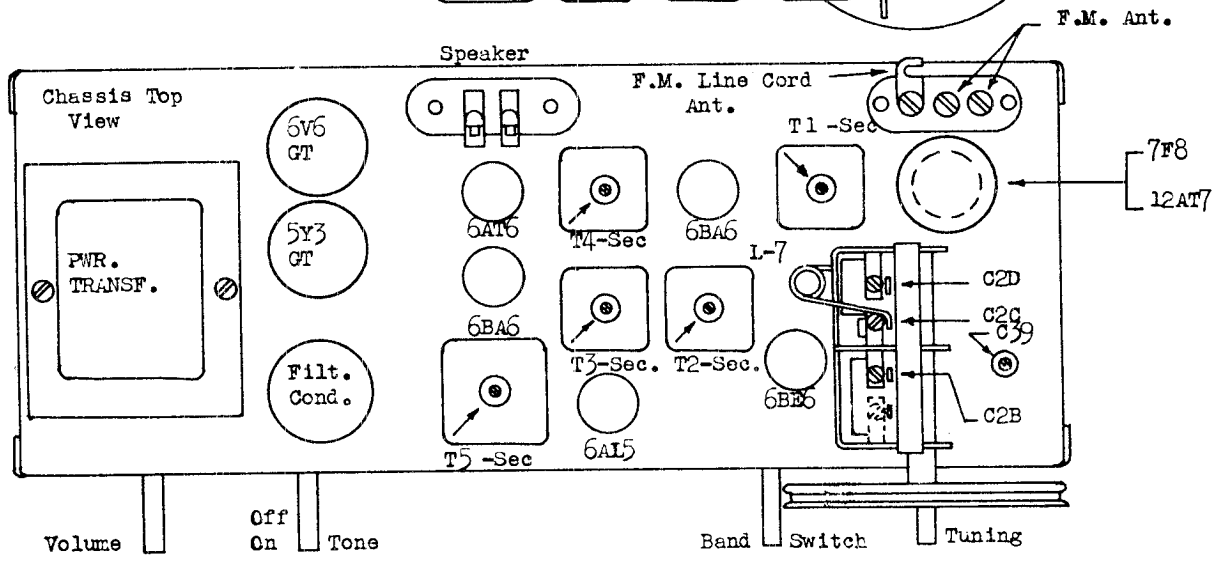
2. THEORY OF VISUAL ALIGNMENT.

One of the characteristics of a tuned circuit is the fact that when it is excited or driven by a generator such as a vacuum tube or another tuned circuit, the voltage developed across it will vary with slight changes in frequency. This voltage will be greatest when the frequency is equal to the resonant frequency of the circuit and will be less if the frequency is higher or lower than the resonant frequency.

CHASSIS DIAGRAM





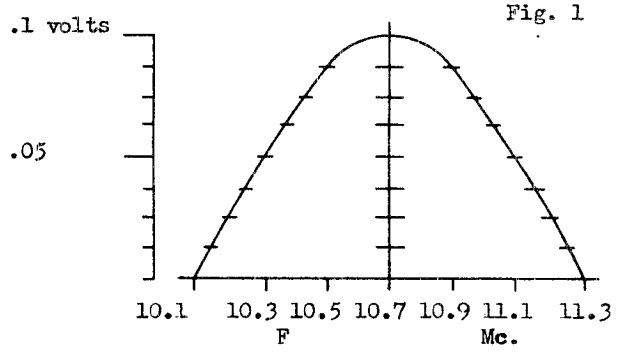


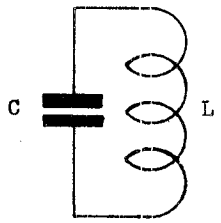
©John F. Rider

VISUAL I. F.-F. M. ALIGNMENT DATA

Thus if we were to shift the frequency from high to low or low to high across the resonant frequency and make a record of the voltage across the tuned circuit, we could plot the voltage against frequency and obtain a curve which might look like Fig. 1.

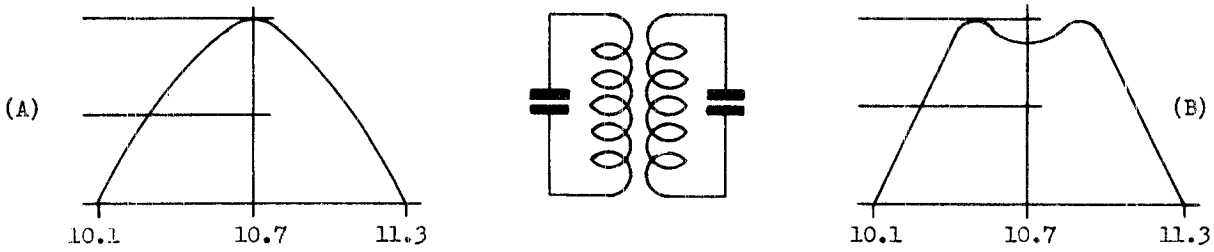
Fig. 1





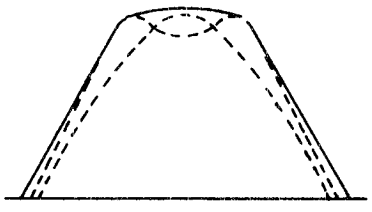
This is the selectivity curve or response curve for the circuit under discussion. This type of circuit may be aligned or adjusted to resonance by simply changing either L or C until maximum voltage is obtained at the resonant frequency. Now if another circuit tuned to the same resonant frequency is coupled to the simple case above, a number of things can happen. First current flowing in one circuit will induce current in the second circuit, the magnitude of this current depending on the degree or amount of coupling between the two circuits. This coupling may be in the form of mutual inductance, mutual capacitance or any impedance common to the two circuits. Now if we repeat the proceedure outlined for obtaining the response curve of a single tuned circuit using the voltage developed across the secondary of the coupled circuit while driving the primary, we may get either of two types of curves depending on the magnitude of the coupling, (a) in Fig. 2 is a typical curve for two circuits coupled below critical coupling and (b) is a representation of the curve for an over coupled circuit.

Fig. 2



Overcoupled circuits producing a response curve like (b) Fig. 2 are often employed where it is important that the response curve remain approximately flat over a narrow band of frequencies near the resonant frequency. They are also frequently combined with single peaked circuits to produce a response curve like Fig. 3.

Fig. 3

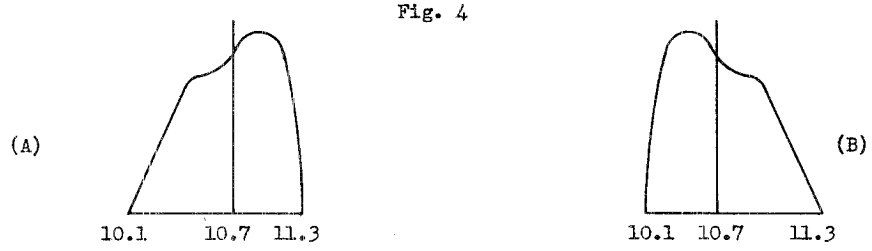


The dotted lines indicate the curves of the individual circuits and the solid curve shows the overall response of the two or more pairs of coupled circuits. Circuits like the above or approaching them in form are desirable in an FM receiver where the pass band should be of the order of 200 Kc. Now from the above it is evident that simple peaking both sides of a circuit coupled below critical for maximum voltage will provide optimum alignment but if this proceedure is followed with an overcoupled circuit it is almost a certainty that the two circuits will not be tuned to the resonant frequency but will instead be aligned so that either one or the other is accentuated. The response curve will then look like Fig. 4 (a) or (b).

©John F. Rider

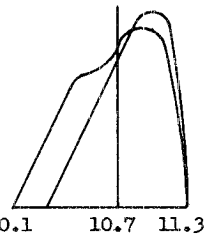
VISUAL I. F.-F. M. ALIGNMENT DATA

Fig. 4



Now if this overcoupled circuit is combined with a single peaked circuit (where the coupling is below critical), the misalignment becomes worse, something like Fig. 5.

Fig. 5



This control should be adjusted so that the dual trace observed on the oscilloscope will blend into a single trace and thereby eliminate any confusion due to the two traces.

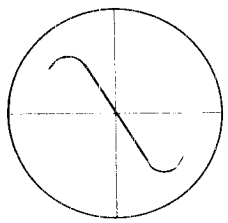
(b) An Oscilloscope with either a 3" or 5" tube equipped with both vertical and horizontal amplifiers.

4. ALIGNMENT OF THE 10.7 I.F.

Turn the wave band switch to F.M. and the generator to 10.7 Mc. Connect the F.M. signal generator output lead to the grid of the ratio detector driver tube and the scope to the 1st audio plate. Now proceed to align the ratio detector transformer for maximum linearity and output, being careful to maintain as symmetrical a trace as possible. Note that the adjustment of the secondary circuit, controls to a large extent, the linearity and symmetry of the pattern, and adjustment of the primary will influence the gain of the circuit. Fig. 6 represents a linear detector curve properly aligned.

It is important that the generator sweep a sufficiently wide band of frequencies so that the curves on both ends of the straight portion can be seen. Maximum linearity of alignment will result when these curves are symmetrically shaped and as previously stated this will result in minimum distortion and noise.

Fig. 6



Connect the generator output lead to the grid of the I.F. amplifier. Align primary and secondary of the I.F. transformer being careful to maintain the same basic ratio detector trace as just described.

Observe that by alternately adjusting the primary and secondary, the vertical amplitude can be increased without the response curve becoming distorted. At all times it is important to reduce the signal generator output to maintain the scope picture on the screen. This will avoid overload and possible misalignment therefrom.

Move the generator lead to the grid of the converter tube and align No. 1 I.F. transformer following the same proceedure as above.

Fig. 7, (A), (B), (C), and (D) represent typical selectivity curves of an overall I.F. Amplifier. Fig. 7, (AA), (BB), (CC), and (DD) represent the corresponding ratio detector curves.

©John F. Rider

VISUAL I. F.-F. M. ALIGNMENT DATA

From the above it appears that to properly align a receiver using overcoupled IF transformers it will be necessary to take a response curve of each stage and align the circuit so that the two peaks are symmetrical, that is, approximately equal in amplitude and displaced equally from the center frequency. To do this with a CW or AM signal would be laborious and time consuming whereas the use of visual equipment makes it nearly as simple as adjusting a simple single peaked amplifier.

Visual alignment test equipment performs the operation of plotting the response curve almost exactly as described above except that instead of manually changing the generator frequency, recording the voltage and then plotting the results, these operations are performed automatically and simultaneously by a combination of electronic circuits. The operation is briefly as follows.

In the signal generator a low AC voltage is applied to a reactance tube modulator which shifts the oscillator frequency from low to high or from high to low at a rate determined by the frequency of the AC voltage and by an amount determined by the AC voltage. The frequency at any instant is dependant on the AC voltage present at that instant of time. An oscilloscope is provided which may be considered a voltmeter used to read the voltage across the tuned circuit, provided a detector is used to convert the RF to a low audio frequency. This voltage is then applied to the vertical plates and results in a vertical displacement of the spot on the screen. Some of the voltage used to shift the oscillator frequency is also applied to the horizontal plates of the oscilloscope providing a means of displacing the spot horizontally. It is now evident that since for any given AC voltage only one frequency may be obtained and since that AC voltage will result in an exact amount of spot deflection on the scope we can read the voltage across the circuit under examination by noticing the position of the spot at this exact instant.

Now if we consider the frequency as shifting from low to high 60 times per second and remember that the spot is moving across the screen of the scope 60 times per second at exact synchronization with the change in frequency it is only necessary to apply the voltage from our circuit to the vertical plates to obtain a replica of the response curve on the face of the cathode ray tube. This curve will be repeated 60 times per second if our sweep frequency is 60 cycles. Adjustments to the circuit may now be made and the effect on the response curve noted instantaneously.

Although it is possible to observe the selectivity curves as shown in Fig. 1, 2, and 3 on the scope by the use of an auxiliary special detector coupled to the plate of the last IF tube, it is much more convenient to observe the effects of IF alignment upon the shape of the ratio detector output trace. When this is done the auxiliary detector is not necessary and a direct connection of the scope into the receiver circuits will provide all the necessary connections.

If the overall selectivity curve is not "flat-topped" (solid line in Fig. 3) the ratio detector curve cannot be linear (straight) throughout the center section, symmetrical and have sufficient band width (Fig. 6).

Under these conditions it would not be possible to receive a signal without distortion and higher than normal noise, the degree of distortion and abnormal noise dependent upon the extent to which the center of the ratio detector trace departs from a straight line and the extent to which the entire trace departs from true symmetry.

After a pattern similar to Fig. 6 is obtained with connection #1 shown in the block diagram, the generator lead may be moved ahead through the IF system one tube at a time and the intervening transformer aligned for maximum output but at all times a curve very similar to Fig. 6 must be maintained.

3. EQUIPMENT REQUIRED.

(a) A sweep signal generator with a center frequency of 10.7 Mc. and a total sweep width of at least 400 Kc. Examination of the block diagram will reveal a variable resistor-capacitor circuit inserted in the lead between the FM sweep generator and the horizontal amplifier of the oscilloscope.

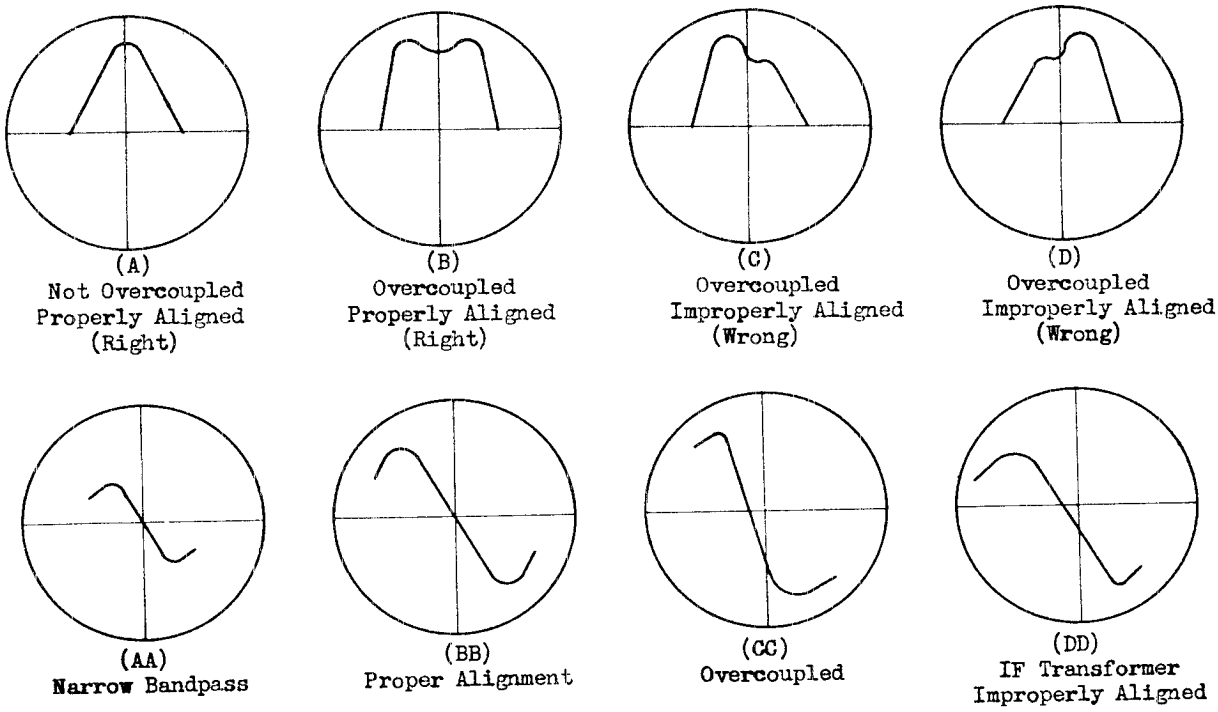
VISUAL I. F.-F. M. ALIGNMENT DATA

Fig. 7



(A) Not Overcoupled Properly Aligned (Right)

(B) Overcoupled Properly Aligned (Right)

(C) Overcoupled Improperly Aligned (Wrong)

(D) Overcoupled Improperly Aligned (Wrong)

(AA) Narrow Bandpass

(BB) Proper Alignment

(CC) Overcoupled

(DD) IF Transformer Improperly Aligned

Should the trace appear unsatisfactory, a very slight readjustment of the detector secondary alignment may be made at this time as the need for any but a slight correction is an indication of incorrect alignment in one of the other stages. This is permissible only if the degree of correction necessary is slight. If this is not the case the entire alignment procedure should be repeated.

BOTTOM VIEW, TERMINAL HOOKUP FOR T-1, T-2, T-3, T-4, T-5

SPECIAL SERVICE NOTE: THESE TRANSFORMERS SUPPLIED IN COMPLETE ASSEMBLIES ONLY.

CHASSIS TYPE 8L9A

USED IN MODELS 121, 122, 141, 142, 1058, 1059, 1060, 1061, 1064, 1072, 1071MGP AND 1072MGP.

The 8L9 chassis with the following mechanical and electrical revisions was released and run in production and was designated chassis type 8L9A. This chassis was used in the models as listed above and differs from chassis type 8L9 as follows:

MECHANICAL CHANGE

1. The dial light assembly has been designed to travel with the pointer across and in back of the dial scale.

ELECTRICAL CHANGES

1. Resistor R23, 470 Ohm. 2 Watt removed from circuit.
2. Filter choke T-8 is connected across same terminals where R23 resistor was removed.
3. Red lead from putput transformer disconnected and tied into B + after passing through filter choke T-8.

Receiver alignment and other specification was not affected by this circuit revision.

SPECIAL SERVICE NOTE: THESE TRANSFORMERS SUPPLIED IN COMPLETE ASSEMBLIES ONLY

MODELS 130, 132, 135, 139; Ch. 5A10

Due to mechanical design of the tuning mechanism in this Sparton model, the receiver chassis cannot be removed from the cabinet without removing the dial scale and pointer. When chassis removal becomes necessary, the serviceman will experience little if any difficulty in chassis removal or installtion if the following procedure is adhered to.

CHASSIS REMOVAL

1. Remove both control knobs.
2. The dial scale is held into position by flanges on the outer edge directly above and below the calibration numbers 1600KC and 5.50KC respectively and a small tab under the metal grill at approximately the 900KC mark. Using a small screwdriver, snap out the ends of the scale from under the cabinet front panel and slide the dial scale to the right and out of position. Sliding scale to the right prevents the holding tab at 900KC point from being broken off.
3. Remove the (3) rubber footed chassis mounting screws.
4. Remove the (2) fasteners which hold the back cover at top corners. Do not remove the (2) hex-head screws at the bottom corners.
5. At this point proceed to remove pointer from tuning shaft and to slide receiver chassis out of the cabinet simultaneously. When the dial pointer has been removed from the tuning shaft, the receiver chassis is free and may be removed from the cabinet.

CHASSIS INSTALLATION

1. Turn tuning condenser to the fully closed position (550KC).
2. Slide receiver chassis into cabinet until the tuning shaft starts to enter the clearance hole in grill. At this point, place the dial pointer over the end of the tuning shaft between the metal grill and the Bakelite panel and continue to slide the chassis forward and at the same time push the pointer onto the shaft until the pointer seats into position on the planetary drive collar of the tuning condenser and the chassis has reached its mounting position in the cabinet.
3. At this point turn the dial pointer counter-clockwise to the straight down position. (Approximately the 550KC position).
4. Install the (3) rubber footed chassis mounting screws and the (2) snap fasteners for back cover.
5. Install the dial scale by sliding the holding tab in and under the slot in the metal grill. Snap the end into position in the cabinet front panel.
6. At this point, turn receiver on and air check for pointer calibration. Should the pointer be slightly past the stop mark on dial scale, the pointer may be moved slightly forward or back with a small pointed instrument through the opening between dial scale and cabinet panel until pointer calibration is correct.
7. Install control knobs.

MODEL SC-448,
FM Tuner

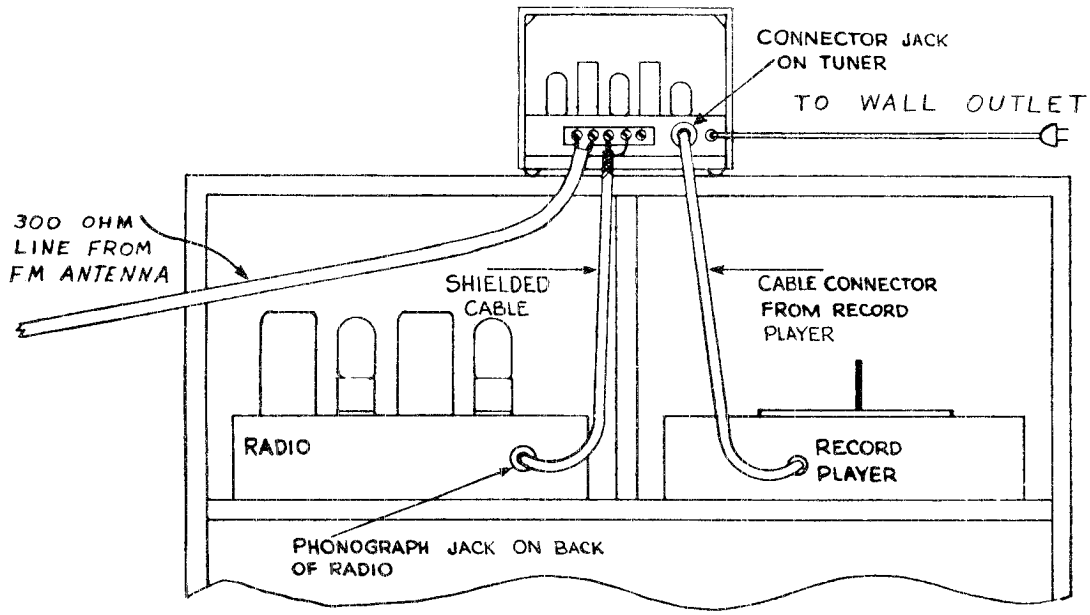

Figure 1—Console Installation

DESCRIPTION

Your FM tuner is a four-tube (plus rectifier) superheterodyne designed to cover the frequency range of the FM broadcast band from 88 to 108 megacycles. It must be operated in conjunction with a broadcast receiver or other audio amplifier. It requires a power source of from 105 to 125 volts, alternating current (AC).

WARNING: Do not connect to any other source.

INSTALLATION

The tuner must be connected to the audio or phonograph circuit of your standard broadcast receiver or to a separate audio amplifier. This can be done in several ways, depending on the type of set. Some of the methods are outlined below. Determine the type of installation you require and proceed as directed.

WARNING: Before proceeding with installation, make certain that the tuner and the radio or amplifier are both disconnected from the power outlet.

NOTE—In every case, the output of the tuner will come from terminals No. 3 and No. 4 at the rear of the tuner. Connections to these terminals should be made with a single conductor shielded cable, with the center conductor connected to No. 3 and the outer shield to No. 4. A length of this cable is packed with your tuner. This cable has a phonograph plug connected to one end which will simplify most installations.

1. If your radio is of the combination type, that is, it also plays records, it probably has the record pickup connected to the radio chassis with a shielded cable and plug like that supplied with your tuner. To connect the tuner to this type of set, pull out the record player plug and plug in the tuner output cable, connected as above. Plug the record player cable into the receptacle at the rear of the tuner. This method of connection is shown in Fig. 1.

2. If your radio is of the combination type but does not have the above type of plug on the record pickup cable, or has no plug connection at all, it will be necessary to disconnect the pickup cable where it connects to the radio. This cable is then connected to terminals No. 4 and No. 5 on the tuner. The shield or ground connection should be made to No. 4 and the center conductor to No. 5. Then connect the tuner output cable to the points where the pickup cable was removed. In order to do this, it will be necessary to cut off the plug at the end of the cable. This connection could best be made by your radio service man.

3. If your radio does not have a record player, the tuner output lead will have to be connected to the audio amplifier portion of your radio. This connection will vary with the type of set that you have, and it is best that this be done by your radio service man.

4. If you are going to use your tuner with an audio amplifier, terminals No. 3 and No. 4 should be connected to the input of the amplifier. If you have a choice of inputs, use the one intended for use with a phonograph.

For best operation, your tuner should be connected to an FM antenna, preferably located out-of-doors. (Select an Aircastle FM Antenna from your big Spiegel catalog.) The tuner is designed for an antenna of the folded-dipole type that uses 300 ohm parallel-line lead-in. Make the lead-in connections to terminals No. 1 and No. 2.

In many cases, you can get satisfactory reception with a short piece of wire (6 to 8 feet long) connected to terminal No. 1.

OPERATION

Insert the tuner power cord into the power receptacle. Turn on your radio or amplifier and switch it to phonograph (if necessary). Your tuner has three conditions of operation, as follows:

1. With the left-hand knob in extreme counter-clockwise or left position the phonograph of your set is connected for normal phonograph operation, and the tuner is off.

2. With this knob in the center position, the tuner power is on, but the phonograph of your set is still connected for normal operation. This standby position allows you to switch from phonograph to tuner without waiting for the tuner to warm up.

3. In the extreme clockwise or right position, the tuner is on and the phonograph off. This is the position in which the tuner makes it possible for you to pick up FM stations on your AM radio.

With the tuner on (and after about a 30 second warm-up) turn the right-hand knob slowly until a station is heard clearly and adjust the volume control on your broadcast receiver or amplifier to the desired intensity. Do not reduce the volume by tuning the unit off station.

©John F. Rider

MODEL SC-448,
FM Tuner

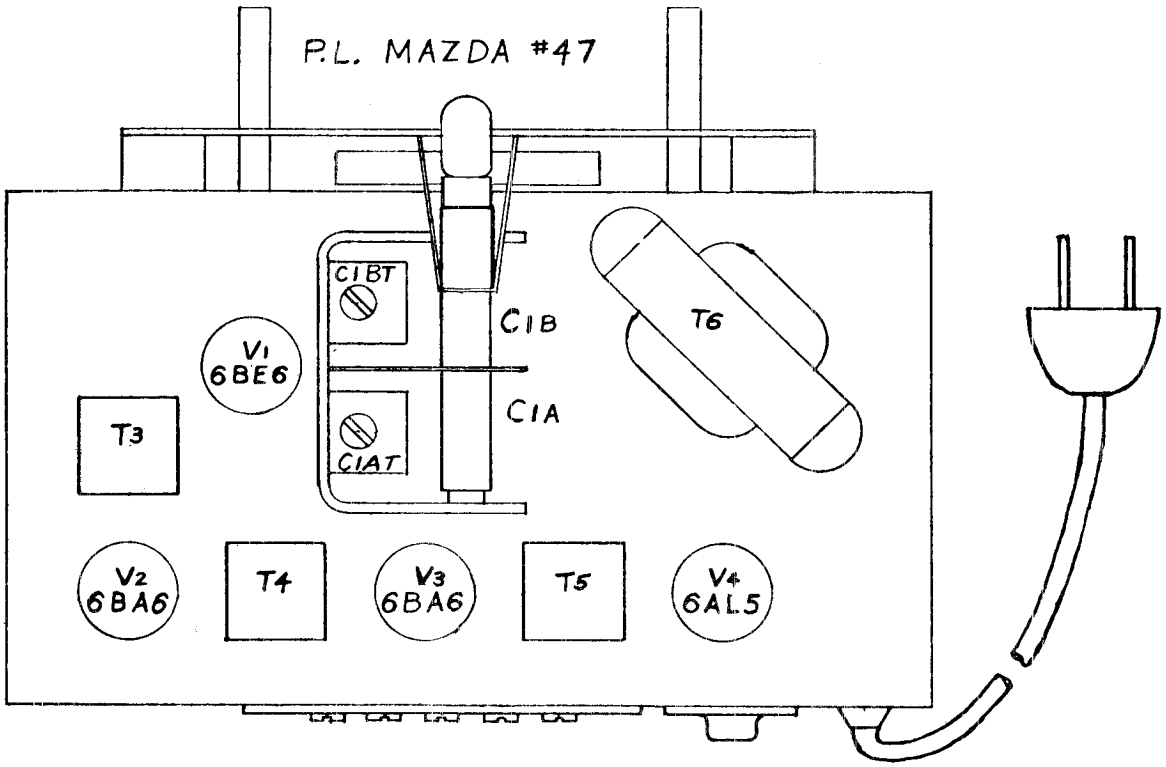

Figure 2—Location Diagram

Alignment Procedure

I. F. ALIGNMENT

An unmodulated or AM signal generator set at 10.7 Mc. is required. For each step, the generator output should be adjusted to give from 1 to 5 volts on the vacuum tube voltmeter as connected below. For best results a VTVM employing a probe should be used. Refer to Fig. 2 and Fig. 3 for symbol numbers.

1. Connect generator to pin 1 of V_3 and ground. Using a VTVM connected from V_4 pin 7 to ground, tune T_5 top to maximum reading.

2. Connect a 200,000 ohm center-tapped resistor from V_4 pin 2 to ground. Connect the VTVM ground lead to the resistor center-tap and the probe to the junction of R_7 and C_{10}. With the generator connected as in (1.) above, tune T_5 bottom for 0 volts.

3. Move the generator connections to V_2 pin 1 and ground. Connect VTVM as in step (1.). Shunt T_4 secondary with a 1000 ohm resistor and tune primary (bottom) to peak reading on the VTVM. Move shunting resistor to primary and tune secondary in like manner.

4. Move generator connections to V_1 pin 7 and ground. Repeat the operations of step (3.) on I. F. transformer T_3.

R. F. ALIGNMENT

A signal generator of good frequency accuracy and low leakage is required. For all of the following adjustments, the signal generator is connected to terminals No. 1 and No. 2 through two 120 ohm resistors (one resistor on each terminal).

1. Set the signal generator at 90 Mc. and tune to 90 on the dial. Adjust the spacing of the turns on T_2 for maximum output. For best results on output indication, use a VTVM connected to pin 7 of V_4 and ground.

2. Set the signal generator at 106 Mc. and tune to 106 on the dial. Alternately adjust C1B trimmer and C1A until no further increase in output can be obtained.

3. Repeat Step (1.), then repeat step (2.). If necessary, go back and forth between step (1.) and step (2.) until no further improvement is obtained.

HOW TO ORDER PARTS

Always give part number (and number printed on part if different from number shown on parts list), and name of part. When this information is not available, give complete description of part. Be sure to give Model and Catalog number.

The Model number will be found stamped on the rear of the chassis.

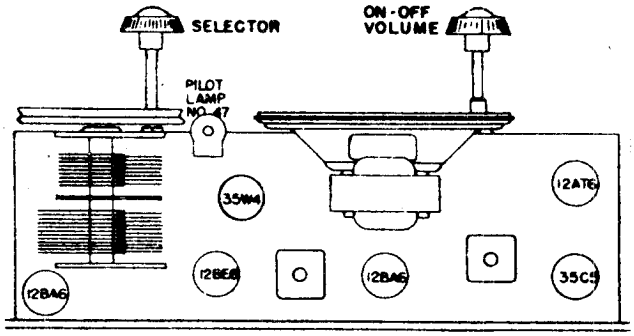
TUBE LOCATION CHART



ALIGNMENT PROCEDURE

1. Connect a suitable signal generator to the R.F. section of the tuning condenser. Connect the ground side of the generator to the frame of the condenser Use a .05 condenser to isolate the generator from the R.F. section.
2. Connect a suitable output meter to the voice coil leads of the speaker.
3. With the variable condenser open, apply a 455 Kc. signal. Use the lowest level consistent with good output indication.
4. Adjust I.F. transformer trimmers to this frequency.
5. Apply a 1620 Kc. signal to loop and adjust trimmer to maximum.
6. Set the signal generator to 1400 Kc. Tune the receiver dial to maximum response, then adjust R.F. trimmer to maximum response. This completes the alignment.

MODEL 211

POWER SUPPLY

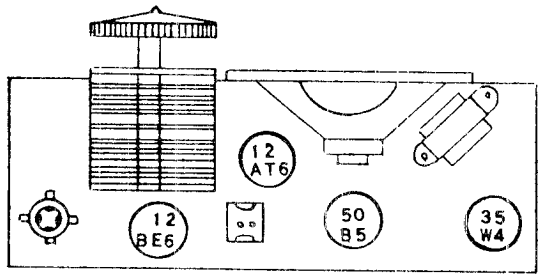
This receiver is designed to operate on either an A.C. or D.C. power supply. The following operation ratings should be observed:

Voltages.....105-125 Volts, A.C. or D.C.

Frequency.....50 to 60 cycles on A.C.

If in doubt as to the voltage and frequency supplied to your home, telephone your local power company.

When operating on a D.C. source, it is necessary to insert the power plug with the proper polarity. If the set fails to function after an interval sufficient for the tubes to reach their operating temperature, reverse the power plug in the outlet.



Remove back to replace tubes

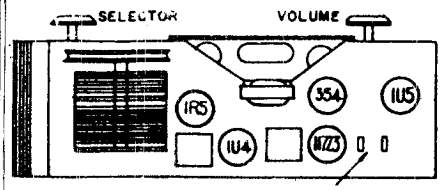
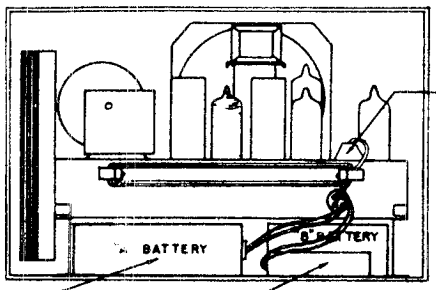
MODEL 213



INSERT LINE CORD PLUG HERE FOR BATTERY OPERATION



Line cord plug shown in position for battery operation, with line cord wrapped around line cord retainers.

For A.C.-D.C. operation remove plug from chassis, unwrap cord and bring out of notch in side of cover.

Insert two-prong plug into "A" BATTERY. Make sure large pin engages large contact in battery. Excessive force is not required to push plug into battery.

Place "B" BATTERY so that contacts are toward bottom. Snap fasteners onto battery.

POWER SUPPLY

This receiver is designed to operate on either an A.C. or D.C. power supply. The following operation ratings should be observed:

Voltages.....105-125 Volts, A.C. or D.C.

Frequency ..... 50 to 60 cycles on A.C.

If in doubt as to the voltage and frequency supplied to your home, telephone your local Power Company.

When operating on a D.C. source, it is necessary to insert the power plug with the proper polarity. If the set fails to function after an interval sufficient for the tubes to reach their operating temperature, reverse the power plug in the outlet.

The battery supply to be used with this receiver is as follows:

"A" supply.....4½ volts. Use Aircastle No. 1512; Eveready No. 746; RCA VS 002, Rayovac P-83A; SEARS-6440 or equivalent. Eveready No. 736 or equivalent.

"B" supply.....67½ volts. Use Aircastle No. 1523 or Burgess No. XX45 or Eveready No. 467 or RCA-VS-016 or equivalent.

ALIGNMENT AND SERVICE DATA

Remove chassis from cabinet for alignment.

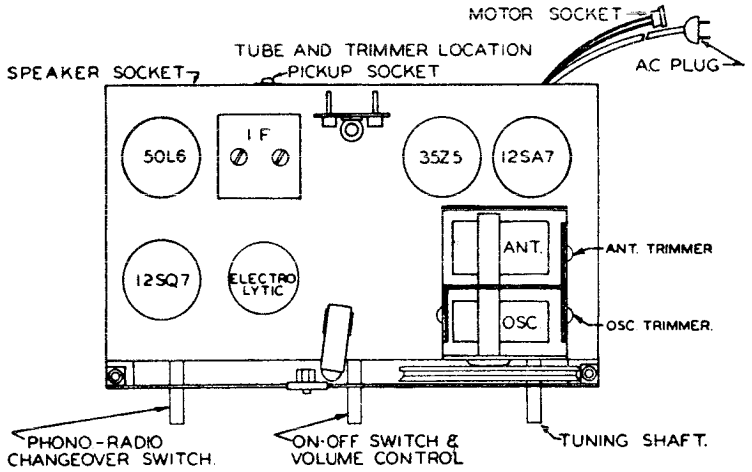
A Signal Generator is required having the following frequencies: 455 KC, 1400 KC, 1620 KC. An output meter should be connected across the speaker.

The receiver volume control should be turned to maximum during the I.F. and all subsequent alignments to keep the AVC from working and giving false readings. Keep the generator output as low as possible to prevent overloading.

FIRST STEP: Connect the hot lead from the generator to the ANT. section of the gang condenser, through a .1 MFD condenser. The ground lead from the generator must be connected to the floating ground buss under the chassis. Turn the gang condenser to complete minimum capacity. Adjust the generator to 455KC and adjust the trimmers of the 1st and 2nd I.F. transformers until a maximum reading is noted on the output meter.

SECOND STEP: With the leads from the generator still connected in the same manner, adjust the Signal Generator to 1620 KC. The OSC. trimmer is located on the front of the chassis. Adjust this trimmer until the 1620 KC signal is tuned in.

THIRD STEP: Remove the hot lead of the generator from the ANT section of the gang condenser. Connect this lead to the primary of the antenna coil through a 200 MMFD condenser. Adjust the Signal Generator to 1400 KC. Rotate the tuning control until this signal is tuned in. The ANT trimmer is located on the top of the ANT. section of the gang condenser. Adjust this trimmer until a maximum reading is noted on the output meter. No further adjustment should be necessary, unless the set has been damaged, as the coils and condenser in this receiver have been specially handled at the factory to insure proper alignment at the lower frequencies.



POWER SOURCES: This combination will operate on alternating (AC) current only, of 110 to 125 volts at 60 cycles.

ALIGNMENT DATA

Remove the chassis from the cabinet. A Signal Generator with the following frequencies is required: 455 KC, 1400 KC and 1720 KC.

The receiver volume control should be turned to maximum during the I.F. and all subsequent alignments to keep the A.V.C. from working and giving false readings. Turn the tone control to complete left hand position. Keep the generator output as low as possible to prevent overloading.

Connect an output meter across the voice coil of the speaker.

Connect a 20,000 ohm resistor across the loop connector terminals to reflect the proper loop impedance.

FIRST STEP: Connect the hot lead from the generator to the "ANT." section of the gang condensor through a .1 MFD. condensor. The ground lead must be connected to the floating ground buss under the chassis. Turn the gang condenser to complete minimum capacity. Adjust the generator to 455 KC and adjust the trimmers of the 1st and 2nd I.F. transformers until a maximum reading is noted on the output meter.

SECOND STEP: With the leads from the generator connected in the same manner as in I.F. alignment, adjust the signal generator to 1720 KC. The "OSC." trimmer is located on the front section of the gang condenser. Adjust this trimmer until the signal is tuned in. The gang condenser should be at complete minimum capacity for this setting.

THIRD STEP: Remove the generator leads from the chassis. Remove the 20,000 ohm resistor from the loop connector terminals. Reinstall the chassis in the cabinet, connect the loop leads, motor plug and phono pickup leads.

Connect the generator leads to a transmitting loop, made of a few turns of wire, and loosely couple to the receiver loop antenna which is located on the back end of the cabinet. Adjust the generator to 1400 KC. Rotate the tuning control until this signal is tuned in. The "ANT." trimmer is located on the rear section of the gang condenser. Adjust this trimmer until a maximum signal is noted on the output meter.

No further adjustment should be necessary, unless the receiver has been damaged, as the coils and tuning condenser have been specially handled at the factory to insure proper alignment at the lower frequencies.

HOW TO ORDER REPAIR PARTS

Always give the part No. (No. printed on the part if different from that shown on list), and the name of the part. When No. is not available, give complete description of part. Be sure to always give the Model No. and Catalog No. The Model No. will be found on either the metal plate at the rear of the chassis or on a printed label which may be on the chassis or cabinet.

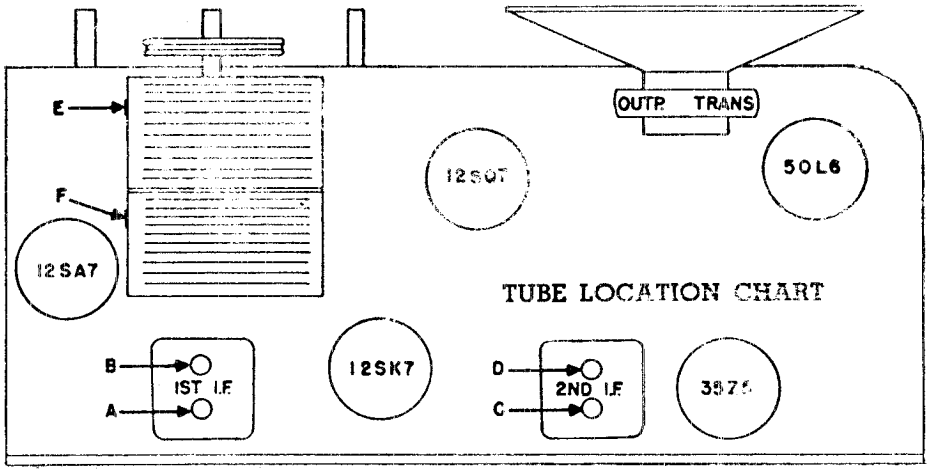
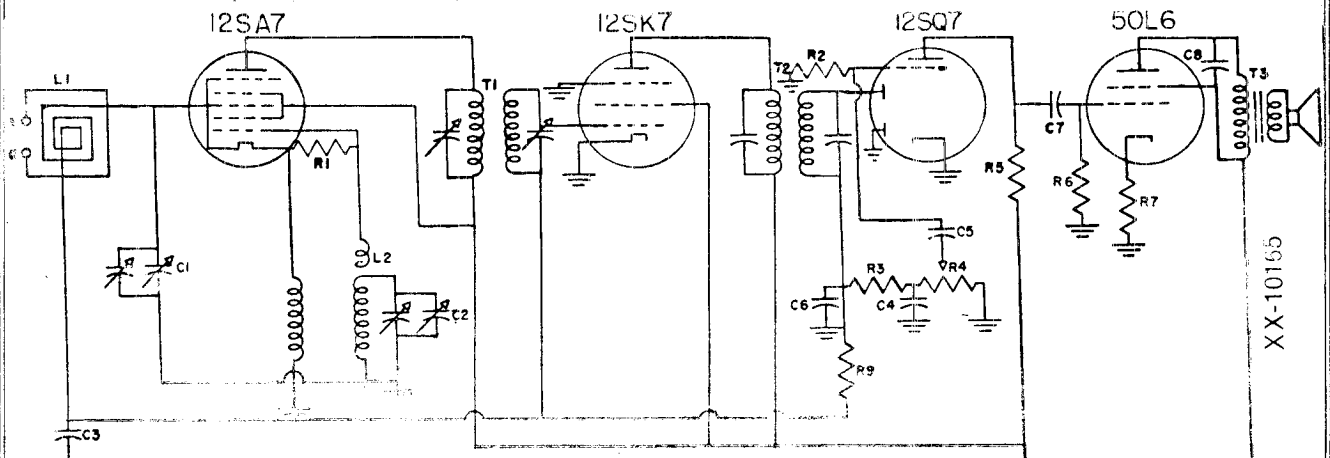
MODEL 10003

ALIGNMENT PROCEDURE

1. Connect a suitable signal generator to the R.F. section of the tuning condenser. Connect the ground side of the generator to the frame of the condenser. Use a .05 condenser to isolate the generator from the R.F. section.
2. Connect a suitable output meter to the voice coil leads of the speaker.
3. With the variable condenser open, apply a 455 Kc. signal. Use the lowest level consistent with good output indication.
4. Adjust trimmers A, B, C, and D for maximum response, reducing the input signal as required to keep the output meter on scale.
5. Connect the generator to terminals A & G through a 400 ohm dummy antenna. Apply a 1720 Kc. signal and adjust trimmer E to maximum.
6. Set the signal generator to 1400 Kc. Tune the receiver dial to maximum response, then adjust trimmer F to maximum response. This completes the alignment.





The tuning range of this receiver is 550 to 1600 kilocycles. The dial has the last 0 omitted so that 55 is 550 Kc. and 160 is 1600 Kc.

MODEL 10005

ALIGNMENT PROCEDURE

1. Connect suitable signal generator to AM R.F. section of the tuning condenser. Connect ground side of generator to chassis. Isolate the generator with .05 condenser from AM R.F. section.

2. Connect a suitable output meter to the voice coil loads of the speaker.

3. With the band switch in AM or counter clockwise position and the gang open, apply a 455 Kc signal. Use the lowest level consistent with good output indication.

4. Adjust slugs E-F-I-J for maximum response reducing the input signal as required to keep the output meter on scale.

5. Connect a vacuum tube voltmeter from test point "A" to chassis -- isolate both sides with 1 meg resistor.

6. Turn band switch to FM or clockwise position. Connect generator to FM mixer grid. Apply a 10.7 Mc signal. Use the lowest level consistent with good output indication.

7. Adjust slugs G-H-K-L-N for maximum output as indicated on vacuum tube voltmeter.

8. Across "A" and "C" (test points indicated on schematic) balance M (top slug) to zero voltage on meter.

9. Return band switch to AM position and connect generator to Terminals "A" "G" (on rear of chassis). Apply a 1720 signal and set trimmer "B" to maximum; set signal generator to 1400 Kc and tune set to maximum response, adjust trimmer "D" to maximum response.

10. Return band switch to FM position and open gang. Connect suitable generator to Terminals #2 and #3 (use 300 ohm dummy).

11. Adjust trimmer "A" for maximum response.

12. Set generator to 105 Mc and tune set to maximum response. Adjust trimmer "C" to maximum by rocking gang as the trimmer is adjusted. This completes alignment.

OPERATION

Insert the power cord plug into the AC outlet receptacle. Turn knob "A" to the right until a click is heard. After a warm-up period of approximately 30 seconds, the set will be in operating condition. Advance the Volume Control (Knob A) to the right until the desired volume level is attained. Tuning knob (Knob D) setting is indicated by means of a beam of light through the translucent knob. Tone of the set is varied by turning knob "B", to the left for more bass, and to the right for more treble tones. The phono will be put in operation by setting knob "C" to its extreme right hand position. Never carry the set by its handle without first locking tone arm to the stand provided for it.

117 volts 60 cycles AC

It covers the standard AM broadcast frequency range, 540-1600 kilocycles (KC) and the FM frequency range from 88 to 108 megacycles (MC) and comes to you equipped with a built-in loop antenna for use on AM reception. Also included is a flexible folded dipole antenna attached to the inside of the cabinet for use on FM reception.

SPECIFICATIONS

Power Supply	117 volts AC 60 cycle
Power Consumption	95 Watts
Frequency Range FM	88 to 108 MC.
Frequency Range AM	540 to 1600 KC.
I.F. frequency FM	10.7 MC.
I.F. frequency AM	455 KC.
Band width, FM, Ratio detector	360 KC.
Band width, FM, 2nd I.F.	280 KC.
Band width, FM, 1st I.F.	240 KC.
Band width, FM, Converter	180 KC.
Tubes	10
Rectifiers	Selenium, 150 ma.
Speaker	10" P.M.

The tubes used are as follows:

12BA6	FM, R.F. Amplifier
12BE6	FM, Converter
12BA6	FM, 1st I.F. Amplifier
12BA6	FM, 2nd I.F. Amplifier
12BA6	FM, 3rd I.F. Amplifier
6AL5	FM, Ratio detector
12BE6	AM, Converter
12BA6	AM, I.F. Amplifier
12AT6	AM, Detector-AVC-1st audio
50L6GT	Power output
A83-463	Selenium rectifier (2)
No. 47	Pilot lights (2)

SERVICE NOTES

GENERAL

Due to the high frequencies at which FM signals are received the service man must use great care when servicing these sets. Extreme caution must be used regarding the moving of component parts in the R.F. and oscillator circuits of the receiver as those circuits can be detuned in this manner.

If it becomes necessary to replace components such as resistors and condensers they must be replaced with parts of the same size, type, voltage rating and tolerance as called for in the parts list.

When installing new parts they should be placed in the same position as the original, and the leads should be cut to the same length.

ALIGNMENT NOTES

This receiver has been thoroughly inspected and tested at the factory, using the most modern test equipment available, such as FM sweep generators and Oscilloscopes. All I.F. circuit adjustments have been sealed at the factory and no attempt should be made to realign these circuits unless it is absolutely necessary.

CAUTION: If realignment is necessary be sure the proper test equipment is available, as listed below, before proceeding with the alignment procedure as given on page 5. This receiver employs the "double peak" type of I.F. circuits, and can not be satisfactorily aligned with conventional AM equipment. Visual alignment procedures must be used.

EQUIPMENT USED FOR ALIGNMENT

AM Signal generator

FM Sweep generator.

Oscilloscope.

Vacuum tube voltmeter.

Insulated screw driver.

Dummy antenna:
- .1 MFD condenser
- .00025 MFD mica condenser
- 150 ohm resistor (2)

Output meter.

All voltage readings are taken from tube pin to chassis.

All measurements are made with no signal, using a 20,000 ohm per volt meter.

AC input voltage must be maintained at 117 volts for accurate readings.

AC voltages shown are at 1000 ohms per volt.

All voltages shown are approximate.

All resistance readings are taken from tube pin to chassis.

Due to manufacturing tolerance on component parts, resistance readings may vary as much as 20%.

All readings are shown in ohms unless otherwise noted.

117 volts 60 cycles AC current.

It covers the standard AM broadcast frequency range, 540-1600 kilocycles (KC) and the FM frequency range from 88 to 108 megacycles (MC) and comes to you equipped with a built-in loop antenna for use on AM reception. Also included is a flexible folded dipole antenna attached to the inside of the cabinet for use on FM reception.

SPECIFICATIONS

Power Supply	117 volts AC 60 cycle
Power Consumption	95 Watts
Frequency Range FM	88 to 108 MC.
Frequency Range AM	540 to 1600 KC.
I.F. frequency FM	10.7 MC.
I.F. frequency AM	455 KC.
Band width, FM, Ratio detector	360 KC.
Band width, FM, 2nd I.F.	280 KC.
Band width, FM, 1st I.F.	240 KC.
Band width, FM, Converter	180 KC.
Tubes	10
Rectifiers	Selenium, 150 ma.
Speaker	10" P.M.

The tubes used are as follows:

12BA6	FM, R.F. Amplifier
12BE6	FM, Converter
12BA6	FM, 1st I.F. Amplifier
12BA6	FM, 2nd I.F. Amplifier
12BA6	FM, 3rd I.F. Amplifier
6AL5	FM, Ratio detector
12BE6	AM, Converter
12BA6	AM, I.F. Amplifier
12AT6	AM, Detector-AVC-1st audio
50L6GT	Power output
A83-463	Selenium rectifier (2)
No. 47	Pilot lights (2)

SERVICE NOTES

GENERAL

Due to the high frequencies at which FM signals are received the service man must use great care when servicing these sets. Extreme caution must be used regarding the moving of component parts in the R.F. and oscillator circuits of the receiver as those circuits can be detuned in this manner.

If it becomes necessary to replace components such as resistors and condensers they must be replaced with parts of the same size, type, voltage rating and tolerance as called for in the parts list.

When installing new parts they should be placed in the same position as the original, and the leads should be cut to the same length.

ALIGNMENT NOTES

This receiver has been thoroughly inspected and tested at the factory, using the most modern test equipment available, such as FM sweep generators and Oscilloscopes. All I.F. circuit adjustments have been sealed at the factory and no attempt should be made to realign these circuits unless it is absolutely necessary.

CAUTION: If realignment is necessary be sure the proper test equipment is available, as listed below, before proceeding with the alignment procedure as given on page 5. This receiver employs the "double peak" type of I.F. circuits, and can not be satisfactorily aligned with conventional AM equipment. Visual alignment procedures must be used.

EQUIPMENT USED FOR ALIGNMENT

AM Signal generator

FM Sweep generator.

Oscilloscope.

Vacuum tube voltmeter.

Insulated screw driver.

Dummy antenna:
- .1 MFD condenser
- .00025 MFD mica condenser
- 150 ohm resistor (2)

Output meter.

All voltage readings are taken from tube pin to chassis.

All measurements are made with no signal, using a 20,000 ohm per volt meter.

AC input voltage must be maintained at 117 volts for accurate readings.

AC voltages shown are at 1000 ohms per volt.

All voltages shown are approximate.

All resistance readings are taken from tube pin to chassis.

Due to manufacturing tolerance on component parts, resistance readings may vary as much as 20%.

All readings are shown in ohms unless otherwise noted.

MODEL 139144

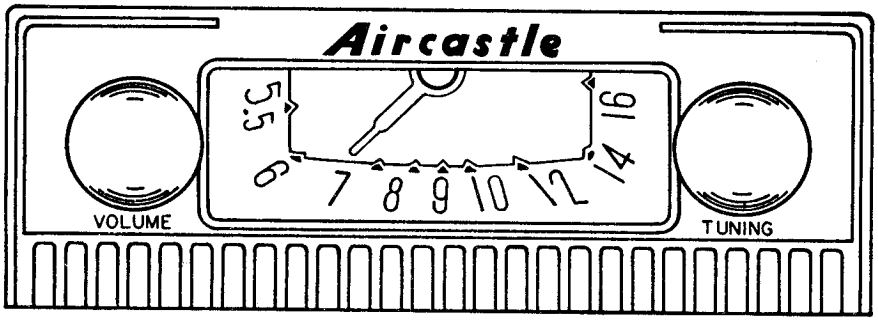

Fig. 1 Front View

INSTALLATION

This radio comes to you complete with all hardware necessary for mounting, and also with a distributor suppressor, ammeter condenser and generator condenser. By referring to Figures 1 and 2, and following the instructions outlined below, you will find that it is very simple to install.

First determine where the receiver is to be mounted by holding it with the hands in the approximate location in the car. Using the front mounting bracket as a template, mark and drill two 5/8" holes in the instrument panel flange. Now secure the mounting bracket to the radio receiver with the screws provided, and then mount the front of the radio to the instrument panel, using the bolts, lock washers and nuts provided for this purpose. The back of the radio is supported by means of the rear mounting strap. The mounting strap should be formed to the correct angles, as illustrated in Figure 2, so that it can then be fastened to the fire wall. After marking and center-punching the fire wall at the correct location, drill with a 3/8" drill. The mounting strap is then secured to the radio and fastened to the fire wall of the car with the 1/4" bolt, lock washer and nut furnished with the receiver.

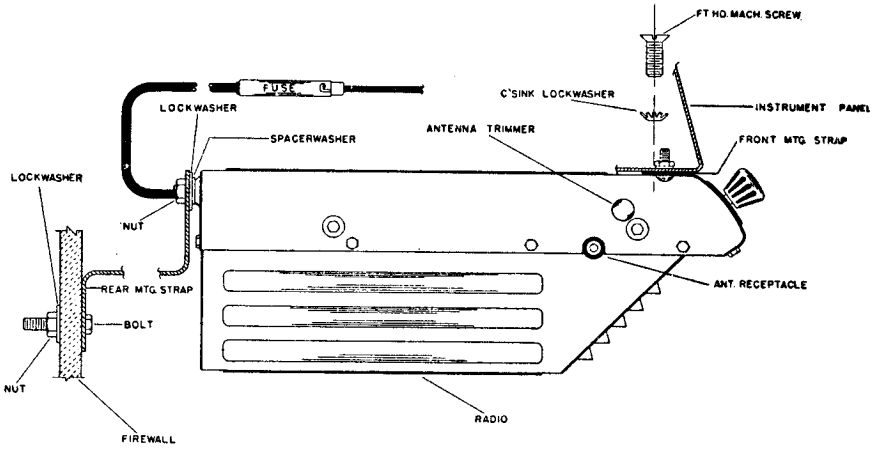

Fig. 2 Side View, Showing Mounting

CONNECTING THE RADIO

The antenna cable should be connected to the radio by inserting the jack into the socket provided on the side of the radio. Connect the battery cable to the hot side of the ammeter behind the instrument panel. The fuse should then be inserted into the cable receptor.

FINAL ADJUSTMENTS

The input circuit has been especially designed to be used with a low capacity antenna, of the fish pole or whip type.

To adjust the antenna trimmer condenser, carefully tune the receiver to a weak station at approximately 600 kilocycles (K.C.). Remove the snap button covering the antenna trimmer (See Figure 2) and adjust the trimmer for maximum volume. A small screw driver will be needed for this purpose.

©John F. Rider

SUGGESTIONS FOR ELIMINATING POSSIBLE MOTOR NOISE

IMPORTANT: Special care should be taken when mounting the radio to make sure all paint, grease, rust, etc., is removed from all three mounting points. A good electrical contact at these points will aid materially in eliminating motor noise. (The following steps may not be necessary in all cases. Install your radio and operate it before making changes.)

GENERATOR CONDENSER

The generator condenser must be connected to the battery terminal of the generator in all cases. If your car is equipped with a generator using an automatic regulator, make sure the condenser IS NOT fastened to the field winding terminal. If in doubt, your local car dealer can advise you as to where the car manufacturer recommends connecting it.

AMMETER CONDENSER

A .5 MFD bypass condenser is furnished for attaching to the ammeter. This should be connected to either side of the ammeter with the ground lug fastened to a good ground nearby. In most cases the use of this condenser, the distributor suppressor, and the generator condenser, will eliminate all objectionable ignition interference.

DISTRIBUTOR SUPPRESSOR

Detach the high tension wire where it goes into the top of the distributor cap and cut two inches off the end. Screw the piece you cut off into one end of the distributor suppressor and then screw the other end of the suppressor on the long wire which leads to the coil. Insert the wire back into the distributor cap.

IGNITION COILS

In cars where the ignition coil is located on the back side of the instrument panel it is often necessary to use an additional .5 MFD condenser. It must be installed from the battery side of the ignition coil to the closest ground on the instrument panel.

Short wires are very important. Where coils are mounted either on the instrument panel or in the driver's compartment, it may be necessary to shield the high tension wire from the coil to the distributor.

HIGH AND LOW TENSION WIRES

In many cases the low tension battery wires, etc., are grouped together with the high tension wires. These wires will very often pick up motor noise and feed it into the receiver through the battery circuit. In cases such as these it will be necessary to separate the low tension from the high tension wires and run them through another hole if they run from the engine compartment up to the instrument panel. These wires should be placed in a flexible wire shield and the shield grounded to frame or motor. This condition is particularly true on the V-8 Ford, as the battery and primary leads run through a special tube which also houses the high tension wires.

BONDING OF FIRE WALL

Bonding the steering column to the fire wall with a short braid may also be effective. Clean the paint from the steering column at the fire wall where the column enters the motor compartment, and solder on a short piece of braid. Ground the end of the braid to the fire wall.

In some cases it may be necessary to ground the cables and rods coming through the fire wall in order to reduce the interference. Clean them with emery cloth and spot-solder the braid, fastening the end under a convenient screw. A 1/4" piece of wire braid 20 inches long is furnished in the suppression kit assembly for this purpose.

WHEEL STATIC

Wheel Static is a form of interference caused by the rotation of the front wheels of the car, and it is, of course, only noticed when the car is in motion. If this form of interference is present it can be eliminated by installing wheel static collector springs between the inner hub cap and the spindle shaft.

ELECTRICAL ACCESSORIES

In some cases, it may be found that car accessories such as electric heaters, lighters, automatic relays, or gauges, may cause interference while in operation. Proper procedure in such cases is to connect a .5 MFD by-pass condenser from ground to the suspected accessory until the source of the interference is found. The condenser then should be permanently mounted in this location.

ACCESSORIES FURNISHED FOR INSTALLATION

All of the parts that are needed for installing this receiver are furnished in the Mounting Parts Kit, part No. S84-192, and the Supression & Misc. Parts Kit, part No. S84-228, as listed below. Also supplied are the rear mounting strap, part No. B31-134, and the front mounting plate, part No. A31-137.

NOTE: For shipping, the two control knobs have been removed from the tuning and volume control shafts. To install the knobs, line up the flat side of the knob spring, (inside knob) with the flat side of the control shaft and push the knob forward until it stops.

S84-192 MOUNTING PARTS KIT

1 1/4" Bolt	2 External Tooth Lock Washers

MODEL 139144

ELECTRICAL SPECIFICATIONS

Power Supply	6.3 volts DC
Current	4.8 amp. average
Frequency Range	540 to 1600 KC
I. F. Frequency	455 KC
Speaker	4" P. M.
Power Output	1.2 watts, undistorted 2.5 watts, maximum
Sensitivity	10 microvolts average for 1 watt output
Selectivity	20 KC broad at 1000 times signal, at 1000 KC

The tube compliment of this receiver is as follows:

1—6SK7GT—R. F. Amplifier.

1—6SA7GT—Converter.

1—6SK7GT—I.F. Amplifier.

1—6SQ7—Detector—AVC—1st audio.

1—6V6GT—Power output.

1—6X5GT—Rectifier.

SERVICE NOTES

Voltages taken from the different points of the circuit to the chassis are measured with volume control in maximum position, all tubes in their sockets, no signal applied, and with a volt meter having a resistance of 20,000 ohms per volt. These voltages are clearly shown on the voltage chart, (Fig. 4).

All voltages should be measured with an input voltage of 6.3 volts DC.

To check for open by-pass condensers, shunt each condenser with another one having the same capacity and voltage rating which is known to be good until the defective unit is located.

ALIGNING INSTRUCTION

Never attempt any adjustments on this receiver unless it becomes necessary to replace a coil or transformer, or the adjustments have been tampered with in the field. Always make certain that other circuit components, such as tubes, condensers, resistors, etc., are normal before proceeding with realignment.

If realignment is necessary follow the instructions given under the heading "ALIGNMENT PROCEDURE". After realignment has been completed repeat the procedure as a final check.

INSTRUCTIONS FOR REMOVING CHASSIS FROM THE CASE

The bottom cover (the one with the speaker louvers) can be removed to permit servicing of major components, such as tubes and vibrator, by removing the eight (8) screws holding it to the top cover. There are three (3) screws on each side, one (1) in the rear, and one (1) in the front.

CAUTION: Before attempting to remove the top cover, to service condensers, resistors, etc., the screw connecting the spark plate to the "A" terminal (inside case) must be removed. This is a round head screw, and is located on the rear of the case, close to the mounting stud bolt. It is recessed in a ½ inch hole in the case itself, thereby permitting contact with the spark plate.

After removing the spark plate screw, remove the two knobs by pulling forward and remove the eight (8) screws securing the cover to the chassis. Lift the chassis at the rear, at the same time moving it away from the front of the case so that the volume and tuning shafts will clear the holes in the cover.

NOTE: When reinstalling the chassis into the case, be sure the screw connecting the spark plate to the "A" terminal (inside case) is tightened very securely, otherwise the receiver will not operate properly.

ALIGNMENT PROCEDURE

Volume control—Maximum, all adjustments.

No signal applied to antenna.

Power input—6.3 volts.

Connect dummy antenna in series with output lead of signal generator.

Connect output meter across voice coil.

Connect ground lead of signal generator to chassis.

Repeat alignment procedure as a final check.

The following equipment is necessary for proper alignment:

Signal generator that will provide the test frequencies as listed.

Non-metallic screwdriver.

Output meter.

Dummy antennas—.1 MFD., .00025 MFD.

For alignment points refer to Figures 4 ad 5.

PARTS LIST

Schematic Diagram Reference	Part No.	Description
CONDENSERS		
C1A, C1B	B19-196	Variable Condenser
C2, C6, C12	A16-187	.1 MFD. 400 Volt Condenser
C3	A15-196	100 MMFD Ceramic Condenser
C4	A15-202	20 MMFD Ceramic Condenser
C5	A15-204	50 MMFD Ceramic Condenser
C7, C15, C17	A15-176	250 MMFD Mica Condenser
C8	A16-190	.005 MFD. 600 Volt Condenser
C9	A16-195	.001 MFD. Ceramic Condenser
C10	A16-193	.05 MFD. 600 Volt Condenser
C11, C21	A16-192	.01 MFD. 400 Volt Condenser
C13	A16-188	.2 MFD. 400 Volt Condenser
C14	A16-185	.005 MFD. 1600 Volt Oil Filled Condenser
C16, C18	A16-184	.5 MFD. 100 Volt Condenser
C19	A20-145	Trimmer Condenser
C20	A16-189	.05 MFD. 400 Volt Condenser
C22	A18-289	20 MFD 25 Volt Electrolytic Condenser
C23		30 MFD 350 Volt Electrolytic Condenser
C24		20 MFD. 350 Volt Electrolytic Condenser
RESISTORS		
R1	A60-722	470 Ohm ½ Watt 20% Resistor
R13, R14	A60-752	100 Ohm ½ Watt 10% Resistor
R2, R5	A60-744	22K Ohm ½ Watt 10% Resistor
R3	A60-685	47K Ohm ½ Watt 20% Resistor
R4, R17	A60-726	2.2 Megohm ½ Watt 20% Resistor
R6	A60-753	220 Ohm ½ Watt 10% Resistor
R7	A60-716	15K Ohm 1 Watt 10% Resistor
R8	A60-728	10 Megohm ½ Watt 20% Resistor
R9	A60-667	220K Ohm ½ Watt 20% Resistor
R10	A60-731	470K Ohm ½ Watt 20% Resistor
R11	A60-754	270 Ohm 1 Watt 10% Resistor
R12	A60-698	10K Ohm 1 Watt 10% Resistor
R15	A60-694	470 Ohm 1 Watt 10% Resistor
R16	A24-177	Volume Control, 500,000 Ohms, with Switch
COILS		
L1	A10-513	Antenna Loading Coil
L2	B10-511	Antenna Coil
L3	A10-512	Oscillator Coil
L4	A33-229	Choke, "A" Line
L5	A33-228	Choke, Vibrator Hash
L6	A10-510	I.F. Trap Coil
T1	A10-508	1st I.F. Transformer
T2	A10-509	2nd I.F. Transformer
TRANSFORMERS		
T3	B80-242	Output Transformer (Part of Speaker, not furnished separately)
T4	B80-243	Power Transformer
DIAL PARTS		
	A11-303	Bracket, Dial Scale
	A11-304	Bracket, String Guide
	A72-29	Bushing, Tuning Shaft Bearing
	A70-130	Clip, Spring, for Tuning Shaft
	A40-143	Dial Escutcheon
	A58-55	Dial Pointer
	B67-523	Dial Scale
	A28-101	Gasket for Speaker
	A52-258	Knob
	A89-10	Pilot Light, Type G.E. No. 422
	A65-37	Rivet, Shoulder, for String Guide Bracket
	A75-68	Shaft, Tuning
	A75-67	Shaft, for Dial Pointer
	A70-132	Spring, for Pilot Light Socket
	A70-133	Spring, String Tension, Pointer Drive and Tuning
MISCELLANEOUS		
	A83-421	Clip, I.F. Transformer Mounting
	A83-517	Clip, Oscillator Coil Mounting
	A43-10	Fuse, 15 Amp.
	A47-112	Grommet, Rubber (for Mounting Speaker and Variable Condenser)
	B31-134	Mounting Strap, Rear
	A31-137	Mounting Plate, Front
	S84-192	Mounting Parts Kit
	A87-38	Receptacle, Antenna Cable
	B79-362	Speaker, 4" P.M. (includes Output Transformer)
	S84-193	Suppression Kit Assembly
	A34-105	Vibrator
	A83-519	Wiper, Grounding, for Case Covers

EQUIPMENT USED FOR ALIGNMENT

Vacuum tube voltmeter.
AM Signal generator
FM Sweep generator.
Oscilloscope.
Insulated screw driver.
Dummy antenna:
.1 MFD condenser
.00025 MFD mica condenser
150 ohm resistor (2)
Output meter.

SPECIFICATIONS

Power Supply	105-125 volts 60 cycle AC only.
Power Consumption	65 Watts
Frequency Range FM	88 to 108 MC.
Frequency Range AM	540 to 1600 KC.
I.F. Frequency FM	10.7 MC.
I.F. Frequency AM	455 KC.
Band width, FM, Ratio Detector	330 KC.
Band width, FM, 1st I.F.	280 KC.
Band width, FM, Converter	220 KC.
Speaker	6¼" P.M.

The tubes used are as follows:

12AT7	FM RF Amplifier, Converter
6BE6	FM Osc, Am Osc, Converter
6BA6	FM-AM, 1st I.F. Amplifier
6BA6	FM-AM, 2nd I.F. Amplifier
6AL5	FM Detector
6AT6	AM Detector, AVC, Audio
6AQ5	Power Output
5Y3	Power Rectifier
No. 47	Pilot Lights (2)

Power Supply	105-125 volts 60 cycle AC only.
Power Consumption	65 Watts
Frequency Range FM	88 to 108 MC.
Frequency Range AM	540 to 1600 KC.
I.F. Frequency FM	10.7 MC.
I.F. Frequency AM	455 KC.
Band width, FM, Ratio Detector	330 KC.
Band width, FM, 1st I.F.	280 KC.
Band width, FM, Converter	220 KC.
Speaker	6 1/4" P.M.

The tubes used are as follows:

12AT7	FM RF Amplifier, Converter
6BE6	FM Osc, Am Osc, Converter
6BA6	FM-AM, 1st I.F. Amplifier
6BA6	FM-AM, 2nd I.F. Amplifier
6AL5	FM Detector
6AT6	AM Detector, AVC, Audio
6AQ5	Power Output
5Y3	Power Rectifier
No. 47	Pilot Lights (2)

GENERAL

Due to the high frequencies at which FM signals are received the service man must use great care when servicing these sets. Extreme caution must be used regarding the moving of component parts in the R.F. and oscillator circuits of the receiver as those circuits can be detuned in this manner.

If it becomes necessary to replace components such as resistors and condensers they must be replaced with parts of the same size, type, voltage rating and tolerance as called for in the parts list.

When installing new parts they should be placed in the same position as the original, and the leads should be cut to the same length.

ALIGNMENT NOTES

This receiver has been thoroughly inspected and tested at the factory, using the most modern test equipment available, such as FM sweep generators and oscilloscopes. All R.F. and I.F. circuits have been accurately adjusted at the factory and no attempt should be made to realign these circuits unless it is absolutely necessary.

CAUTION: If realignment is necessary be sure the proper test equipment is available, as listed below, before proceeding with the alignment procedure as given on page 5.

EQUIPMENT USED FOR ALIGNMENT

Vacuum tube voltmeter.
AM Signal generator
FM Sweep generator.
Oscilloscope.
Insulated screw driver.
Dummy antenna:
.1 MFD condenser
.00025 MFD mica condenser
150 ohm resistor (2)
Output meter.

All voltage readings are taken from tube pin to chassis.

All measurements are made with no signal, using a 20,000 ohm per volt meter.

AC input voltage must be maintained at 117 volts for accurate readings.

AC voltages shown are at 1000 ohms per volt.

NOTE A: When aligning the FM I.F. circuits, keep the out put from the signal generator as low as possible.

FIGURE 2

HOW TO ORDER REPAIR PARTS

Always give the part No. (No. printed on the part if different from that shown on the parts list), and the name of the part. When No. is not available, give complete description of part. Be sure to always give the Model No. and Catalog No. The Model No. will be found on either the metal plate at the rear of the chassis or on a printed label which may be on the chassis or cabinet.

28	505873	Condenser—ceramic .005 Mfd. 450 volt
30-A	505858	Condenser—ceramic .005 Mfd. 450 volt (part of audio coupling unit)
30-B	505858	Condenser—ceramic 250 Mmfd. 450 volt (part of audio coupling unit)
32	505873	Condenser—ceramic .005 Mfd. 450 volt
33-A, B	503655	Condenser—electrolytic (includes shield) A—30 Mfd. 150 volt; B—20 Mfd. 150 volt
38	504444	Condenser—.05 Mfd. 400 volt
39	505475	Condenser—ceramic 7 Mmfd. 500 volt
		RESISTORS
16	510061	Resistor—carbon 22,000 Ohms ¼ watt
19	510079	Resistor—carbon 220,000 Ohms ¼ watt
22	510016	Resistor—carbon 68 Ohms ½ watt
23	510093	Resistor—carbon 2.2 Meg. ¼ watt
27-A, B	505871	Volume control 1 Meg. (with switch)
29	510094	Resistor—carbon 3.3 Meg. ¼ watt
30-C, D	505858	Resistor—carbon 470,000 Ohms 1/5 watt (part of audio coupling unit)
31	510421	Resistor—wire wound 150 Ohms ½ watt ±10%
34	510510	Resistor—wire wound 33 Ohms 1 watt
36	510239	Resistor—carbon 1,500 Ohms 1 watt ±10%
		OTHER ELECTRICAL PARTS
11	505865	Loop antenna
13	505874	Coil—antenna (includes slug)
	505894	Slug core for antenna coil
20	505472	Coil—oscillator
21	505867	Transformer—I. F.
25	505867	Transformer—I. F.
30 (A, B, C, D)	505858	Audio coupling unit: A—Condenser—ceramic .005 Mfd. 450 volt; B—Condenser—ceramic 250 Mmfd. 450 volt; C—Resistor—carbon 470,000 Ohms 1/5 watt; D—Resistor—carbon 470,000 Ohms 1/5 watt
35	505869	Transformer—output
37	505868	Speaker—P.M. dynamic (3½ inch) includes output transformer
		MISCELLANEOUS
	505878	Baffle and grill cloth for Models B51T1 and B51T2
	505879	Baffle and grill cloth for Model B51T3
	504389	Bottom plate
	503647	Cabinet—ivory; Model B51T1 (includes baffle and metal grill)
	503648	Cabinet—mahogany; Model B51T2 (includes baffle and metal grill)
	503649	Cabinet—black; Model B51T3 (includes baffle and metal grill)
	———	Cabinet—College colors; Model B51T4—specify name of college when ordering replacement cabinet
	113019	Clip—retains dial scale
	114955	Clip—retainer on end of dial cord
	505101	Clip for mounting I. F. transformers
	506902	College letters for Model B51T4 ea.
	117057	Cord—dial drive (2 ft. required) per ft.
	505884	Dial scale for Models B51T1 and B51T2
	505885	Dial scale for Model B51T3
	505103	Insulating sheet on bottom of cabinet
	504470	Knob—black; Model B51T3
	504474	Knob—ivory; Model B51T1
	504541	Knob—mahogany; Model B51T2
	———	Knob—College colors; Model B51T4—specify name of college when ordering replacement knob
	505877	Metal grill and "S-W" name plate
	505886	Pointer
	119087	Ring for dial cord
	116584	Rubber feet
	12531	Screw—No. 8-32 x 3/8; retains bottom plate to cabinet
	17861	Screw—Set No. 4-40; shaft extension
	83624	Screw—No. 8 x ¼; retains chassis to bottom plate
	504721	Shaft extension for tuning gang
	505894	Slug core for antenna coil
	504397	Socket—miniature
	505299	Spring; dial cord tension
	504472	Window for dial

NOTE

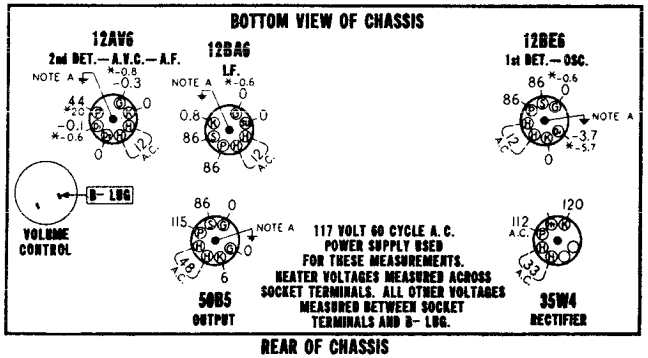
Condenser #39 was added to improve frequency stability. Chassis incorporating this change are stamped with the letter "S".

I. F. 455 KC.

SOCKET VOLTAGES

Measured with voltmeter having sensitivity of 1000 ohms per volt except where indicated by (*). The (*) symbol designates a vacuum tube voltmeter measurement.

VOLUME ON FULL WITH NO SIGNAL **DIAL TUNED TO 540 KC.**



REAR OF CHASSIS

NOTE A: Grounding of center stud on tube socket is necessary to reduce capacity coupling between other pins. Oscillation may result if this ground is omitted.

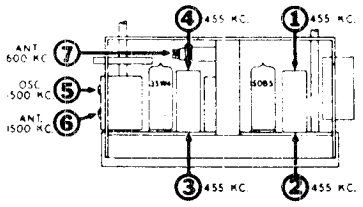
MODELS B51T1, Code 9044-A; B51T2, Code 9044-B; B51T3, Code 9044-C; B51T4, Code 9044-D

ALIGNMENT PROCEDURE

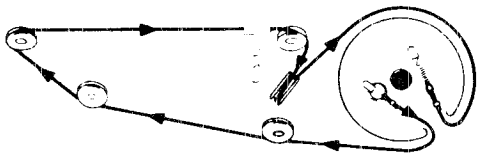
1. To remove chassis from cabinet lift edge of insulating sheet at bottom of cabinet and take out mounting screws at each corner. Then remove bottom plate by taking out screws at each end holding it to chassis. Solder approximately 8" of insulated wire to any B— connection (see voltage chart on opposite side for convenient B— location).
2. With the gang condenser fully meshed, dial pointer should be in the position indicated by the last division below 55 on the dial. If it is set incorrectly, release pointer clip on dial cord and reposition pointer.
3. Connect ground lead of signal generator to B— lug.
   CAUTION: If your test oscillator is designed with an AC-DC power supply, connect ground lead of signal generator to B— lug through a .25 mfd. condenser.
4. Connect output meter from plate of 50B5 tube to B — through a 0.1 Mfd condenser.
5. Set volume control at maximum volume position and use a weak signal from the signal generator.

DUMMY ANT. IN SERIES WITH SIGNAL GENERATOR	CONNECT HIGH SIDE OF GENERATOR TO	SIGNAL GENERATOR FREQUENCY	RECEIVER DIAL SETTING	TRIMMER OR SLUG NUMBER	TRIMMER DESCRIPTION	TYPE OF ADJUSTMENT
200 MMFD. Mica Condenser	Lug on trimmer No. 6 at bottom section of gang (see figure below for location of trimmer).	455 KC	Any point where it does not affect the signal.	1-2	2nd I.F.	Adjust for maximum output. Then repeat adjustment.
				3-4	1st I.F.	
200 MMFD. Mica Condenser	External antenna lead	1500 KC	1500 KC	5	Broadcast Oscillator	Adjust for maximum output.
200 MMFD. Mica Condenser	External antenna lead	1500 KC	Tune to 1500 KC generator signal.	6	Broadcast Antenna	Adjust for maximum output.
200 MMFD. Mica Condenser	External antenna lead	600 KC	Tune to 600 KC generator signal.	7	Broadcast Antenna (shunt)	Adjust for maximum output.

Repeat Adjustment of Trimmers 6 and 7 Until One No Longer Detunes the Other.



REAR VIEW OF CHASSIS



DIAL AND POINTER DRIVE CORD ARRANGEMENT

To string dial cord, turn the drive drum to maximum clockwise position and use the following parts:

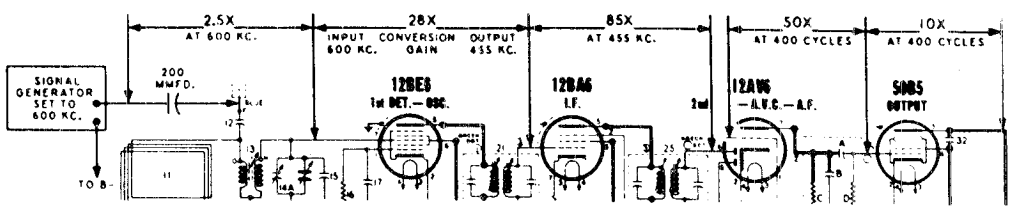
114955	Clip on end of cord	119087	Ring for dial cord
117057	Cord (2 feet required)	505299	Tension Spring

STAGE GAIN MEASUREMENT PROCEDURE

REQUIRED INSTRUMENTS: The amount of amplification or "gain" of each of the stages of this receiver may be measured with an A.C. Vacuum Tube Voltmeter or a "channel" type instrument containing a tuned and calibrated amplifier.

PROCEDURE: It is exceedingly important to adhere to the procedure outlined below since the accuracy of these measurements will be affected to a considerable extent by the failure to establish proper operating conditions.

1. Be sure that R.F. and I.F. stages are carefully and accurately aligned by utilizing the alignment procedure given above.
2. Connect Signal Generator as shown below.
3. The values of stage gain which are given here were measured with a fixed bias of 3 volts on the control grids of all R.F. and I.F. tubes which are connected to the A.V.C. circuit. Therefore, these values are not intended to indicate the full capability of a stage but they will serve as a convenient basis for determining proper operation. In order to duplicate the fixed bias voltage, connect the negative terminal of a 3 volt battery to A.V.C. at terminal "J" of antenna coupling coil and connect the positive battery lead to B— in receiver chassis.
4. Set Signal Generator for operation at 600 Kc with 400 cycle modulation and carefully tune radio receiver to this signal by using an output meter to indicate peak output. If a local station interferes, set generator to a nearby frequency and re-tune the receiver.
5. R.F. and I.F. circuits are slightly de-tuned when contact is made with an instrument probe and this action, which is indicated by a change in the output meter reading, may seriously affect the gain measurement. Therefore, it is important to adjust the associated circuit trimmer for a maximum output meter reading and to set the input signal level to a convenient reference point on the gain measuring instrument while the probe is making contact. After removing the probe it is again necessary to adjust the trimmer so as to obtain the same output meter reading and thereby assure that the signal voltage at the specified point has not changed as a result of circuit de-tuning.
6. When using a "channel" type instrument, carefully tune it for maximum output at desired frequency before making measurements.



DIFFERENCES in tube characteristics, tolerance of parts, adjustment of tuned circuits and variations in line voltage will influence stage gain. These factors should be given due attention in event the gain of a stage varies extensively from the values shown above.

B61T2, Code 9046-B

ALIGNMENT PROCEDURE

1. Remove chassis from cabinet—allow loop antenna to remain attached to chassis.
2. Note that there are four calibrating lines stamped into front edge of the metal dial frame. When gang condenser is fully meshed, dial pointer should be in the position indicated by first line at the left. If it is set incorrectly, release pointer clip on dial cord and reposition pointer.
3. Connect an output meter across the speaker voice coil or from plate of 35L6GT tube to B— through a .1 Mfd. condenser (see voltage chart for convenient B— connection).
4. Connect ground lead of signal generator to B— lug. CAUTION: If your test oscillator is designed with an AC-DC power supply, connect ground lead of signal generator to B— lug through a .25 Mfd. condenser.
5. Set volume control to maximum volume position and use a weak signal from the signal generator.

DUMMY ANT. IN SERIES WITH SIGNAL GENERATOR	CONNECTION OF SIG. GENERATOR OUTPUT TO RECEIVER	SIGNAL GENERATOR FREQUENCY	RECEIVER DIAL SETTING	TRIMMER NUMBER	TRIMMER DESCRIPTION	TYPE OF ADJUSTMENT

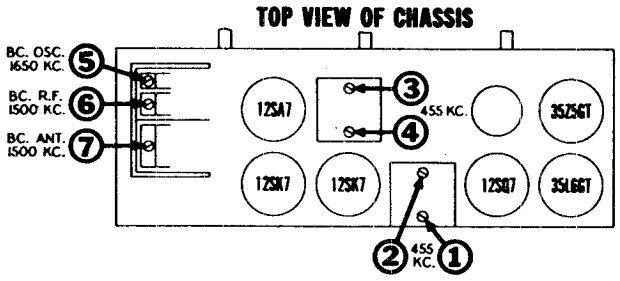
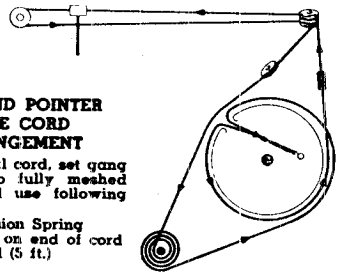
200 MMFD. Mica Condenser	External Antenna Terminal on Loop Frame	1500 KC	Tune to 1500 KC generator signal	7	Broadcast Antenna	Adjust for maximum output.





DIAL AND POINTER DRIVE CORD ARRANGEMENT

To string dial cord, set gang condenser to fully meshed position and use following parts:

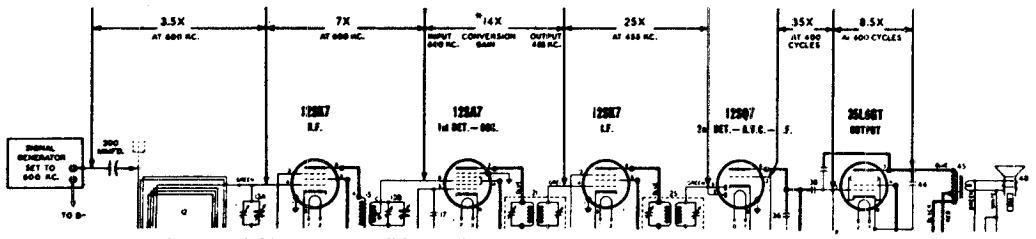
161384 Tension Spring
114955 Clip on end of cord
117057 Cord (5 ft.)

STAGE GAIN MEASUREMENT PROCEDURE

REQUIRED INSTRUMENTS: The amount of amplification or "gain" of each of the stages of this receiver may be measured with an A.C. Vacuum Tube Voltmeter or a "channel" type instrument containing a tuned and calibrated amplifier.

PROCEDURE: It is exceedingly important to adhere to the procedure outlined below since the accuracy of these measurements will be affected to a considerable extent by the failure to establish proper operating conditions.

1. Be sure that R.F. and I.F. stages are carefully and accurately aligned by utilizing the alignment procedure given above.
2. Connect Signal Generator as shown below.
3. The values of stage gain which are given here were measured with a fixed bias of 3 volts on the control grids of all R.F. and I.F. tubes which are connected to the A.V.C. circuit. Therefore, these values are not intended to indicate the full capability of a stage but they will serve as a convenient basis for determining proper operation. In order to duplicate the fixed bias voltage, connect the negative terminal of a 3 volt battery to A.V.C. at terminal "E" of the R.F. coil and connect the positive battery lead to B— in receiver chassis.
4. Set Signal Generator for operation at 600 Kc with 400 cycle modulation and carefully tune radio receiver to this signal by using an output meter to indicate peak output. If a local station interferes set generator to a nearby frequency and re-tune the receiver.
5. R.F. and I.F. circuits are slightly de-tuned when contact is made with an instrument probe and this action, which is indicated by a change in the output meter reading, may seriously affect the gain measurement. Therefore, it is important to adjust the associated circuit trimmer for a maximum output meter reading and to set the input signal level to a convenient reference point on the gain measuring instrument while the probe is making contact. After removing the probe it is again necessary to adjust the trimmer so as to obtain the same output meter reading and thereby assure that the signal voltage at the specified point has not changed as a result of circuit de-tuning.
6. When using a "channel" type instrument carefully tune it for maximum output at desired frequency before making measurements.



*When measuring the gain of this stage use a "channel" type instrument or a signal generator with calibrated output voltage.

DIFFERENCES in tube characteristics, tolerance of parts, adjustment of tuned circuits and variations in line voltage will influence stage gain. These factors should be given due attention in event the gain of a stage varies extensively from the values shown above.

MODELS C51T1, Code 9045-A;
C51T2, Code 9045-B

ALIGNMENT PROCEDURE

1. Remove chassis and loop antenna (on cabinet back) from cabinet—allow loop to remain attached to chassis.
2. With the gang condenser fully meshed, the dial indicator should be pointing horizontally to the left. If it is set incorrectly, reposition by firmly holding the gang condenser shaft while rotating the indicator. Then check to see that the dial indicator is pointing horizontally to the right when the gang condenser is fully open.
3. Couple the signal generator to the receiver by connecting its output to several turns of wire formed in a circular shape so that it may be placed adjacent and parallel to the receiver loop antenna.
4. Connect an output meter across the speaker voice coil or from the plate of the 50L6GT tube to B— through a 0.1 Mfd. condenser.
5. Set volume control at maximum volume position and use a weak signal from the signal generator.

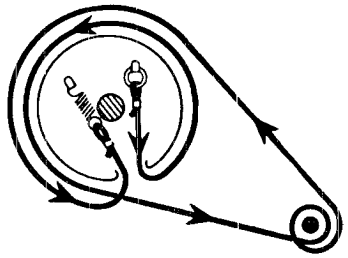
117057 Cord (2 feet)
119087 Ring for dial cord
505161 Tension Spring

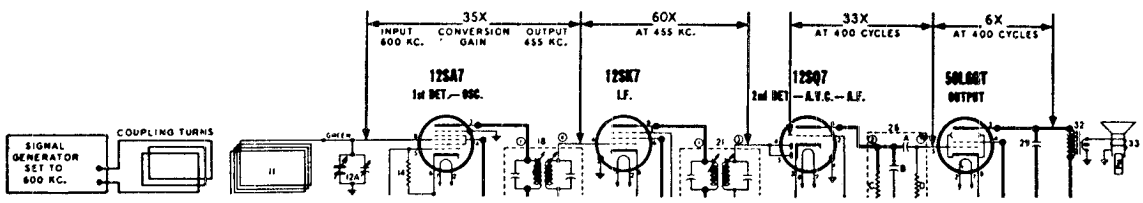


STAGE GAIN MEASUREMENT PROCEDURE

REQUIRED INSTRUMENTS: The amount of amplification or "gain" of each of the stages of this receiver may be measured with an A.C. Vacuum Tube Voltmeter or a "channel" type instrument containing a tuned and calibrated amplifier.

PROCEDURE: It is exceedingly important to adhere to the procedure outlined below since the accuracy of these measurements will be affected to a considerable extent by the failure to establish proper operating conditions.

1. Be sure that R.F. and I.F. stages are carefully and accurately aligned by utilizing the alignment procedure given above.
2. Connect Signal Generator as shown below.
3. The values of stage gain which are given here were measured with a fixed bias of 3 volts on the control grids of all R.F. and I.F. tubes which are connected to the A.V.C. circuit. Therefore, these values are not intended to indicate the full capability of a stage but they will serve as a convenient basis for determining proper operation. In order to duplicate the fixed bias voltage, connect the negative terminal of a 3 volt battery to A.V.C. at terminal #3 of the 1st I.F. transformer and connect the positive battery lead to B— in receiver chassis.
4. Set Signal Generator for operation at 600 Kc with 400 cycle modulation and carefully tune radio receiver to this signal by using an output meter to indicate peak output. If a local station interferes, set generator to a nearby frequency and re-tune the receiver.
5. R.F. and I.F. circuits are slightly de-tuned when contact is made with an instrument probe and this action, which is indicated by a change in the output meter reading, may seriously affect the gain measurement. Therefore, it is important to adjust the associated circuit trimmer for a maximum output meter reading and to set the input signal level to a convenient reference point on the gain measuring instrument while the probe is making contact. After removing the probe it is again necessary to adjust the trimmer so as to obtain the same output meter reading and thereby assure that the signal voltage at the specified point has not changed as a result of circuit de-tuning.
6. When using a "channel" type instrument, carefully tune it for maximum output at desired frequency before making measurements.



DIFFERENCES in tube characteristics, tolerance of parts, adjustment of tuned circuits and variations in line voltage will influence stage gain. These factors should be given due attention in event the gain of a stage varies extensively from the values shown above.

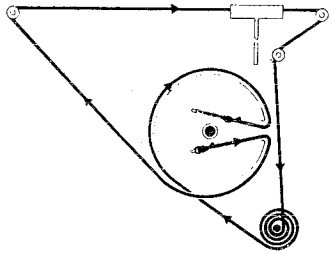
AUDIO OSCILLATION

The audio system of this receiver utilizes a two stage type of inverse feedback arrangement and should it ever be necessary to replace the speaker or output transformer it is important to maintain a definite phase relationship in the feed-back circuit. If the connections to the output transformer are reversed or if the feed-back connection is made to the wrong side of the output transformer secondary, the system will become regenerative instead of degenerative. Under those conditions audio oscillation may result. If that occurs, oscillation may be prevented by reversing the connections to the primary of the output transformer.

TUNING DIAL AND POINTER DRIVE CORD ARRANGEMENT



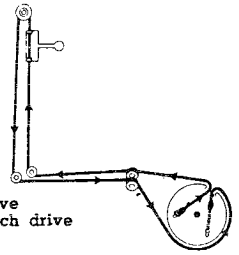
To string tuning dial drive cord, set gang condenser to fully open position.

To string band switch drive cord, turn "Band Selector" knob to its extreme counter-clockwise position.

When stringing drive cord, use the following parts:

113177 Tension Spring
114955 Clip on end of cord
119087 Ring
502773 Cord (9 feet)
5 ft. for tuning drive
4 ft. for band switch drive

BAND SWITCH INDICATOR DRIVE CORD ARRANGEMENT



MODEL 9041-A

ALIGNMENT PROCEDURE

1. Remove chassis and speaker from cabinet.
2. When gang condenser is fully meshed, dial pointer should be in the position indicated by the left hand starting edge of the dial scale. If it is set incorrectly, release pointer clip on dial cord and reposition pointer.
3. Connect an output meter across the speaker voice coil or from the plate of the 6K6GT tube to chassis through a 0.1 Mfd. condenser.
4. Connect the ground lead of the signal generator to the receiver chassis.
5. Set volume control to maximum volume position and use a weak signal from the signal generator.
6. Set Radio-Phono and Tone switch to "Radio-Bass" position.
7. Set Local-Distant switch to "Distant" position.

IMPORTANT: Align this receiver in exactly the order shown below. The 13-16 Meter band must be aligned before any of the other short wave bands.

MODEL 9042-A

ALIGNMENT PROCEDURE

1. Remove chassis and speaker from cabinet.
2. When gang condenser is fully meshed, dial pointer should be in the position indicated by the left hand starting edge of the dial scale. If it is set incorrectly, release pointer clip on dial cord and reposition pointer.
3. Connect an output meter across the speaker voice coil or from the plate of a 7B5 tube to chassis through a 0.1 Mfd. condenser.
4. Connect the ground lead of the signal generator to the receiver chassis.
5. Set volume control to maximum volume position and use a weak signal from the signal generator.

IMPORTANT: Align this receiver in exactly the order shown below.

DUMMY ANT. IN SERIES WITH SIGNAL GENERATOR	CONNECT HIGH SIDE OF SIGNAL GENERATOR TO	SIGNAL GENERATOR FREQUENCY	BAND SWITCH POSITION	RECEIVER DIAL SETTING	TRIMMER NUMBER	TRIMMER DESCRIPTION	TYPE OF ADJUSTMENT
200 MMFD. Mica Condenser	Lug on Antenna section of gang; see point "X" in chart on next page.	455 KC	Broadcast (*Position 1)	Any point where it does not affect the signal.	1-2	2nd I.F.	Adjust for maximum output. Then repeat adjustment.
					3-4	1st I.F.	
200 MMFD. Mica Condenser	"A" terminal at rear of chassis.	1500 KC	Broadcast (*Position 1)	1500 Kc.	5	Broadcast Oscillator (Shunt)	Adjust for maximum output.
200 MMFD. Mica Condenser	"A" terminal at rear of chassis.	1500 KC	Broadcast (*Position 1)	Tune to 1500 Kc. generator signal.	6	Broadcast Antenna	Adjust for maximum output.
200 MMFD. Mica Condenser	"A" terminal at rear of chassis.	600 KC	Broadcast (*Position 1)	Tune to 600 Kc. generator signal.	7	Broadcast Oscillator (Series Pad)	Adjust for maximum output. Try to increase output by detuning trimmer and retuning receiver dial until maximum output is obtained.
200 MMFD. Mica Condenser	"A" terminal at rear of chassis.	Repeat adjustment of trimmers 5 and 6 at 1500 Kc. Then re-check adjustment of trimmer 7 at 600 Kc.					
400 OHM Carbon Resistor	"A" terminal at rear of chassis.	8 MC	Short Wave 1 (*Position 2)	8 Mc.	8	Short Wave 1 Oscillator	Adjust for maximum output. Check to see if proper peak was obtained by tuning in image at approx. 7.1 Mc. If image does not appear, realign at 8 Mc. with trimmer screw further out. Recheck image.
400 OHM Carbon Resistor	"A" terminal at rear of chassis.	8 MC	Short Wave 1 (*Position 2)	Tune to 8 Mc. generator signal.	9	Short Wave 1 Antenna	Adjust for maximum output. Try to increase output by detuning trimmer and retuning receiver dial until maximum output is obtained.
400 OHM Carbon Resistor	"A" terminal at rear of chassis.	21 MC	Short Wave 2 (*Position 3)	21 Mc.	10	Short Wave 2 Oscillator	Adjust for maximum output. Check to see if proper peak was obtained by tuning in image at approx. 21.9 Mc. If image does not appear, realign at 21 Mc. with trimmer screw further in. Recheck image.
400 OHM Carbon Resistor	"A" terminal at rear of chassis.	21 MC	Short Wave 2 (*Position 3)	Tune to 21 Mc. generator signal.	11	Short Wave 2 Antenna	Adjust for maximum output. Try to increase output by detuning trimmer and retuning receiver dial until maximum output is obtained.
400 OHM Carbon Resistor	"A" terminal at rear of chassis.	15 MC	Short Wave 3 (*Position 4)	15 Mc.	12	Short Wave 3 Oscillator	Adjust for maximum output. Check to see if proper peak was obtained by setting signal generator to 14.1 Mc. and tuning radio in vicinity of 15 Mc. If signal is not heard realign at 15 Mc. with trimmer screw further in. Recheck.
400 OHM Carbon Resistor	"A" terminal at rear of chassis.	15 MC	Short Wave 3 (*Position 4)	Tune to 15 Mc. generator signal.	13	Short Wave 3 Antenna	Adjust for maximum output. Try to increase output by detuning trimmer and retuning receiver dial until maximum output is obtained.
400 OHM Carbon Resistor	"A" terminal at rear of chassis.	11 MC	Short Wave 4 (*Position 5)	11 Mc.	14	Short Wave 4 Oscillator	Adjust for maximum output. Check to see if proper peak was obtained by setting signal generator to 10.1 Mc. and tuning radio in vicinity of 11 Mc. If signal is not heard, realign at 11 Mc. with trimmer screw further in. Recheck.
400 OHM Carbon Resistor	"A" terminal at rear of chassis.	11 MC	Short Wave 4 (*Position 5)	Tune to 11 Mc. generator signal.	15	Short Wave 4 Antenna	Adjust for maximum output. Try to increase output by detuning trimmer and retuning receiver dial until maximum output is obtained.

* Position 1 corresponds to extreme counter-clockwise setting of band switch. Succeeding positions are numbered in ascending order as switch is rotated clockwise.

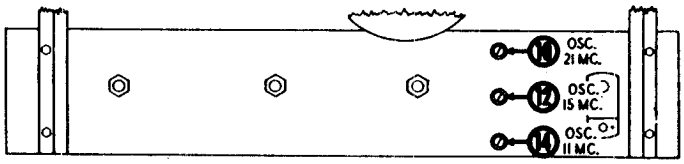
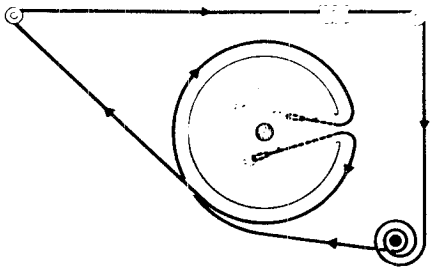
TOP VIEW OF CHASSIS



FRONT VIEW OF CHASSIS



DIAL AND POINTER DRIVE CORD ARRANGEMENT

To string dial cord, set gang condenser to fully open position and use following parts:

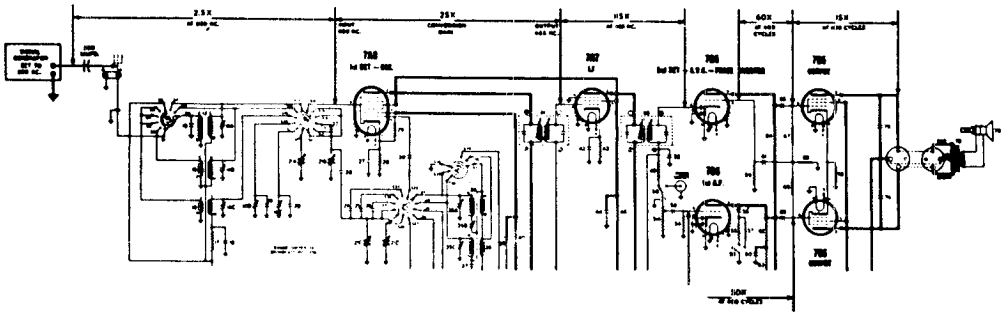
113177 Tension Spring
114955 Clip on end of cord
119087 Ring
502773 Cord (4 ft.)

STAGE GAIN MEASUREMENT PROCEDURE

REQUIRED INSTRUMENTS: The amount of amplification or "gain" of each of the stages of this receiver may be measured with an A.C. Vacuum Tube Voltmeter or a "channel" type instrument containing a tuned and calibrated amplifier.

PROCEDURE: It is exceedingly important to adhere to the procedure outlined below since the accuracy of these measurements will be affected to a considerable extent by the failure to establish proper operating conditions.

1. Be sure that R.F. and I.F. stages are carefully and accurately aligned by utilizing the alignment procedure given on preceding page.
2. Connect Signal Generator as shown below.
3. The values of stage gain which are given here were measured with a fixed bias of 3 volts on the control grids of all R.F. and I.F. tubes which are connected to the A.V.C. circuit. Therefore, these values are not intended to indicate the full capability of a stage but they will serve as a convenient basis for determining proper operation. In order to duplicate the fixed bias voltage, connect the negative terminal of a 3 volt battery to A.V.C. at terminal No. 2 of the 1st I.F. transformer and connect the positive battery lead to the receiver chassis.
4. Set Signal Generator for operation at 600 Kc with 400 cycle modulation and carefully tune radio receiver to this signal by using an output meter to indicate peak output. If a local station interferes, set generator to a nearby frequency and re-tune the receiver.
5. R.F. and I.F. circuits are slightly de-tuned when contact is made with an instrument probe and this action, which is indicated by a change in the output meter reading, may seriously affect the gain measurement. Therefore, it is important to adjust the associated circuit trimmer for a maximum output meter reading and to set the input signal level to a convenient reference point on the gain measuring instrument while the probe is making contact. After removing the probe it is again necessary to adjust the trimmer so as to obtain the same output meter reading and thereby assure that the signal voltage at the specified point has not changed as a result of circuit de-tuning.
6. When using a "channel" type instrument, carefully tune it for maximum output at desired frequency before making measurements.



DIFFERENCES in tube characteristics, tolerance of parts, adjustment of tuned circuits and variations in line voltage will influence stage gain. These factors should be given due attention in event the gain of a stage varies extensively from the values shown above.

MODEL 9050-A

ALIGNMENT PROCEDURE

1. With the gang condenser fully meshed, the dial pointer should be in the position indicated by the last mark below 55 on the dial. If it is set incorrectly, release the pointer clip on the dial cord and reposition pointer.
2. During the alignment of this receiver it will be necessary to set the dial pointer to the following frequencies: 1500 Kc., 600 Kc., 6 Mc., 5.1 Mc., 20 Mc., and 19.1 Mc. In order to avoid replacing the chassis in the cabinet each time a dial setting is required, it will be found more convenient to mark the required frequency points on the white dial background plate before starting the alignment.
3. Connect an output meter across the speaker voice coil or from plate of 35L6GT tube to B- lug through a .1 Mfd. condenser (see voltage chart for convenient B— connection).
4. Connect ground lead of signal generator to B— lug.
   CAUTION: If your test oscillator is designed with an AC-DC power supply, connect ground lead of signal generator to B— lug through a .25 mfd. condenser.
5. Set volume control at maximum volume position and use a weak signal from the signal generator.

IMPORTANT: Align this receiver in exactly the order shown below. Broadcast band should be aligned before short wave bands.

DUMMY ANT. IN SERIES WITH SIGNAL GENERATOR	CONNECT HIGH SIDE OF SIGNAL GENERATOR TO	SIGNAL GENERATOR FREQUENCY	BAND SWITCH POSITION	RECEIVER DIAL SETTING	TRIMMER NUMBER	TRIMMER DESCRIPTION	TYPE OF ADJUSTMENT
200 MMFD. Mica Condenser	Lug on front section of gang.	455 KC	Broadcast (counter-clockwise)	Any point where it does not affect the signal.	1-2	2nd I.F.	Adjust for maximum output. Then repeat adjustment.
					3-4	1st I.F.	
200 MMFD. Mica Condenser	External antenna lead (blue)	1500 KC	Broadcast (counter-clockwise)	1500 KC	5	Broadcast Oscillator (Shunt)	Adjust for maximum output.
200 MMFD. Mica Condenser	External antenna lead (blue)	1500 KC	Broadcast (counter-clockwise)	Tune to 1500 KC Generator Signal	6	Broadcast Antenna	Adjust for maximum output.
200 MMFD. Mica Condenser	External antenna lead (blue)	600 KC	Broadcast (counter-clockwise)	Tune to 600 KC Generator Signal	7	Broadcast Oscillator (Series Pad)	Adjust for maximum output. Try to increase output by detuning trimmer and retuning receiver dial until maximum output is obtained.
200 MMFD. Mica Condenser	External antenna lead (blue)	Repeat adjustment of trimmers 5 and 6 at 1500 Kc. Then re-check adjustment of trimmer 7 at 600 Kc.

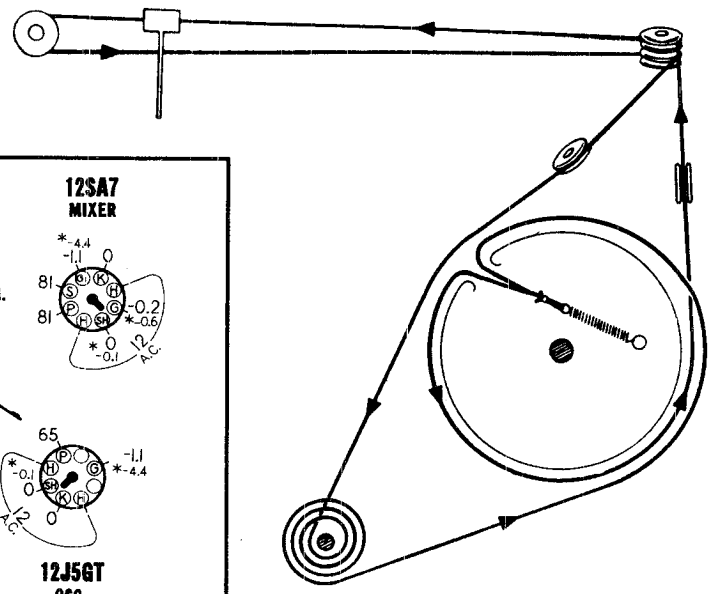
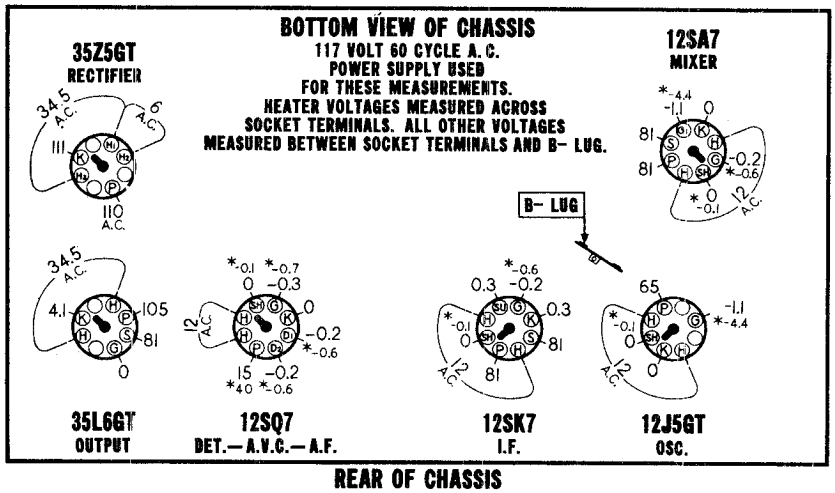
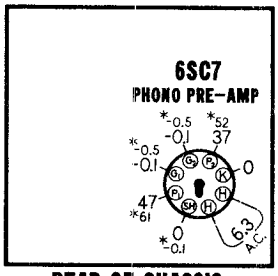
MODEL 9050-A





REAR OF CHASSIS



REAR OF CHASSIS

SOCKET VOLTAGES

Measured with voltmeter having sensitivity of 1000 ohms per volt except where indicated by (*). The (*) symbol designates a vacuum tube voltmeter measurement.

DIAL TUNED TO 540 KC.

VOLUME ON FULL WITH NO SIGNAL

BAND SWITCH IN BROADCAST POSITION

RADIO-PHONO SWITCH IN "RADIO" POSITION

DIAL AND POINTER DRIVE CORD ARRANGEMENT

To string dial cord, set gang condenser to fully meshed position and use following parts:

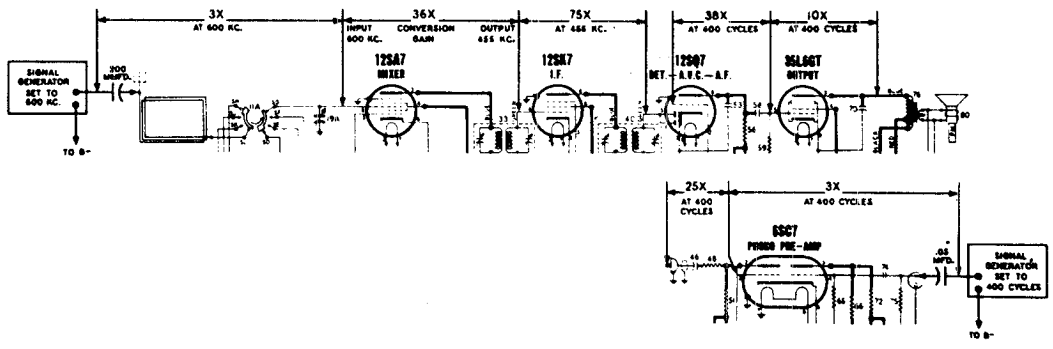
161384	Tension Spring
114955	Clip on end of cord
502773	Cord (60 inches)

STAGE GAIN MEASUREMENT PROCEDURE

REQUIRED INSTRUMENTS: The amount of amplification or "gain" of each of the stages of this receiver may be measured with an A.C. Vacuum Tube Voltmeter or a "channel" type instrument containing a tuned and calibrated amplifier.

PROCEDURE: It is exceedingly important to adhere to the procedure outlined below since the accuracy of these measurements will be affected to a considerable extent by the failure to establish proper operating conditions.

1. Be sure that R.F. and I.F. tuned circuits are carefully and accurately aligned by utilizing the alignment procedure given above.
2. Connect Signal Generator as shown below.
3. The values of stage gain which are given here were measured with a fixed bias of 3 volts on the control grids of all R.F. and I.F. tubes which are connected to the A.V.C. circuit. Therefore, these values are not intended to indicate the full capability of a stage but they will serve as a convenient basis for determining proper operation. In order to duplicate the fixed bias voltage, connect the negative terminal of a 3 volt battery to A.V.C. at terminal "M" of Short wave Band Antenna Coil (17) and connect the positive battery lead to B- in receiver chassis.
4. Set Signal Generator for operation at 600 Kc with 400 cycle modulation and carefully tune radio receiver to this signal by using an output meter to indicate peak output. If a local station interferes set generator to a nearby frequency and re-tune the receiver.
5. R.F. and I.F. circuits are slightly de-tuned when contact is made with an instrument probe and this action, which is indicated by a change in the output meter reading, may seriously affect the gain measurement. Therefore, it is important to adjust the associated circuit trimmer for a maximum output meter reading and to set the input signal level to a convenient reference point on the gain measuring instrument while the probe is making contact. After removing the probe it is again necessary to adjust the trimmer so as to obtain the same output meter reading and thereby assure that the signal voltage at the specified point has not changed as a result of circuit de-tuning.
6. When using a "channel" type instrument carefully tune it for maximum output at desired frequency before making measurements.



DIFFERENCES in tube characteristics, tolerance of parts, adjustment of tuned circuits and variations in line voltage will influence stage gain. These factors should be given due attention in event the gain of a stage varies extensively from the values shown above.

	504099	Socket for dial lamp (with leads)
	160039	Socket for phono input to pre-amp
	506470	Socket for phono pick-up input to receiver
	502761	Socket for pre-amp power cable
	161384	Spring—dial cord tension
	506277	Trim strip for dial

TO REPLACE BATTERIES

Unscrew the two bolts holding the loop to the chassis and loosen the metal bar holding the "B" batteries in place. Pull the battery out and replace new batteries in the same relative position. Use 2 Eveready #746 (or equivalent) and 2 Eveready #482 (or equivalent)

Batteries are considered to be poor or defective when they measure 1/3 less terminal voltage than the normal voltage than the normal value thus the 90 volt "B" batteries should read better than 60 volts and the 9 volts "A" batteries should read better than 6 volts. These voltage measurements are to be taken after the set has been playing in the battery position for approximately one quarter hour. Use a voltmeter with low drain to read voltages (a 1000 ohm per volt meter or better)

TO OPERATE THIS SET ON A 120 VOLT POWER LINE.

Disconnect the set from the power line. Take voltage selector plug (behind loop under loop mounting bracket) and insert into the 120 volt jack (red).

TO OPERATE THIS SET ON A 220 VOLT POWER LINE

Disconnect the set from the power line. Take voltage selector plug (behind loop under loop mounting bracket) and insert it into the 220 volt jack (red).

CAUTION:

NEVER PLUG THIS SET INTO A 220 VOLT POWER LINE WHEN THE VOLTAGE SELECTOR PLUG IS IN THE 120 VOLT POSITION (BLACK JACK) OTHERWISE PERMANENT DAMAGE WILL RESULT. DO NOT CUT THE LINE CORD OR OTHERWISE CHANGE IT'S CHARACTERISTICS OR DAMAGE WILL OCCUR. DO NOT CHANGE TUBES WHILE THE SET IS TURNED ON SINCE DAMAGE CAN BE CAUSED BY SO DOING.

Operating Instructions

POWER SOURCES: This combination will operate on an alternating (AC) current only, of 110 to 125 volts at 60 cycles.

CAUTION: Always predetermine voltage of power source. Never try to plug this combination into a 220 volt line, as this will cause serious damage.

Never try to operate this combination on 50 cycle current, as this will cause the motor to rotate at an incorrect speed. The normal speed is 78 R.P.M., (revolutions per minute) and to insure proper reproduction of recordings 60 cycle current must be used.

This receiver is equipped with a sensitive bank antenna and under ordinary conditions no external antenna would be required. However, in steel constructed buildings or in distant isolated locations, the reception may be improved by using an outside antenna. This should be a single wire not more than 50 feet long and should be connected to the antenna lead that projects from the back of the receiver. No ground wire is required at any time.

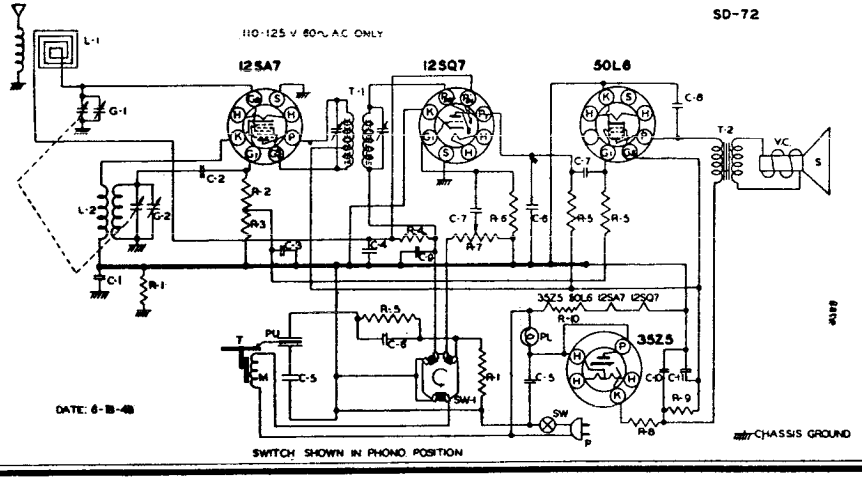
INSTALLATION: Unwind power cord and plug into a convenient power outlet. Follow instructions under "Controls" to operate receiver.

CONTROLS: Three controls are provided on the front panel for operation of this combination. The right hand control is the station selector which is used only in "Radio" operation. The left hand control is a switch which selects operation of either "Radio" or "Phonograph". The center control is used to adjust volume on either "Radio" or "Phonograph" and is also used as a power switch to turn the combination "On" or "Off."

RADIO RECEPTION: After the power cord plug has been connected to your power outlet, turn the center control to the right in a clockwise direction and a click will be heard. This indicates that the power is turned on, and the pilot light in the dial should begin to glow. After about 30 seconds, the set will be ready for operation.

Make sure that the left hand control is turned to the left, in "Radio" position. Turn the center control about halfway on, in a clockwise direction to increase volume. Rotate the right hand control to the right or left to select the desired station. By mentally adding a zero to the figures on the upper half of the dial, the result will be read directly in kilocycles (i.e., 60 plus 0 equals 600KC or 140 plus 0 equals 1400KC). After a station has been tuned in, adjust the center control to your desired volume.

PHONOGRAPH REPRODUCTION: To operate the phonograph, be sure that the left hand control is turned to the right. This puts the circuit in "Phonograph" position and also turns on the power for the motor. The center control must also be turned on (as in Radio instructions) as it is the master control for power to the radio receiver and phonograph motor.



ALIGNMENT AND SERVICE DATA

Remove chassis from cabinet for alignment.

A Signal Generator is required having the following frequencies: 455 KC, 1400 KC, 1720 KC. An output meter should be connected across the speaker.

The receiver volume control should be turned to maximum during the I.F. and all subsequent alignments to keep the AVC from working and giving false readings. Keep the generator output as low as possible to prevent overloading.

FIRST STEP: Connect the hot lead from the generator to the ANT. section of the gang condenser, through a .1 MFD condenser. The ground lead from the generator must be connected to the floating ground buss under the chassis. Turn the gang condenser to complete minimum capacity. Adjust the generator to 455KC and adjust the trimmers of the 1st and 2nd I.F. transformers until a maximum reading is noted on the output meter.

SECOND STEP: With the leads from the generator still connected in the same manner, adjust the Signal Generator to 1720 KC. The OSC. trimmer is located on the front of the chassis. Adjust this trimmer until the 1720 KC signal is tuned in.

THIRD STEP: Remove the hot lead of the generator from the ANT section of the gang condenser. Connect this lead to the primary of the loop antenna through a 200 MMFD condenser. Adjust the Signal Generator to 1400 KC. Rotate the tuning control until this signal is tuned in. The ANT trimmer is located on the top of the ANT. section of the gang condenser. Adjust this trimmer until a maximum reading is noted on the output meter. No further adjustment should be necessary, unless the set has been damaged, as the coils and condenser in this receiver have been specially handled at the factory to insure proper alignment at the lower frequencies.

ALIGNMENT DATA

Remove the chassis from the cabinet. A Signal Generator with the following frequencies is required: 455 KC, 1400 KC and 1720 KC.

The receiver volume control should be turned to maximum during the I.F. and all subsequent alignments to keep the A.V.C. from working and giving false readings. Turn the tone control to complete left hand position. Keep the generator output as low as possible to prevent overloading.

Connect an output meter across the voice coil of the speaker.

Connect a 20,000 ohm resistor across the loop connector terminals to reflect proper loop impedance.

FIRST STEP: Connect the hot lead from the generator to the "ANT." section of the gang condenser through a .1 MFD. condenser. The ground lead must be connected to the floating ground buss under the chassis. Turn the gang condenser to complete minimum capacity. Adjust the generator to 455 KC and adjust the trimmers of the 1st and 2nd I.F. transformers until a maximum reading is noted on the output meter.

SECOND STEP: With the leads from the generator connected in the same manner as in I.F. alignment, adjust the signal generator to 1720 KC. The "O.S.C." trimmer is located on the front section of the gang condenser. Adjust this trimmer until the signal is tuned in. The gang condenser should be at complete minimum capacity for this setting.

THIRD STEP: Remove the generator leads from the chassis. Remove the 20,000 ohm resistor from the loop connector terminals. Reinstall the chassis in the cabinet, connect the loop leads, motor plug and phono pickup leads.

Connect the generator leads to a transmitting loop, made of a few turns of wire, and loosely couple to the receiver loop antenna which is located on the back end of the cabinet. Adjust the generator to 1400 KC. Rotate the tuning control until this signal is tuned in. The "ANT." trimmer is located on the rear section of the gang condenser. Adjust this trimmer until a maximum signal is noted on the output meter.

No further adjustment should be necessary, unless the receiver has been damaged, as the coils and tuning condenser have been specially handled at the factory to insure proper alignment at the lower frequencies.

HOW TO INSTALL THE RADIO

POWER SUPPLY: This receiver is designed to operate from a power source of 110 to 125 volts AC current at 60 cycles only.

Always predetermine the type of power in your location by consulting the local power company for this information.

CAUTION: Never plug this unit into a 220 Volt or a DC power source as you will seriously damage the component parts, which have been designed for 110 to 125 volts AC current at 60 cycles only.

ANTENNA: This receiver is equipped with a sensitive loop antenna and will require no external antenna or ground. However, due to the directional qualities of the loop antenna, the reception of some stations may be improved by turning the receiver in different directions.

CONTROL KNOBS: This instrument is equipped with four knobs to control the operation. The extreme left knob is the "Tone" control. This control has three positions. The left hand position is "Normal" usually used for speech. The center position is "Medium" and is used for music. The right hand position is "Low" and is used to attenuate the high notes and increase the low notes. The second knob is the "Tuning" selector. This knob may be moved to the right or left to select the desired station. By mentally adding a zero to the numbers on the dial, the result will be read directly in kilocycles, i. e. 60 + 0 = 600 KC or 170 + 0 = 1700 KC.

The first knob to the right of the speaker opening is the "Volume" control and also the "OFF-ON" switch. In the extreme left hand position the switch is in "OFF" position. Turn this knob to the right and a click will be heard. This indicates that the power has been turned on. Allow about 30 seconds for the tubes to heat up and the instrument will be ready for operation. To increase volume, turn this knob to the right.

The extreme right hand knob is the "Radio-Phono" switch. The right hand position is for "Radio" operation and the left hand position is for "Phono" operation.

* These parts are not normally required for service but can be ordered by specifying the model radio, and the Illustration number and description as shown in this parts list.

GENERAL:

Push-Pull Lockup Tuners are used on the following radios:

Buick Model
980782 — 1949

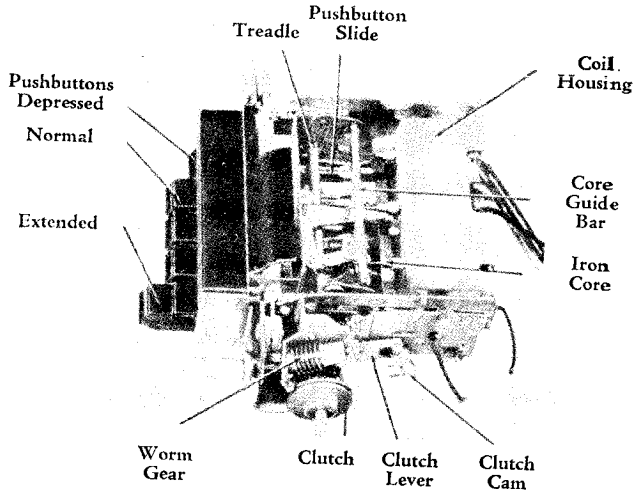
Cadillac Models
7256609 — 1948
7258155 — 1949

Chevrolet Models
986067 — 1947-48-49
986240 — 1949

GMC Truck Model
2233029 — 1947-48-49

Oldsmobile Models
982454 — 1948
982455 — 1948
982400 — 1949
982421 — 1949

Pontiac Model
984296 — 1949



The service bulletin for any radio using this type of tuner, and not listed above, will refer to this bulletin for tuner service.

The push-pull lockup tuner is a mechanism used to tune the radio through the broadcast band. This tuner uses permeability tuning. The tuning is done either with the manual tuning control or any of five push buttons.

TUNER OPERATION

MANUAL TUNING MECHANISM

In a permeability tuned radio the tuning is done by moving powdered iron cores in and out on the tuning coils. Therefore, the manual drive mechanism connects the rotary motion of the manual tuning knob to the straight line motion of the iron cores. This is done as follows: (See Illustration #1)

1. The manual knob (1) and shaft (2) turn the worm gear (3) in its bracket.
2. The worm gear (3) then turns at a slower speed the flat anti-backlash gear (4) which is fastened through the clutch (5) to the treadle shaft (6).
3. As the treadle (7) rotates it moves the

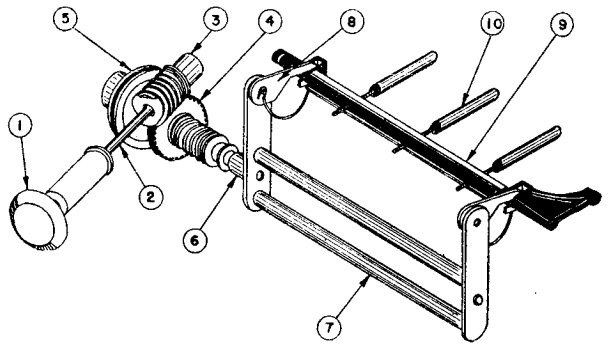


Illustration #1

core guide bar (9) which is connected to it by the links (8), in or out along the slots in the tuner side plates (not shown).

4. The iron cores (10) are fastened to the core guide bar (9) and move in or out of the coil forms (not shown).

The worm gear drive acts as a positive brake to hold the tuning cores in position even though the radio is jarred. A worm gear drive can only be turned from the worm gear (manual tuning knob) end of the drive. This brake eliminates any mechanical drift of the tuner.

PUSH BUTTON OPERATION

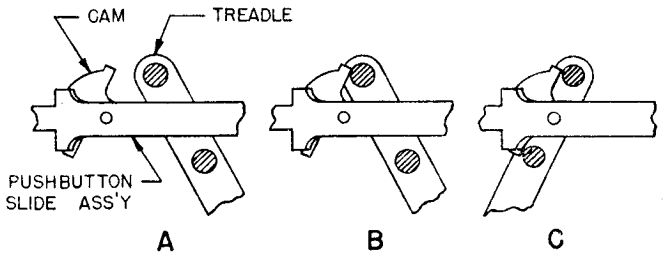

Illustration #2

The push button is operated by pushing the button all the way in and releasing. The sequence of operation is as follows: (See Illustration #2)

1. The push button is in its normal position and the relationship between the push button slide assembly and the treadle is shown in Illustration 2, Figure A.
2. As the push button is pushed in to the position shown in Illustration 2, Figure B, the clutch is disengaged (see clutch operation) allowing the treadle to move easily.
3. When the push button is pushed all the way in, the treadle takes a position in accordance with the setting of the cam on the push button slide assembly, (See Illustration 2, Figure C) thereby changing the frequency to which the radio is tuned.
4. The push button is released allowing the button slide assembly to return to its normal position shown in Illustration 2, Figure A. During this operation the clutch is re-engaged.

PUSH BUTTON SET UP PROCEDURE

1. Tune the desired station in manually.
2. Select the button to be set up and push it to the side or down (see bulletin for radio involved) and pull all the way out (about ½ inch).
3. Push the button all the way in.

How It Works:

To set up the push buttons to tune in a station it is necessary to position the cam on the push button slide assembly so that when the push button is depressed it will move the treadle to the correct position to tune the radio to the desired frequency. This is done as follows:

1. The desired station is tuned in manually. This positions the treadle correctly for the desired frequency and holds it securely in position.
2. The push button is moved to the side. This moves the black portion of the push button slide away from the white portion (See Illustration 3, Step 1) disengaging the pip from the hole.
3. The push button is pulled all the way out to the extended position as shown in Step 1. In this position the locking lever exerts no pressure on the cam, allowing the cam to move freely.
4. As the push button slide assembly is pushed in, it remains extended until the cam is positioned against the treadle as shown in Illustration 3, Step 2. This places the cam in a position so that when the cam is locked, the push button will return the treadle to the same position whenever it is operated.
5. As the push button is pushed further in, the white portion remains stationary while the black portion moves forward past the white portion as shown in Step 3. During this part of the operation the collar slides along the inclined plane of the locking lever causing the locking lever to exert pressure on the cam to hold it securely in position thus setting up the push button. Immediately after the cam has been locked the clutch tab operates the clutch mechanism. (See "Clutch Operation"). This clutch action has nothing to do with the push button set up operation.
6. The push button is released and assumes its normal position as shown in Illustration 3, Step 4.

The push button is now set up and any time the push button is operated it will tune the radio to the frequency for which it has been set.

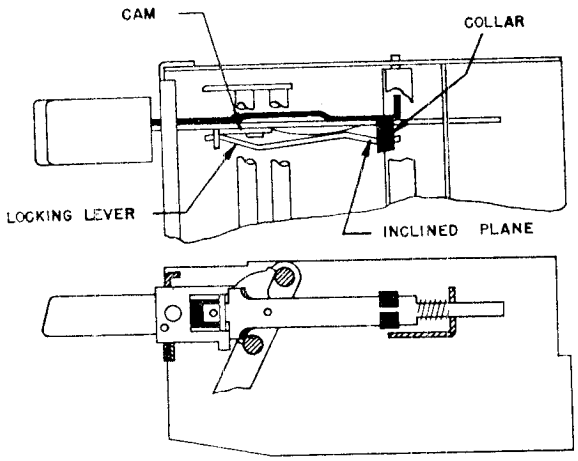
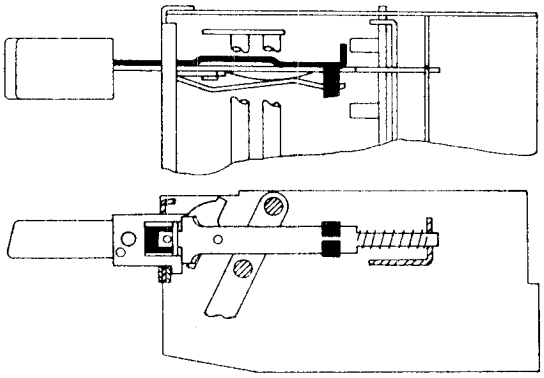
STEP 2- BUTTON EXTENDED-CAM ALIGNED



STEP 3- BUTTON LOCKED-CAM LOCKED IN POSITION



STEP 4- CAM LOCKED-BUTTON IN NORMAL POSITION

Illustration #3

CLUTCH OPERATION

The clutch in this tuner is used to release the braking action of the manual tuning mechanism by completely disengaging the manual drive mechanism from the treadle while the push button is operated. The clutch operates as follows:

1. As the push button is depressed the clutch operating tab "B" (See Illustration 4) pushes the finger "C" on the clutch cam assembly "D."

2. This rotates the clutch cam "D", causing the roller on the clutch lever "E" to move toward the tuner.

3. This lever "E" is fastened to the inside face of the clutch "A" and moves the inside face away from the outer face of the clutch "A."

4. The inside face of the clutch "A" is fastened to the flat anti-backlash gears and therefore to the manual drive. The outer face of the clutch is fastened to the shaft of the treadle and when the faces of the clutch "A" are separated the treadle is free to move easily.

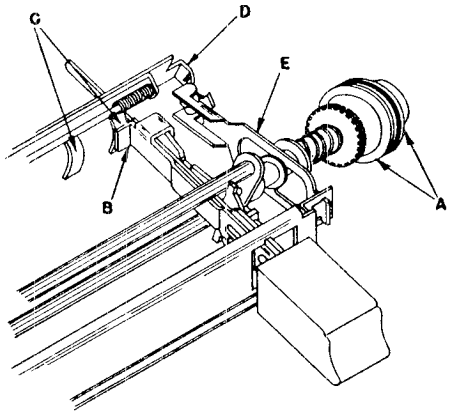


Illustration #4

©John F. Rider

TUNER ADJUSTMENTS

No tuner adjustments should be necessary unless some parts have been changed in the tuner. The factory makes all adjustments with precision equipment. Always be sure an adjustment is necessary before it is made.

POINTER CALIBRATION ADJUSTMENT

The procedure for calibrating the pointer is as follows:

1. Connect the signal lead of a signal generator to the antenna connector of the radio and the return lead to chassis.
2. Tune the signal generator to the frequency specified under "Alignment Procedure" in the service bulletin for the radio involved. (This is important because the adjustment screw is not accessible at all frequencies)
3. The pointer should then be adjusted by turning the pointer adjustment screw (See Illustration 5) until the pointer indicates the correct frequency on the dial. Any special instructions for this adjustment will be included in the service bulletin for the particular radio.

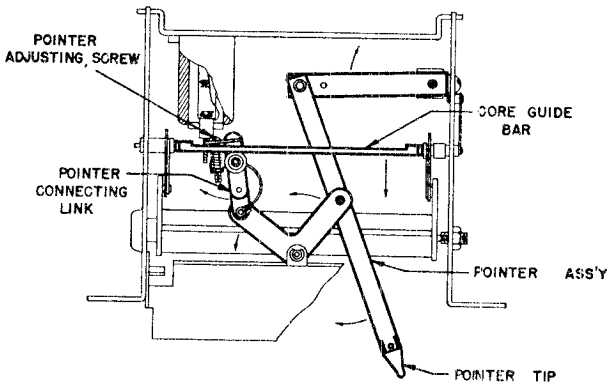

Illustration #5

ANTI-BACKLASH GEAR ADJUSTMENT

An anti-backlash gear is a special gear used to take out any looseness or "play" in the mesh of two gears. The anti-backlash gear of this tuner consists of two flat gears, side by side. One of these gears is fastened to the shaft on which it is mounted while the other is free to rotate around the shaft. These gears are spring loaded against each other so their teeth will completely fill the space between the teeth of the mating gear (worm gear) even though this space may vary. The anti-backlash gear is adjusted as follows:

1. Loosen or remove the worm gear and bracket assembly.
2. Turn the part of the gear that is free to rotate against the spring tension between the halves of the gear a distance of five teeth.
3. Replace the worm gear and bracket assembly, being careful not to lose the spring tension between the anti-backlash gears.

CLUTCH ADJUSTMENT

The only clutch adjustment on this tuner controls the amount of pressure between the faces of the clutch and the timing of the clutch operation. It must be made anytime the clutch disc driven is removed and is made as follows:

1. Place a 20 to 30 thousandth shim between the clutch lever roller and the clutch cam assembly (See Illustration 6).
2. Push the outer clutch disc on the treadle shaft up snug to the other face of the clutch. Do not use force.

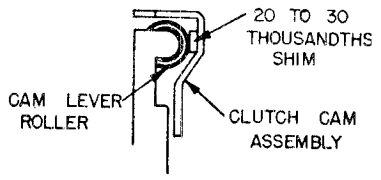

Illustration #6

3. Tighten the set screws on the clutch disc and remove the shim.

©John F. Rider

TUNER PARTS REPLACEMENTS

The replacement of most of the tuner parts is straight forward, in accordance with the blown up view shown in the Illustration 11. The tuners used on the various models listed in this bulletin will vary in detail from this illustration, but their operation is identical and the replacing of parts is very similar. Whenever parts are replaced on a tuner, careful consideration should be given to the removal of the tuner from the radio. Many times this removal is made when it is not necessary.

The procedure for making some special replacements is described below to aid in a speedy and efficient replacement..

REPLACING TUNING COILS — ALL RADIOS USING SHEET METAL COIL HOUSINGS

Before attempting the replacement of the tuning coils examine the radio involved carefully to determine the necessity of removing the complete tuner from the radio. Whenever possible leave the tuner in the radio.

1. Dissolve the cement from the iron tuning core stud at the core guide bar with acetone and remove the iron core from the core bar and coil.
2. Remove the fiber board support at the front of the shield cans.
3. Remove the nuts which hold the sheet metal can in place (on the rear of the tuner) and remove the can from the coil.
4. Remove the defective coil from the rubber grommet to which it is mounted and replace with a new coil.
5. Reassemble the parts that have been removed and realign the radio in accordance with the alignment instructions in the Radio Service Bulletin.

REPLACING TUNING COILS — ALL RADIOS USING DIE CAST COIL HOUSINGS

It is necessary to remove only the rear cover of the radio to make this replacement on all tuners using the die cast coil housing with the exception of the Chevrolet model 986240. On this model it is necessary to remove the rear cover and wraparound from the R.F. unit and to loosen the R.F. chassis enough to have free access to the coil mounting strip. The procedure for making this replacement on these tuners is as follows:

1. Remove the four screws holding the coil mounting strip to the die cast coil housing.
2. Remove the coil assembly from the housing.
3. Remove the defective coil from the rubber grommet to which it is mounted and replace with a new coil.
4. Reassemble all the parts and realign the radio in accordance with the alignment instructions in the Radio Service Bulletin.

CLUTCH REASSEMBLY

When the clutch is reassembled the clutch operating lever must be in the position shown in the Illustration 7. The procedure for positioning this lever is as follows:

1. Depress the clutch spring until the assembly bottoms.
2. Assemble the clutch lever on the side of the clutch operating collar toward the gears and slide the lever into its fulcrum as shown.
3. Release the clutch face and adjust the clutch in accordance with "Clutch Adjustment."

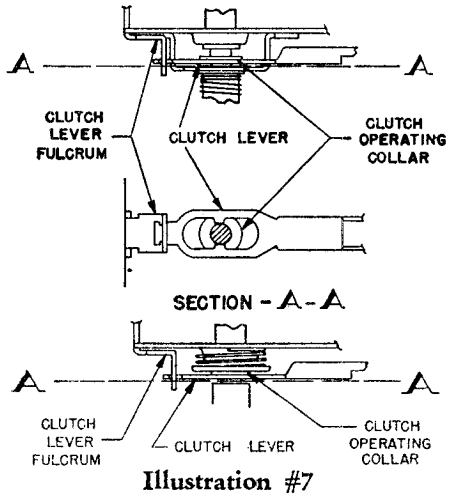

Illustration #7

Note: Both of the above types of clutch assemblies have been used. The only difference is in the position of the spring.

BEARING REPLACEMENTS

This tuner uses ball bearings on the treadle and worm gear. A small amount of grease will hold these bearings in place during assembly and will also provide lubrication for the bearings.

©John F. Rider

REPLACING THE POINTER ASSEMBLY

Use the following procedure to replace the complete pointer assembly. On radios having plastic pointers it is not necessary to replace the complete pointer assembly to replace the pointer tip. In such cases the pointer tip will be listed separately in the service parts list.

1. Remove the tuner from the radio.
2. Unfasten the pointer connecting link from the pointer assembly by removing the pointer connecting link spring. (See Illustration #5)
3. Remove the screw which fastens the pointer assembly to the tuner side plate.
4. Remove the "C" washer holding the pointer to the dial light shield.
5. Remove the pointer from the tuner.
6. Mount the new pointer assembly by making the same connections that were removed.

REPLACING PUSH BUTTON AND SLIDE ASSEMBLIES

In this bulletin the replacement of push button and slide assemblies in the 1949 or later model radios (assemblies using the cam that has an ear on each end) is described. For the replacement of this assembly in earlier models see the December 1947, Volume 4, No. 5 issue of "Testing Tips." The procedures are similar in both cases.

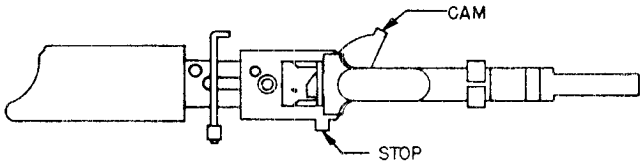

Illustration #8

1. Remove the tuner from the radio and tear it down as shown in the Illustration 11 until you have the front bearing plate and the five push button and slide assemblies.
2. Place the push button and slide assembly that is to be removed in the extended position as shown in Illustration 8 (move the button to the side or down and pull all the way out).
3. Position the slide with respect to the holes in the front bearing plate as shown in Illustration 9.

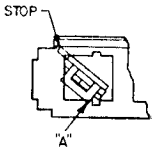

Illustration #9

4. Pull the slide in the direction of the button until the stop hits the front bearing plate. Work this stop through the bearing plate.
5. Turning the slide slightly, guide point "A" through the notch in the hole of the front bearing plate. (See Illustration 9)
6. Pull the slide on through the front bearing plate until the cam hits the front bearing plate. One end of the cam should readily pass through the bearing plate when this is done.
7. Maneuver the cam with your fingers until it is roughly perpendicular to the center line of the slide assembly and work the cam through the hole.
8. Pull the slide the rest of the way out of the front bearing plate. NO EXCESSIVE FORCE IS NECESSARY IN ANY OF THIS PROCEDURE.

The new push button and slide assembly can be put in the front bearing plate by using the exact reverse of this procedure.

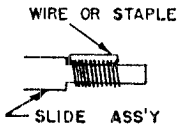

Illustration #10

When the bearing plate and the five push button and slide assemblies are put back in the tuner the slide return springs may make the reassembly difficult. However, this can be avoided by holding these springs in a compressed position on the ends of the slides with a paper staple or piece of wire during the assembly operation as shown in the Illustration 10. Be sure to remove the staple or wire before returning the tuner to the radio.

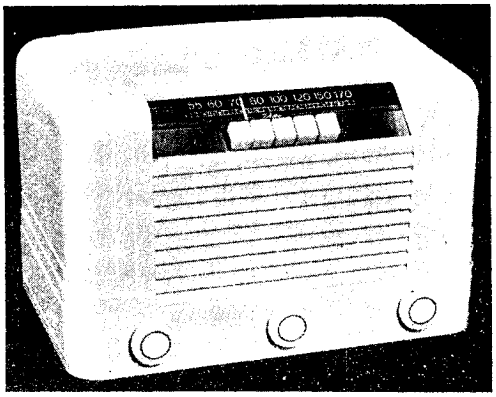
MODEL R-1236

GENERAL:

Tubes	6
Speaker	5" PM
Tuning	Manual and 5 Pushbuttons
Tuning Range	540 to 1720 KC
Intermediate Frequency	456 KC
Power Supply	105/125 volts AC-DC
Power Consumption	35 Watts
Cabinet	Ivory Plastic



Model R-1236

PUSHBUTTON SETUP PROCEDURE

1. Remove button from pushbutton shaft.
2. Loosen exposed screw by means of screwdriver.
3. Push shaft all the way in and hold in this position with screwdriver.
4. Tune in desired station manually.
5. Release shaft carefully and tighten shaft screw.
6. Replace button over shaft and push all the way in to be sure the pushbutton is set up accurately.

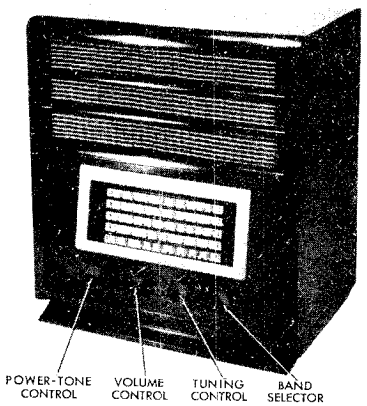
MODEL 808



POWER SUPPLY:

CAUTION: This receiver must be operated from a 105-125 V. or 210-250 V. 50/60 cycle AC supply. The receiver will not function on direct current (DC). If you are in doubt as to the voltage and frequency of the power supplied to your home, consult the local power company representative. Before plugging the power cord plug into the wall outlet, check to see that the line voltage switch, located on the chassis, is set for the source available. Refer to Fig. 5 for the location of this switch. The power receptacle provided for the record player supplies 115 V. regardless of the setting of the "110/220 V." switch on the receiver or the source to which the receiver has been connected.

ANTENNA:

A loop antenna has been installed inside the cabinet of the receiver and for reception of local stations no other additional antenna is usually required.

Metal structures concealed in walls, radiators, or other large metal objects near the receiver prevent best possible pickup of radio signals. Locate your receiver as far as possible from such objects.

For best results, especially at remote points from broadcast stations, an outside antenna about 25 to 100 feet long, including lead-in, may be necessary. The lead-in wire is connected to the terminal marked "A" located on the rear apron of the chassis. To avoid excessive electrical noise, erect the antenna so that its length runs at right angles to nearby power lines, streetcar lines, and other similar types of electrical apparatus. For some installations it will be found desirable to connect a ground wire between the "G" terminal and a suitable ground such as a water pipe or radiator.

LOCATION:

Do not place the radio in a warm location, such as on a radiator or over a hot air register. When placing the radio against a wall, leave sufficient clearance for the circulation of air.

BAND SELECTOR - The band selector knob has six positions which perform the following functions in the order of its rotation from left to right. The position of the band selector knob is indicated by the illumination of the particular band being tuned. When operating in the "phono" position, the whole dial will be illuminated.

Position 1 - Phono - With the record player connected to power and pick-up receptacles on the rear apron of the receiver, the reciever operates as a phonograph. The volume and tone controls function as they do for radio reception.

Position 2 - BROADCAST Band - The receiver will tune the standard broadcast band in this position. The receiver frequency is read from the dial scale marked BROADCAST.

Positions 3, 4, 5, 6 - SHORTWAVE Bands - The receiver tunes the shortwave ranges (A - 2.2 to 7 mc), (B - 7 to 22 mc), (C - 9 to 12 mc) and (D - 15 to 18 mc) on these last four positions and dial scales SHORTWAVE A, B, C and D respectively indicating the receiver frequency directly in megacycles.

DAY AND NIGHT RECEPTION:

You will notice that you are able to receive several more stations during the night than during the day. This is a phenomenon due to the sun's effect on the ionosphere. It is not a peculiairty of your receiver.

FADING:

Fading will be encountered only on distant stations. It will be recognized by a gradual diminishing of volume, sometimes to a point where the signal is no longer heard, followed by a gradual return to normal volume. This happens without any change of the controls of the radio. It is often accompanied by distortion or "garbling" of the signal. By means of the automatic volume control in your receiver this effect is reduced considerably. In severe cases it will be necessary to tune to some other station.

STATIC:

Static, like fading, is not attributable to a defective receiver. It is caused by electrical disturbances in the atmosphere (lightning flashes will be heard as severe static) and the more sensitive the receiver the more static will be heard. It us usually most prevalent in the summer and during storm periods.

STATION INTERFERENCE:

Because of the limited number of channels to which broadcasting stations can be assigned it has been necessary to assign more than one station to a channel. This results in interference between the stations particularly if the desired station is not powerful or if it tends to fade. The interference will take the form of whistles or growls and in some cases the interfering station will actually be louder than the desired station. There is no remedy for this other than to tune to a different station at another point on the dial.

LOCAL INTERFERENCE:

Interference caused by electrical apparatus is known as local or "man made" static. Though somewhat similar to static it can usually be distinguished by its regularity or by some peculiar tone. It is caused by arcing or leaking of current in industrial equipment, appliances, high tension power lines, automobile ignition systems, electric razors, etc. It is usually much more prevalent in cities or industrial areas although rural power lines are a common source.

Local interference can be controlled to some extent by proper filtering of appliances and equipment and to this end present day manufacturers of such equipment are contributing a great deal in improved designs. Power companies are also helpful and cooperative in seeking out and eliminating interference where their equipment is at fault.

©John F. Rider

TUBE AND DIAL LAMP REPLACEMENT:

The types of tubes required and their relative position in the receiver are shown in Fig. 5. When installing a replacement tube, insert the center guide pin into the center hole of the tube socket. Rotate the tube until the key on the guide pin drops into the notch in the socket hole. Push down until the base of the tube rests firmly on the socket.

To replace two of the dial lamps, it will be necessary to remove the chassis from the cabinet. To replace the dial lamps for the individual bands, unclip the socket by pinching the side springs of the socket together and withdrawing them from their light shield.

SOCKET VOLTAGES:

The socket voltages shown in the voltage chart were obtained with a 20,000 ohm per volt meter while operating the receiver from a 117-volt a-c source. All voltages are to be measured between the tube pin and receiver chassis. Blanks are provided for your meter readings to establish an average set of readings for this receiver as measured with your test equipment. The normal power consumption for the receiver is 85 watts.

ALIGNMENT:

All connections and adjustments necessary for alignment are accessible from the top of the chassis. The output transformer is located on the under side of the chassis, hence, the output meter connection should be made at the speaker socket. The speaker voice coil impedance is 3 ohms.

All alignment adjustments are made at maximum volume. Refer to the alignment chart for the dial and bandswitch settings.

The standard RMA dummy antenna specified in the alignment chart consists of a 200 mmf condenser in series with a 20 uh r-f choke which is shunted by a 400 mmf condenser in series with a 400 ohm carbon resistor.

CAUTION: The loop antenna must be connected during alignment.

ALIGNMENT CHART

Step	Dummy Antenna	Signal Generator Coupling	Signal Generator Frequency	Band Switch Setting	Receiver Dial Setting	Adjust
1	.01 mfd capacitor	Connect to rear section stator of tuning cap.	455 kc	BC	1000 kc	ABCD

MODEL 980851, Buick

SUBJECT: SERVICE INSTRUCTIONS - BUICK MODEL 980851

GENERAL

MOUNTING—All 1949 Buick Cars.

TUBES—Six, Plus Rectifier.

SPEAKER—8" Round, Permanent Magnet.

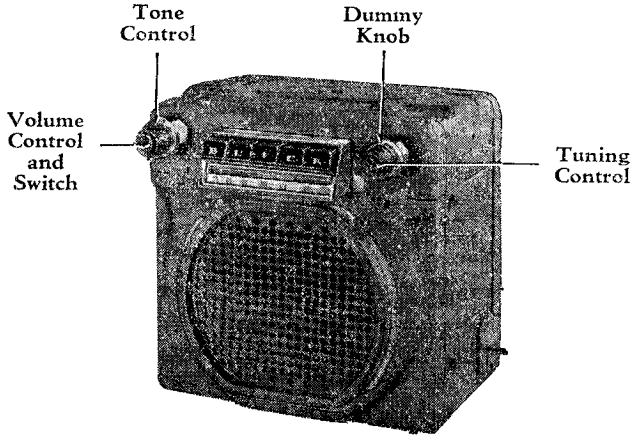
TUNING—Manual and 5 P. B. Mechanical.

ANTENNA TRIMMER COMPENSATION—For Antennas Between 0.000052 — 0.000068 Mfd.

TUNING RANGE—550-1600 KC.

PUSH BUTTON SETUP PROCEDURE

Pull Push Button to the left and out. Tune in desired station manually. Push button all the way in.



MODEL 980851

ALIGNMENT PROCEDURE

Output Meter Connections ..... Across Voice Coil
Generator Return ..... To Receiver Chassis
Dummy Antenna ..... In Series With Generator
Volume Control Position ..... Maximum Volume
Tone Control Position ..... Treble
Generator Output ..... Minimum for Readable Indication

Steps	Series Condenser or Dummy Antenna	Connect Signal Generator to	Signal Generator Frequency	Tune Receiver to	Adjust in Sequence For Max. Output
1	0.1 Mfd.	6SA7 Grid (Pin #8)	260 KC	High Frequency Stop	A, B, C, D
2	0.000056 Mfd.	Antenna Connector	1615 KC	High Frequency Stop	*E, F, G
3	0.000056 Mfd.	Antenna Connector	1000 KC	Signal Generator Signal	J, K
4	0.000056 Mfd.	Antenna Connector	1615 KC	High Frequency Stop	F, G
5	0.000056 Mfd.	Antenna Connector	1000 KC	Signal Generator Signal	L**

*Before making this adjustment check mechanical setting of oscillator core "H." The rear of the core should be 1 25/32" from the mounting end of the coil form. (This measurement is readily made by inserting a suitable plug in the mounting end of the coil form.) Core adjustments should be made with an insulated screw driver, and core studs should be cemented in place with glyptal or household cement after alignment.

**L is the pointer adjustment screw which is on the connecting link, between the pointer assembly and the parallel guide bar. It should be adjusted so that the dial pointer corresponds with the 1000 KC mark on the dial. (On first "0" of "100.")

With the radio installed and the car antenna plugged in adjust the antenna trimmer "G" for maximum volume with the radio tuned to a weak station near 1400 KC (see sticker on case).

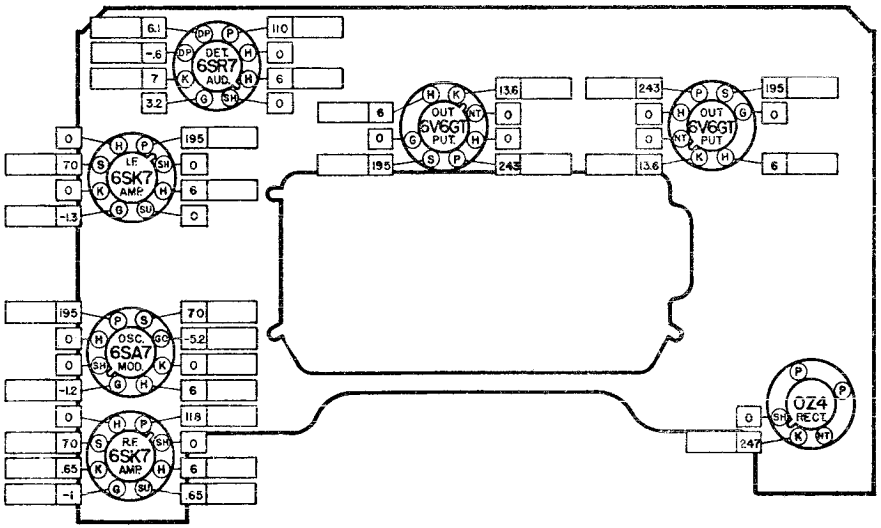
TUBE SOCKET VOLTAGE CHART

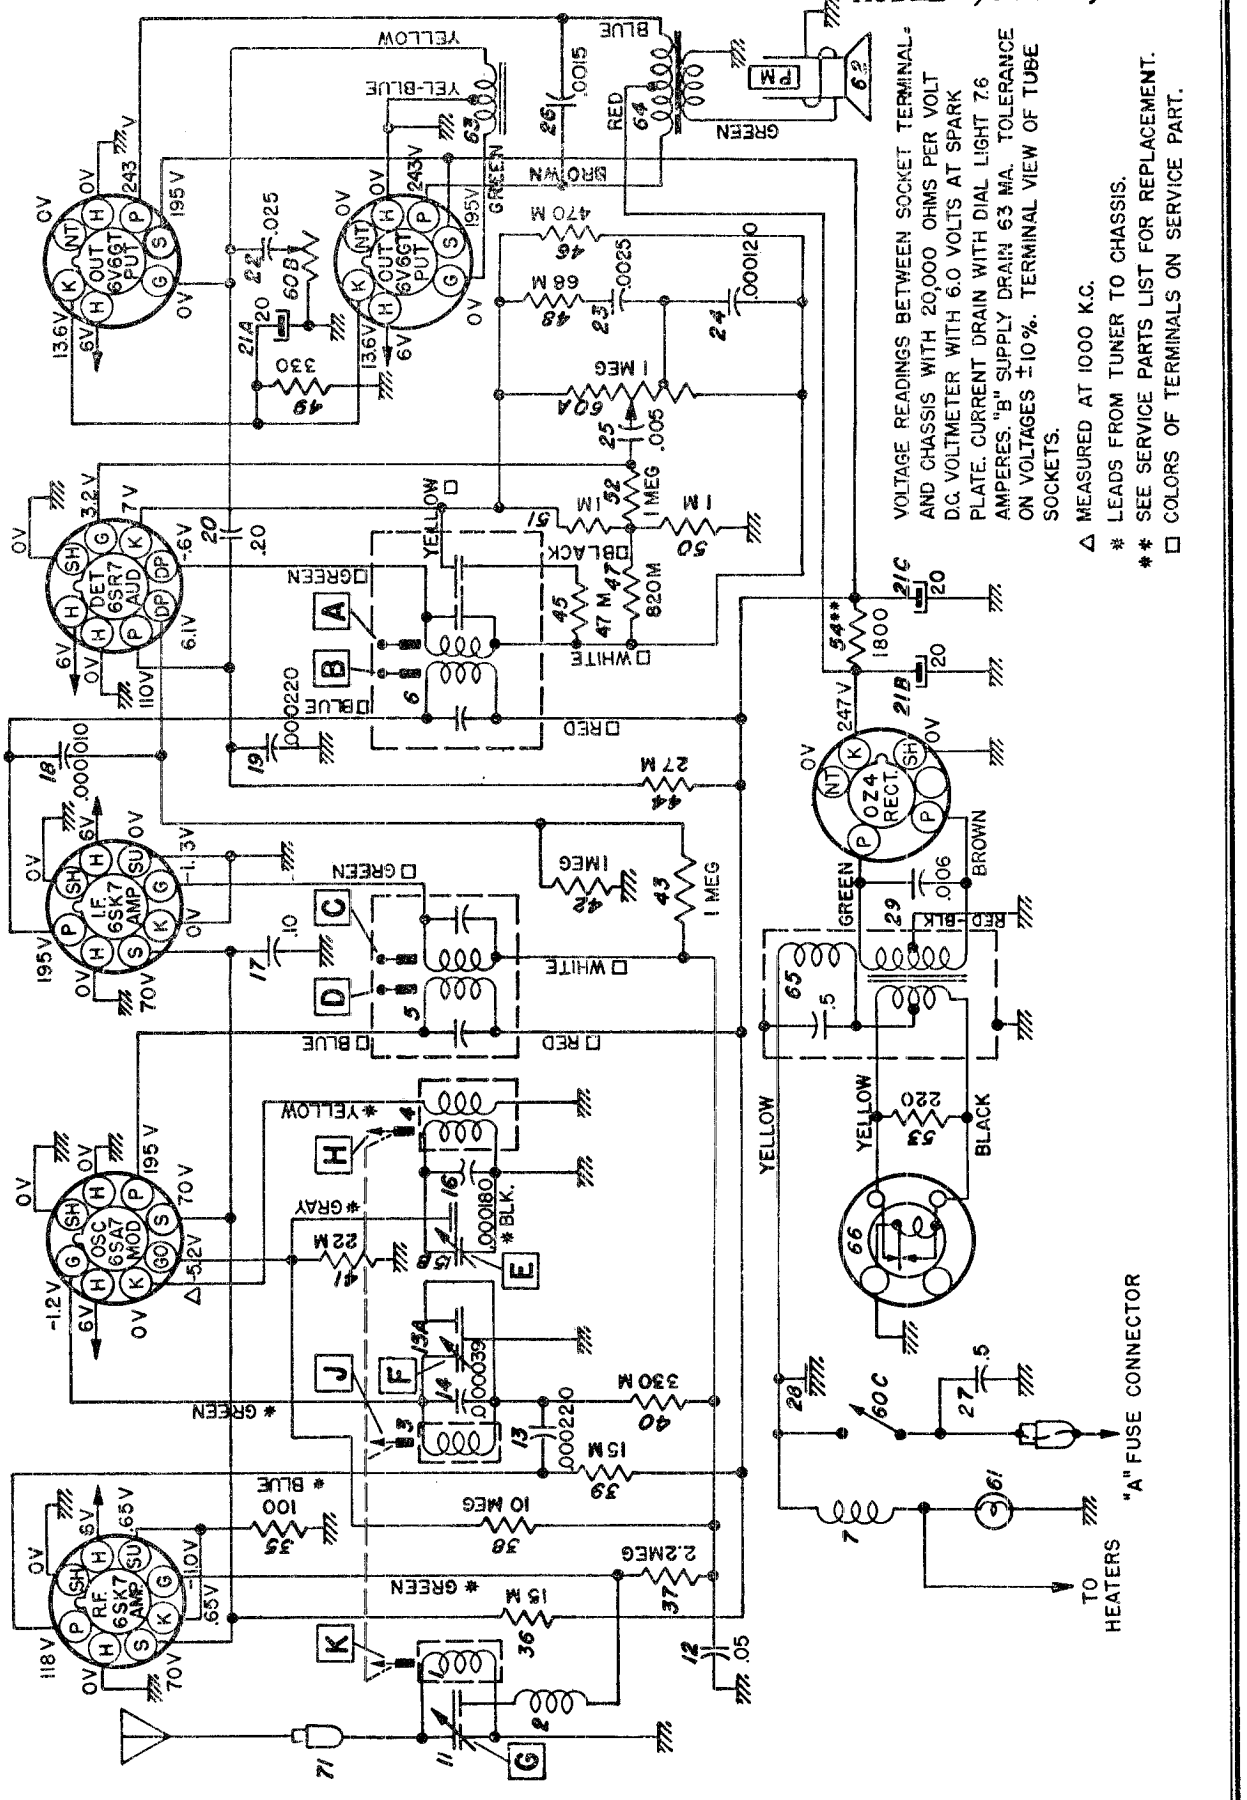
The tube socket voltages, as measured at the factory and under the conditions shown on the schematic diagram on Page 3 are shown.

The blank spaces are provided so the service man may fill in the actual voltage readings as taken with his own equipment. A normal operating radio should be used for these measurements.



VOLT METER RESISTANCE ..... OHMS PER VOLT. READINGS TAKEN WITH ..... VOLTS AT SPARK PLATE. VOLTAGES MEASURED FROM SOCKET TERMINALS TO CHASSIS AND ARE POSITIVE UNLESS MARKED OTHERWISE.

MODEL 980868, Buick



VOLTAGE READINGS BETWEEN SOCKET TERMINALS AND CHASSIS WITH 20,000 OHMS PER VOLT D.C. VOLTMETER WITH 6.0 VOLTS AT SPARK PLATE. CURRENT DRAIN WITH DIAL LIGHT 7.6 AMPERES. "B" SUPPLY DRAIN 63 MA. TOLERANCE ON VOLTAGES ±10%. TERMINAL VIEW OF TUBE SOCKETS.
△ MEASURED AT 1000 K.C.

TUNER UNIT

ALIGNMENT PROCEDURE

Volume Control maximum.
Tone Control on high position.
Signal Generator Output minimum for satisfactory output indication.

Series Capacitor Or Dummy Antenna	Connect To	Signal Generator Frequency	Adjust Screws In Order
0.1 mfd.	Terminal X (See Parts Layout)	257.5 KC	A, B, C, D
.000065 mfd.	Antenna Terminal	1610 KC	E, F, G

Low frequency alignment not required.
Adjust Trimmer F to match car antenna (1400 KC) when radio is installed.

PUSH BUTTON SET-UP

Turn counter clockwise - tune in manually - depress loosened button - turn button clockwise to tighten.

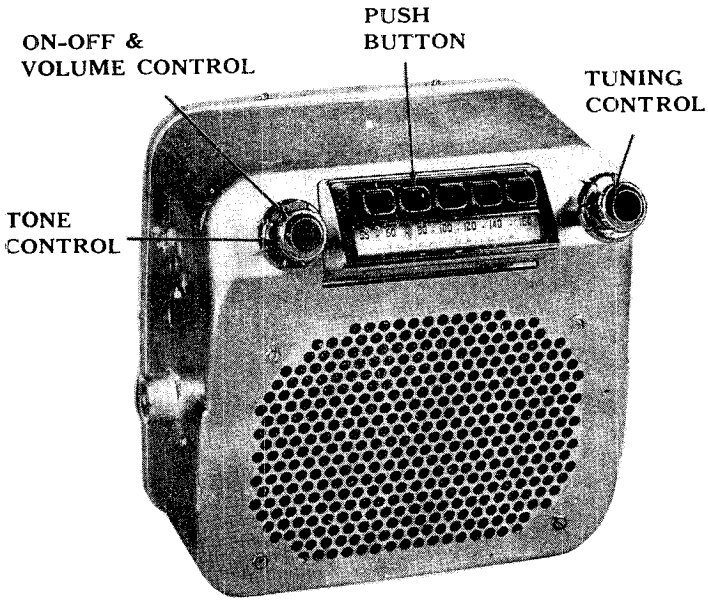
Starting with Serial No.
B59-40001



MODEL 982420

(Starting with serial number B59-40001).

PUSHBUTTON SET-UP

Pull pushbutton to the left and then out. Tune in desired station manually. Push button all the way in.

GENERAL

MOUNTING ___All 1949 Oldsmobile Cars

TUBES_____Six, Plus Rectifier

SPEAKER_____
__6" x 9" Elliptical Permanent Magnetic

TUNING _ Manual and 5 P.B. Mechanical

ANTENNA TRIMMER COMPENSATION—For Antennas between
0.000055—0.000090 Mfd.

TUNING RANGE_____535 - 1610 KC.

ALIGNMENT PROCEDURE

Output Meter Connection_____Across Voice Coil
Generator Return_____To Receiver Chassis
Dummy Antenna_____In Series with Generator
Volume Control Position_____Maximum Volume
Tone Control Position_____Treble
Generator Output_____Minimum for Readable Indication

Steps	Series Condenser or Dummy Antenna	Connect to	Signal Generator Frequency	Tune Receiver To	Adjust In Sequence For Max. Output
1	0.1 Mfd.	7Q7 Grid (Pin #6)	257.5 KC.	High Frequency Stop	A, B, C, D
2	0.000070 Mfd.	Antenna Connector	1610 KC.	High Frequency Stop	E, F, G, H

Low frequency alignment not required.

With the radio installed, and the car antenna plugged in, adjust the antenna trimmer "H" for maximum volume with the radio tuned in to a weak station near 1400 KC.

MODEL 984570,
Pontiac

SUBJECT: SERVICE INSTRUCTIONS - PONTIAC CHIEFTAIN MODEL 984570

GENERAL

MOUNTING—All 1950 Pontiac Cars.

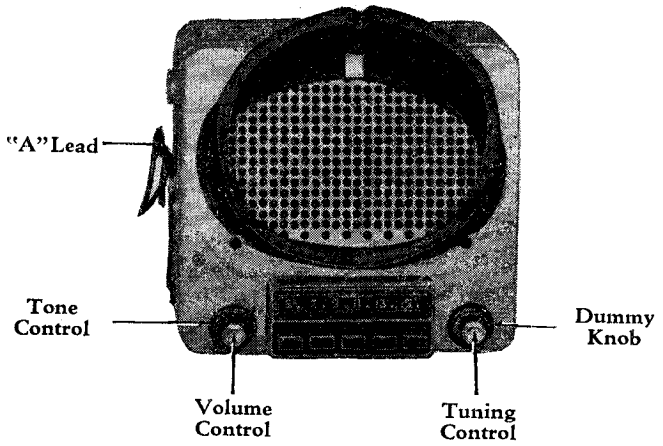
TUBES—Seven, Plus Rectifier.

SPEAKER—6" x 9" Elliptical, Permanent Magnet.

TUNING—Manual and 5 Push Button Mechanical.

ANTENNA TRIMMER COMPENSATION — For Antennas Between 0.000060 - 0.000090 Mfd.

TUNING RANGE — 550-1600 KC.



MODEL 984570

PUSHBUTTON SET-UP

Pull button to the right and out. Tune in desired station manually. Push button in as far as it will go.

ALIGNMENT PROCEDURE

Output Meter Connections ..... Across Voice Coil

Generator Ground ..... Receiver Chassis

Dummy Antenna ..... In Series With Generator

Volume Control Position ..... Maximum Volume

Tone Control Position ..... Treble

Generator Output ..... Minimum for Readable Indication

Steps	Series Condenser or Dummy Antenna	Connect to	Signal Generator Frequency	Tune Receiver To	Adjust in Sequence for Max. Output
1	0.1 Mfd.	6SA7 Grid (Pin #8)	260 KC	High Freq. Stop	A, B, C, D
2	0.000068 Mfd.	Antenna Connector	1615 KC	High Freq. Stop	*E, F, G
3	0.000068 Mfd.	Antenna Connector	1000 KC	Signal Gen. Signal	J, K
4	0.000068 Mfd.	Antenna Connector	1615 KC	High Freq. Stop	F, G
5	0.000068 Mfd.	Antenna Connector	1000 KC	Signal Gen. Signal	L**

*Before making this adjustment check the mechanical setting of the oscillator core "H." The slotted end of the core should be 1 25/32" from the mounting end of the coil form. (This measurement is readily made by inserting a suitable plug in the mounting end of the coil form). If adjustment is necessary be sure to first dissolve the glyptal seal on the core studs. Core adjustments are made from the mounting end of the coil form with an insulated screwdriver, and core studs should be resealed with glyptal or household cement after alignment.

**"L" is the pointer adjustment screw on the pointer connecting link (see tuner drawing). Adjust so pointer reads 1000 KC.

With the radio installed and the car antenna plugged in adjust antenna trimmer "G" (see sticker on case) for maximum volume with the radio tuned to a weak station near 1400 KC.

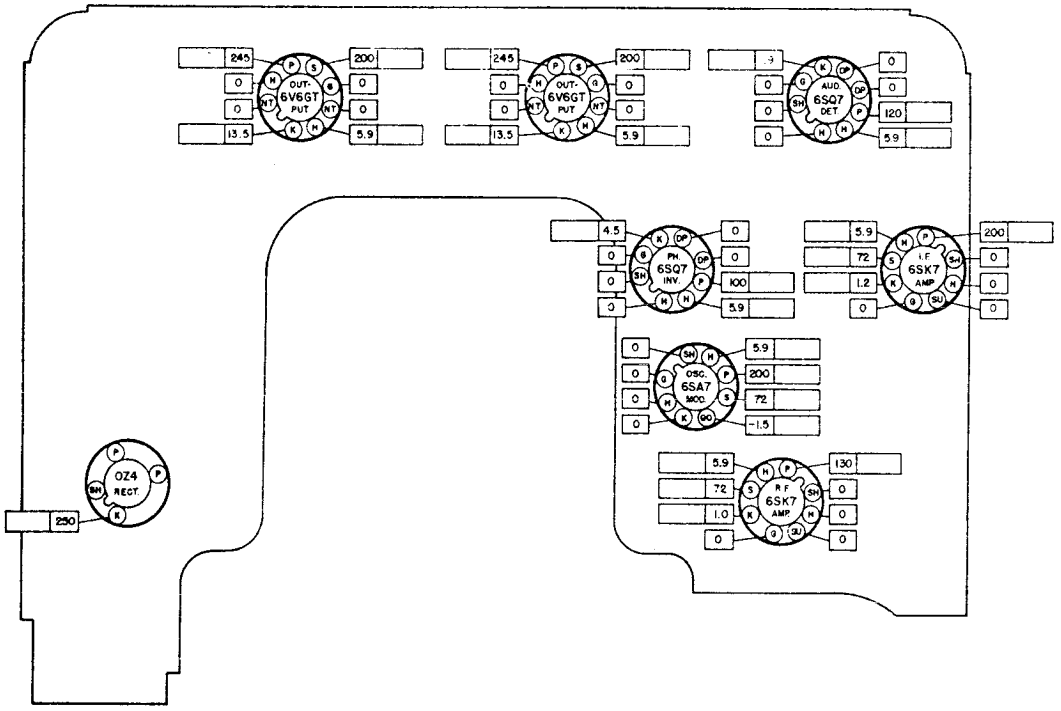
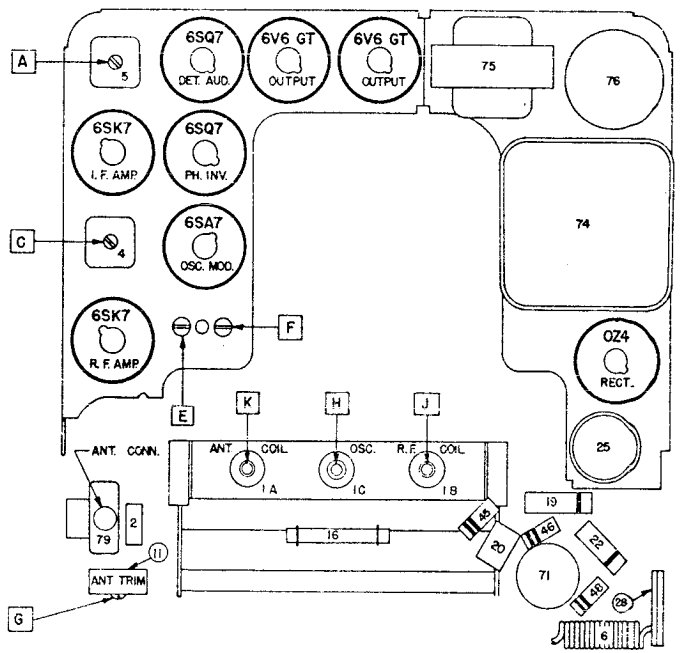
TUBE SOCKET VOLTAGE CHART





PARTS LAYOUT — TUBE VIEW

The tube socket voltages, as measured at the factory and under the conditions shown on the Schematic Diagram on Page 3, are shown above. The blank spaces are provided so the serviceman may fill in actual voltage readings as taken with his own equipment. A normal operating radio should be used for these measurements.

Voltmeter resistance is ..... ohms per volt. Voltages taken with ..... volts at the spark plate. Tolerance on voltages is ± 10%. All readings are taken from socket terminals to chassis.

ALIGNMENT

Trimmer condensers in this receiver have been carefully adjusted at the factory and should require no further adjustment (except antenna trimmer) unless a coil or iron core has been replaced. It is advisable not to attempt any adjustment unless it is definitely known that alignment is necessary. Since the iron cores of the tuning unit are set at the factory, only the trimmer adjustments as outlined under "Alignment Procedure" should be made. A signal generator and an output meter must be used to align the receiver circuits correctly. All alignment adjustments must be made with radio frequency unit removed from the car.

1. I.F. Alignment at 262 Kilocycles

Note: The signal generator output should be as low as possible to give a readable indication on the output meter for all adjustments.

(a) Connect one lead from the output meter in parallel with speaker voice coil, other lead to chassis ground.
(b) Connect the ground lead of the signal generator to chassis ground.
(c) Connect the signal lead of the signal generator to the grid (G) prong of the 6BE6 tube socket through a .02 mfd. condenser.
(d) Turn the set volume control on full and rotate the tone control knob to center of its range. Set the signal generator to 262 kilocycles and tune the receiver to a frequency where no squeals or beat notes may be heard and so when tuning control is moved through narrow limits no appreciable change in output is noticeable.
(e) Adjust I.F. trimmers A, B, C and D for maximum output.

2. Alignment at 1615 Kilocycles

(a) Connect the signal lead of the signal generator to the antenna connection through a .000075 mfd. condenser.
(b) Turn the manual tuning control of the receiver to stop at the high frequency end of the dial.
(c) Set signal generator to 1615 kilocycles.
(d) Adjust oscillator trimmer "E" for maximum output.

3. Alignment at 1400 Kilocycles

(a) Set the signal generator to 1400 kilocycles and tune the receiver to 1400 kilocycles.
(b) Adjust R.F. trimmer "F" for maximum output.
(c) Adjust Antenna trimmer "G" for maximum output.

4. Alignment with Car Antenna

Antenna trimmer "G" must be adjusted to match the car antenna when receiver is installed. With antenna fully extended, tune in a weak station around 1400 kilocycles and adjust antenna trimmer "G" for maximum volume.

CAPACITY AND INDUCTANCE ALIGNMENT

This alignment should be used only when there is definite evidence that the iron cores are out of adjustment or coils have been changed.

1. I.F. Alignment at 262 Kilocycles

The same procedure as outlined in Alignment Procedure.

2. Alignment at 1615 Kilocycles

(a) Connect signal lead of signal generator to receiver antenna connection of the set through a .000075 mfd. condenser.
(b) Set signal generator to 1615 kilocycles.
(c) Turn manual tuning knob of receiver to the high frequency end of dial.

© John F. Rider

MODEL 986240, Chevrolet

CAPACITY AND INDUCTANCE ALIGNMENT—(Cont'd)

(d) Mechanically align the oscillator, R.F., and antenna iron core "H" "J" "K" so that slotted end of iron cores is $1\frac{25}{32}$ inches from mounting end of coil form.
(e) Adjust oscillator trimmer "E" for maximum output.
(f) Adjust R.F. trimmer "F" for maximum output.
(g) Adjust antenna trimmer "G" for maximum output.

3. Alignment at 1400 Kilocycles

(a) Adjust signal generator to 1400 kilocycles.
(b) Tune manual tuning knob until dial pointer is at 1400 kilocycles.
(c) Adjust R.F. core "J" for maximum output.
(d) Adjust antenna core "K" for maximum output.

Note: The rear end of iron cores are slotted so these adjustments can be made with a non-metallic screw driver that fits loosely in coil form. (No inward force should be used)

4. Realignment at 1615 and 1400 Kilocycles

(a) Repeat alignment procedure as noted in paragraphs 2 and 3 under Capacity and Inductance (except oscillator core "E") until adjustment for maximum output at 1615 and 1400 kilocycles coincides with 1400 kilocycles alignment.

5. Alignment with Car Antenna

With antenna fully extended tune in a weak station around 1400 kilocycles, volume on full, adjust antenna trimmer "G" for maximum volume.

COIL REPLACEMENT PROCEDURE

To replace the Antenna, R.F. or Oscillator Coil proceed as follows:

(a) Remove rear cover of set.
(b) Remove "PK" screws holding center section of receiver case and remove.
(c) Remove tubes and spring clips holding 1st and 2nd I.F. coils in place.
(d) Remove 4 screws on coil assembly mounting strip.
(e) Pull coil mounting strip towards the I.F. coils, until antenna, R.F. and oscillator coils are exposed.
(f) Unsolder leads to coil being replaced.
(g) Remove coil from mounting grommet.

TO REASSEMBLE COIL ASSEMBLY

(a) Place coil on mounting grommet.
(b) Solder coil leads to proper terminals.
(c) Place coil assembly mounting strip in to shield.
(d) Replace 4 screws holding mounting strip.
(e) Replace springs holding I.F. coils in place, replace tubes.
(f) Replace center case section.
(g) Realign receiver as outlined under "Capacity and Inductance Alignment."

NEW COMPONENT

This component is a condenser and resistor in one unit, and will be known as a capristor.

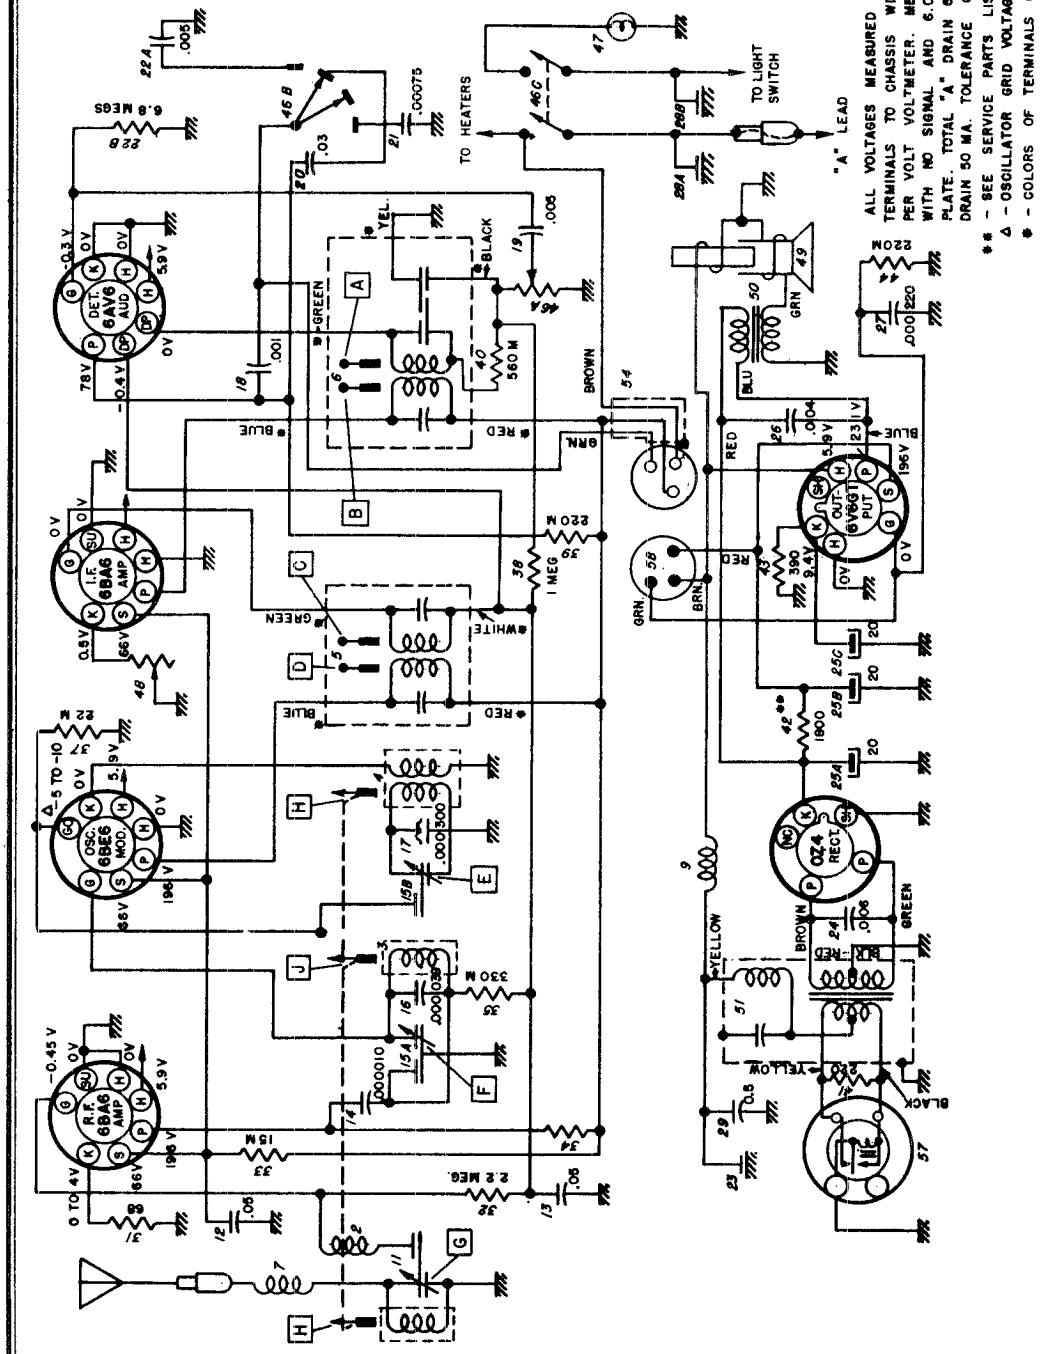
MODEL 986240,
Chevrolet



CIRCUIT DESCRIPTION

The circuit used in this receiver is the conventional superheterodyne type and uses no regeneration. Tuning circuits are tuned by varying the inductance of the antenna, R. F. and Oscillator coils by means of iron cores which slide in and out of the coils like pistons. . The alignment of iron cores has been set at the factory and further adjustment should not be required unless the coils or iron cores have been replaced. A special tone control circuit is employed to give the desired tone without distortion.

PROCEDURE FOR SETTING PUSH BUTTONS

Turn on the receiver for 10 minutes or longer to allow circuits to stabilize.

1. Select five good stations in order of their frequency.
2. Pull top push button slightly down and out as far as it will go.
3. With manual tuning knob tune-in desired station.
4. Push button in firmly to end of its travel.
5. Repeat same procedure for remaining four buttons.

ANTENNA SYSTEM

An 80-inch fully extended (25 5/16 inches collapsed) fender type antenna is furnished with this receiver, designed expressly for use on the 1949 Chevrolet passenger car and will operate very efficiently with this Chevrolet radio.

ANTENNA CIRCUIT

The antenna circuit is directly coupled to the antenna. The antenna, oscillator and R.F. circuit are tuned by means of iron cores. The antenna circuit is adjusted for slight variations in antenna by means of an antenna trimmer located on the bottom of the radio frequency unit.

	505924	Terminal strip (FM-FM-AM-AM)
	506619	Window for dial

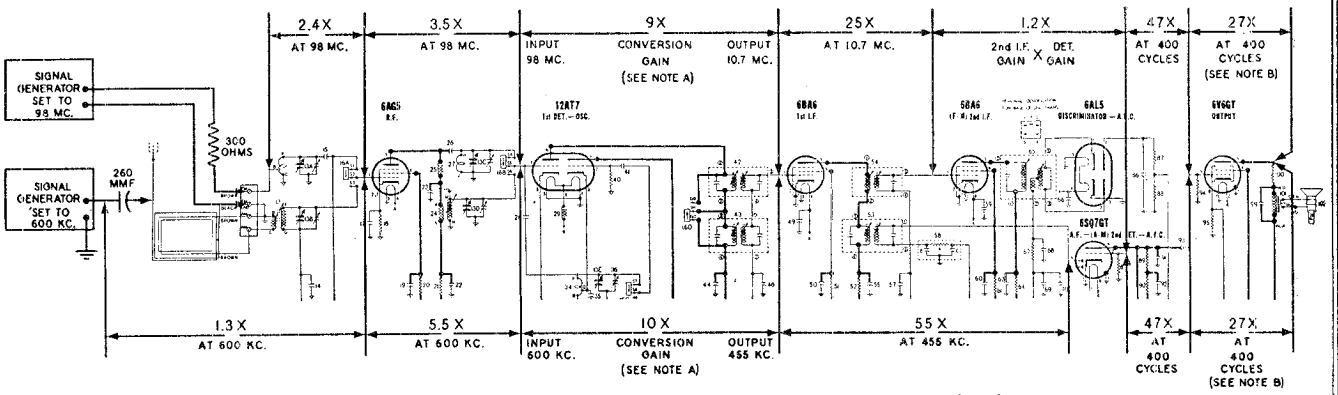
MODEL D1949

STAGE GAIN MEASUREMENT PROCEDURE

REQUIRED INSTRUMENTS: The amount of amplification or "gain" of most of the stages of this receiver can be measured with an A.C. Vacuum Tube Voltmeter of the high frequency type. An AM (600 KC.) as well as an FM (98 MC.) signal source is required. For gain measurements in the FM antenna—FM converter—FM 1st I.F. stages, a microvolt calibrated FM signal generator should preferably be used.

PROCEDURE: It is exceedingly important to adhere to the procedure outlined below since the accuracy of these measurements will be affected to a considerable extent by the failure to establish proper operating conditions.

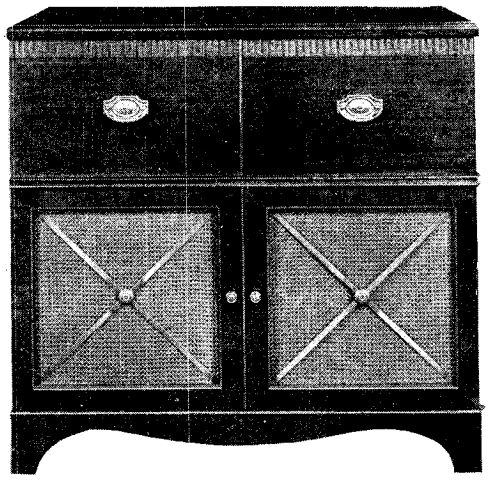
1. Be sure that R.F., I.F. and Discriminator stages are carefully and accurately aligned by utilizing the alignment procedure given in this manual.
2. Connect Signal Generator as shown below. Note that generator connections differ for "AM" and "FM" measurements.
3. For "AM" measurements, set signal generator to 600 KC. (400 cycle modulation) and then carefully tune radio receiver to this signal by using an output meter to indicate peak output. If a local station interferes, set generator to a nearby frequency and re-tune the receiver.
4. For "FM" measurements, set signal generator to 98 MC. (400 cycle modulation with 22½ KC. deviation) and then carefully tune radio receiver to this signal by using a D.C. Vacuum Tube Voltmeter as an output indicator—meter must be connected between pin No. 7 of 6AL5 tube and chassis. If a local station interferes, set generator to a nearby frequency and re-tune the receiver.
5. The values of stage gain which are given here were measured with a fixed bias of —3 volts on the control grids of all R.F. and I.F. tubes which are connected to the A.V.C. system. Therefore, these values are not intended to indicate the full capability of a stage but they will serve as a convenient basis for determining proper operation. In order to duplicate the fixed bias voltage, connect the negative terminal of a 3 volt battery to both A.V.C. supply lines by effecting a common connection to terminal 4 of 2nd FM-I.F. transformer and terminal 2 of 1st AM-I.F. transformer. Then connect the positive battery lead to the receiver chassis.
6. R.F. and I.F. circuits are slightly de-tuned when contact is made with an instrument probe and this action, which is indicated by a change in the output meter reading, may seriously affect the gain measurement. Therefore, it is important to adjust the associated circuit trimmer for a maximum output meter reading and to set the input signal level to a convenient reference point on the gain measuring instrument while the probe is making contact. After removing the probe it is again necessary to adjust the trimmer so as to obtain the same output meter reading and thereby assure that the signal voltage at the specified point has not changed as a result of circuit de-tuning.



NOTE A: Short oscillator grid (pin 2 of 12AT7) to ground when measuring input voltage at signal grid (pin 7) of 12AT7 tube.

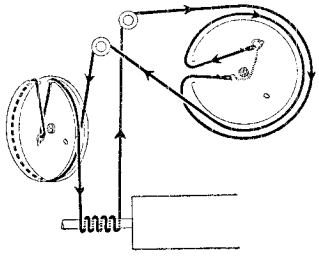
NOTE B: Measured with input voltage of 0.3.

DIFFERENCES in tube characteristics, tolerance of parts, adjustment of tuned circuits and variations in line voltage will influence stage gain. These factors should be given due attention in event the gain of a stage varies extensively from the values shown above.



DIAL AND POINTER DRIVE CORD ARRANGEMENT

SIDE VIEW



To string dial cord, set gang condenser to fully open position and use the following parts:

114955 Clip on end of cord
117057 Cord (3 feet)
119087 Ring for dial cord
505161 Tension spring

Do not connect to a Direct Current (D. C.) or to a 50 cycle A.C. power supply.

© John F. Rider

BROADCAST BAND —"AM"—ALIGNMENT PROCEDURE

1. Disconnect leads from FM-AM antenna terminal strip (labeled FM-FM-AM-AM) at back of chassis; also disconnect speaker leads and phono plugs. Remove chassis and speaker. If desired, allow speaker to remain in cabinet and connect to receiver by extension leads.
2. Stand chassis on one edge so that all trimmers are accessible.
3. Loop antenna leads (on cabinet) do not have to be connected to terminal strip on chassis while I. F. stages are being aligned. Before starting alignment of Ant., R.F., and Osc. stages, reconnect all antenna leads to chassis—do not attempt to use extension leads; place chassis as close as required to cabinet so that connections may be made direct to antenna terminal strip at back.
4. With the gang condenser fully meshed, dial pointer should be in the position indicated by the last division below 55 on the dial. If it is set incorrectly, hold tuning shaft steady and reposition pointer.
5. Connect an output meter across speaker voice coil, or from plate of 6V6GT tube to chassis through a 0.1 Mfd. condenser.
6. Connect ground lead of signal generator to the receiver chassis.
7. Set volume control of maximum volume position and use a weak signal from the signal generator.

DUMMY ANT. IN SERIES WITH SIGNAL GENERATOR	CONNECT HIGH SIDE OF SIGNAL GENERATOR TO	SIGNAL GENERATOR FREQUENCY	BAND SWITCH POSITION	RECEIVER DIAL SETTING	TRIMMER OR SLUG NUMBER	TRIMMER DESCRIPTION	TYPE OF ADJUSTMENT
.1 MFD. Condenser	Lug on trimmer No. 6 at top of gang (see figure below for location of trimmer).	455 KC	AM Broadcast (Middle)	Any point where it does not affect the signal.	1-2	2nd I.F.	Adjust for maximum output. Then repeat adjustment.
					3-4	1st I.F.	
260 MMFD. Mica Condenser	External Antenna Clip on Cabinet	1500 KC	AM Broadcast (Middle)	1500 KC	5	Broadcast Oscillator	Adjust for maximum output.
260 MMFD. Mica Condenser	External Antenna Clip on Cabinet	1500 KC	AM Broadcast (Middle)	Tune to 1500 Kc. generator signal.	6	Broadcast R.F.	Adjust for maximum output.
					7	Broadcast Antenna	Adjust for maximum output.
260 MMFD. Mica Condenser	External Antenna Clip on Cabinet	600 KC	AM Broadcast (Middle)	Tune to 600 Kc. generator signal.	8	Adjustable core of Broadcast R.F. Coil.	Adjust for maximum output.
					9	Adjustable core of Broadcast Antenna Coil.	Adjust for maximum output.
Repeat adjustment of trimmers 6 & 7 and slugs 8 & 9 until one no longer detunes the other.							

NOTE: It is preferable to check the alignment of the I.F. stages in the FM channel after completing AM alignment.

MODEL D1949

FREQUENCY MODULATION—"FM"—ALIGNMENT PROCEDURE
(USING A VACUUM TUBE VOLTMETER AND AM SIGNAL GENERATOR)

INSTRUMENTS: Although it is preferable to use on FM generator and an oscilloscope, reasonably accurate alignment is obtainable when using a conventional AM generator and vacuum tube voltmeter providing proper care is exercised in adjusting the discriminator circuit trimmer.

IMPORTANT: When using an AM signal generator, it should be capable of producing fundamental frequencies of 10.7 MC and 88 to 108 MC — avoid using an AM generator which produces signals in the 88 to 108 MC range by using harmonics higher than the second. Generators which are dependent upon third, fourth or fifth harmonics for output frequencies of 88 to 108 MC will generally produce undesirable spurious beat signals with the local oscillator in the receiver and alignment will be exceedingly difficult.

1. If alignment of both AM and FM channels is required it is necessary to align the AM channel first, then align the FM channel as instructed in chart below (AM alignment procedure is given on the preceding page).
2. Disconnect leads from FM-AM aerial terminal strip (labelled FM-FM-AM-AM) at back of chassis; also disconnect speaker leads and phono plugs. Remove chassis and speaker. If desired, allow speaker to remain in cabinet and connect to receiver by extension leads.
3. With the gang condenser fully meshed, dial pointer should be in the position indicated by the last division below 88 on the dial. If it is set incorrectly, hold tuning shaft steady and reposition pointer.
4. A specific setting of the receiver volume control is not required. However, it will be found convenient to leave it in the maximum volume position so that alignment signals will be audible even though the output indication is obtained by a V-T voltmeter connected to points in the discriminator circuit.
5. Dress FM circuit leads as short and straight as possible, particularly those in the oscillator circuit. I.F. plate and grid leads should also be kept short and straight.
6. **Set band switch to the FM (extreme counter-clockwise) position.**

SIGNAL GENERATOR CONNECTIONS	FREQUENCY & TYPE OF MODULATION	VACUUM TUBE VOLTMETER CONNECTIONS	RECEIVER DIAL SETTING	TRIMMER OR SLUG NUMBER	TRIMMER DESCRIPTION	TYPE OF ADJUSTMENT AND OUTPUT INDICATION
Connect high side in series with an .01 Mfd condenser to lug on trimmer No. 17 at top of gang (see illustration on page 8 for location of trimmer). Connect ground lead to receiver chassis in vicinity of 12AT7 tube.	**10.7 MC** AM signal may be 400 cycle modulated.	Connect common (or ground) terminal of meter to receiver chassis. D.C. probe lead of meter is then connected to pin No. 7 of the 6AL5 tube.	Any position where it does not affect the signal.	**11**	Discriminator Primary	Adjust these trimmers for maximum meter reading—the output voltage will be of negative polarity.
				12 and 13	2nd I.F.	
				14 and 15	1st I.F.	
Same as above	Same as above	Connect common (or ground) terminal of V-T voltmeter to the **junction** of resistors 87 and 88 in the discriminator circuit. D.C. probe lead of meter is then connected to **junction** of resistor No. 67 (18,000 ohms) and condenser No. 70 (.003 MFD.) which are in the discriminator output circuit. Set meter for operation on its lowest D.C. voltage range.	Same as above	**10**	Discriminator Secondary	Note that as trimmer No. 10 is rotated a point will be found where voltmeter will swing from a positive to a negative reading or vice versa. Correct setting of trimmer No. 10 is obtained when meter reads zero as trimmer is moved through this point. The adjustment is somewhat critical and considerable care must be exercised to set the trimmer for a zero meter indication.
Recheck adjustment of trimmers No. 10 and No. 11 to be sure that both are set as accurately as possible to obtain the specified output indication.						
Connect generator "high" side in series with a 300 ohm carbon resistor to **end** terminal marked "FM" on strip at back of chassis. **Generator ground lead** must connect to next terminal marked "GND".	**106 MC** AM signal may be 400 cycle modulated.	Connect common (or ground) terminal of meter to receiver chassis. D.C. probe lead of meter is then connected to Pin No. 7 of the 6AL5 tube.	**106 MC**	**16**	Oscillator Trimmer	Set trimmer No. 16 to receive 106 MC. signal as indicated by maximum meter reading. **IMPORTANT:** It will be noted that there are two different settings of trimmer No. 16 at which the 106 MC. signal will be received—always select the trimmer setting which is nearest to the low capacity end of its range.
Same as above	Same as above	Same as above	Tune to 106 MC. generator signal.	**17**	R.F. Trimmer	Adjust trimmer No. 17 for maximum meter reading.
				18	Antenna Trimmer	Adjust trimmer No. 18 for maximum meter reading.
				14 and 15	1st I.F.	Recheck adjustment of these trimmers for maximum meter reading.

Check calibration and tracking of receiver with input signals of 90 and 98 MC. If difference between dial pointer setting and 90 or 98 MC. calibration mark does not exceed ± 0.3 MC. and antenna and R.F. circuits are tracking properly, then alignment may be considered satisfactory and no further adjustment is necessary.

Where the calibration error is greater than ± 0.3 MC. it is advisable to make the following adjustments:

1. If pointer falls above the 90 MC. calibration point, it will be necessary to slightly spread the windings of the FM oscillator coil. Then repeat the two preceding adjustments of trimmers 16, 17 and 18 at 106 MC. Should it be found impossible to obtain the 106 MC. signal at the proper point on the dial by adjustment of the trimmers it will then be necessary to adjust the spacing of the gang condenser plates.
2. If pointer falls below the 90 MC. calibration point, it will be necessary to push the windings together on the FM oscillator coil. Then repeat the two preceding adjustments of trimmers 16, 17 and 18 at 106 MC. Should it be found impossible to obtain the 106 MC. signal at the proper point on the dial by adjustment of the trimmers it will then be necessary to adjust the spacing of the gang condsenser plates.
3. Correction for mistracking of antenna and R.F. may be accomplished by adjusting coil turns and gang plate spacing in the same manner as outlined above for the oscillator stage.

FREQUENCY MODULATION—"FM"—ALIGNMENT PROCEDURE

(USING AN OSCILLOSCOPE AND FM "SWEEP" GENERATOR)

INSTRUMENTS: Alignment of the FM circuits in this receiver can be most conveniently accomplished with an FM signal generator. When using this type generator, the output indicator must be an oscilloscope.

1. If alignment of both AM and FM channels is required it is necessary to align the AM channel first, then align the FM channel as instructed in chart below (AM alignment procedure is given on page 8).
2. Disconnect leads from FM-AM aerial terminal strip (labelled FM-FM-AM-AM) at back of chassis; also disconnect speaker leads and phono plugs. Remove chassis and speaker. (If desired, allow speaker to remain in cabinet and connect to receiver by extension leads.)
3. With the gang condenser fully meshed, dial pointer should be in the position indicated by the last division below 88 on the dial. If it is set incorrectly, hold tuning shaft steady and reposition pointer.
4. A specific setting of the receiver volume control is not required, however, it will be found convenient to leave it in the maximum volume position so that alignment signals will be audible even though the output indication is obtained by an oscilloscope connected to points in the discriminator circuit.
5. Dress FM circuit leads as short and straight as possible, particularly those in the oscillator circuit. I.F. plate and grid leads should also be kept short and straight.
6. **Set band switch to the FM (extreme counter-clockwise) position.**
7. Set tone control to fully counter-clockwise position.

SIGNAL GENERATOR CONNECTIONS	FREQUENCY & TYPE OF MODULATION	OSCILLOSCOPE CONNECTIONS	RECEIVER DIAL SETTING	TRIMMER OR SLUG NUMBER	TRIMMER DESCRIPTION	TYPE OF ADJUSTMENT AND OUTPUT INDICATION
Connect **high** side in series with an .01 Mfd condenser to lug on trimmer No. 17 at top of gang (see illustration on page 8 for location of trimmer). Connect ground lead to receiver chassis in vicinity of 12AT7 tube.	**10.7 MC** FM signal should preferably be modulated ±400 KC.	Connect vertical amplifier "high" lead to junction of resistor No. 67 (18000 ohms) and condenser No. 70 (.003 Mfd.) which are in discriminator output circuit. Connect scope ground lead to receiver chassis. ——— Set vertical amplifier of scope for maximum amplification. Where FM signal generator provides an output voltage for synchronization, connect this voltage to "sync" terminals of the scope.	Any position where it does not affect the signal.	10	Discriminator Secondary	Before attempting to adjust trimmer No. 10, set trimmers No. 11, 12, 13, 14 and No. 15 for approximately maximum sound output from the speaker (output meter not required). This is done to obtain sufficient signal for an oscilloscope pattern of desirable amplitude when making the following discriminator trimmer adjustment. Adjust setting of trimmer No. 10 until a pattern similar to that shown in Fig. 2 appears on the screen. If pattern does not remain stationary operate sweep frequency control on 'scope and also "sync" control until desired result is obtained. Correct setting of trimmer No. 10 is obtained when crossover point "B" (Fig. 2) is centrally located in both the horizontal and vertical directions; in addition that portion of the curve between "A" and "C" should be as linear (straight) as possible.
Same as above	Same as above	Same as above	Same as above	11	Discriminator Primary	Adjust these trimmers for maximum amplitude and steepness of that portion of the pattern between "A" and "C" (see Fig. 2).
				12 and 13	2nd I.F.	
				14 and 15	1st I.F.	
Recheck adjustments of trimmers No. 10 and No. 11 to be sure that both are set as accurately as possible to obtain correct cross-over point or symmetry of pattern.						
Connect generator "high" side in series with a 300 ohm carbon resistor to end terminal marked "FM" on strip at back of chassis. Generator ground lead must connect to next terminal marked "GND"	**106 MC** FM signal should preferably be modulated ±400 KC.	Same as above	**106 MC**	16	Oscillator Trimmer	Adjust trimmer No. 16 to obtain the symmetrical pattern shown in Fig. 2. Correct setting of trimmer No. 16 is obtained when cross-over point in pattern is centrally located. **IMPORTANT:** It will be noted that there are two different settings of trimmer No. 16 at which the desired 'scope pattern can be obtained—always select the trimmer setting which is nearest to the low capacity end of its range.
Same as above	Same as above	Same as above	Tune to 106 MC. generator signal.	17	R.F. Trimmer	Adjust trimmer No. 17 for maximum amplitude of pattern.
				18	Antenna Trimmer	Adjust trimmer No. 18 for maximum amplitude of pattern.
				14 and 15	1st I.F.	Recheck adjustment of these trimmers for maximum amplitude of pattern.

Check calibration and tracking of receiver with input signals of 90 and 98 MC. If difference between dial pointer setting and 90 or 98 MC. calibration mark does not exceed ± 0.3 MC. and antenna and R.F. circuits are tracking properly, then alignment may be considered satisfactory and no further adjustment is necessary.

Where the calibration error is greater than ± 0.3 MC. it is advisable to make the following adjustments:

1. If pointer falls above the 90 MC. calibration point, it will be necessary to slightly spread the windings of the FM oscillator coil. Then repeat the two preceding adjustments of trimmers 16, 17 and 18 at 106 MC. Should it be found impossible to obtain the 106 MC. signal at the proper point on the dial by adjustment of the trimmers it will then be necessary to adjust the spacing of the gang condenser plates.
2. If pointer falls below the 90 MC. calibration point, it will be necessary to push the windings together on the FM oscillator coil. Then repeat the two preceding adjustments of trimmers 16, 17 and 18 at 106 MC. Should it be found impossible to obtain the 106 MC. signal at the proper point on the dial by adjustment of the trimmers it will then be necessary to adjust the spacing of the gang condenser plates.
3. Correction for mistracking of antenna and R.F. may be accomplished by adjusting coil turns and gang plate spacing in the same manner.

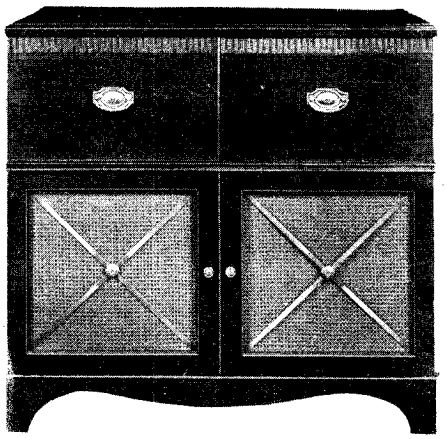
MODEL D1952



This radio receiver and phonograph combination must be connected to 60 cycle Alternating Current (A.C.) at 105 to 125 volts.

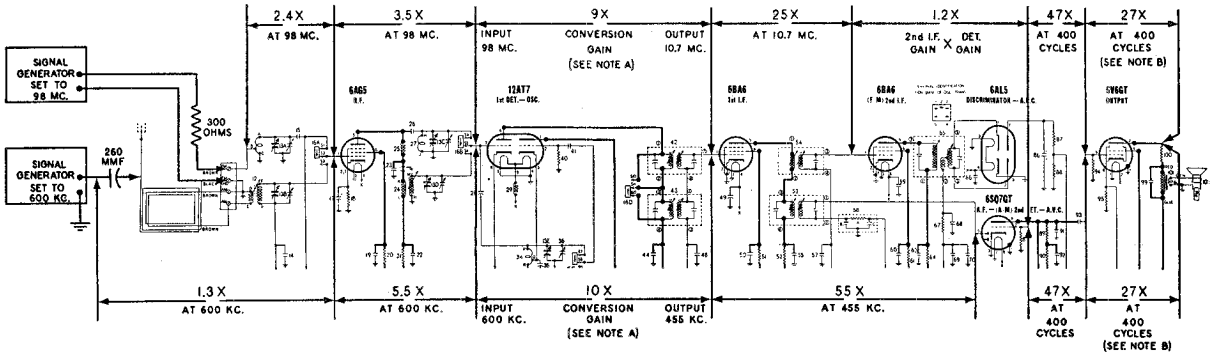
Do not connect to a Direct Current (D.C.) or to a 50 cycle A.C. power supply.

STAGE GAIN MEASUREMENT PROCEDURE

REQUIRED INSTRUMENTS: The amount of amplification or "gain" of most of the stages of this receiver can be measured with an A.C. Vacuum Tube Voltmeter of the high frequency type. An AM (600 KC.) as well as an FM (98 MC.) signal source is required. For gain measurements in the FM antenna—FM converter—FM 1st I.F. stages, a microvolt calibrated FM signal generator should preferably be used.

PROCEDURE: It is exceedingly important to adhere to the procedure outlined below since the accuracy of these measurements will be affected to a considerable extent by the failure to establish proper operating conditions.

1. Be sure that R.F., I.F. and Discriminator stages are carefully and accurately aligned by utilizing the alignment procedure given in this manual.
2. Connect Signal Generator as shown below. Note that generator connections differ for "AM" and "FM" measurements.
3. For "AM" measurements, set signal generator to 600 KC. (400 cycle modulation) and then carefully tune radio receiver to this signal by using an output meter to indicate peak output. If a local station interferes, set generator to a nearby frequency and re-tune the receiver.
4. For "FM" measurements, set signal generator to 98 MC. (400 cycle modulation with 22½ KC. deviation) and then carefully tune radio receiver to this signal by using a D.C. Vacuum Tube Voltmeter as an output indicator—meter must be connected between pin No. 7 of 6AL5 tube and chassis. If a local station interferes, set generator to a nearby frequency and re-tune the receiver.
5. The values of stage gain which are given here were measured with a fixed bias of —3 volts on the control grids of all R.F. and I.F. tubes which are connected to the A.V.C. system. Therefore, these values are not intended to indicate the full capability of a stage but they will serve as a convenient basis for determining proper operation. In order to duplicate the fixed bias voltage, connect the negative terminal of a 3 volt battery to both A.V.C. supply lines by effecting a common connection to terminal 4 of 2nd FM-I.F. transformer and terminal 2 of 1st AM-I.F. transformer. Then connect the positive battery lead to the receiver chassis.
6. R.F. and I.F. circuits are slightly de-tuned when contact is made with an instrument probe and this action, which is indicated by a change in the output meter reading, may seriously affect the gain measurement. Therefore, it is important to adjust the associated circuit trimmer for a maximum output meter reading and to set the input signal level to a convenient reference point on the gain measuring instrument while the probe is making contact. After removing the probe it is again necessary to adjust the trimmer so as to obtain the same output meter reading and thereby assure that the signal voltage at the specified point has not changed as a result of circuit de-tuning.



NOTE A: Short oscillator grid (pin 2 of 12AT7) to ground when measuring input voltage at signal grid (pin 7) of 12AT7 tube.

NOTE B: Measured with input of 0.3 volt.

DIFFERENCES in tube characteristics, tolerance of parts, adjustment of tuned circuits and variations in line voltage will influence stage gain. These factors should be given due attention in event the gain of a stage varies extensively from the values shown above.

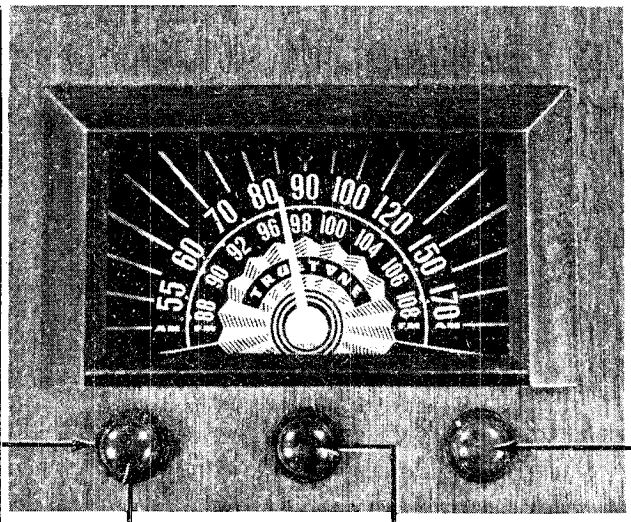
©John F. Rider

HOW TO OPERATE THE CONTROLS

THE DIAL has two separate scales. **UPPER SCALE** covers standard "Broadcast" band frequencies between 540 and 1700 Kc.; add a zero to the dial numbers on this scale to obtain frequency in kilocycles (Kc.). **BOTTOM SCALE** covers frequencies between 88 and 108 Mc. (Megacycles). All of the new Frequency Modulation ("FM") stations are located in this tuning range.

TONE CONTROL

Use this control (large knob) to select most pleasing tone. Extreme clockwise setting is recommended for speech and settings in the middle range are suggested for music. If a mellow tone with reduced high note content is desired, turn knob fully counter-clockwise.



FM-AM-PHONO SWITCH

For Standard Broadcast stations, turn knob to center position (AM). For FM stations, turn knob counter-clockwise to position marked (FM). For PHONO operation, turn knob to clockwise position marked (PHONO).

ON-OFF SWITCH AND VOLUME CONTROL

Turn this (small) knob clockwise to turn set on. Continuing to turn clockwise will increase volume.

TUNING CONTROL

Use this control to tune receiver to the desired station.

TUBES USED

The tubes used in this receiver are arranged on the chassis as shown in illustration at the right.

NOTE: IF TUBES ARE REMOVED FOR TEST OR REPLACEMENT, MAKE CERTAIN THAT EACH TUBE IS PLACED IN ITS PROPER SOCKET WHEN REPLACING THE TUBES IN THE SET.

BROADCAST BAND —"AM"—ALIGNMENT PROCEDURE

1. Disconnect leads from FM-AM antenna terminal strip (labeled FM-FM-AM-AM) at back of chassis; also disconnect speaker leads and phono plugs. Remove chassis and speaker. If desired, allow speaker to remain in cabinet and connect to receiver by extension leads.
2. Stand chassis on one edge so that all trimmers are accessible.
3. Loop antenna leads (on cabinet) do not have to be connected to terminal strip on chassis while I. F. stages are being aligned. Before starting alignment of Ant., R.F., and Osc. stages, reconnect all antenna leads to chassis—do not attempt to use extension leads; place chassis as close as required to cabinet so that connections may be made direct to antenna terminal strip at back.
4. With the gang condenser fully meshed, dial pointer should be in the position indicated by the last division below 55 on the dial. If it is set incorrectly, hold tuning shaft steady and reposition pointer.
5. Connect on output meter across speaker voice coil, or from plate of 6V6GT tube to chassis through a 0.1 Mfd. condenser.
6. Connect ground lead of signal generator to the receiver chassis.
7. Set volume control of maximum volume position and use a weak signal from the signal generator.

DUMMY ANT. IN SERIES WITH SIGNAL GENERATOR	CONNECT HIGH SIDE OF SIGNAL GENERATOR TO	SIGNAL GENERATOR FREQUENCY	BAND SWITCH POSITION	RECEIVER DIAL SETTING	TRIMMER OR SLUG NUMBER	TRIMMER DESCRIPTION	TYPE OF ADJUSTMENT
.1 MFD. Condenser	Lug on trimmer No. 6 at top of gang (see figure below for location of trimmer).	455 KC	AM Broadcast (Middle)	Any point where it does not affect the signal.	1-2	2nd I.F.	Adjust for maximum output. Then repeat adjustment.
					3-4	1st I.F.	
260 MMFD. Mica Condenser	External Antenna Clip on Cabinet	1500 KC	AM Broadcast (Middle)	1500 KC	5	Broadcast Oscillator	Adjust for maximum output.
260 MMFD. Mica Condenser	External Antenna Clip on Cabinet	1500 KC	AM Broadcast (Middle)	Tune to 1500 Kc. generator signal.	6	Broadcast R.F.	Adjust for maximum output.
					7	Broadcast Antenna	Adjust for maximum output.
260 MMFD. Mica Condenser	External Antenna Clip on Cabinet	600 KC	AM Broadcast (Middle)	Tune to 600 Kc. generator signal.	8	Adjustable core of Broadcast R.F. Coil.	Adjust for maximum output.
					9	Adjustable core of Broadcast Antenna Coil.	Adjust for maximum output.

Repeat adjustment of trimmers 6 & 7 and slugs 8 & 9 until one no longer detunes the other.

NOTE: It is preferable to check the alignment of the I.F. stages in the FM channel after completing AM alignment.

FREQUENCY MODULATION—"FM"—ALIGNMENT PROCEDURE

(USING AN OSCILLOSCOPE AND FM "SWEEP" GENERATOR)

INSTRUMENTS: Alignment of the FM circuits in this receiver can be most conveniently accomplished with an FM signal generator. When using this type generator, the output indicator must be an oscilloscope.

1. If alignment of both AM and FM channels is required it is necessary to align the AM channel first, then align the FM channel as instructed in chart below (AM alignment procedure is given on page 8).
2. Disconnect leads from FM-AM aerial terminal strip (labelled FM-FM-AM-AM) at back of chassis; also disconnect speaker leads and phono plugs. Remove chassis and speaker. (If desired, allow speaker to remain in cabinet and connect to receiver by extension leads.)
3. With the gang condenser fully meshed, dial pointer should be in the position indicated by the last division below 88 on the dial. If it is set incorrectly, hold tuning shaft steady and reposition pointer.
4. A specific setting of the receiver volume control is not required, however, it will be found convenient to leave it in the maximum volume position so that alignment signals will be audible even though the output indication is obtained by an oscilloscope connected to points in the discriminator circuit.
5. Dress FM circuit leads as short and straight as possible, particularly those in the oscillator circuit. I.F. plate and grid leads should also be kept short and straight.
6. **Set band switch to the FM (extreme counter-clockwise) position.**
7. Set tone control to fully counter-clockwise position.

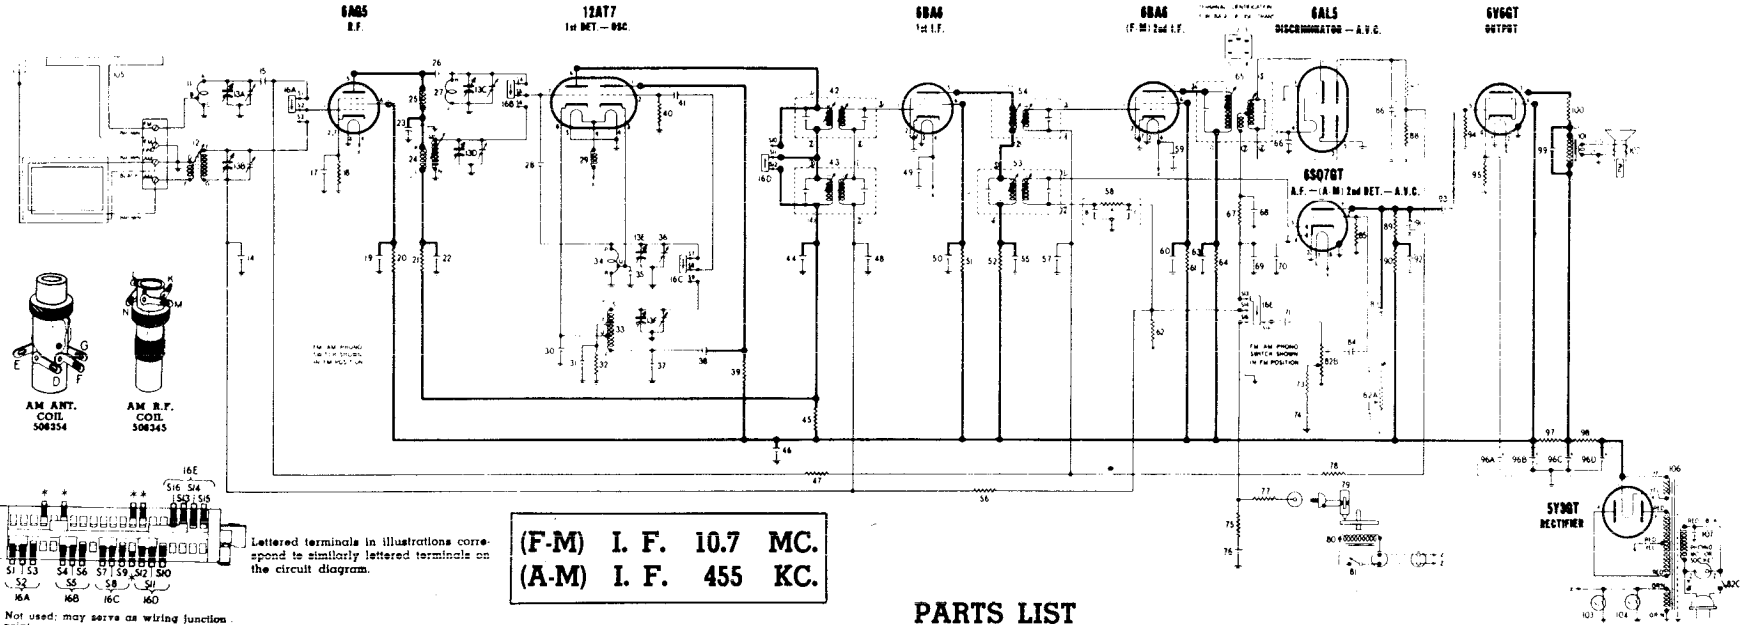
SIGNAL GENERATOR CONNECTIONS	FREQUENCY & TYPE OF MODULATION	OSCILLOSCOPE CONNECTIONS	RECEIVER DIAL SETTING	TRIMMER OR SLUG NUMBER	TRIMMER DESCRIPTION	TYPE OF ADJUSTMENT AND OUTPUT INDICATION
Connect high side in series with an .01 Mfd condenser to lug on trimmer No. 17 at top of gang (see illustration on page 8 for location of trimmer). Connect ground lead to receiver chassis in vicinity of 12AT7 tube.	**10.7 MC** FM signal should preferably be modulated ±400 KC.	Connect vertical amplifier "high" lead to junction of resistor No. 67 (18,000 ohms) and condenser No. 70 (.003 Mfd.) which are in discriminator output circuit. Connect scope ground lead to receiver chassis. Set vertical amplifier of scope for maximum amplification. Where FM signal generator provides an output voltage for synchronization, connect this voltage to "sync" terminals of the scope.	Any position where it does not affect the signal.	10	Discriminator Secondary	Before attempting to adjust trimmer No. 10, set trimmers No. 11, 12, 13, 14 and No. 15 to approximately maximum sound output from the speaker (output meter not required). This is done to obtain sufficient signal for an oscilloscope pattern of desirable amplitude when making the following discriminator trimmer adjustment. Adjust setting of trimmer No. 10 until a pattern similar to that shown in Fig. 2 appears on the screen. If pattern does not remain stationary operate sweep frequency control on 'scope and also "sync" control until desired result is obtained. Correct setting of trimmer No. 10 is obtained when crossover point "B" (Fig. 2) is centrally located in both the horizontal and vertical directions; in addition that portion of the curve between "A" and "C" should be as linear (straight) as possible.
Same as above	Same as above	Same as above	Same as above	11	Discriminator Primary	Adjust these trimmers for maximum amplitude and steepness of that portion of the pattern between "A" and "C" (see Fig. 2).
				12 and 13	2nd I.F.	
				14 and 15	1st I.F.	
Recheck adjustments of trimmers No. 10 and No. 11 to be sure that both are set as accurately as possible to obtain correct cross-over point or symmetry of pattern.						
Connect generator "high" side in series with a 300 ohm carbon resistor to **end** terminal marked "FM" on strip at back of chassis. **Generator ground lead** must connect to next terminal marked "GND".	**106 MC** FM signal should preferably be modulated ±400 KC.	Same as above	**106 MC**	16	Oscillator Trimmer	Adjust trimmer No. 16 to obtain the symmetrical pattern shown in Fig. 2. Correct setting of trimmer No. 16 is obtained when cross-over point in pattern is centrally located. IMPORTANT: It will be noted that there are two different settings of trimmer No. 16 at which the desired scope pattern can be obtained always select the trimmer setting which is nearest to the low capacity end of its range.
Same as above	Same as above	Same as above	Tune to 106 MC. generator signal.	17	R.F. Trimmer	Adjust trimmer No. 17 for maximum amplitude of pattern.
				18	Antenna Trimmer	Adjust trimmer No. 18 for maximum amplitude of pattern.
				14 and 15	1st I.F.	Recheck adjustment of these trimmers for maximum amplitude of pattern.

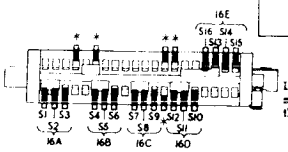
Check calibration and tracking of receiver with input signals of 90 and 98 MC. If difference between dial pointer setting and 90 or 98 MC. calibration mark does not exceed ± 0.3 MC. and antenna and R.F. circuits are tracking properly, then alignment may be considered satisfactory and no further adjustment is necessary.

Where the calibration error is greater than ± 0.3 MC. it is advisable to make the following adjustments:

1. If pointer falls above the 90 MC. calibration point, it will be necessary to slightly spread the windings of the FM oscillator coil. Then repeat the two preceding adjustments of trimmers 16, 17 and 18 at 106 MC. Should it be found impossible to obtain the 106 MC. signal at the proper point on the dial by adjustment of the trimmers it will then be necessary to adjust the spacing of the gang condenser plates.
2. If pointer falls below the 90 MC. calibration point, it will be necessary to push the windings together on the FM oscillator coil. Then repeat the two preceding adjustments of trimmers 16, 17 and 18 at 106 MC. Should it be found impossible to obtain the 106 MC. signal at the proper point on the dial by adjustment of the trimmers it will then be necessary to adjust the spacing of the gang condenser plates.
3. Correction for mistracking of antenna and R.F. may be accomplished by adjusting coil turns and gang plate spacing in the same manner.

©John F. Rider





Lettered terminals in illustrations correspond to similarly lettered terminals on the circuit diagram.

Instructions for Using Your RADIO-ALARM CLOCK Combination Receiver

This skillfully designed and carefully constructed combination will give you long and enjoyable service. This Receiver can perform the following services for the user:

1. Provide accurate time.
2. Receive broadcast programs being transmitted and within range—at any time.
3. Turn off radio program at will of user up to 60 minute interval or less.
4. Turn on radio program for awakening.
5. Turn buzzer Alarm on 10 minutes after Radio starts playing.
6. Turn on buzzer Alarm for awakening—with Radio silenced.

INSTALLATION—Check the voltage and cycles of the electric power supplied to your home. This combination will operate ONLY on 60 cycle alternating current (a-c), from 105 to 125 volts. THIS SET WILL NOT OPERATE ON ANY OTHER TYPE OF CURRENT OR CYCLES. Your electric company will help you make certain that you have the correct kind of power.

This combination includes a sensitive five multi-purpose tube superheterodyne radio including a rectifier tube. Your radio has a self contained duro-loop antenna capable of supplying sufficient volume in areas of normal reception. If you live in an area where radio reception is poor, you can improve the performance by connecting an outside antenna to the screw marked EXT. ANT. which you will find on the right hand side of the rear of the cabinet.

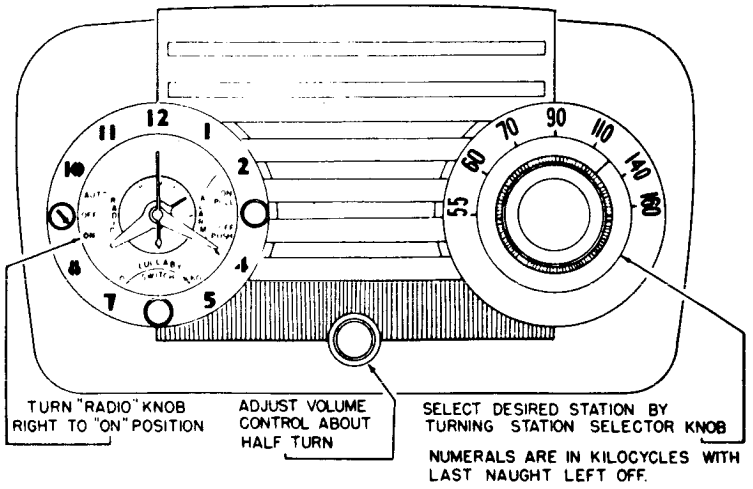
1.

TO SET THE CLOCK

Your self-starting TELECHRON movement will begin operating when the set is plugged into the proper outlet and your sweep second hand begins to rotate. Set the correct time by means of the small knob at the right REAR of the cabinet. Turn ONLY in the direction shown on the back cover.

2.

TO TURN ON RADIO MANUALLY

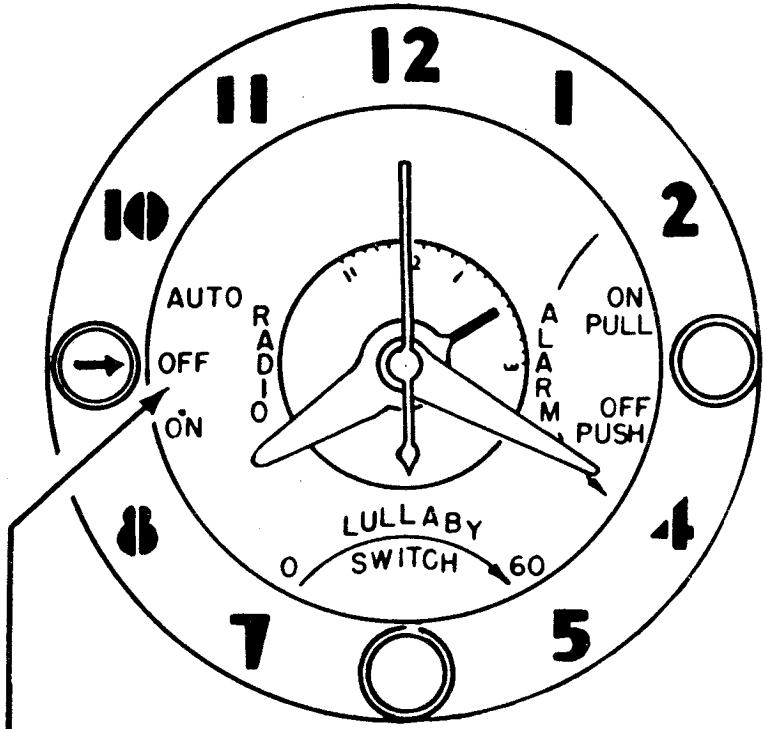


TURN "RADIO" KNOB RIGHT TO "ON" POSITION
ADJUST VOLUME CONTROL ABOUT HALF TURN
SELECT DESIRED STATION BY TURNING STATION SELECTOR KNOB
NUMERALS ARE IN KILOCYCLES WITH LAST NAUGHT LEFT OFF.

©John F. Rider

3.

TO TURN OFF RADIO MANUALLY

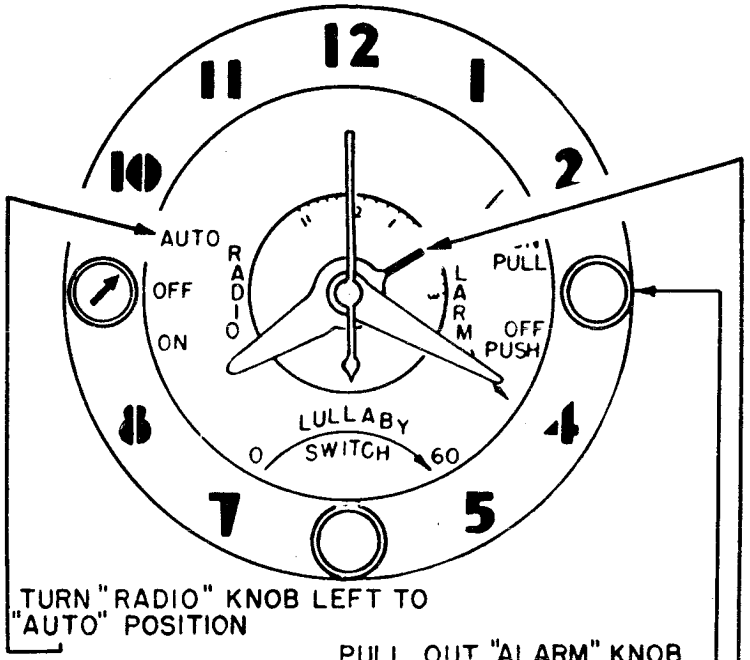


TURN "RADIO" KNOB LEFT TO "OFF"

4.

TO AWAKE TO MUSIC

Select station and adjust volume to level sufficient to awaken you (as indicated in Illustration 2)



TURN "RADIO" KNOB LEFT TO "AUTO" POSITION

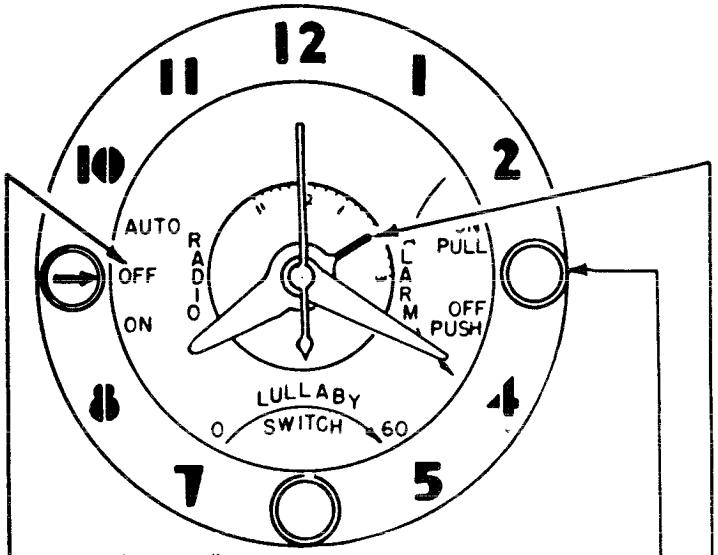
PULL OUT "ALARM" KNOB AND TURN IN COUNTER CLOCKWISE (ARROW) DIRECTION UNTIL POINTER IS OVER HOUR FIGURE AND MINUTE MARKS DESIRED FOR AWAKENING

THIS TIME SETTING MAY BE 11 HOURS IN ADVANCE OR LESS. AFTER HAVING SET AWAKENING HOUR PUSH IN "ALARM" KNOB.

©John F. Rider

5.

TO AWAKE TO BUZZER ALARM



TURN "RADIO" KNOB LEFT TO MID "OFF" POSITION

PULL OUT "ALARM" KNOB AND TURN IN COUNTER CLOCKWISE (ARROW) DIRECTION UNTIL POINTER IS SET TEN MINUTES AHEAD OF HOUR FIGURE AND MINUTE MARKS DESIRED FOR AWAKENING

THIS TIME SETTING MAY BE 11 HOURS IN ADVANCE OR LESS.

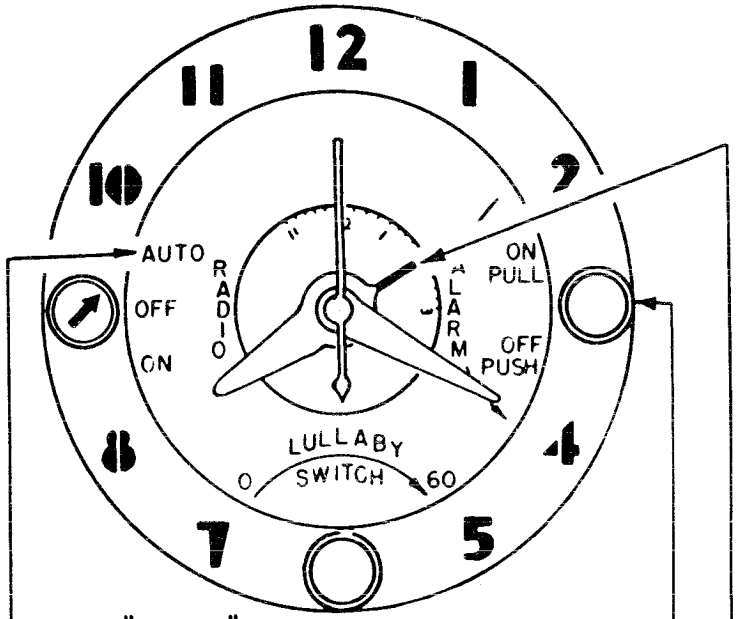
FOR EXAMPLE :- SHOULD YOU DESIRE TO AWAKEN AT 7, SET ALARM POINTER TO 6:50

TO SHUT OFF BUZZER PUSH IN "ALARM" KNOB

6.

TO AWAKE TO MUSIC AND BUZZER ALARM

Select station and adjust volume to level sufficient to awaken you (as indicated in Illustration 2)



TURN "RADIO" KNOB LEFT TO "AUTO" POSITION

PULL OUT "ALARM" KNOB AND TURN IN COUNTER CLOCKWISE (ARROW) DIRECTION UNTIL POINTER IS OVER HOUR FIGURE AND MINUTE MARKS DESIRED FOR AWAKENING.

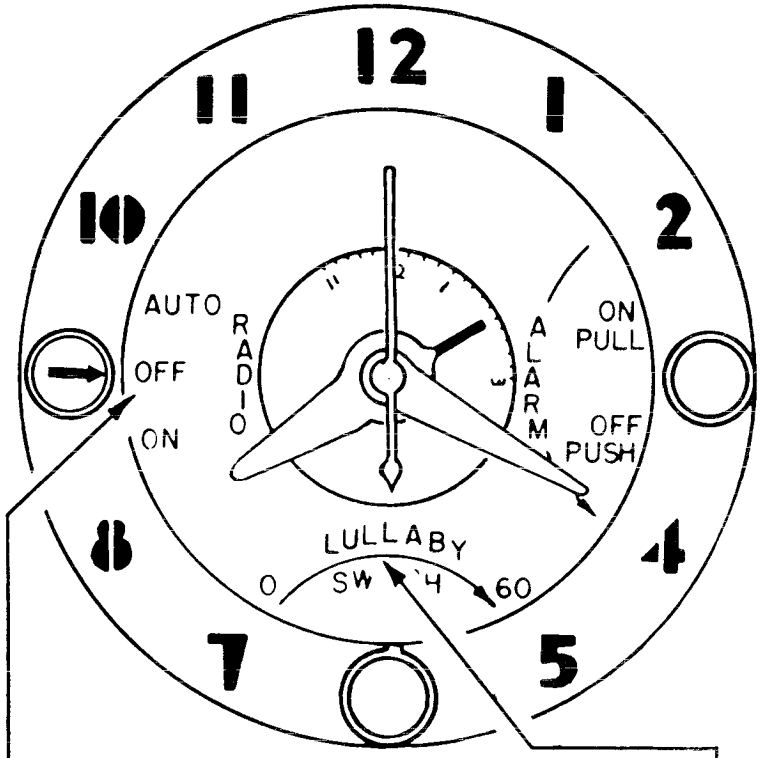
THIS TIME SETTING MAY BE 11 HOURS IN ADVANCE OR LESS.

Buzzer sounds as a reminder approximately 10 minutes after radio comes on. To shut off buzzer push in "Alarm" Knob.

©John F. Rider

7.
TO TURN RADIO OFF AUTOMATICALLY WHEN RETIRING

This receiver can be adjusted to play for a period of 60 or fewer minutes before retirement if desired by the listener.



8.—To Turn Radio Off Automatically When Retiring and Awaken to Music

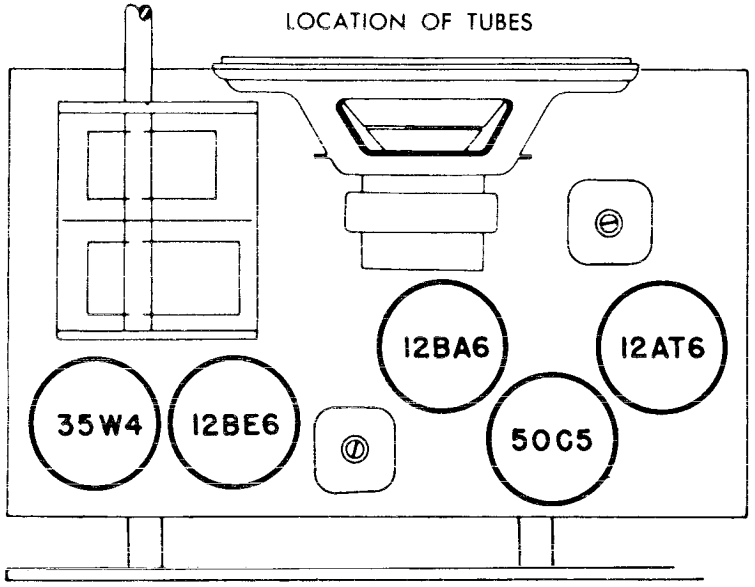
Set "Radio" Control as in Illustration 4,
Set "Lullaby" Knob as in Illustration 7.

9.—To Turn Radio Off Automatically When Retiring and Awaken to Buzzer Alarm

Set Controls as in Illustration 5.
Set "Lullaby" Knob as in Illustration 7.

10.—To Turn Radio Off Automatically When Retiring, Awaken to Music and Buzzer Alarm

Set "Radio" Control as in Illustration 6.
Set "Lullaby" Knob as in Illustration 7.



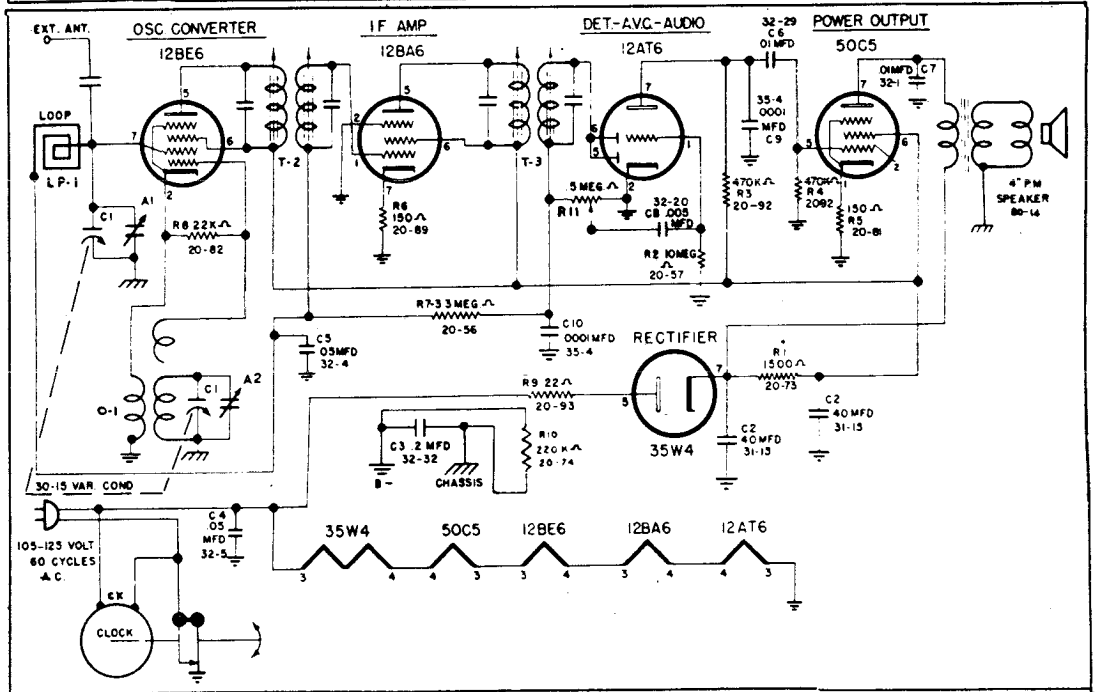
© John F. Rider

ALIGNMENT PROCEDURE

- Output meter across voice coil (3.2 ohm)
- Volume control at maximum for all adjustments.
- Align for maximum output. Reduce input as needed to keep output near 1.28 volts (0.5 watt).

SIGNAL GENERATOR				*TUNER SETTING*	*ADJUST TRIMMERS TO MAXIMUM OUTPUT (in order shown)*
Frequency	*Coupling Capacitor*	*Connections to Receiver*	*Ground Connection*		
455 kc	0.1 mfd.	12BE6 grid	B—	Rotor full open (Plates out of mesh)	Input and output slugs of IF cans
1650 kc	0.1 mfd.	12BE6 grid	B—	Rotor full mesh (Plates out of mesh)	Oscillator trimmer A2
1500 kc		Radiating Loop		1500 kc*	Antenna trimmer A1

* Seven markings on the dial bracket represent respectively 550 kc, 600 kc, 700 kc, 900 kc, 1100 kc, 1400 kc, and 1600 kc reading from left to right. These points are to be used for the alignment of the receiver.



REPLACEMENT PARTS LIST

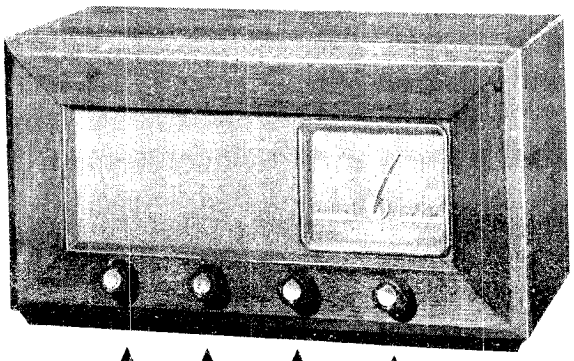
CK	140-6	Clock

MODEL D2025A

MODEL D2025A

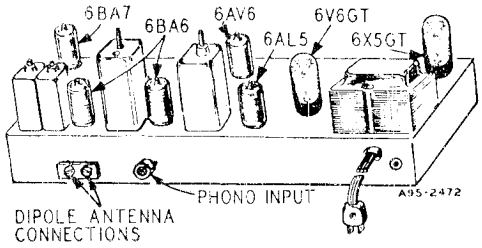


CHECK YOUR LINE VOLTAGE

Unless otherwise marked this radio must be operated on a supply of 105-125 volts AC, 50 to 60 cycles only. Do not connect the radio to a wall outlet unless certain that the power supply is correct for the receiver. If in doubt, telephone your local power company before inserting the plug. Radios of this model which are to be used on other power supplies are marked accordingly.

NOTE: An external ground should not be used at any time.

GENERAL INFORMATION



TUBES AND DIAL LAMP

The type designation of each tube is stamped on the tube and the radio chassis base. The correct positions in which the tubes must be installed are shown in the tube position illustration.

The tubes in the radio should be checked periodically by taking them out and having them tested. To reach the tubes for servicing, remove the cabinet back from the rear of the receiver. See instructions on cabinet back.

When replacing the tubes, be sure that they are inserted in the proper sockets. To install a tube, insert the center guide pin into the center hole of the tube socket and turn the tube until the key drops into position. Then push the tube down until it is held firmly in the socket. All tubes must be in their sockets to operate the radio. Use only No. 47 dial lamps.

Refasten the cabinet back in place before operating the radio.

IF THE RADIO FAILS TO OPERATE SATISFACTORILY

Recheck the foregoing instructions. If the radio still does not appear to operate satisfactorily, proceed as follows:

FIRST—Check Power Supply. Be sure there is power at the convenience outlet to which the radio is connected. To determine this, connect a lamp to the outlet and see whether or not the lamp lights.

Check the voltage and frequency of the power supply with that shown on the power rating label on the radio. If there is any doubt concerning the power supply, withdraw the plug from the outlet and consult the local power company before reinserting the plug.

SECOND — Check Tube Positions. See that the tubes are in the correct sockets as shown in the illustration.

Make certain that the tubes are operating. (Glass tubes will light very dimly).

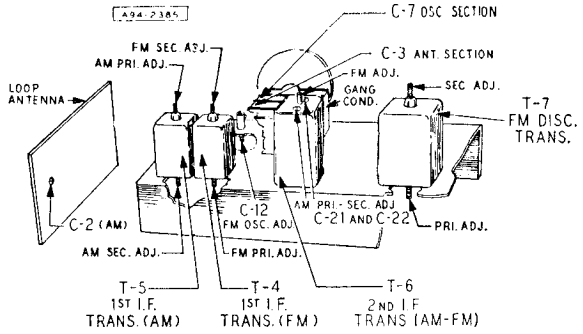
THIRD — Check Antenna. If an outside antenna is being used, inspect the antenna system to see that it is in good condition and not grounded at any point.

FOURTH—Test Tubes. Remove the tubes from the radio, take them to your local radio dealer and have them tested either by means of a tube tester or by inserting them in a radio that is operating satisfactorily.

FAULTY FM RECEPTION

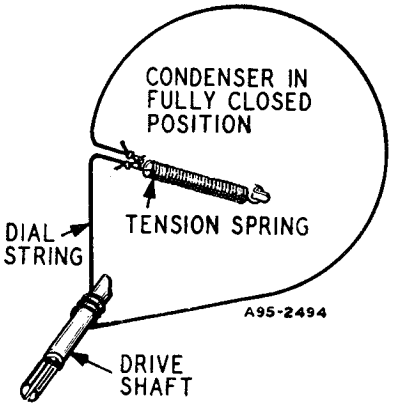
The requirements for FM reception are more critical than for Standard band broadcast or short wave reception. This includes the area in which the receiver is located, the type of antenna used, the distance the receiver is located from the station to be received and other factors not encountered in Standard band broadcast reception. It is to be noted that reception in the high frequency FM band is usually limited to "line of sight" distances or up to about 45 miles. Also tall buildings or other structures between the transmitter and the receiver may be found to affect reception. Reception under these conditions will sometimes be helped by the addition of an external folded dipole antenna with a 300 ohm line lead-in. Information concerning this is given in the Antenna paragraph.

© John F. Rider



DRIVE CORD REPLACEMENT

Replacement of the drive cord may be accomplished as shown in the illustration. For this purpose use the new drive cord assembly listed in the Replacement Parts List. Turn the gang condenser until the plates are fully meshed Then install the string as shown, winding three turns counter-clockwise around the tuning shaft with the turns progressing away from the chassis. After the cord is installed, rotate the tuning shaft several times in order to take up any slack in the cord.



RECORD PLAYER AND TELEVISION SOUND CONNECTIONS

For models not equipped with built-in record player, a socket marked PHONO is provided on the back of the chassis for connections to an external record player or automatic record changer. When it is desired to play records through the radio, insert the connector on the cable of any standard record player into this socket. Turn the phono-radio switch to the phono position and use the volume control to adjust the sound level.

When television programs become available in your community, the audio amplifier and speaker of this radio may be used in conjunction with a Television Picture Receiver and sound converter to reproduce the sound portion of the television programs. Simply insert the connector on the cable of the Television Converter into the socket marked PHONO and operate the receiver in the same manner as described in the foregoing paragraph.

ELECTRICAL SPECIFICATIONS

Power Consumption—
117 volts AC—35 watts

Power Output—
1.5 watts maximum
.9 watts 10% distortion

Speaker—5¼ inch PM dynamic

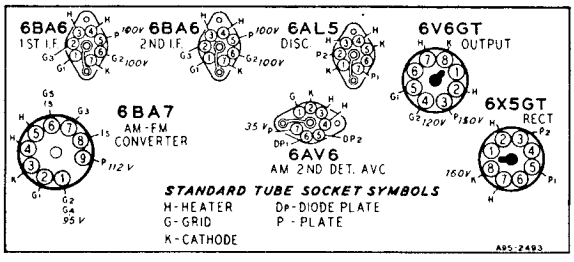
Frequency Ranges—
Broadcast 540-1600 KC
Frequency modulation 88-108 MC

Intermediate Frequency—
AM 455 KC — FM 10.7 MC

Selectivity — AM — 60 KC broad at 1000 times signal, measured at 1000 KC
I.F. FM—200 KC broad at 2 times down
I.F. FM—700 KC broad at 200 times down

AM Sensitivity—(For .5 watt output with external antenna)
10 microvolts average

FM Sensitivity—(For .5 watt output)
100 microvolts average



TUBE SOCKET VOLTAGES

Socket voltages are shown on the Bottom Socket diagram at the tube socket terminals. All voltages are between the socket terminal and chassis ground. Plate, screen and cathode voltages were taken with a 1000 ohm-per-volt meter with a 300 volt scale used for plate and screen voltages. Audio grid voltages were read with a vacuum tube volt-meter. Conditions of measurement are:

Line voltage .....117 Volts AC
Signal Input .....None
A Variation of ±10% is usually permissible.

© John F. Rider

ALIGNMENT PROCEDURES

AM STAGES

Volume Control Maximum all Adjustments.

Connect Radio Chassis to Ground Post of Signal Generator with a Short Heavy Lead.

Allow Chassis and Signal Generator to "Heat Up" for Several Minutes.

The following is required for aligning:

An All Wave Signal Generator Which Will Provide an Accurately Calibrated Signal at the Test Frequencies as Listed.

Output Indicating Meter, Non-Metallic Screwdriver, Dummy Antennas — .1 mf, and 50 mmf.

SIGNAL GENERATOR					
FREQUENCY SETTING	CONNECTION AT RADIO	GROUND CONNECTION	DUMMY ANTENNA	GANG CONDENSER SETTING	ADJUST TUNING SLUGS AND TRIMMERS
455 KC	Control Grid 1st 6BA6 Pin No. 1	Chassis Base	.1 mf	Turn Rotor to Full Open	2nd I.F. C-21 & C-22
455 KC	Control Grid 6BA7 Pin No. 7 1st Det.	Same as above	.1 mf	Turn Rotor to Full Open	1st I.F. Pri. & Sec.
1620 KC	Control Grid 6BA7 Pin No. 7	Same as above	.1 mf	Turn Rotor to Full Open	Oscillator C-7
1400 KC	External Antenna Clip	Same as above	50 mmf	Turn Dial to 1400 KC. See Note A	Antenna C-2

NOTE A—Set pointer at the 1400 KC mark on the dial scale. Attach pointer to drive cord.

FM STAGES

Allow chassis and signal generator to warm up for several minutes.

The following equipment is required for aligning:

An accurately calibrated signal generator providing unmodulated signals at the test frequencies listed below.

Non-metallic screwdriver.

Dummy Antennas and I-F Loading Resistor—2500 mmf, 300 ohms and a 3300 ohm .5 watt resistor with short leads.

Zero center scale DC vacuum tube voltmeter having a range of approximately 3 volts.

(If a zero center scale meter is not available, a standard scale vacuum tube voltmeter may be used by reversing the meter connections for negative readings.)

FM ALIGNMENT NOTES

NOTE A—The zero center scale DC vacuum tube voltmeter is to be connected between chassis ground and the AVC line. A signal of .1 volt must be fed into the receiver for this adjustment.
Note output voltage on the zero center DC vacuum tube voltmeter.

NOTE B—Disconnect zero center DC vacuum tube voltmeter from AVC and connect it to the audio takeoff point at the 27 K ohm resistor (R-11) and its junction with the terminal strip. Adjust for zero voltage indication.

NOTE C—Connect zero center DC vacuum tube voltmeter as in Note A. Adjust input to give same output on the zero center DC vacuum tube voltmeter as in Note A.

NOTE D—Unsolder 3300 ohm resistor from terminals 3 and 4 of 1st I-F transformer and resolder across terminals 1 and 2.

NOTE E—2nd I-F Trimmers (AM) must be aligned before attempting to adjust 2nd I-F (FM) tuning slug.

NOTE F—Remove the 3300 ohm load resistor before attempting to check the antenna and oscillator adjustments.

APPLYING POWER TO RADIO

This receiver, unless otherwise marked must be operated on an AC voltage of 105 to 125 volts, 50 to 60 cycles, or on a DC voltage of 105 to 125 volts.

BROADCAST BAND

This is the tuning band in which the standard broadcast stations operate. The upper scale on the dial covers the broadcast range of 535-1620 Kc., and is calibrated in channel numbers. To obtain the kilocycle reading, multiply the number on the dial by 10; thus 80 on the dial corresponds to 800 kilocycles.

FM BAND

The FM tuning range covers the newly allocated frequency-modulation band of 88 to 108 megacycles

REPLACEMENT OF DIAL CORDS

REPLACEMENT OF DIAL CORDS

GENERAL—A dual track drum pulley and two individual cords are used on this model.

The rear track on the drum carries the *Drive String* (see illustration) while the front track carries the *Pointer String.*

DRIVE STRING 1. To replace the *Drive String,* take approximately 20 inches of dial cord and wrap three times around *Tuning Shaft* as shown.

2. Pass ends of cord around drum and through the hole in the rear track, then through loop in end of tension spring (not shown, inside drum).

3. Hook other end of tension spring over ear near center of drum. Draw string through spring loop until spring is extended 1/4 inch. Tie string to loop.

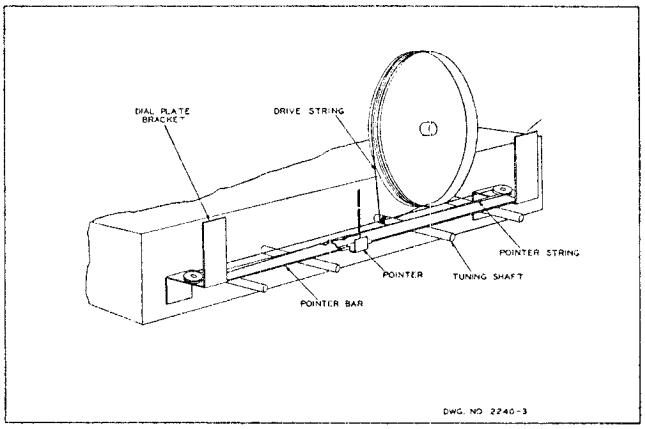
POINTER STRING 4. To replace the *Pointer String* take approximately 40 inches of dial cord and place across inside of *Dial Plate Brackets* at each end.

5. Pass around idler pulleys from front to rear and cross directly under drum pulley.

6. Rotate drum pulley so that hole in the front track is uppermost. Pass cord end from right hand idler pulley around left side of front track of drum pulley. Pass cord end from left hand idler pulley around right hand side of front track. Drop ends through hole in front track then through loop in end of pointer tension spring (not shown, inside drum).

7. Hook other end of tension spring over ear near center of drum. Draw string through spring loop until spring is extended 1/4 inch. Tie string to loop.

8. Rotate drum so that gang is closed. Slide *Pointer* to left end of *Pointer Bar* so that right edge of pointer coincides with right edge of first calibration marker (low frequency end of dial). Loop *Pointer String* once around upright ear on *Pointer* carriage.



Pointer Stringing and Alignment

© John F. Rider

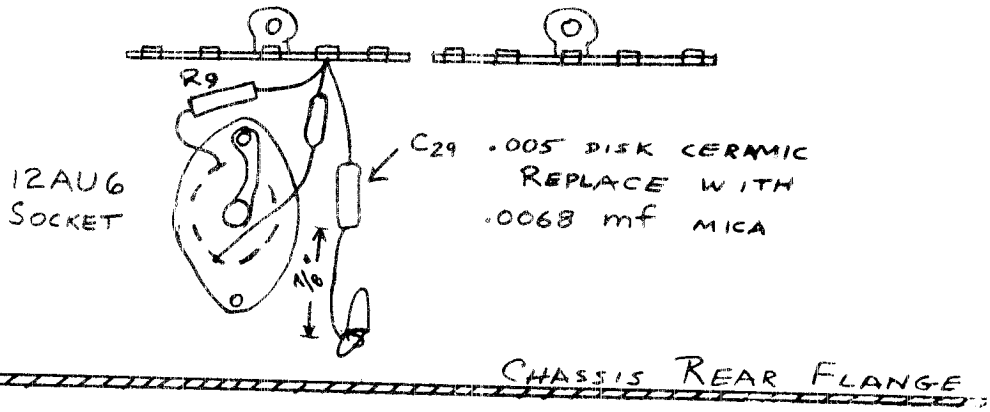
MODEL D2919

It has been found that in some instances instability has developed in the FM band in these receivers, which may cause distorted reception and in extreme cases loss of reception entirely. In practically every case the trouble lies in the lead length on condenser C29. Aging of this condenser may cause a change in value upsetting circuit conditions. It is recommended that C29 be replaced with a .0068 mf mica condenser, ± 10% tolerance. These may be obtained by ordering part number C-8F9-135. Condenser must be installed with approximately 7/8 in. lead length from chassis lug to condenser body. Other lead length approximately 3/4 in. (to be adjusted as per following procedure).

ADJUSTMENT USING OSCILLOSCOPE

To make the adjustment, remove the chassis from the cabinet and lay on its back flange on bench. Locate the condenser indicated in figure #1. (This is shown as C29 in the service manual schematic) Carefully remove the lead connecting the condenser at the terminal strip.

FIGURE 1



Connect signal generator thru a 300 ohm resistor to "dipole 300 a." FM antenna terminals. Connect vertical deflection amplifier of scope to end terminals of volume control (black wire ground and white wire high). Set oscilloscope amplifier for maximum gain and generator to 10.7 MC with approximately 150 KC FM deviation.

Temporarily reconnect condenser C29 using maximum length of wire available. If part of lead has broken off, splice on an additional one-half inch. Adjust generator output until a response is seen. If necessary slightly readjust frequency. Figure #2 shows a correct response, figure #3 a poor response, and figure #4 one very poor. Observe response and if not correct shorten condenser lead by one-eighth inch. Repeat this in steps of one-eighth inch until a response like figure #2 is obtained. This lead length is fairly critical and if the lead is either too long or too short distortion will result. After finding the best lead length permanently solder wire at this point.

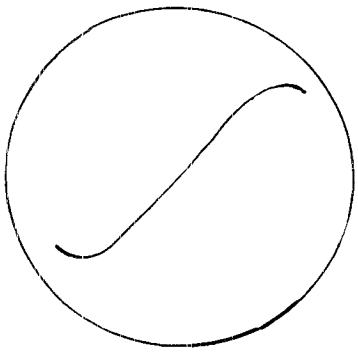


FIGURE 2

PROPER RESPONSE

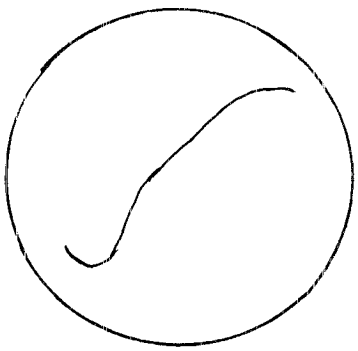

FIGURE 3

SLIGHTLY UNSTABLE

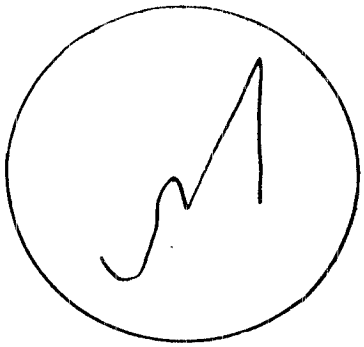

FIGURE 4

VERY UNSTABLE

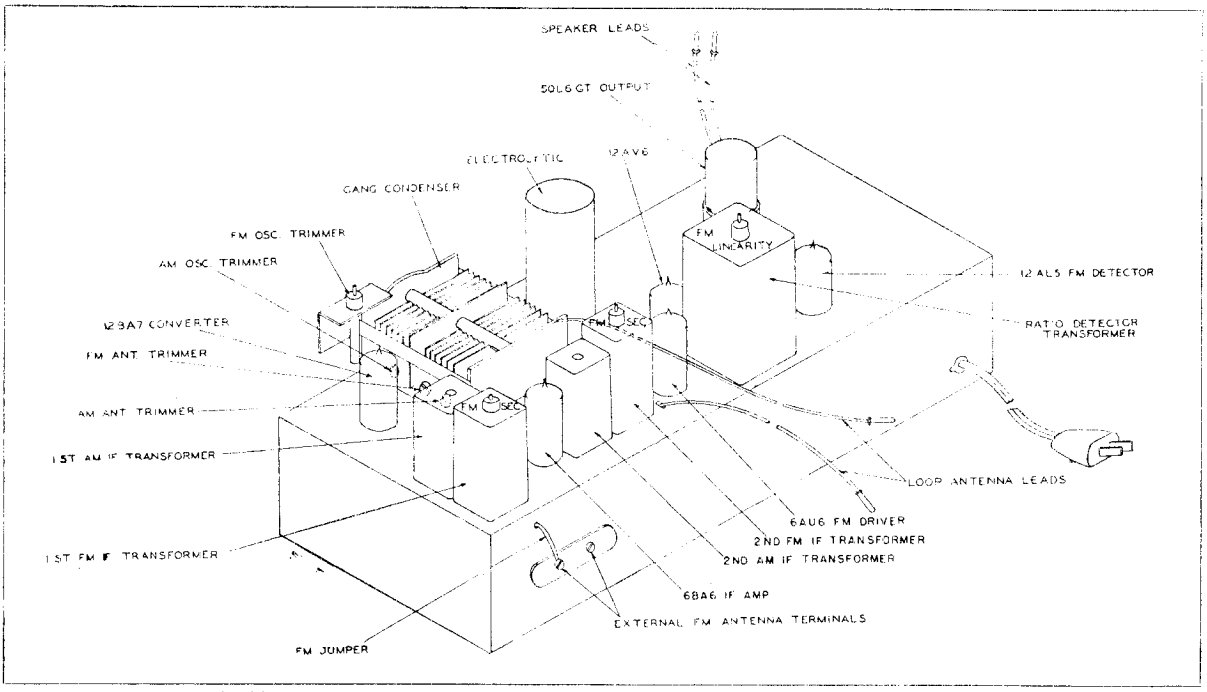
©John F. Rider

ADJUSTMENT ON FM BROADCAST STATION

(If Oscilloscope & Signal Generator are not available)

Remove chassis from cabinet and lay on its back flange. Connect speaker and antenna and tune in any FM station. If distortion is severe only a slight disturbance may be heard. Locate the condenser indicated in Figure #1. This is shown as C29 in the service manual. Carefully remove the lead connecting the condenser at the terminal strip.

Temporarily reconnect condenser C29 using maximum length of wire available. If part of lead has broken off, splice on an additional one-half inch. Retune station and observe results. Reduce lead length by one-eighth inch and repeat . Find the length that produces the lowest back ground noise, clearest response and easiest tuning and permanently solder condenser lead at this point. The exact length is fairly critacal and distortion will result if it is either too long or too short.



ERRATUM: 6BA6, 6AU6 should be 12BA6, 12AU6 respectively.

ALIGNMENT PROCEDURE

Broadcast Band Section I. F. and R. F.

The alignment procedure below includes the sensitivities at the inputs of various stages. All signal input values are based on an output of 50 milliwatts. This may be measured by disconnecting the speaker voice coil and substituting a 3.2-ohm resistor across the secondary winding of the output transformer. A reading of 40 volts AC across this resistor will be approximately equivalent to 50 milliwatt output with the speaker connected. The volume control must be set at maximum. The tone control must be set for maximum treble.

The signal source must be an accurately calibrated signal generator capable of supplying the frequencies designated, modulated 30% with a 400-cycle audio signal. A 400 cycle audio signal is required for the audio measurement. Variations in sensitivities of plus or minus 25% are usually permissable.

AM - I. F. ALIGNMENT

Band Switch in AM Position, Gang Open, Dummy Antenna .1 Mfd.

SIGNAL GENERATOR FREQENCY	*CONNECTION TO RADIO*	*ADJUSTMENTS TO BE MADE*	*ADUST FOR*
455 Kc. Use 1000 microvolts	Pin 1 of 12BA6 I.F. Amp. and B minus	Primary and Secondary of T8. See chassis view.	Maximum output Should be 50 Milliwatts
455 Kc. Use 30 microvolts	Pin 7 of 12BA7 Converter and B minus	Primary and Secondary of T6. See chassis view.	Maximum output Should be 50 Milliwatts
400 cycles. Use 17 millivolts	High Side of Volume Control and B minus	None	Maximum output Should be 50 Milliwatts

MODEL D2919

BROADCAST BAND—R. F. ALIGNMENT

Check pointer so that the right hand edge of the pointer skirt coincides with the right hand edge of marker to the extreme left when gang is closed.
For Adjustment, see dial mechanism illustration.

SIGNAL GENERATOR FREQUENCY	*SET POINTER AT*	*CONNECT TO RADIO*	*ADJUST*
1620 Kc.	Extreme Right Calibration Marker	AM Antenna Clip and B minus	Oscillator trimmer C17 for maximum
1400 Kc.	Second Calibration from Left	AM Antenna Clip and B minus	Antenna trimmer C3 for maximum

Check tracking at 1000 Kc, 600 Kc, and 535 Kc to be sure oscillator is set correctly.

NOTE: A special fibre alignment tool having a hex end (similar to an Allen wrench) is required for adjusting the 455 Kc. IF transformers.

ALIGNMENT PROCEDURE

FM Band Section I. F. and R. F.

A non-metallic alignment tool must be used.

IMPORTANT

No alignment of the FM section of this radio should be attempted unless you are positive that the circuits are in need of adjustment and you have the necessary equipment.

All components used in this radio are extremely stable and the tuned circuits should require no adjustment over a long period of time.

NOTE

The following alignment is based in the use of the new Simpson vacuum tube voltmeter which has a "floating ground". In other words, the meter, when used as a vacuum tube voltmeter, can have both the positive and negative sides connected to points above ground and still give true readings.

A standard AM signal generator is required.

FM—I. F. ALIGNMENT

Band Switch in FM Position. Dummy Antenna .1 Mfd.

SIGNAL GENERATOR FREQUENCY	*CONNECTION TO RADIO*	*VACUUM TUBE VOLT METER CONNECTION TO RADIO*	*ADJUSTMENTS TO BE MADE*	*ADJUST FOR*
10.7 Mc. Use about .1 volt	Pin No. 1 of 12AU6	Pin No. 7 of 12AL5 and B minus	Top Core Primary of T9	Resonance should be about 3 volts
10.7 Mc. Use about .1 volt	Pin No. 1 of 12AU6	Pin No. 7 of 12AL5 and B minus	Bottom Core Secondary of T9	Zero. Use zero center scale See note "C"
10.7 Mc. Use about 3300 microvolts	Pin No. 1 of 12BA6	See note "A"	Primary and Secondary of T7 See chassis view.	Resonance should be about 3 volts
10.7 Mc. Use about 200 microvolts	Pin No. 7 of 12BA7	Pin No. 7 of 12AL5 and B minus	Primary and Secondary of T5 See chassis view.	Resonance should be about 3 volts

NOTES ON FM — I. F. ALIGNMENT

NOTE "A"—Connect two resistors in series, 100K OHMS each, from Pin No.7 of 12AL5 to B minus (pin no.1). These resistors must be matched within 5%. Connect vacuum tube voltmeter between the midpoint of the resistors and point zz.

NOTE "B"—If T9 has been tampered with, it is possible that no crossover point will be found at first. Careful adjustment of both primary and secondary is necessary.

NOTE "C"—To use a VTVM which does not have the "floating ground" feature, in step 2 above connect "ground" side of VTVM to B minus and "high" side to midpoint of 100K resistors (Note A). Adjust bottom core of T9 for zero reading.

GENERAL—Input signals should be adjusted to give approximately 3 volts. The ratio detector is operating at a resonable level at this point and will give the truest indication of correct alignment with the procedure specified.

© John F. Rider

FM – R.F. ALIGNMENT

Check pointer so that the right hand edge of the pointer skirt coincides with the right hand edge of marker to the extreme left when gang is closed.
For Adjustment, see dial mechanism illustration.

SIGNAL GENERATOR FREQUENCY	*POINTER*	*CONNECTION TO RADIO*	*ADJUST*	*V T V M CONNECTIONS*
108 MC.	108 MC. Marker	FM antenna terminals	FM Osc C13 for maximum	Pin No. 7 of 12AL5 to B minus
98 MC.	Tune in Gen. Signal	See Note "B" below	FM Ant. C6 for maximum	

NOTE "A"—If a signal generator with the above fundamental frequency is not available, it is sometimes possible to use harmonics. Use extreme care in picking harmonics. An alternate procedure is to use a local station carrier of known frequency to align the FM Band and to use the vacuum tube volt-meter as above for resonance indication. A weak carrier, however, will not produce 3 volts.

NOTE "B"—Connect 300 ohms in series with "hot" side of generator and connect to left hand screw of external FM Antenna Terminals. Connect cold side of generator to right hand screw.

or
105-125 volts DC

Frequency Range..540-1600 KC

Intermediate Frequency.....455 KC

Selectivity.....at 1000 KC, 41 KC wide at 1000 times signal

Sensitivity.....(for .05 watt output with external antenna)
50. microvolts average

Power Output.....280 watt maximum
.130 watt 10% harmonics

Speaker.....5” P.M.

ALIGNMENT PROCEDURE

Volume Control—Maximum All Adjustments.

Allow Chassis and Signal Generator to “Heat Up” for several minutes.

The equipment in column at right is required for aligning.

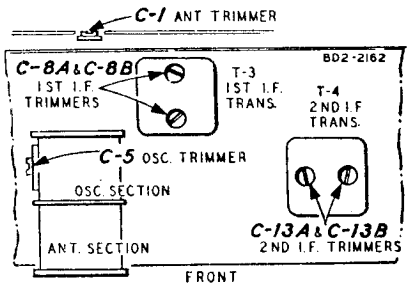
A Signal Generator which will provide an accurately calibrated signal at the test frequencies as listed.

Output Indicating Meter—Non-Metallic Screwdriver.

Dummy Antennas—.1 mf., 100 mmf.

SIGNAL GENERATOR FREQUENCY SETTING	CONNECTION AT RADIO	GROUND CONNECTION	DUMMY ANTENNA	CONDENSER SETTING	ADJUST TRIMMERS TO MAXIMUM
Remove chassis from cabinet					
455 KC	Signal Grid of 1st Det. (1R5 Pin 6)	Chassis base thru .1 mf Condenser	.1 mf.	Turn Rotor to Full Open	2nd I.F. (C-13A) & (C-13B) 1st I.F. (C-8A) & (C-8B)
1600 KC	Signal Grid of 1st Det. (1R5 Pin 6)	Chassis base thru .1 mf Condenser	.1 mf.	Turn Rotor to Full Open	Oscillator (C-5)
Reassemble chassis in cabinet.					
1400 KC	External Antenna Clip	External Ground Clip on Antenna	100 mmf.	Turn Rotor to Max. Output	Antenna (C-1)

CAUTION—As the metal chassis is connected to one side of the line, in any service work keep it on a wood or other insulated surface to avoid contact with ground.



REMOVAL OF CHASSIS FROM CABINET

To remove the chassis from the cabinet, it will be necessary to pull off the 2 control knobs and then unscrew the 2 screws fastening the chassis to the cabinet. See the tube position illustration for the location of these screws. After these screws have been removed, carefully pull out the chassis taking care not to damage the connections to the loop antenna.

REPLACEMENT PARTS LIST

NOTICE: There is a model number label on the chassis. This label identifies the radio as to model and issue letter. When ordering parts or writing, give ALL information appearing on this label.

MODEL D3615

BATTERY OPERATION

The following size battery pack, consisting of a 90 volt "B" section and a 7½ volt "A" section is required:

10¼ x 3¼ x 4 inches high.

To install a battery pack, remove the wooden block at the bottom of the cabinet by taking out the two screws. Place the battery in the cabinet with the socket facing upward and near the front of the cabinet under the speaker. Note the position of the prongs on the battery cable plug and the holes in the socket on the battery. Then insert the plug into the socket. Place the wooden block flush against the battery pack. It may not always be possible to use the original holes when replacing the screws, as battery packs will vary in size. Wind the power line cord around the two hooks just above the battery.

CAUTION — Secure the power line plug in position so that it cannot move around the cabinet.

AC-DC — BATTERY SWITCH — Push the switch at the back of the chassis to the "BATT" position. (See illustration on page 2).

AC-DC OPERATION

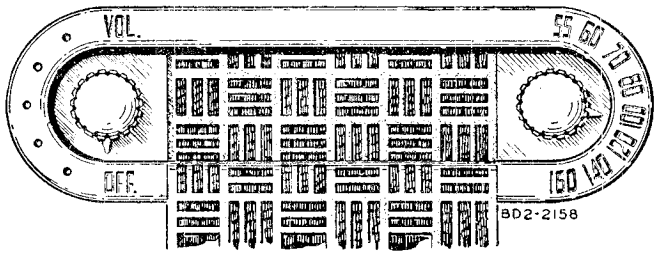
Unless otherwise marked, this radio must be operated on a power supply of 105-125 volts AC, 50-60 cycles only or 105-125 volts DC. Do not connect the radio to a power outlet until certain that the power supply is correct for the receiver. If in doubt, check with your local power company before connecting the radio.

To connect the radio for AC-DC operation, open the cabinet back and unwind the power line cord from the hooks at the sides of the cabinet and pass the cord through one of the lower openings in the back. Push the switch at the back of the chassis to the AC-DC position. (see illustration on page 2).

CAUTION: Never open the back of the cabinet or allow the metal chassis to come in contact with any ground while the power line plug is inserted in the power outlet. If excessive hum is encountered while using the radio on an AC power supply, reverse the plug. Leave the plug inserted in the position that results in the least hum.

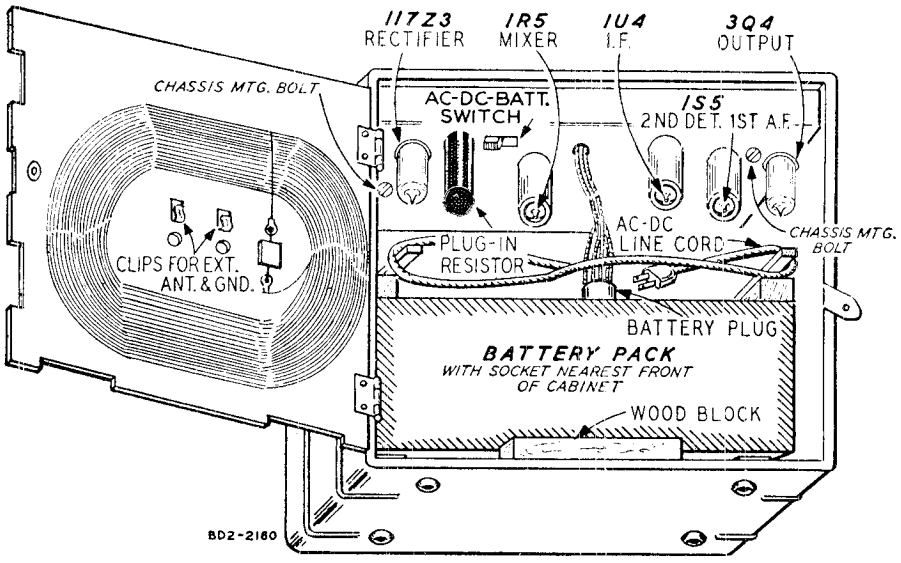
110 VOLT DC OPERATION

Insert the plug so that the red mark on the side of the plug is on the positive side of the line. CAUTION—If polarity of line is not known, insert plug; if set does not operate after one minute, reverse plug.



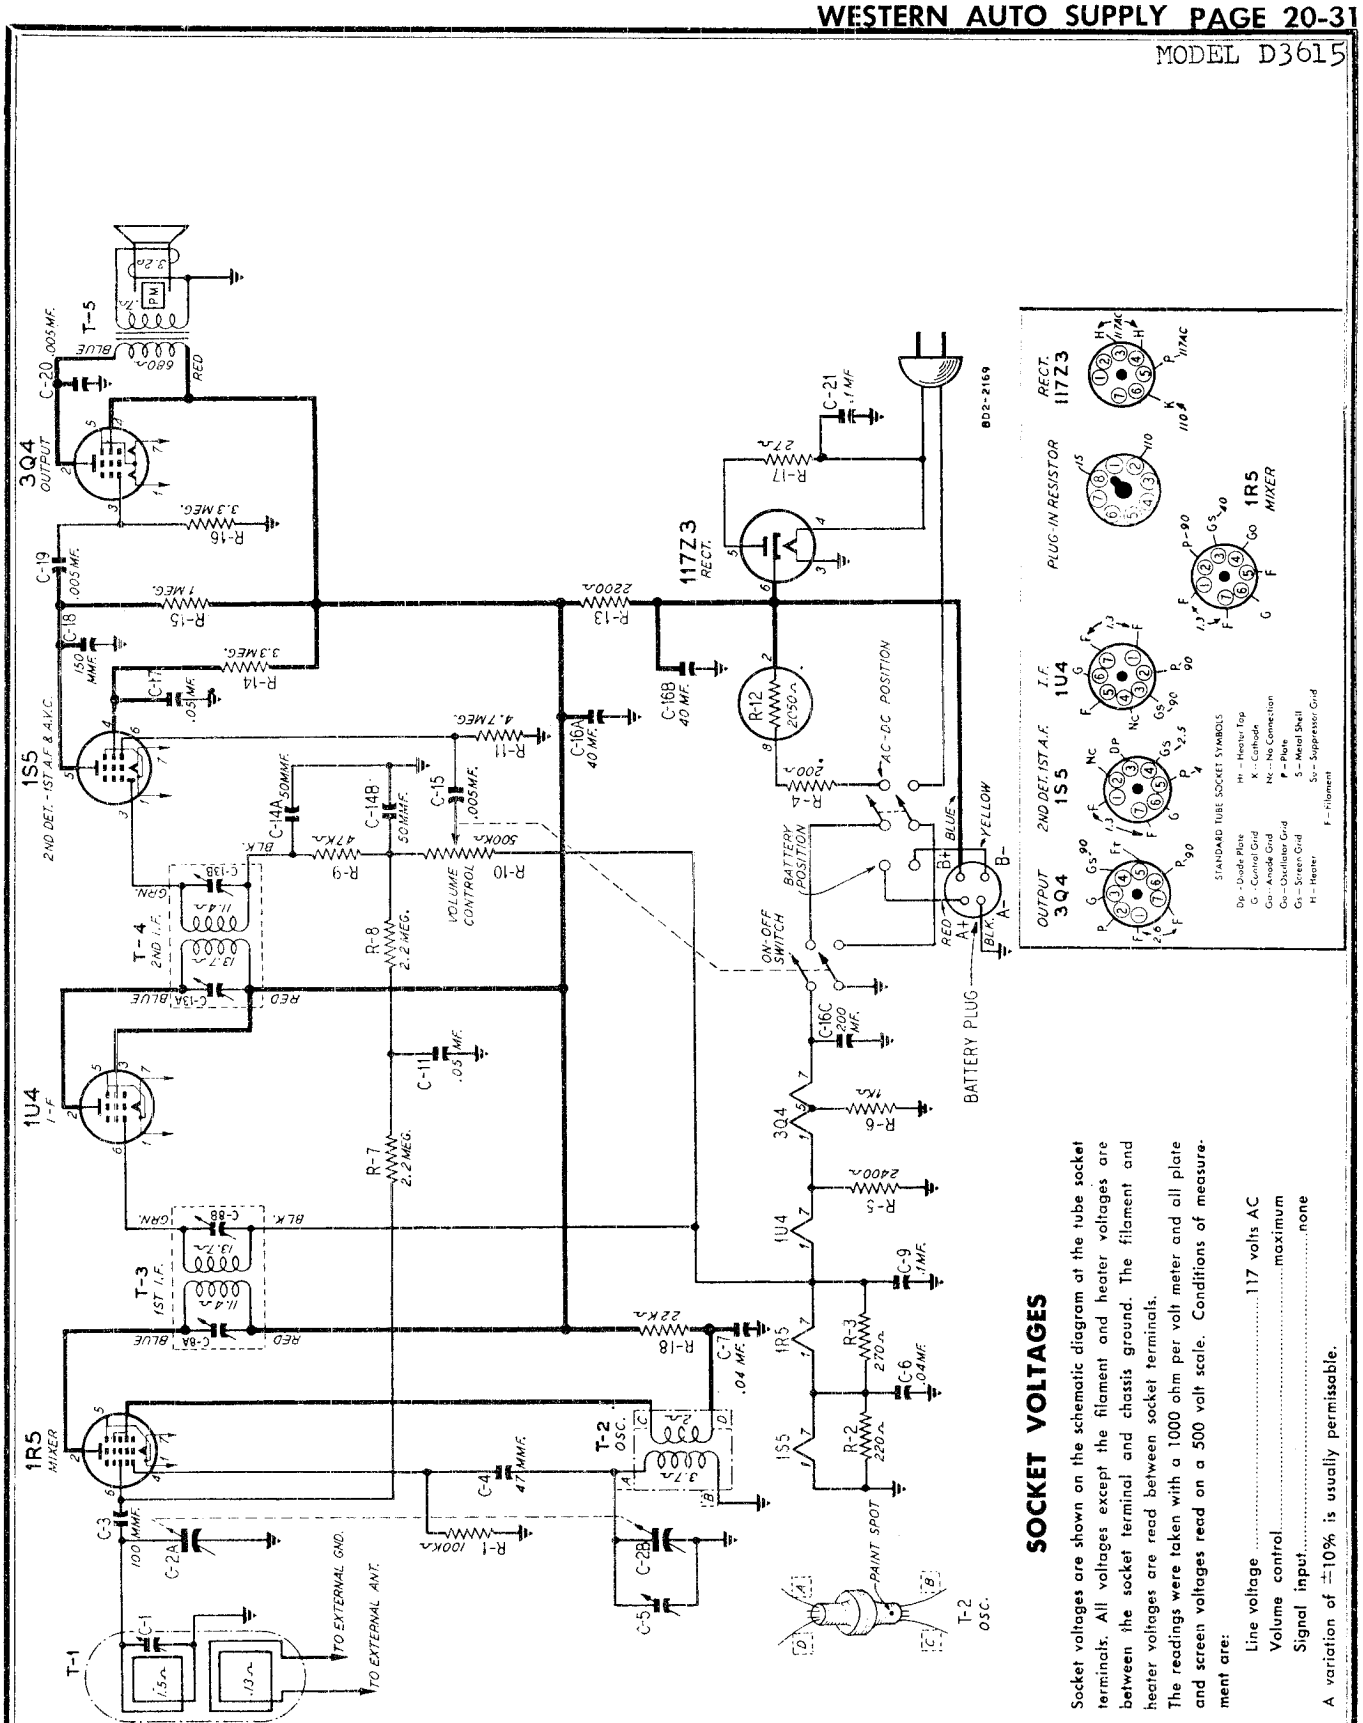
ON-OFF SWITCH AND VOLUME CONTROL

TUNING KNOB



© John F. Rider

MODEL D3615



SOCKET VOLTAGES

Socket voltages are shown on the schematic diagram at the tube socket terminals. All voltages except the filament and heater voltages are between the socket terminal and chassis ground. The filament and heater voltages are read between socket terminals.

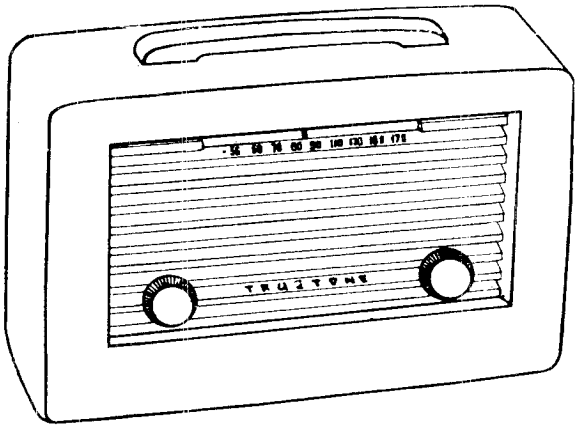
The readings were taken with a 1000 ohm per volt meter and all plate and screen voltages read on a 500 volt scale. Conditions of measurement are:

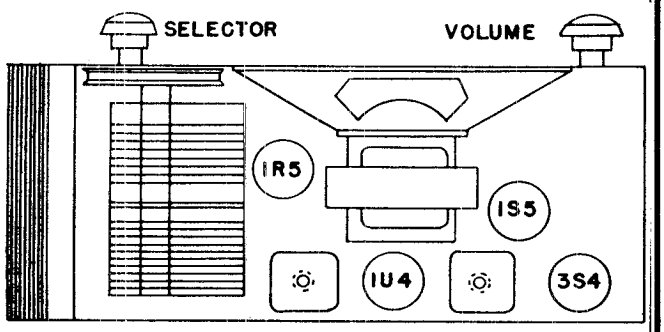
Line voltage ..... 117 volts AC
Volume control ..... maximum
Signal input ..... none

A variation of ±10% is usually permissable.

©John F. Rider

MODEL D3809



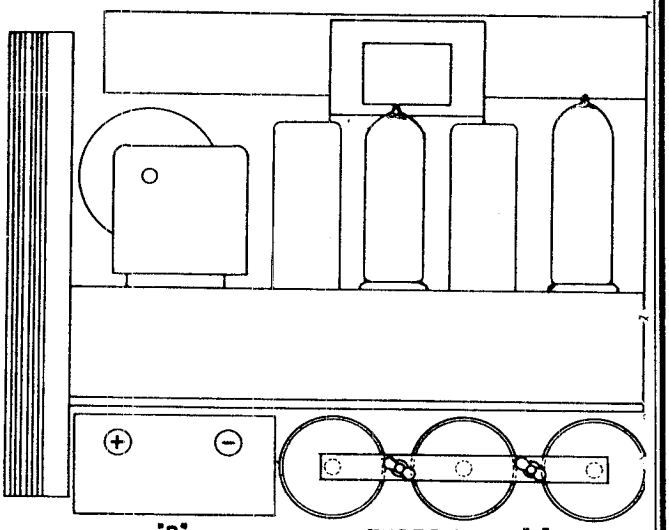


POWER SUPPLY

The battery supply to be used with this receiver is as follows:

"A" supply ..... 1½ volts. Use three type "D" flashlight cells; Wizard No. B-6722, B-6740, or B-6745, or Burgess No. 2, or Winchester No. 1511, or Eveready No. 950 or equivalent.

Use Wizard No. B-6258 or Burgess No. XX45 or Winchester No. 1710 or Eveready No. 467 or equivalent.



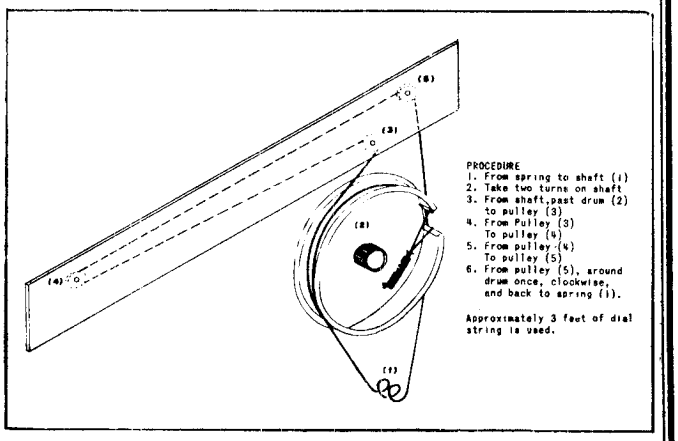
REPLACEMENT OF CELLS

The three "D" cells are inserted so that the brass caps on the positive terminals fit snugly into the holes provided in the contact strip. The contact strip is held in place with the two wing nuts provided.

Clip the fastener to the terminals on the "B" battery so that they snap tight, and place the battery in the space provided.

ELECTRICAL SPECIFICATIONS

Batteries	A—1½ volts. 250 ma. B—67½ volts. 8 ma. average.
Frequency Range	530 to 1700 kc.
Intermediate Freq.	455 kc.
Tuning	Two-gang capacitor
Antenna	Built-in loop
Speaker	4 inch PM; voice coil Impedance 3.5 ohms.
Power Output	80 milliwatts undistorted 140 milliwatts maximum
Sensitivity	800 microvolts per meter for 50 milliwatt output
Selectivity	55 kc broad at 1000 times signal at 1000 kc.



PROCEDURE
1. From spring to shaft (1)
2. Take two turns on shaft
3. From shaft, past drum (2) to pulley (3)
4. From Pulley (3) To pulley (4)
5. From pulley (4) To pulley (5)
6. From pulley (5), around drum once, clockwise, and back to spring (1).
Approximately 3 feet of dial string is used.

Replacement of Drive Cord

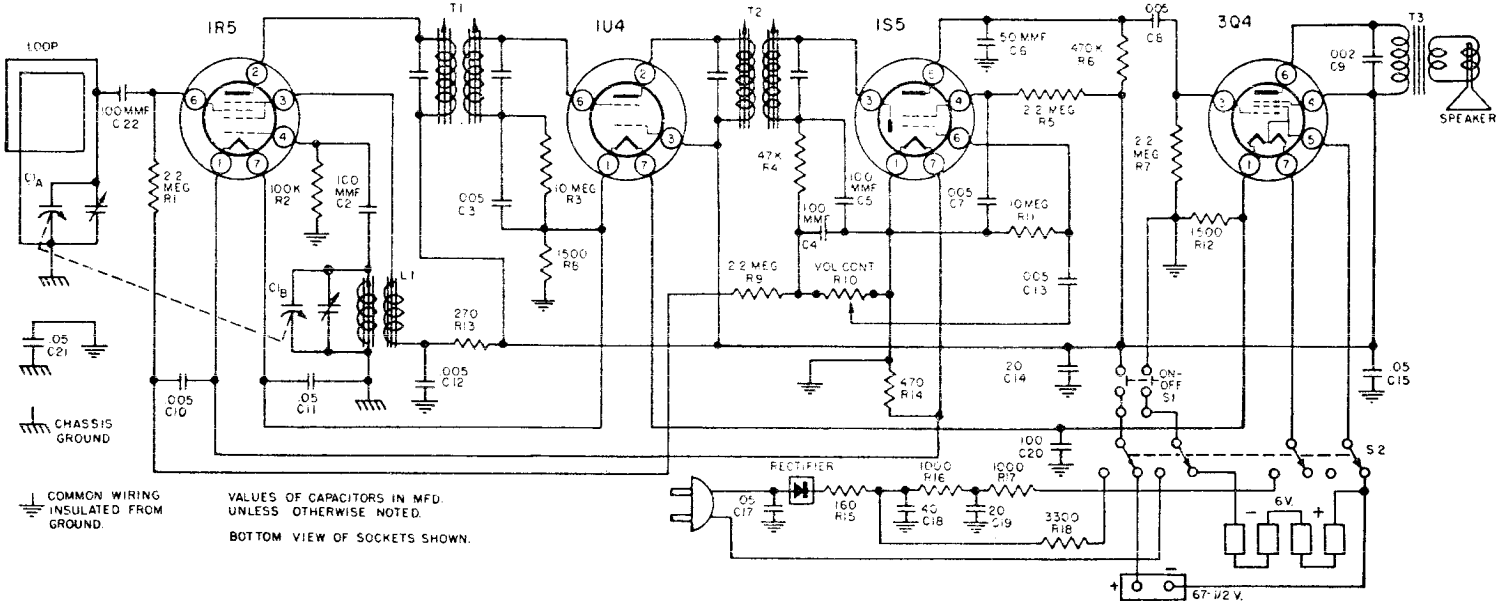

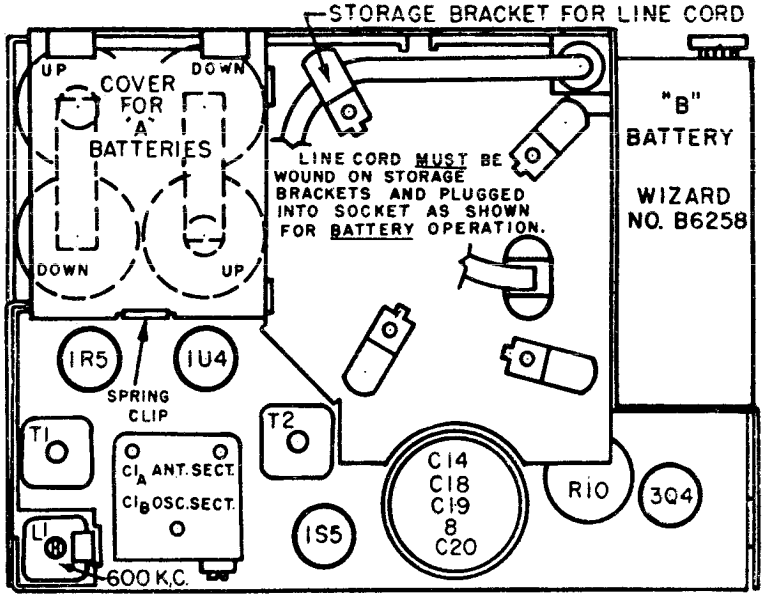

FIG. 2 PICTORIAL DIAGRAM

TUBE COMPLEMENT

The tube complement of this receiver consists of the following:

1—1R5—Mixer Osc.

1—1U4—I.F. Amplifier

1—1S5—Detector and 1st Audio

1—3Q4—Power Output

No Rectifier Tube is needed since a Selenium Rectifier is used for this purpose when the radio is operated on AC current.

MODEL D3811

POWER SUPPLY

This receiver is designed to operate from self contained batteries, or from 105-125 volt AC or DC power supply. One 67½ volt "B" battery, Wizard No. B6258, and four "A" batteries, either Wizard No. B6722, B6732, B6740 or B6745 are used for battery operation. If Truetone batteries are not available Eveready No. 467, Burgess No. XX45, Ray-O-Vac No. 4367 or similar "B" battery may be used. Any standard No. 2 flash light dry cells can be used as "A" batteries.

SERVICE NOTES

Voltages taken from the different points of the circuit to common "B" are measured with volume control in maximum position, all tubes in their sockets and with a volt meter having a resistance of 20,000 ohms per volt. These voltages are clearly indicated on the voltage chart.

All voltages should be measured with a line voltage of 117 volts.

To check for open by-pass condensers, shunt each condenser with another one having the same capacity and voltage rating which is known to be good until the defective unit is located.

ALIGNING INSTRUCTIONS

Never attempt any adjustments on this receiver unless it becomes necessary to replace a coil or transformer, or the adjustments have been tampered with in the field. Always make certain that other circuit components, such as tubes, condensers, resistors, etc., are normal before proceeding with realignment.

If realignment is necessary follow the instructions given below in the order listed. After realignment has been completed repeat the procedure as a final check.

ALIGNMENT PROCEDURE

Volume control—Maximum: all adjustments.

Connect ground lead of signal generator to common "B."

Connect dummy antenna in series with output lead of signal generator.

Connect output meter across voice coil of speaker.

The following equipment is necessary for proper alignment:

Signal generator that will provide the test frequencies as listed, 30% modulated, 400 c.p.s.

Output meter.

Non-metallic screwdriver.

Dummy antennas— .1 mfd., .00025 mfd.

For alignment points refer to Figure No. 2.

CAUTION: This is an A.C.-D.C. receiver and if alignment is made with the receiver connected to 117 volts A.C. or D.C., it is necessary to isolate the signal generator or the receiver from the line by use of a transformer, or place a .2 M.F.D. condenser in both test leads of the Signal Generator.

Position of Variable	Generator Frequency	Dummy Ant. Mfd.	Generator Connections	Trimmer Adjustment	Trimmer Function
Fully open	455 KC	.1	*1R5 Grid (Stator of C1A)	T2	Output I.F.
Fully open	455 KC	.1	*1R5 Grid (Stator of C1A)	T1	Input I.F.
Fully open	1600 KC	.00025	*1R5 Grid (Stator of C1A)	C1B	Oscillator
Tune in signal from generator	1400 KC	—	Loosely coupled to loop	C1A	Antenna
**Tune in signal from generator	600 KC	—	Loosely coupled to loop	L1	600 KC Padder

*Connect ground lead of signal generator to chassis.

**When making this adjustment the variable should be rocked back and forth.

VOLTAGE CHART

All voltages are measured from minus "B" with a 20,000 ohm per volt meter, volume control at maximum, no signal applied, and the radio operating from a 117 volt AC power supply.

NOTE: Normal tolerance on component values may cause a plus or minus of 10% in voltage readings.

TUBE	Pin Numbers						
	1	2	3	4	5	6	7
1R5	1.6	65	67	—8	1.5	0	2.8
1U4	2.8	65	65	0	2.8	0	4.2

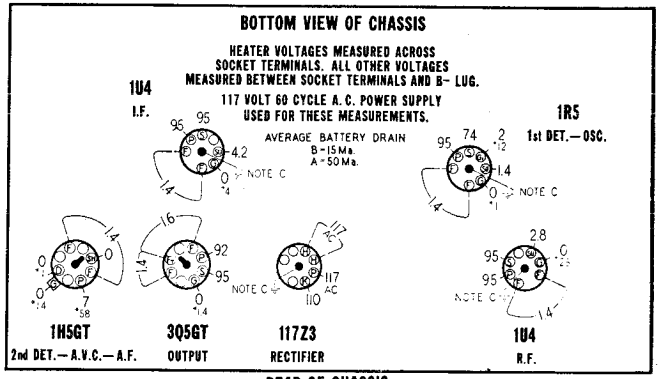
SOCKET VOLTAGES

Measured with voltmeter having sensitivity of 1000 ohms per volt except where indicated by (*). The (*) symbol designates a vacuum tube voltmeter measurement.

VOLUME ON FULL WITH NO SIGNAL — DIAL TUNED TO 540 KC.

"BATT.—AC-DC" SWITCH IN "AC-DC" POSITION



NOTE C: Grounding of center stud on tube socket is necessary to reduce capacity coupling between other pins. Oscillation may result if this ground is omitted.

MODEL D3840

GROUND: Do not connect a ground wire to this receiver while it is connected to the electric power supply. Failure to observe this caution may result in damage to the receiver.

When connecting the radio to the electric power outlet be sure that outlet will supply the proper current and voltage. This radio may be connected to either 50 or 60 cycle Alternating Current (A.C.) at 105 to 125 volts or Direct Current (D.C.) at 105 to 125 volts.

The bottom compartment of the cabinet provides adequate space to accommodate a single unit battery pack. **Any of the following single unit type battery packs may be used as a suitable power supply for this receiver.**

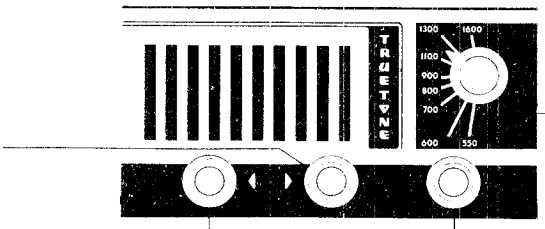
HOW TO OPERATE THE CONTROLS



SELECTOR SWITCH

AC-DC (counter-clockwise position): Use this position when receiver power cord is connected to an electric power outlet.

BATTERY (clockwise position): Use this position when operating the receiver on the self-contained battery.

ON-OFF SWITCH AND VOLUME CONTROL Turn this knob clockwise to turn set on. Continuing to turn clockwise will increase volume.

TUNING CONTROL Use this control to tune receiver to the desired station.

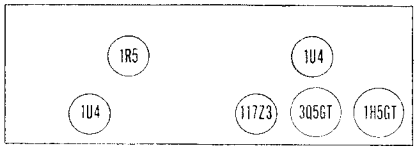
THE DIAL SCALE is calibrated to cover standard "broadcast" band frequencies between 540 Kc and 1600 Kc.

TUBES USED

The tubes used in this receiver are arranged on the chassis as shown in illustration at the right.

IMPORTANT: DISCONNECT POWER CORD FROM WALL OUTLET BEFORE ATTEMPTING TO REMOVE TUBES FOR TEST OR REPLACEMENT. MAKE CERTAIN THAT EACH TUBE IS INSTALLED IN ITS PROPER SOCKET WHEN REPLACING THE TUBES IN THE SET.

TUBE LOCATIONS



REAR OF CHASSIS

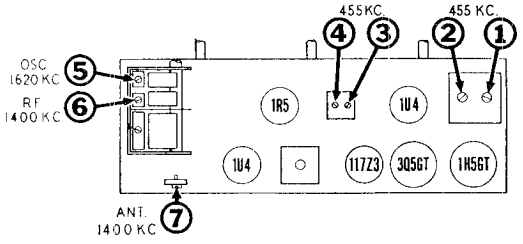
MODEL D3840

ALIGNMENT PROCEDURE

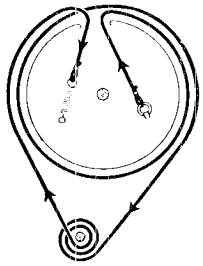
1. Disconnect and remove battery from cabinet. Then remove the two plug buttons which are located at bottom of cabinet so that a long blade screwdriver may be inserted to remove chassis holddown screws. After removing these screws be sure to replace and reconnect the battery as battery position affects alignment of loop antenna circuit.
2. Partially withdraw the chassis from cabinet so as to obtain access to trimmer adjustments—**do not completely remove the chassis from the cabinet** as position of chassis relative to loop antenna is important.
3. In order to provide a means of coupling the signal generator to the antenna, wind approximately two turns of insulated wire around outside of cabinet so that its position corresponds to that of the built-in loop. Then connect both leads of this coupling to signal generator.
4. Connect an output meter across voice coil of speaker or between plate of 3Q5GT output tube and chassis through a 0.1 mfd. condenser.
5. Set the volume control at maximum volume position and use a weak signal from the signal generator.
6. Set "BATT.—AC-DC" Switch in "AC-DC" position.

DUMMY ANT. IN SERIES WITH SIGNAL GENERATOR	SIGNAL GENERATOR CONNECTION	SIGNAL GENERATOR FREQUENCY	RECEIVER DIAL SETTING	TRIMMER OR SLUG NUMBER	TRIMMER DESCRIPTION	TYPE OF ADJUSTMENT
None	Connect directly to coupling turn around cabinet.	455 KC	Any point where it does not affect the signal.	1-2	2nd I.F.	Adjust for maximum output. Then repeat adjustment.
				3-4	1st I.F.	
None	Connect directly to coupling turn around cabinet.	1620 KC	Set so that gang condenser is in fully open position.	5	Broadcast Oscillator	Adjust for maximum output.
None	Connect directly to coupling turn around cabinet.	1400 KC	Tune to 1400 KC generator signal	6	Broadcast R. F.	Adjust for maximum output.
None	Connect directly to coupling turn around cabinet.	1400 KC	Tune to 1400 KC generator signal	7	Broadcast Antenna	Adjust for maximum output. Slide chassis all the way into cabinet when making this adjustment.

TOP VIEW OF CHASSIS



TRIMMER LOCATIONS



DIAL DRIVE CORD ARRANGEMENT

To string dial cord, set gang condenser to fully open position and use following parts:

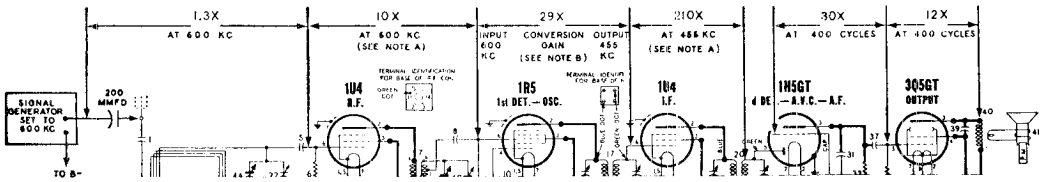
114955	Clip on end of cord
117057	Cord (3 feet)
119087	Ring for dial cord
505161	Tension Spring

STAGE GAIN MEASUREMENT PROCEDURE

REQUIRED INSTRUMENTS: The amount of amplification or "gain" of each of the stages of this receiver may be measured with an A.C. Vacuum Tube Voltmeter or a "channel" type instrument containing a tuned and calibrated amplifier.

PROCEDURE: It is exceedingly important to adhere to the procedure outlined below since the accuracy of these measurements will be affected to a considerable extent by the failure to establish proper operating conditions.

1. Be sure that R.F. and I.F. stages are carefully and accurately aligned by utilizing the alignment procedure given above.
2. Connect Signal Generator as shown below.
3. The values of stage gain which are given here were measured with a fixed bias of 1½ volts on the control grids of all R.F. and I.F. tubes which are connected to the A.V.C. circuit. Therefore these values are not intended to indicate the full capability of a stage but they will serve as a convenient basis for determining proper operation. In order to duplicate the fixed bias voltage, connect the negative terminal of a 1½ volt battery to A.V.C. at junction of resistors No. 9 and 16 and connect the positive battery to B—
4. Set Signal Generator for operation at 600 Kc with 400 cycle modulation and carefully tune radio receiver to this signal by using an output meter to indicate peak output. If a local station interferes, set generator to a nearby frequency and re-tune the receiver.
5. R.F. and I.F. circuits are slightly de-tuned when contact is made with an instrument probe and this action, which is indicated by a change in the output meter reading, may seriously affect the gain measurement. Therefore, it is important to adjust the associated circuit trimmer for a maximum output meter reading and to set the input signal level to a convenient reference point on the gain measuring instrument while the probe is making contact. After removing the probe it is again necessary to adjust the trimmer so as to obtain the same output meter reading and thereby assure that the signal voltage at the specified point has not changed as a result of circuit de-tuning.
6. When using a "channel" type instrument, carefully tune it for maximum output at desired frequency before making measurements.



NOTE A: Measured with input voltage of 0.1.
NOTE B: Measured with input voltage of 0.2.

DIFFERENCES in tube characteristics, tolerance of parts, adjustment of tuned circuits and variations in line voltage will influence stage gain. These factors should be given due attention in event the gain of a stage varies extensively from the values shown above.

ALIGNMENT PROCEDURE

ALIGNING INSTRUCTIONS

Never attempt any adjustments on this receiver unless it becomes necessary to replace a coil or transformer, or the adjustments have been tampered with in the field. Always make certain that other circuit components, such as tubes, condensers, resistors, etc., are normal before proceeding with realignment.

If realignment is necessary follow the instructions given below in the order listed. After realignment has been completed repeat the procedure as a final check. For alignment points refer to Figure No. 2.

Volume control—Maximum: all adjustments.
Connect ground lead of signal generator to common "B." negative.
Connect dummy antenna in series with output lead of signal generator.
Connect output meter across voice coil of speaker.

The following equipment is necessary for proper alignment:
Signal generator that will provide the test frequencies as listed, 30% modulated, 400 c.p.s.
Output meter.
Non-metallic screwdriver.
Dummy antennas— .1 mfd., .00025 mfd.

MODEL D3910

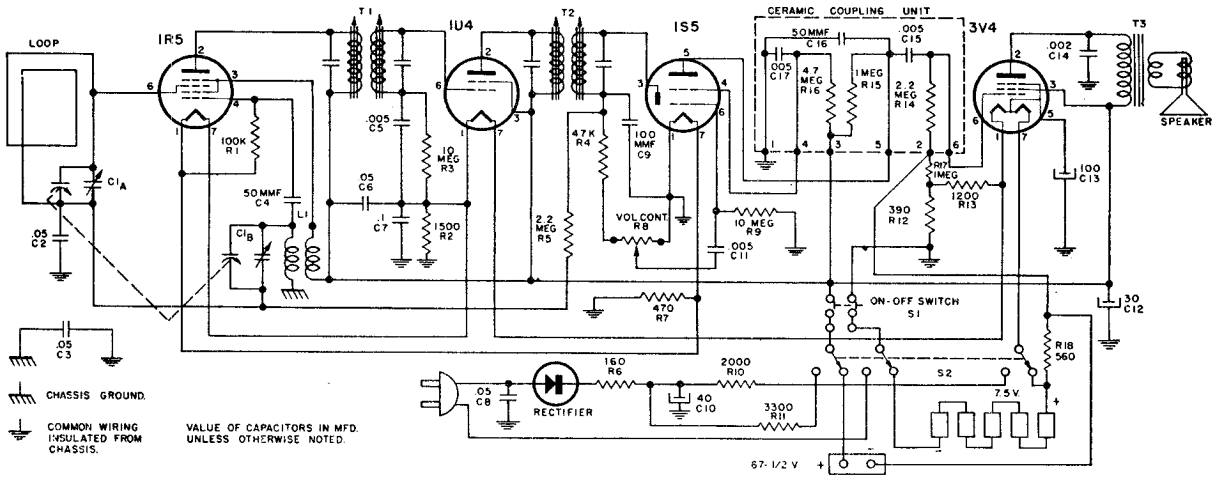

Fig. 1 Schematic Diagram

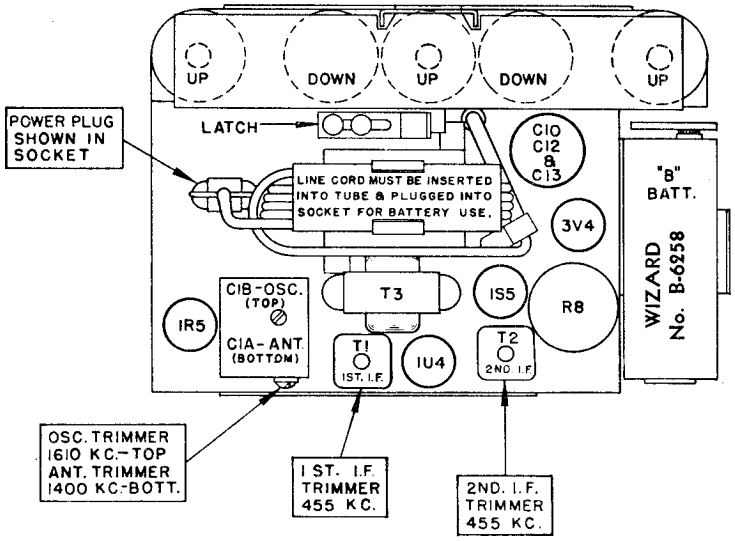

Fig. 2. Tube, Trimmer and Battery Locations

All voltages are measured from tube pin to common "B" negative with a 20,000 ohm per volt voltmeter.

Voltages shown in circles are obtained when set is operated on 117 volt current.

Voltages shown outside the circles are obtained when the set is operated on batteries. New batteries in good condition should be used for these measurements.

2.5 watts, maximum
Sensitivity.....10 microvolts average for 1 watt output
Selectivity...20 KC broad at 1000 times signal, at 1000 KC

The tube compliment of this receiver is as follows:

1—6SK7GT—R. F. Amplifier.

1—6SA7GT—Converter.

1—6SK7GT—I.F. Amplifier.

1—6SQ7—Detector—AVC—1st audio.

1—6V6GT—Power output.

1—6X5GT—Rectifier.

SERVICE NOTES

Voltages taken from the different points of the circuit to the chassis are measured with volume control in maximum position, all tubes in their sockets, no signal applied, and with a volt meter having a resistance of 20,000 ohms per volt. These voltages are clearly shown on the voltage chart, (Fig. 4).

All voltages should be measured with an input voltage of 6.3 volts DC.

To check for open by-pass condensers, shunt each condenser with another one having the same capacity and voltage rating which is known to be good until the defective unit is located.

ALIGNING INSTRUCTION

Never attempt any adjustments on this receiver unless it becomes necessary to replace a coil or transformer, or the adjustments have been tampered with in the field. Always make certain that other circuit components, such as tubes, condensers, resistors, etc., are normal before proceeding with realignment.

If realignment is necessary follow the instructions given under the heading "ALIGNMENT PROCEDURE". After realignment has been completed repeat the procedure as a final check.

INSTRUCTIONS FOR REMOVING CHASSIS FROM THE CASE

The bottom cover (the one with the speaker louvers) can be removed to permit servicing of major components, such as tubes and vibrator, by removing the eight (8) screws holding it to the top cover. There are three (3) screws on each side, one (1) in the rear, and one (1) in the front.

CAUTION: Before attempting to remove the top cover, to service condensers, resistors, etc., the screw connecting the spark plate to the "A" terminal (inside case) must be removed. This is a round head screw, and is located on the rear of the case, close to the mounting stud bolt. It is recessed in a ½ inch hole in the case itself, thereby permitting contact with the spark plate.

After removing the spark plate screw, remove the two knobs by pulling forward and remove the eight (8) screws securing the cover to the chassis. Lift the chassis at the rear, at the same time moving it away from the front of the case so that the volume and tuning shafts will clear the holes in the cover.

NOTE: When reinstalling the chassis into the case, be sure the screw connecting the spark plate to the "A" terminal (inside case) is tightened very securely, otherwise the receiver will not operate properly.

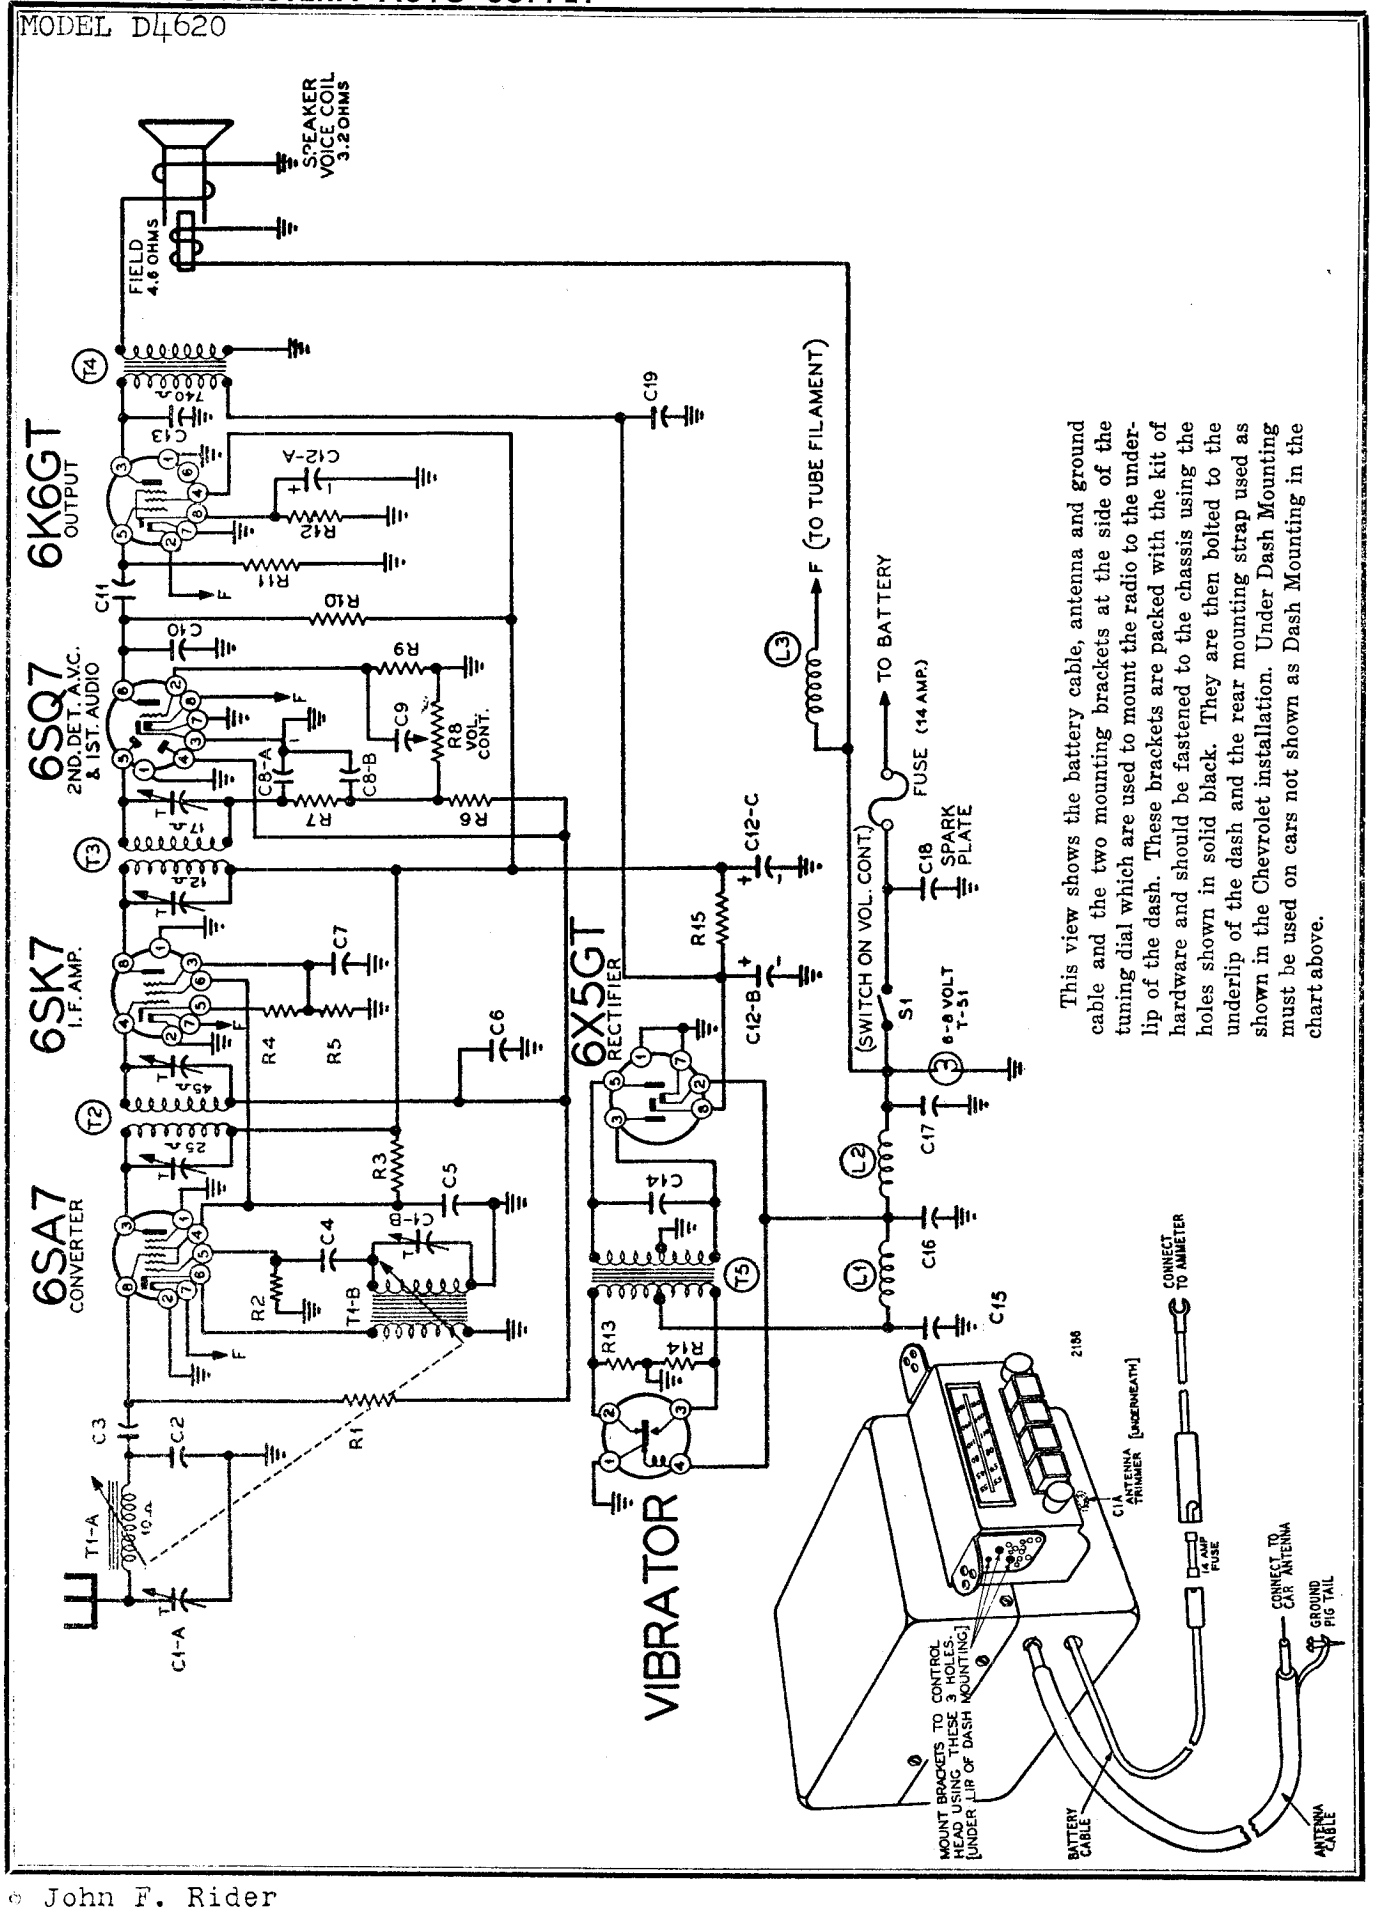
MODEL D4620



This view shows the battery cable, antenna and ground cable and the two mounting brackets at the side of the tuning dial which are used to mount the radio to the underlip of the dash. These brackets are packed with the kit of hardware and should be fastened to the chassis using the holes shown in solid black. They are then bolted to the underlip of the dash and the rear mounting strap used as shown in the Chevrolet installation. Under Dash Mounting must be used on cars not shown as Dash Mounting in the chart above.

© John F. Rider

FINAL CONNECTIONS

The antenna cable should be connected and the shield grounded to the car body.

Connect the battery cable to the hot side of the ammeter behind the instrument panel and then insert the fuse in the cable receptor.

ANTENNA TRIMMER

(See Chassis View)

The input circuit has been especially designed to be used with a low capacity antenna of the fish pole or whip type.

Truetone antennas are especially designed to be used with this radio.

Tune in a station on the high frequency end of the dial and adjust the antenna trimmer for maximum volume. A weak station which does not fade is best for this adjustment.

ELIMINATING MOTOR NOISE

GENERATOR CONDENSER

A Generator Condenser must be connected in all cases from the battery terminal of the generator to the Generator frame.

This condenser must not be connected across the field winding terminal on late cars which use Automatic Cutouts.

It is advisable that you find out from your local car dealers where the manufacturer recommends the condenser be connected for each make of car.

DISTRIBUTOR SUPPRESSOR

A Distributor Suppressor is required in practically all cases, except Ford V8's where none is used. The high tension lead must be removed from the distributor head and the suppressor inserted in its place. The high tension lead is then plugged into the suppressor.

AMMETER CONDENSER

A .5 Mfd. by pass condenser should be connected from one ammeter terminal to a good ground on the instrument panel. Usually this condenser plus the generator condenser and distributor suppressor will remove all objectionable ignition noise.

ELECTRICAL ACCESSORIES

If the above procedure has not reduced the noise sufficiently, it will be necessary to continue by passing sources of noise.

Accessories such as lighters, electric motor heaters, horns, light switches, automatic relays, electrical gauges such as oil, water and gas are often a source of interference. In these cases the procedure is to try a condenser from ground to various accessories until the interference is eliminated, then install the condensers in those places permanently. Spark intensifiers should not be used.

HIGH AND LOW TENSION LEADS

In many cars the low tension battery leads, etc., are grouped together with the high tension wires. These leads will very often pick up motor noise and feed it into the receiver through the battery circuit. In cases such as these it will be necessary to separate the low tension from the high tension wires and run them through another hole if they run from the engine compartment up to the instrument panel. This condition is particularly true on the V-8 Ford as the battery and primary leads run through a special tube which also houses the high tension leads. Shield and ground these leads.

IGNITION COILS

In cars where the ignition coil is located on the back side of the instrument panel it is often necessary to use an additional condenser. It must be installed from the battery side of the ignition coil to the closest ground on the instrument panel.

Short leads are very important. Where coils are mounted either on the instrument panel or in the driver's compartment, it may be necessary to shield the high tension lead from the coil to the distributor.

ELECTRICAL SPECIFICATIONS

Power Supply.....6 volts D.C.

Frequency Range.....530 to 1600 kc.

Intermediate Freq.....455 kc.

Tuning.....Two permeability-tuned circuits.

Antenna System.....Adjustable to accommodate various car antennae capacities.

Speaker.....5-inch; electro dynamic voice coil impedance 3.2 ohms.

Power Output.....1 watt undistorted; 1.6 watts maximum.

Sensitivity.....20 microvolts average for 500-milliwatt output.

Selectivity.....50 kc broad at 1000 times signal at 1000 kc.

ALIGNMENT PROCEDURE

(Refer to Chassis View)

- Output meter across 3.2-ohm output load.
- Align for maximum output. Reduce input as needed to keep output near 0.4 volts.
- Volume control at maximum for all adjustments.
- Connect ground post of signal generator to radio chassis.

BAND	*SIGNAL GENERATOR*				*ADJUSTMENT Adjust for Max. Output*
	Frequency	*Dummy Antenna*	*Connection to Radio*	*Ground Connection*	
I.F.	455 kc	.1 mfd.	Pin #4 Grid 6SK7 Tube	Chassis	Adjust Trimmers of T3 output I.F.
I.F.	455 kc	.1 mfd.	Pin #8 Grid 6SA7 Tube	Chassis	Adjust Trimmers of T2 input I.F.
Broadcast Band	1600 kc	30 mmfd.	Antenna Lead	Chassis	Adjust Trimmers C1-B Oscillator and C1-A Antenna.
Broadcast Band	1400 kc	30 mmfd.	Antenna Lead	Chassis	*Slide Antenna Coil lengthwise for max. output by means of a screw driver.
Broadcast Band	1600 kc	30 mmfd.	Antenna Lead	Chassis	**Adjust Antenna Trimmer C1-A to maximum output.

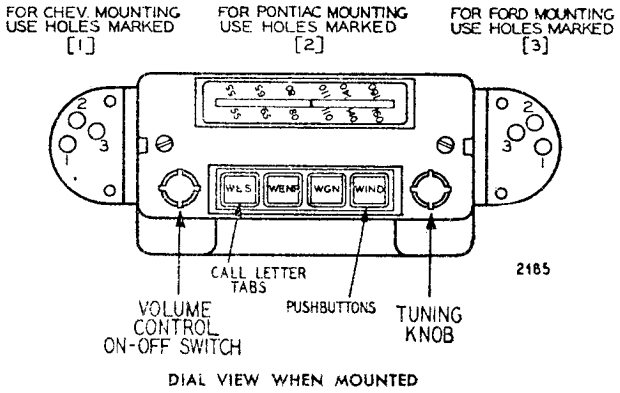
*This adjustment will seldom be necessary in service work as the Antenna Coil is adjusted and sealed in place at the factory. The necessity of this adjustment can be checked quickly by tuning set to a 1400 kc. signal and adjusting C1-A. If a large increase in output is noted the Antenna Coil should be adjusted.

**If Antenna Coil is adjusted, C1-A should be readjusted at 1600 kc. These two adjustments (Antenna Trimmer C1-A and Antenna Coil) should be repeated until no further improvement is noted.

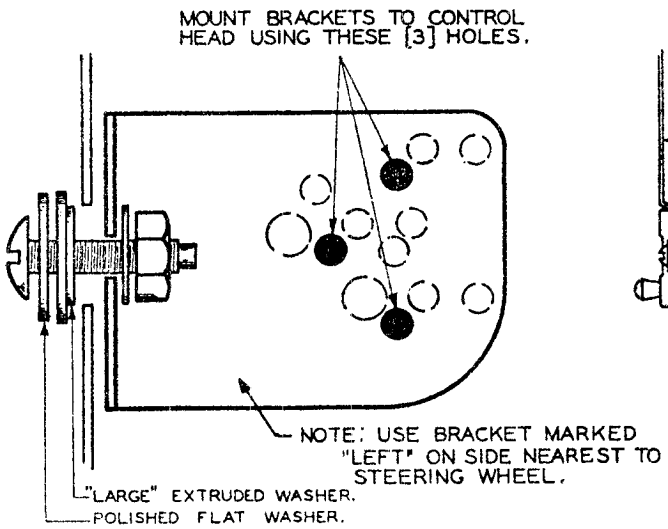
NOTE: At 1600 kc., the Oscillator Core should extend 31/32 inch from the edge of the Coil Form.

1941, 1942 and 1946 Chevrolet

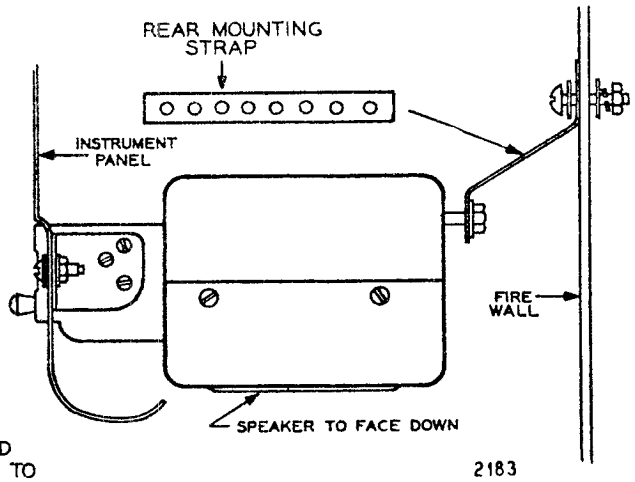
This view shows how the chassis is mounted to the dash. The rear mounting strap (in the kit of hardware) should be bent as shown and used to support the chassis at the back. The two front mounting brackets should be fastened to the chassis using the solid black holes as shown. Lay the bracket on the left hand drawing and the black circles will show through the holes to be used. The two holes marked No. 1 in the front brackets, as shown in the Dial View Drawing, should be used to bolt the chassis to the dash.



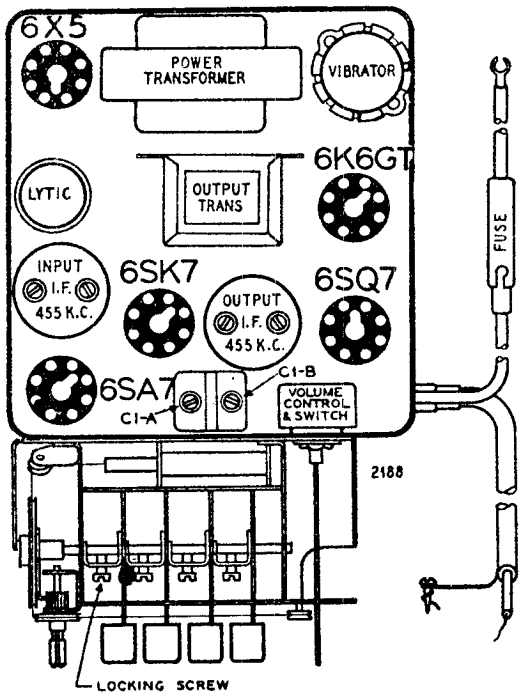
DIAL VIEW WHEN MOUNTED



MOUNT BRACKETS TO CONTROL HEAD USING THESE [3] HOLES.
NOTE: USE BRACKET MARKED "LEFT" ON SIDE NEAREST TO STEERING WHEEL.
"LARGE" EXTRUDED WASHER.
POLISHED FLAT WASHER.



NOTE: Mount Chassis as shown with the speaker face down. Be sure to use rear mounting strap.



CHASSIS VIEW—Showing tube location, trimmers, and the push-button locking-screws.

1941 and 1942 Americar Models (Willys)

Remove the panel from the left side of the dash and cut an opening, using the dimensions below. Mount the chassis the same as in the Chevrolet installation.

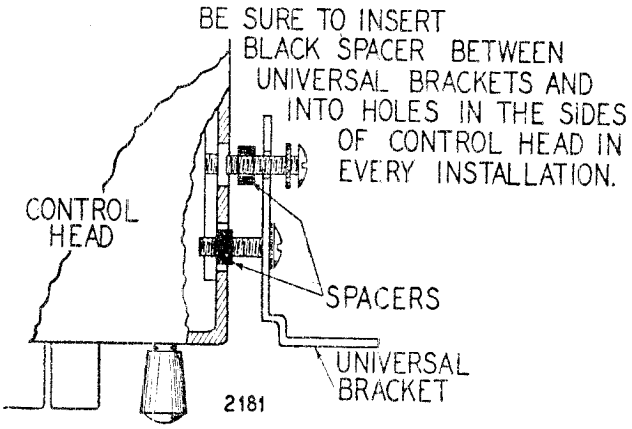
MODEL D4620

IMPORTANT (ALL INSTALLATIONS)

1. Two universal mounting brackets are supplied with the kit of hardware and are mounted in various positions on the chassis for installation in or under the dash of different cars.
2. In all installations it is very important that the black metal spacers be used between the front mounting brackets and the side of the chassis. The spacers must fit into the holes in the side of the chassis. They are packed in the kit of hardware.
3. Be sure to draw the rear mounting strap up tight so that it holds the chassis rigid.
4. In some installations it may be necessary to adjust the antenna trimmer before bolting the chassis to the dash.
5. Two pairs of extruded washers are supplied for use when bolting the chassis to the dash. Be sure the washers seat properly in the dash mounting holes and use the pair which fits the holes snugly.



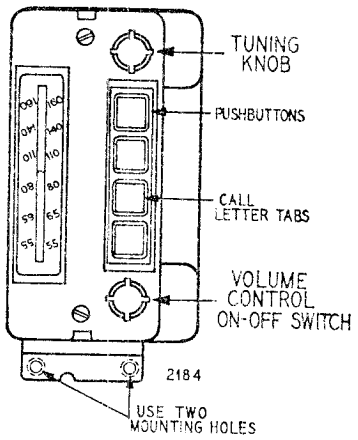
BE SURE TO INSERT BLACK SPACER BETWEEN UNIVERSAL BRACKETS AND INTO HOLES IN THE SIDES OF CONTROL HEAD IN EVERY INSTALLATION.
CONTROL HEAD
SPACERS
UNIVERSAL BRACKET
2181

Dash Panel Mounting

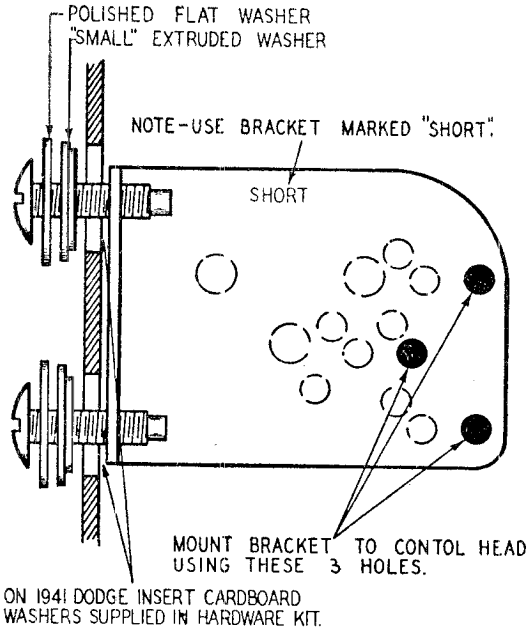
1940, 1941, 1942 and 1946 Models of Chrysler, De Soto, Dodge, Plymouth

Mount the chassis as shown with the dial vertical. A special bracket marked "short" is supplied with the kit of hardware. Mount this bracket to the chassis, using the solid black holes shown in the left hand drawing. Note that the chassis should be mounted with the tuning knob at the top. It may be necessary in some installations to reverse the bolt in the cowl lever to prevent it from hitting the speaker grill. On Plymouth cars remove Pal nut behind dash at top of dial opening so the dial will come up flush.

The call letters must be carefully trimmed to fit the push-buttons horizontally. Be sure to use the black spacers pictured above when mounting the front (short) bracket.

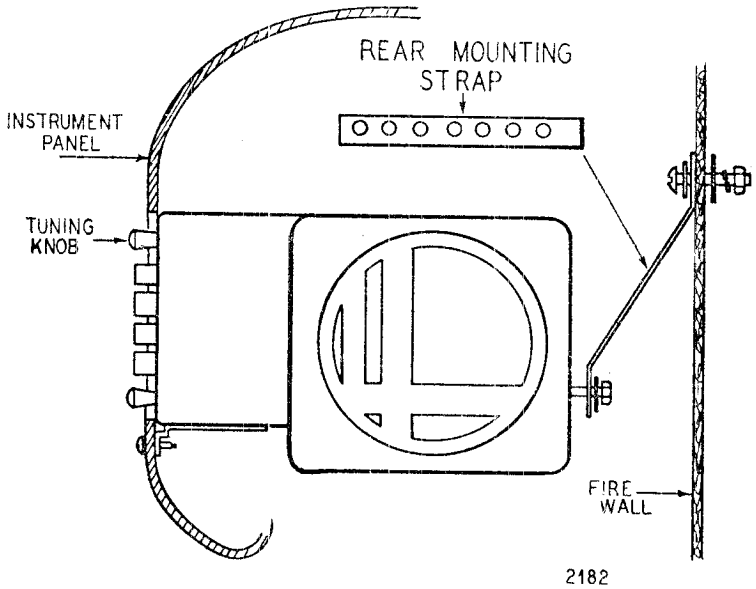


DIAL VIEW WHEN MOUNTED



POLISHED FLAT WASHER
"SMALL" EXTRUDED WASHER
NOTE-USE BRACKET MARKED "SHORT".
SHORT
MOUNT BRACKET TO CONTOL HEAD USING THESE 3 HOLES.
ON 1941 DODGE INSERT CARDBOARD WASHERS SUPPLIED IN HARDWARE KIT.

NOTE: Lay the bracket on drawing above to identify holes. Bracket when mounted will of course be at bottom of tuner.



NOTE: Mount Chassis as shown — Be sure to use Rear Mounting Strap.

SPECIFICATIONS

Power Consumption	6.5 Amperes at 6.6 Volts
Power Output (6.6 Volts)	6.5 Watts 10% Distortion 9.0 Watts Maximum
Sensitivity	2 Microvolts at 1 Watt Output
Selectivity	40 KC Broad at 1000 Times Signal
Tuning Frequency Range	540 to 1600 KC
Intermediate Frequency	455 KC
Speaker	6" PM Dynamic

ALIGNMENT PROCEDURE

Volume Control—Maximum All Adjustments.

Connect Radio Chassis to Ground Post of Signal Generator with a Short Heavy Lead.

Allow Chassis and Signal Generator to "Heat Up" for several minutes.

The following equipment is required for aligning:

A Signal Generator which will provide an accurately calibrated signal at the test frequencies as listed.

Output Indicating Meter—Non-Metallic Screwdriver.

Dummy Antenna—.05 mf., See Note A.

SIGNAL GENERATOR FREQUENCY SETTING	SIGNAL GENERATOR CONNECTION AT RADIO	DUMMY ANTENNA	IRON CORE SETTING	ADJUST TUNING SLUGS (IF) AND TRIMMERS TO MAXIMUM (See Fig. 4)

1400 KC ADJUSTMENT				
1400 KC	Antenna Cable	See Note A	Tune to Max. Output with Tuning Knob	RF (C1B) Ant. (C1A)

Reassemble Radio—Install in Car—Connect Car Antenna to Radio.

Car Antenna Readjustment—Tune in weak signal near 1400 KC—Readjust Antenna Trimmer C1A for maximum output.

Attenuate the signal from the signal generator to prevent the leveling-off action of the AVC.

NOTE A—Insert the antenna cable plug in the antenna socket on the chassis. The total capacity of the antenna cable and dummy antenna should be 60 mmf. If the cable, for example, has a capacity of 30 mmf., use a 30 mmf. condenser for a dummy antenna. Connect the other end of the antenna cable through the dummy antenna capacity to the output of the signal generator.

CALIBRATION—To calibrate the radio see article "Calibrating the Radio"

ANTENNA

HIGH CAPACITY ANTENNA

If this radio is to be installed with a high capacity car antenna (200 to 500 mmf. total capacity of antenna and shielded cable), a 24 inch shielded adapter extension cable is necessary. The adapter is inserted in the socket at the side of the radio case. Then the antenna cable plug is inserted in the socket at the other end of the adapter.

Types of High Capacity Antennas—Over-the-roof types which are long and are mounted close to the metal roof of the car; ordinary built-in roof antennas (not metal roof). Under-car antennas (these are usually high capacity) are not recommended for this radio.

LOW CAPACITY ANTENNA

This radio is designed for a low capacity car antenna. The total capacity of antenna and shielded cable should be 40 to 200 mmf.

Types of Low Capacity Antennas—"Fishpole" type, such as door hinge and cowl; over-the-roof types which are short and are mounted quite a distance from the metal roof of the car.

Mount the antenna on the same side of the car as the radio.

ANTENNA CABLE

A shielded antenna cable (30 mmf. capacity) with bayonet connector plug is required.

The plug on the antenna cable is inserted in the socket at the side of the radio case as shown in Fig. 3. The wire at the other end of the cable is connected to the antenna.

CAUTION—Be careful not to bend the antenna cable too sharply or to clamp it tightly as the small wire inside the cable may be broken.

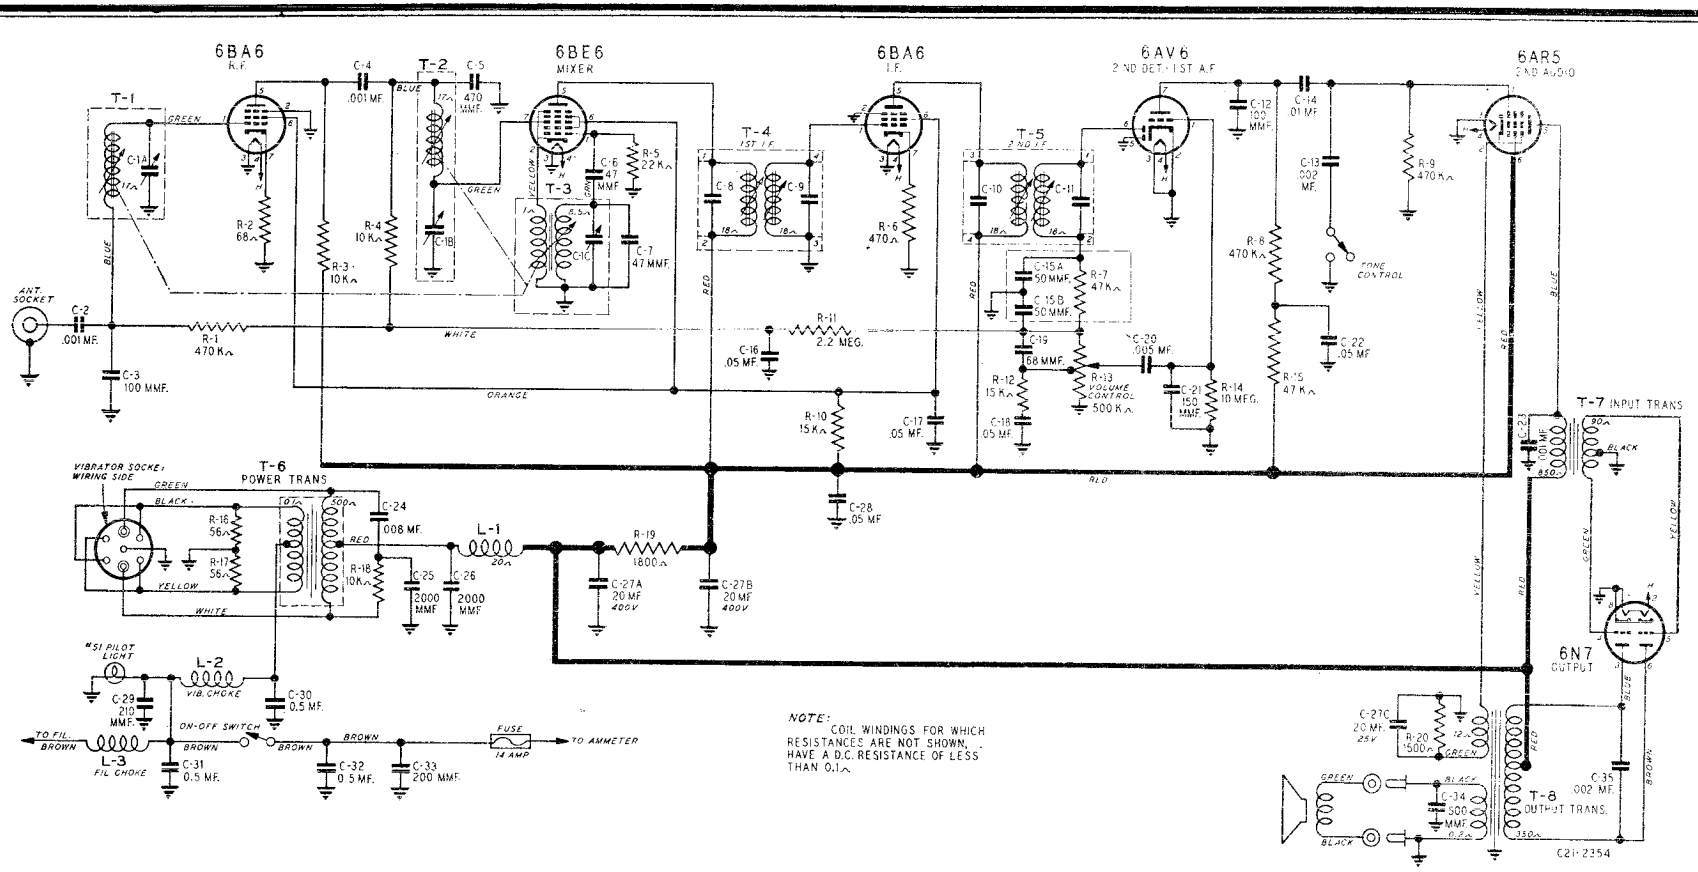
Keep the antenna cable as far away from car wiring as possible and ground the pigtail of the antenna cable shield at the antenna end, otherwise ignition noise may be picked up. The length of the pigtail from the grounding point to the end of the antenna cable should be kept as short as possible, preferably not over one inch.

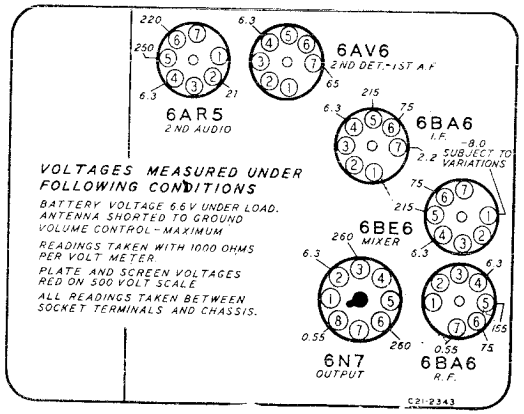
For the "fish pole" and over-the-roof type antennas, the antenna lead must be shielded the entire distance from the radio to the point where the lead goes through the car body to the outside.

When the antenna cable is connected to an antenna lead coming down the pillar post, the shielded cable should be pushed several inches up into the pillar post.

© John F. Rider

©John F. Rider





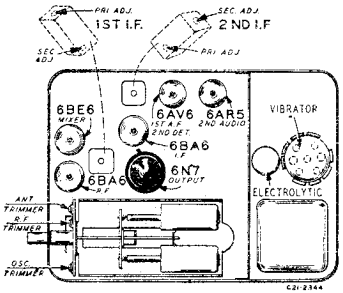
Calibrating the Radio

To calibrate the radio, tune in a station of known frequency, loosen the knurled nut at the tuning control clamp fitting and turn the flexible shaft with the fingers until the dial pointer indicates the frequency of the station being received.

Slide the flexible shaft in or out of the tuning control clamp fitting until a smooth action with a minimum of backlash is obtained.

The knurled nut should then be tightened with the fingers.

Fig. 4—Location of Tubes and Vibrator



Adjusting Antenna Trimmer

After the antenna is connected, tune in a weak signal at approximately 1400 KC with the volume control about three-fourths on. Turn the adjusting screw of the antenna trimmer (C1A) in or out until maximum output is obtained. See Fig. 3 for location of this trimmer.

ALIGNMENT
Broadcast Band

Connect an output meter across the speaker voice coil.

While making the following adjustments, keep the volume control set for maximum output, the tone control set for maximum treble, and the signal generator output attenuated to avoid A.V.C. action.

Step	Connect Signal Generator to —	Signal Generator Frequency	Radio Dial Setting	Adjust
1	Set the band switch to AM.			
2	Stator of tuning capacitor (C58) through a 0.1 mfd capacitor	455 kc.	maximum capacity	455 kc. pri. and sec. of 1st and 2nd I-F trans. for max. output
	NOTE: If the I-F transformers are badly mis-aligned, it may be impossible to obtain sufficient output using the above system. In this event, it will be necessary to align each transformer separately. Start with the last I-F transformer and work forward, connecting the signal generator through a 0.1 mfd capacitor to the control grid of the tube preceding the transformer under alignment.			
3	Radiated signal (no actual connection)	1600 kc.	1600 kc.	AM osc. trimmer (C55) for max. output
4	Radiated signal (no actual connection)	1400 kc.	tune to signal	AM ant. trimmer (C10, located on rear cover) for max. output (rock-in adjustment)

FM Band

Do not align the FM circuits until all AM adjustments have been completed.

Step	Connect Signal Generator to —	Signal Generator Frequency	Radio Dial Setting	Adjust
1	Set the band switch to FM.			
2	Connect two 100,000 ohm resistors (the resistances must be equal within 5 percent) between pin #7 of the 6AL5 tube and ground as shown on the schematic diagram.			
3	Connect a V.T.V.M. between points "X" and "Y" (see schematic diagram).			
4	Stator of FM conv. section (C56) of tuning capacitor through a .01 mfd mica capacitor	10.7 mc.	maximum capacity	Sec. of ratio det. trans. for *zero* (use medimum strength signal)
5	Connect the V.T.V.M. between point "Z" and ground.			
6	Same as step 4	10.7 mc.	maximum capacity	Pri. of ratio det. trans. and pri. and sec. of 10.7 mc. 1st and 2nd I-F trans. for max.
	NOTE: The pri. of the ratio det. trans. peaks in two places. Use the peak with the slug farthest out.			
7	Reconnect the V.T.V.M. between point "X" and "Y", and increase the signal strength 2 times.			
8	Same as step 4	10.7 mc.	maximum capacity	Recheck sec. of ratio det. trans. for *zero* voltage
9	Reconnect the V.T.V.M. between point "Z" and ground.			
10	Same as step 4	10.7 mc.	maximum capacity	Pri. of ratio det. trans. for maximum voltage
11	Remove the two 100,000 ohm resistors that were inserted in step 2.			
12	FM ant. terminal through a 300 ohm non-inductive resistor	105 mc.	105 mc.	FM osc. trimmer (C53) for maximum output
13	Same as step 12	105 mc.	105 mc.	FM ant. trimmer (C57) for maximum output

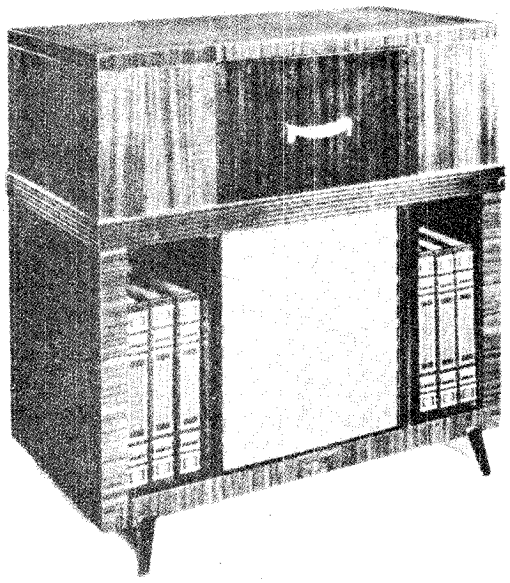
MODEL H-199,
Ch. V-2137-1



MODEL H-199

SPECIFICATIONS

FREQUENCY RANGES:

Amplitude Modulation ..... 540 to 1600 kc.
Frequency Modulation ..... 88 to 108 mc.

INTERMEDIATE FREQUENCIES:

Amplitude Modulation ..... 455 kc.
Frequency Modulation ..... 10.7 mc.

TUBE COMPLEMENT:

1 12AT7 ..... R-F Amp. and Mixer (FM)
1 6BE6 H-F Osc. (AM/FM) and converter (AM)
1 6BA6 ..... I-F Amp.
1 6BA6 ..... I-F Driver (FM)
1 6AL5 ..... Ratio Det. (FM)
1 6AV6 ..... Det. & AVC (AM) and A-F Amp.
1 6V6GT ..... Output Amp.
1 5Y3GT ..... Rectifier

PILOT LAMPS:

2 Westinghouse No. 47 ..... 6.3 v., 0.15 a.

POWER OUTPUT:

Undistorted ..... 3.5 watts
Maximum ..... 6 watts

LOUDSPEAKER: ..... 10" P.M.

OPERATING VOLTAGE: .... 105 to 120 volts, 60 cycles A-C

POWER CONSUMPTION: ..... 110 watts

©John F. Rider

MODEL H-199,
Ch. V-2137-1

ALIGNMENT

Broadcast Band

Connect an output meter across the speaker voice coil.

While making the following adjustments, keep the volume control set for maximum output, the tone control set for maximum treble, and the signal generator output attenuated to avoid A.V.C. action.

Step	Connect Signal Generator to —	Signal Generator Frequency	Radio Dial Setting	Adjust
1	Set the band switch to AM.			
2	Stator of tuning capacitor (C53) through a 0.1 mfd capacitor	455 kc.	maximum capacity	455 kc. pri. and sec. of 1st and 2nd I-F trans. for max. output
NOTE: If the I-F transformers are badly mis-aligned, it may be impossible to obtain sufficient output using the above system. In this event, it will be necessary to align each transformer separately. Start with the last I-F transformer and work forward, connecting the signal generator to the control grid of the tube preceding the transformer under alignment.				
3	Radiated signal (no actual connection)	1600 kc.	1600 kc.	AM osc. trimmer (C55) for max. output
4	Radiated signal (no actual connection)	1400 kc.	tune to signal	AM ant. trimmer (C57) for max. output (rock-in adjustment)

FM Band

Do not align the FM circuits until all AM adjustments have been completed.

Step	Connect Signal Generator to —	Signal Generator Frequency	Radio Dial Setting	Adjust
1	Set the band switch to FM.			
2	Connect two 100,000 ohm resistors (the resistances must be equal within 5 percent) between pin #7 of the 6AL5 tube and ground as shown on the schematic diagram.			
3	Connect a V.T.V.M. between points "X" and "Y" (see schematic diagram).			
4	Stator of FM ant. section (C52) on tuning capacitor through a .01 mfd mica capacitor	10.7 mc.	maximum capacity	Sec. of ratio det. trans. for *zero* (use medium strength signal)
5	Connect the V.T.V.M. between point "Z" and ground.			
6	Same as step 4	10.7 mc.	maximum capacity	Pri. of ratio det. trans. and pri. and sec. of 10.7 mc. 1st and 2nd I-F trans. for max.
NOTE: The pri. of the ratio det. trans. peaks in two places. Use the peak with the slug farthest out.				
7	Reconnect the V.T.V.M. between points "X" and "Y", and increase the signal strength 2 times.			
8	Same as step 4	10.7 mc.	maximum capacity	Recheck sec. of ratio det. trans. for *zero* voltage
9	Reconnect the V.T.V.M. between point "Z" and ground.			
10	Same as step 4	10.7 mc.	maximum capacity	Pri. of ratio det. trans. for maximum voltage
11	Remove the two 100,000 ohm resistors that were inserted in step 2.			
12	FM ant. terminal through a 300 ohm non-inductive resistor	105 mc.	105 mc.	FM osc. trimmer (C54) for maximum output
13	Same as step 12.	105 mc.	105 mc.	FM ant. trimmer (C56) for maximum output

PARTS LIST FOR MODEL H-199

When ordering parts, specify model number of set in addition to part number and description of part.

Part No.	Description
V-5982-2	Antenna Assembly, AM loop .

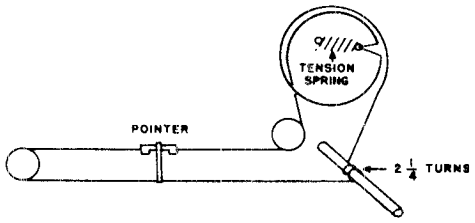

FIG. 2 — DIAL DRIVE

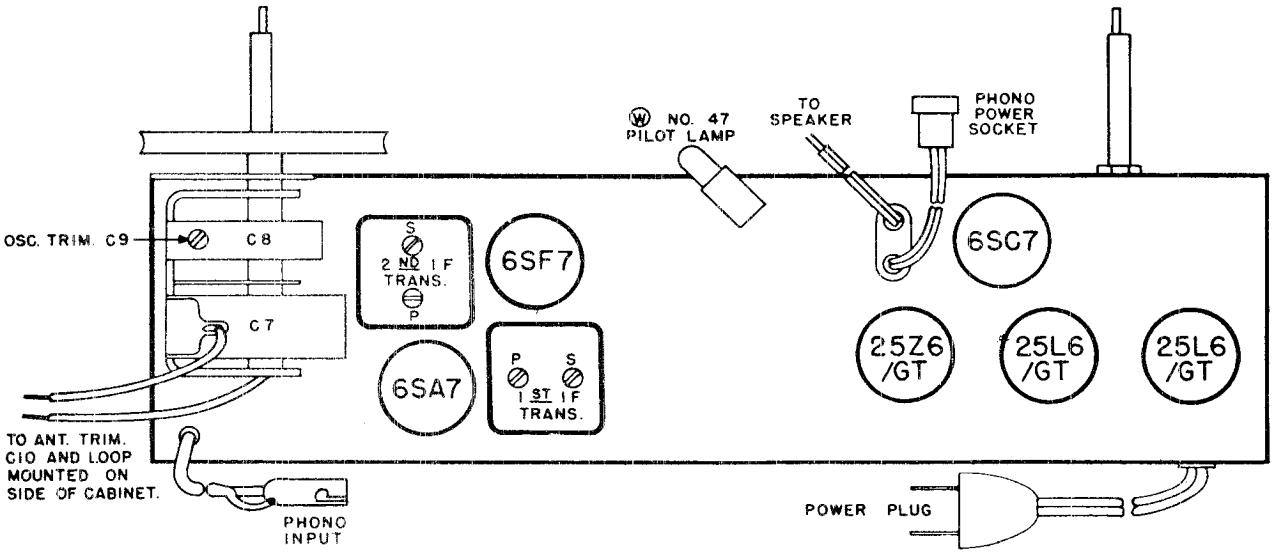

FIG. 3 — CHASSIS LAYOUT

ALIGNMENT PROCEDURE

The use of an isolation transformer in the power line is recommended.

Connect an output meter across the speaker voice coil.

While making the following adjustments, keep the volume control set for maximum output and the signal generator output attenuated to avoid A.V.C. action.

Step	Connect Signal Generator to —	Signal Generator Frequency	Radio Dial Setting	Adjust
1	Pin No. 2 of 6SF7 tube through a 200 mmf capacitor	455 kc	540 kc	Secondary and primary of 2nd I-F transformer for maximum output
2	Stator of tuning capacitor (C7) through a 200 mmf capacitor	455 kc	540 kc	Secondary and primary of 1st I-F transformer for maximum output
3	Recheck 1st and 2nd I-F transformers.			
4	Antenna terminal through a 200 mmf capacitor	1615 kc	1615 kc	Oscillator trimmer (C9) for maximum output
5	Radiated signal (no actual connection)	1400 kc	1400 kc	Antenna trimmer (C10) for maximum output

Undistorted ..... 0.12 watt

LOUDSPEAKER: ..... 4" P.M.

POWER SUPPLY:

Battery Operation:

1 Westinghouse V-9292 "A" battery (4.5 v.)
1 Westinghouse V-9293 "B" battery (90 v.)

Line Operation:

105 to 120 volts, 50 - 60 cycles A-C, or D-C

CURRENT CONSUMPTION (Battery Operation):

"A" Battery ..... 0.1 amp.
"B" Battery ..... 0.014 amp.

POWER CONSUMPTION (Line Operation): 15 watts

ALIGNMENT

It is recommended that the chassis be isolated from the power line by means of an isolation transformer.

While making the following adjustments, keep the volume control set for maximum output and the signal generator output attenuated to avoid AVC action.

Step	Connect Signal Generator to —	Signal Generator Frequency	Radio Dial	Adjust for Maximum Output —
1.	Stator of R-F tuning capacitor (C5) through a 200 mmf capacitor	455 kc.	minimum capacity	Top and bottom slugs in 2nd and 1st I-F trans. in order given*
2.	Same as step 1	1615 kc.	minimum capacity	Osc. trimmer (C8)
3.	Radiated signal	1400 kc.	1400 kc.	R-F trimmer (C6)

**It is recommended that a fiber aligning tool that snugly fits the slot in the powdered iron core be used to prevent chipping of the slot.*

BATTERY PLACEMENT NOTE: The batteries should be inserted in the relative positions shown in Fig. 2 with the connector end of the "B" battery facing the front of the receiver and the connector end of the "B" battery facing the side of the "B" battery.

Auto Perm-
iability Tuner

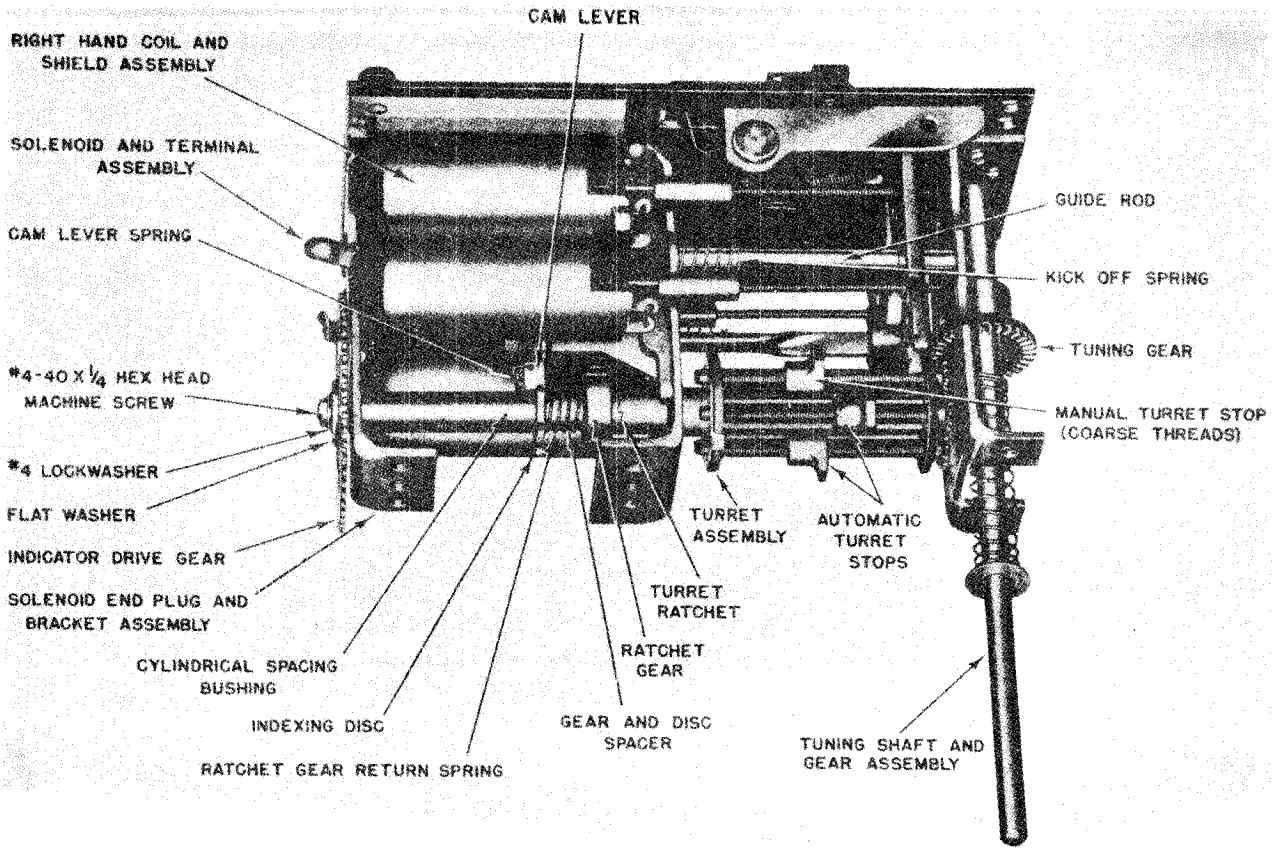

FIG. 1

OPERATING PRINCIPLE

When the station selector push button or foot switch is depressed all the way, the solenoid (Fig. 1) is energized by current from the car battery. The cross arm assembly is pulled from the right or resting position from any one of the six turret stops on the turret assembly to the left or closed position. As this assembly approaches the closed position, the ratchet cam shaft (Fig. 2) turns the ratchet drive gear clockwise. The ratchet drive gear turns the ratchet gear counter clockwise 60° or until it engages the ratchet teeth on the turret shaft. The detent lever (inset Fig. 2) prevents the turret assembly from turning counter clockwise during this operation. At the same time a cam on the hub of the ratchet drive gear lifts the cam lever from its locking position in the indexing disc (inset Fig. 2). This will allow the turret assembly (Fig. 2) to be turned clockwise. The tuning unit will remain in the closed position until the push button or foot switch is released.

When the push button or foot switch is released the cross arm return spring pulls the cross arm assembly back to the resting position. As this assembly starts the return stroke to the resting position, the ratchet camshaft turns the ratchet drive gear counter clockwise. The ratchet drive gear turns the ratchet gear clockwise 60°. As the ratchet gear turns it rotates the turret assembly clockwise 60°. When the turret assembly has been turned 60°, the cam lever is pulled into locking position in the indexing disc, preventing the turret assembly from moving farther.

There are six turret stops, one for each of the five automatic tuning positions, which may be adjusted to five desired stations, and one to be used for tuning the radio manually. For information concerning setting up the five automatic tuning positions refer to Owner's Manual or the Service Manual for the radio in question.

HOW TO CHANGE THE RATCHET GEAR IN MODEL 6MF080

Before starting the following operations BE SURE THE TUNER IS ON MANUAL. Set Dial at 16.

1—Remove the top and bottom covers of the receiver. Remove 7C5 and 7B6 tubes. Take off knobs.

2—Remove the complete escutcheon assembly.

3—Loosen the antenna socket and trimmer from the nose piece. NOTE: On this receiver the nose piece and front plate are welded together.

4—Loosen the speaker socket on the left hand of the nose piece.

5—Remove the drum dial idler gear and bracket, also the dial scale.

6—Loosen the tuner assembly from the front plate.

7—Loosen the front plate and nose piece from receiver.

8—Remove the two assembly screws in the back plate of the tuner holding the top right coil and shield assembly. Slip the coils toward the left end of the receiver until clear of the tuner slugs. This will allow access to the turret shaft and gear.

9—Remove the screw lock washer, flat washer and brass indicator drive gear from the end of turret shaft.

10—Remove the screw holding the solenoid end plug and bracket assembly to the back plate of the tuner. IMPORTANT: Remove only the one screw holding the bracket to the rear plate.

11—Disconnect one side of the small lever spring. Be careful not to lengthen or distort this spring. If the spring is distorted the detent and cam levers may not work properly after assembly.

12—Remove the long cylindrical brass spacer, indexing disc, ratchet return spring and short cylindrical spacer. IMPORTANT: Note the position of the teeth before removing the ratchet gear.

13—Replace the ratchet gear. Make sure the teeth are in exactly the same position as the original gears.

14—Be sure the tuning mechanism and indicator drum is in the "M" position when replacing the indicator idler gear.

15—Reassemble the tuner unit in reverse order. Replace front plate and dial scale.

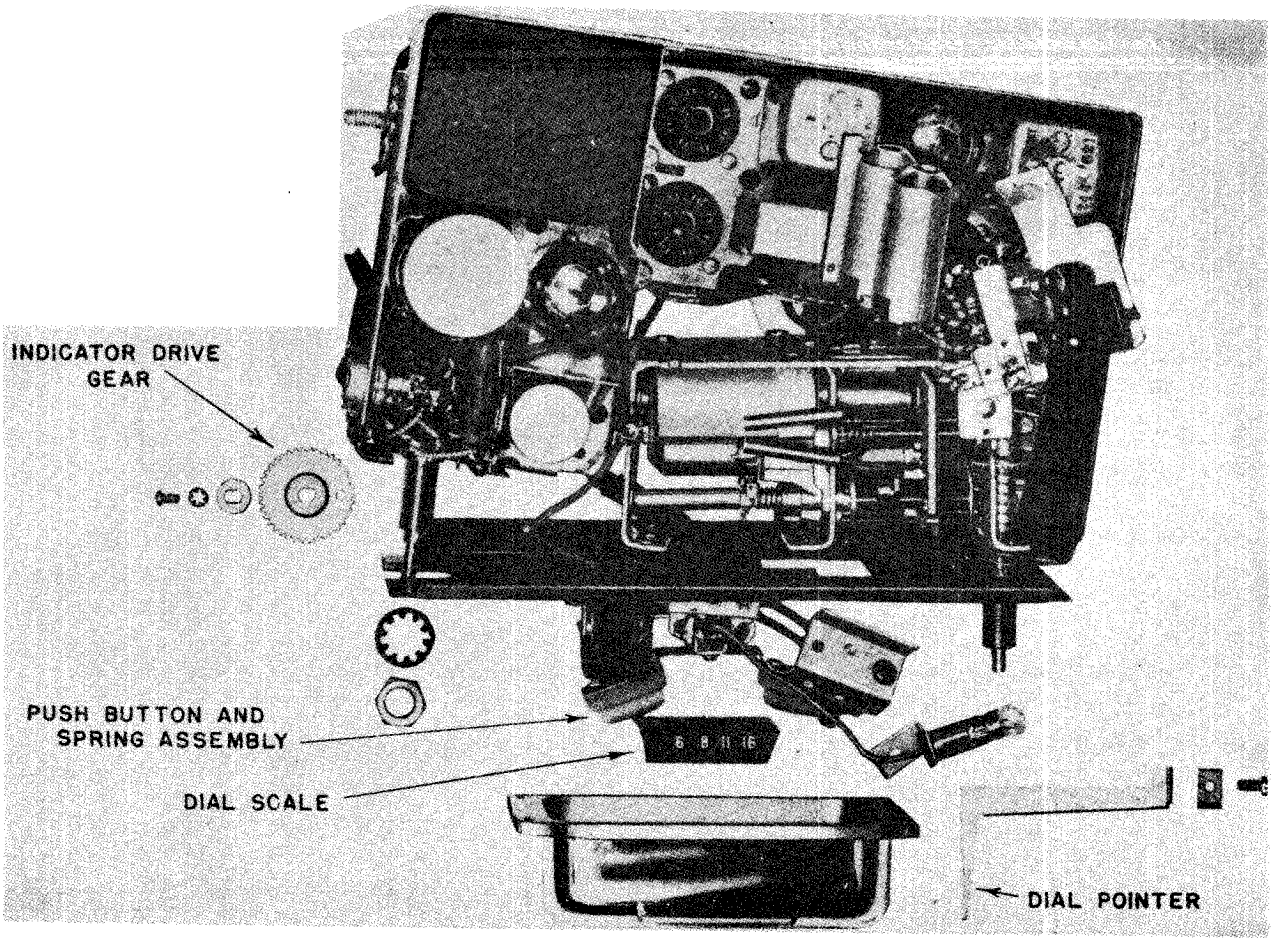
TUNER



HOW TO CHANGE THE RATCHET GEAR IN MODEL 6MH081

BE SURE THE TUNER IS ON MANUAL. Set Dial at 16.

1—Remove the top and bottom covers of the receiver. Remove 7C5 and 7B6 tubes.

2—Remove the knobs and the complete escutcheon from the front plate.

3—Loosen the front plate from the receiver.

4—Remove the ⅜" nut and lock washer from the volume control shaft.

5—Remove the dial pointer from the tuner assembly.

6—Remove the automatic station selector switch, and pilot light bracket from the front plate.

7—Remove plastic push buttons and spring assembly.

8—Remove the screws holding the front plate to the tuner.

9—Remove the dial scale from its mounting to avoid scratching.

10—Remove front plate from receiver.

11—Pull the front plate from the left end of the receiver until it clears the volume control shaft.

12—Loosen the antenna socket and bracket from the tuning assembly.

13—Loosen the right hand top two turret coils. Slip the coils to the left end of the set until free of the tuning slugs. This will allow access to the turret shaft and gear.

14—Remove the screw and lock washer, and flat washer from the end of the turret shaft. Remove the brass indicator drive gear.

15—Remove the rear assembly screw from the solenoid end plug and bracket assembly.

16—Push the solenoid end plug and bracket assembly toward the left of the receiver until it clears the turret shaft.

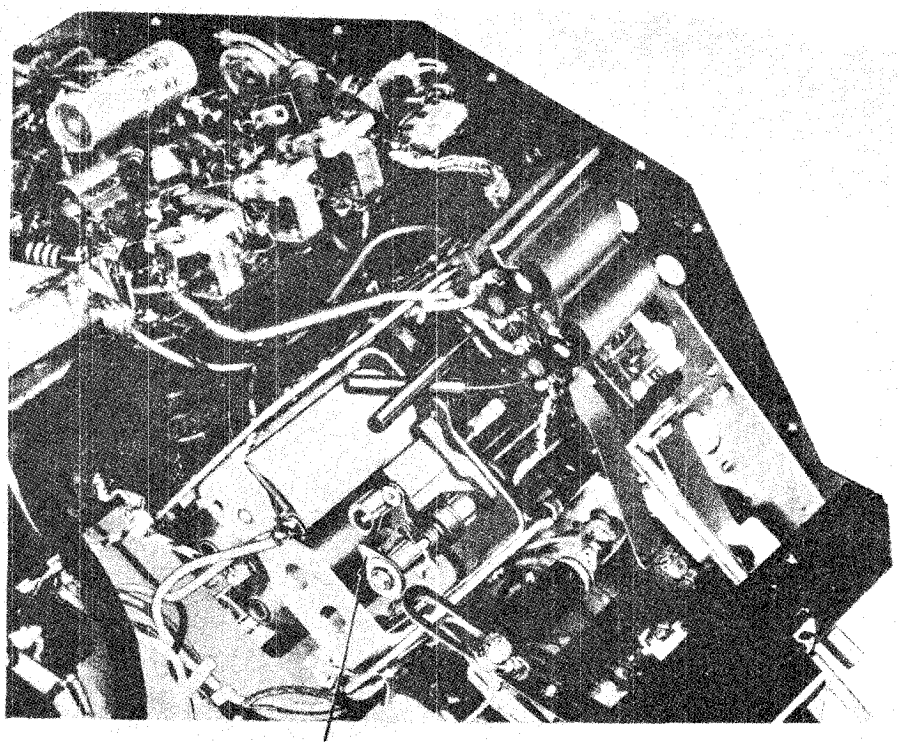
17—Disconnect one side of the small lever spring. Be careful not to distort or lengthen this spring. The detent and cam levers may not operate properly when the unit is reassembled if this spring is bent or distorted.

18—Remove the long cylindrical brass spacer, indexing disc, spring and short cylindrical spacer. IMPORTANT: Note the position of the teeth before removing the ratchet gear.

19—Replace the racthet gear. Make sure the teeth are in exactly the same position as the original gear. The tuning mechanism and the indicator drum must be on "M" position when replacing the indicator drive gear.

20—Reassemble the tuner unit in reverse order. Replace the front plate, dial scale, automatic push button switch and pilot light bracket.

©John F. Rider



HOW TO CHANGE THE RATCHET GEAR IN MODEL 7ML080-7ML081

1—Remove the top cover of the receiver.

2—Remove the screw, lock washer and flat washer and indicator cam from the turret shaft. This can be accomplished by inserting a small screw driver through a hole in the solenoid end bracket.

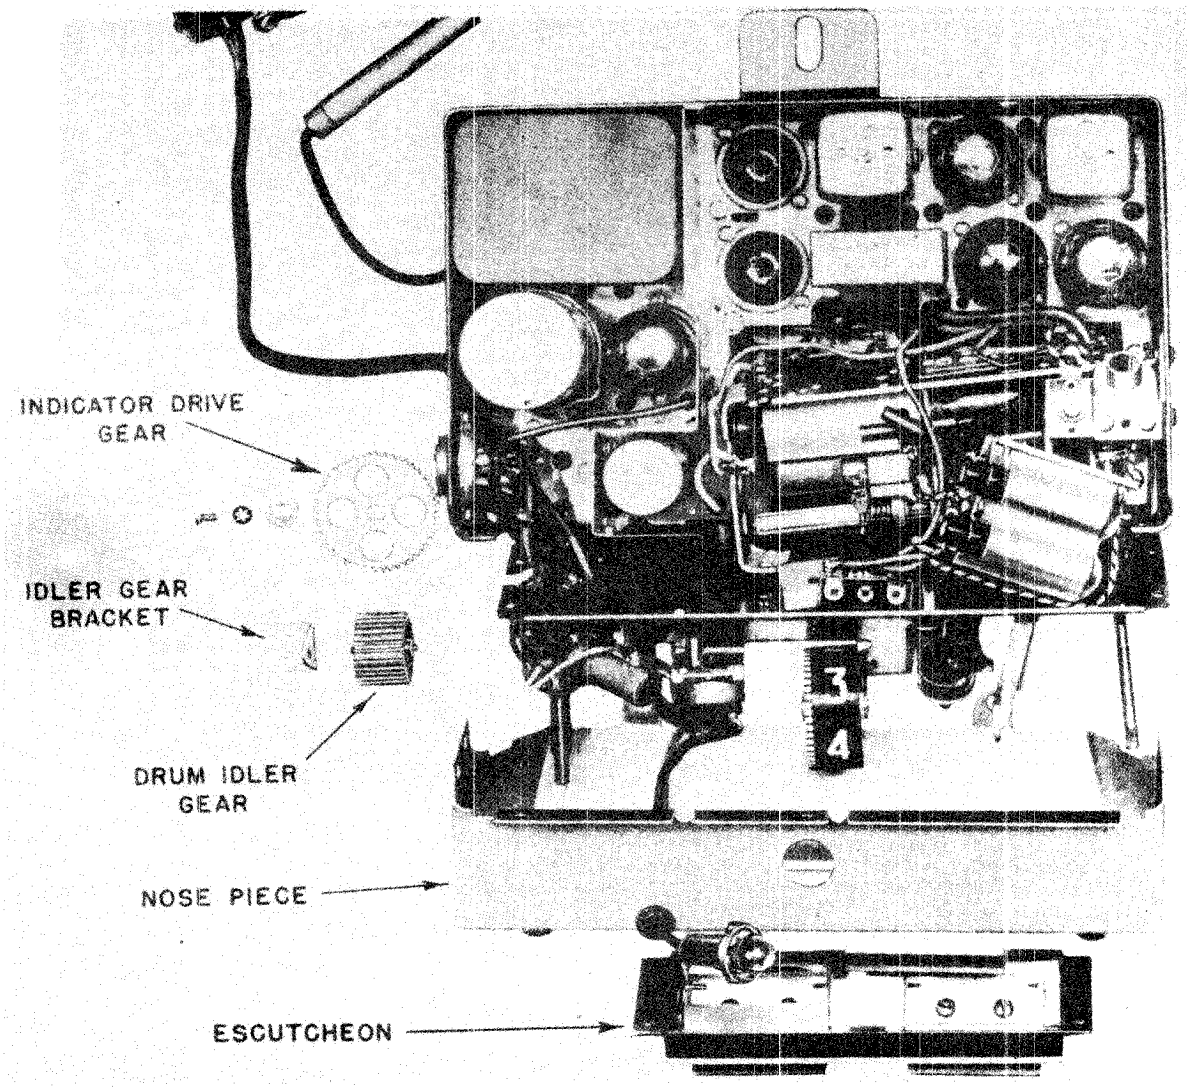
3—Disconnect the cam lever spring. Be careful not to stretch or distort this spring. If this spring is distorted the detent and cam levers may not operate properly when tuner is reassembled.

4—Remove the brass cylindrical spacer, indexing disc, brass spacer and spring. IMPORTANT: Note the position of the teeth in the ratchet gear before it is removed.

5—Replace ratchet gear. Make sure the ratchet gear teeth engage exactly the same as the original gear.

6—Reassemble the brass spacer spring, long cylinder spacer, flat washer, etc., to turret shaft. Replace detent spring.

©John F. Rider



HOW TO CHANGE THE RATCHET GEAR IN MODEL 6MN082

BE SURE THE TUNER IS ON MANUAL. Set Dial at 16.

1—Remove the top and bottom covers. Loosen dial light from the nose piece. Remove 7C5 and 7B6 tubes.

2—Remove the escutcheon from the nose piece.

3—Remove the nose piece from the front plate. Remove dial scale from nose piece.

4—Remove the indicator dial idler gear and bracket. This is necessary to get at the solenoid bracket and plug front assembly screw.

5—Remove the two remaining assembly screws holding the tuner unit to the front plate.

6—Loosen the front plate from the receiver, and pull forward as far as possible.

7—Remove the brass drum indicator drive gear from the turret drive shaft.

8—Remove the rear assembly screw holding the solenoid end plug and bracket assembly to the back plate.

9—Push the solenoid end plug bracket assembly toward the left end of the receiver.

10—Remove the mounting screws from the top tuner coil assembly, and push the coil assembly toward the left end of the receiver until the coils are free of the tuner slug.

11—Disconnect one side of lever spring. Be careful not to distort or lengthen this spring. If the spring is distorted the detent and cam levers may not operate properly when reasssembled.

12—Remove the long brass cylindrical spacer, indexing disc, and ratchet return spring, and short brass spacer. IMPORTANT: Note the position of the teeth before removing the ratchet gear.

13—Replace the ratchet gear. Make sure the teeth are in exactly the same position as the original gear. Also be sure the tuning mechanism and the indicator drum is in the "M" position when replacing the idler gear and bracket.

14—Replace the ratchet gear. Reassemble tuner unit. Replace the front plate, nose piece, dial scale and escutcheon.

©John F. Rider

CHANGING THE SOLENOID IN MODELS 6MF080, 6MH081 AND 6MN082 AUTO RECEIVERS

1—(a) Nash—Perform operations 1 to 10 inclusive under changing ratchet gear in Model 6MN082.
(b) Ford—Perform operations 1 to 10 inclusive under changing ratchet gear in Model 6MF080.
(c) Hudson—Perform operations 1 to 16 inclusive under changing ratchet gear in Model 6MH081.

2—Unsolder the yellow wires from the solenoid and terminal assembly.

3—Remove the solenoid bracket and plug assembly.

4—Slide solenoid toward the left end of the receiver until free of the solenoid magnet core.

5—Replace solenoid and reassemble tuning unit. Be sure to check the position of the ratchet gear —one tooth engaging the ratchet drive gear. Also make sure the tuning mechanism and the indicator drum are in the "M" position.

CHANGING THE SOLENOID IN MODELS 7ML080 AND 7ML081 AUTO RECEIVERS

1—Remove top cover from the receiver.

2—Set the tuner to manual position and tune set to 16 on the dial.

3—Unsolder the yellow wires from the solenoid.

4—Remove solenoid end plug and bracket assembly.

5—Slide solenoid toward the left end of receiver until free of the solenoid magnet core.

6—Replace solenoid and reassemble tuning unit.

REPLACING THE RATCHET AND BRACKET ASSEMBLY

1—Loosen the left hand lower tuning coil assembly. Slip the assembly to the left of the set until free of the tuning slugs.

2—Follow the procedure outlined above for removing the solenoid.

3—Remove the ratchet and bracket assembly, held in place by one screw through the front plate, and one screw through the front plate.

4—With replacement ratchet and bracket assembly, reassemble the tuner in reverse order.

LUBRICATION

The ratchet gear must engage freely with the ratchet on the turret assembly. It, therefore, must be clean and lubricated with a good grade of clock oil. WARNING: Do not use a heavy grade of lubricant.

The points of friction on the guide rods, dial pointer, solenoid magnet core, and the hub of the station indicator drum must also be lubricated with clock oil.

All other points of friction should be lubricated with Texaco RCX-148 low temperature grease No. 67 or its equivalent.

TROUBLE SHOOTING

Mechanism fails to move from one position to the next or jams tightly between two positions

1—Be sure the "A" battery supply is capable of delivering 5.5 volts at 20 amperes.

2—Check lubrication of ratchet gear and guide rods.

3—Check dial pointer and indicator drum and drive gear assemblies for binding or warped parts.

4—Teeth on ratchet gear are worn or damaged. Replace gear.

5—Lever spring missing from ratchet and bracket assembly. Replace spring.

6—Detent lever or cam lever broken from ratchet and bracket assembly. Replace ratchet and bracket assembly.

©John F. Rider

Mechanism fails to return all the way to resting position or 16 on the dial when tuned manually

1—Check lubrication of guide rods.

2—Be sure pointer does not rub on dial glass or dial scale.

3—Be sure of proper distance between holes and slot in pointer.

Tuning knob will not remain in the "Out" position when it is pulled out to set up the stations or to tune manually

1—Tuning shaft locking lever bent. Bend lever back to original position. (Fig. 3).

2—Shoulder rivet pulled out. Replace rivet, or replace mounting plate and lever assembly.

Knob fails to return to the "In" position when the push button or foot switch is pressed

1—End broken from lever (Fig. 2). Replace lever or replace complete mounting plate and lever assembly.

Pointer sticks at the low frequency end of dial

1—Tuning knob too close to panel. Will not allow knob to rotate freely when it is in the "IN" position. Loosen knob, and re-fit. Allow approximately ⅛" clearance between knob and panel.

2—Plastic ring loosened from knob (Ford only) allowing same conditions as above. Replace knob.

3—Idler gear or indicator drum binding.
(a) Be sure drum does not rub on escutcheon.
(b) Remove escutcheon and check drive gear and indicator drum to make sure they do not bind against the idler gear or front plate.

4—Cross arm return spring broken. Replace spring. To replace spring loosen left hand coil and shield assembly and pull loose end of return spring retaining strip upward. This will permit the easy removal of the spring. (Fig. 2.)

TO THE SERVICE MAN:

Chassis 5G40 features a high gain tuned RF stage ahead of a conventional superheterodyne circuit with band spread tuning on the 49, 31, 25, 19 and 16 meter bands.

If removal of the chassis from the cabinet ever becomes necessary this should be done with care.

The alignment of chassis 5G40 is conventional. However, care must be exercised when making adjustments, and the alignment procedure must be followed exactly. Set the chassis over a metal plate approximately the same distance the battery pack is from the bottom of the chassis when it is in the cabinet. This procedure will introduce the approximate amount of metal in the field of the RF and oscillator coils as when the chassis is in the cabinet. A signal generator of reasonable accuracy and good attenuation must be used. An output meter (AC) of the copper oxide rectifier type with a range of 1 to 30 volts in several steps is necessary to get accurate output readings. Alignment wrenches should be of the non-metallic type, especially when making adjustments at the higher frequencies.

When reinstalling the chassis in the cabinet be careful not to disturb the cabling between the short wave coil assembly and chassis. Tune in a weak broadcast signal near 1400 Kc. and touch up trimmer C2. This will insure maximum performance after alignment.

The I.F. transformers incorporated in this receiver are of the new permeability tuned type. The advantage of an I.F. transformer of this type is its extreme stability under various humidity and temperature conditions. The upper coil is the secondary and the lower the primary. When adjusting these I.F. transformers the tuning wrench 68-7 can be inserted into the top slug, rotated until maximum output is obtained and then dropped down to the lower slug and the same operation repeated. The tuning wrench is so designed that turning one slug does not affect the adjustment of the other.

TUBE, TRIMMER LOCATION, DIAL CABLE DRAWING AND DETAILED VIEW OF I. F. TRANSFORMERS.

The I.F. transformers incorporated in this receiver are of the new permeability tuned type. The advantage of an I. F. transformer of this type is its extreme stability under various humidity and temperature conditions. The upper coil is the secondary and the lower the primary. When adjusting these I. F. transformers the tuning wrench 68-7 can be inserted into the top slug, rotated until maximum output is obtained and then dropped down to the lower slug and the same operation repeated. The tuning wrench is so designed that turning one slug does not affect the adjustment of the other.

TO THE SERVICE MAN:

The 4F40 chassis is an AC, DC or battery operated superheterodyne. The chassis is isolated from the DC circuit, and all measurements must be made from a common negative point. The most convenient place to reach this negative point is the terminal strip to which C17 is connected. When the change over Switch S1 is in AC position, the DC resistance from chassis to any circuit must be almost infinite. If any circuit becomes grounded a hum will result. Microphonic tubes will cause audio howl. Check the 1R5 and 1S5.

The wavemagnet is connected to the chassis by two wires that pass through the hollow dial pivots. If the R.F. becomes weak or dead, check the D.C. resistance of the wavemagnet. This D.C. resistance should be approximately .9 ohm. If it is open check the wavemagnet.

IF Alignment: Remove the chassis from the cabinet and arrange the units so that the wavemagnet can be connected. All the connections and adjustments can be made from the top of the chassis. Connect a signal generator, through a .1 mfd. dummy antenna, to the converter grid and B - (common return). Connect an output meter across the voice coil of the speaker (two lugs provided). Set the signal generator to 455 Kc. and adjust L3, L4, L5 and L6 for maximum indication on the output meter. Always keep the signal output from the generator just high enough to get an indication, otherwise excessive loading may result.

RF Alignment: Connect a two turn loop across the leads of the signal generator, loosely couple this loop to the wavemagnet. Set the signal generator and the dial pointer of the receiver to 1600 Kc. and adjust C3 oscillator trimmer to resonance. Set the signal generator and dial pointer to 1400 and adjust C2 antenna trimmer to resonance. These trimmers are on the top of gang condenser. Check operation and re-install set in cabinet. Tune in a weak station near 1400 Kc. or use background noise and readjust antenna trimmer for maximum sensitivity.

SHAFT IN COMPLETE CLOCKWISE ROTATION
1½ TURNS OF STRING

DIAL CORD DRIVE

On receivers using Tuning Gang #22-2108, Dial String Assemblies #S-15440 (short) and #S-16106 (long) must be used.

PARTS LIST

PART NO.	REF.NO.	DESCRIPTION	
		DIAL ASSEMBLY	
12-1554		Tuning Shaft Bracket

SPECIFICATIONS AND CIRCUIT FEATURES

MODEL 6MH889—CHASSIS 6E89

TUBE COMPLEMENT: 7A7 R.F., 7B8 Converter, 6BA6 I.F., 7B6 Detector, A.V.C., 1st Audio, 6V6GT Beam Power Output, 7Y4 Rectifier.

TUNING RANGE: 540 to 1600 Kilocycles.

AUTOMATIC POSITIONS: 6.

SPEAKER: 6" x 9" Oval Permanent Magnet externally mounted behind instrument panel. Voice coil impedance 3.2 ohms at 400 cycles.

TONE CONTROL: Continuously variable.

POWER OUTPUT: Maximum 4.5 watts. Measured at voice coil.

VIBRATOR: Non-synchronous.

POWER RATING: Current drain 6 amperes.

FUSE: 14 amperes. Type SFE-14.

SENSITIVITY: 4 Microvolts at one watt output.

I.F. FREQUENCY: 265 Kilocycles.

WARRANTY AND SERVICE

The DB48 Hudson Receiver is covered by warranty against defect in material and workmanship for a period of 90 days after retail delivery.

This warranty covers a receiver installed at the factory or a receiver installed in the field as an accessory.

IMPORTANT

A warranty registration tag is furnished with each receiver. This tag must be filled in and attached to the unit at the time of retail delivery and must accompany the receiver when service during the warranty period is expected by the customer or dealer. Otherwise regular charges for labor and material prevail. All warranty labor claims must be made to the Hudson Dealer. Do NOT send claims to the radio manufacturer. Defective parts in warranty will be replaced, no charge to you, by the nearest Zenith Distributor.

OPERATING INSTRUCTIONS

OFF-ON SWITCH AND VOLUME CONTROL

To turn the receiver on, turn the volume control knob to the right until it clicks and the dial is illuminated. Allow the receiver to reach operating temperature. (Approximately 20 seconds.) To increase the volume, continue to turn this control knob to the right. To turn the receiver off turn the volume control knob to the left until it clicks.

TONE CONTROL

The tone control is located directly behind the volume control knob (Fig. 1). Rotating this control to the right or left will change the tone of the receiver. Tuning to the right will emphasize the high notes, while turning to the left will emphasize the bass notes.

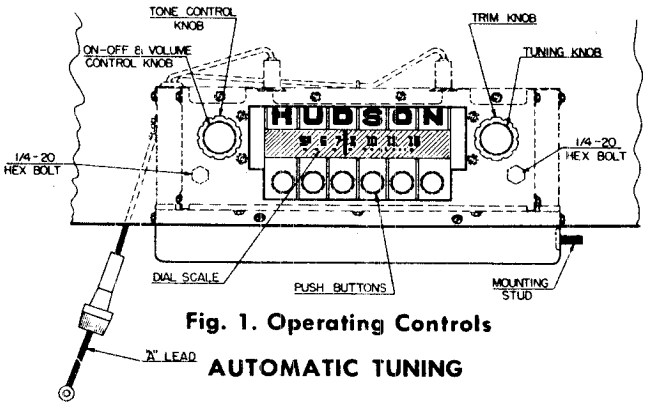

Fig. 1. Operating Controls

AUTOMATIC TUNING

There are six automatic tuning positions, each of which may be adjusted to any desired station. In order to simplify the identification of the stations, it is advisable to set the automatic tuning mechanism in sequence according to frequencies of the stations, beginning with the station broadcasting on the lowest frequency, and progressing to the station broadcasting on the highest frequency. If the positions have not been previously adjusted, proceed as follows:

1. Loosen the first push button by turning it counter-clockwise with your fingers, not more than two turns. If the push button is completely unscrewed, the plunger assembly, inside the receiver, may fall apart. Then it will be necessary to remove the radio from the car, open the case, and reassemble the plunger.

2. Turn the manual tuning control knob (Fig. 1) to tune in the desired station. Carefully tune to the middle of the signal for clearest reception.

3. Push the first push button in as far as it will go. Release the button, and tighten securely by turning it clockwise with the fingers.

4. Repeat the above procedure for the remaining five push buttons.

MANUAL TUNING

To tune manually it is only necessary to turn the manual tuning knob (on the right side of the receiver, see Fig. 1). Tune to exact frequency for the best tone quality. This can be done at any time without disturbing the automatic setting

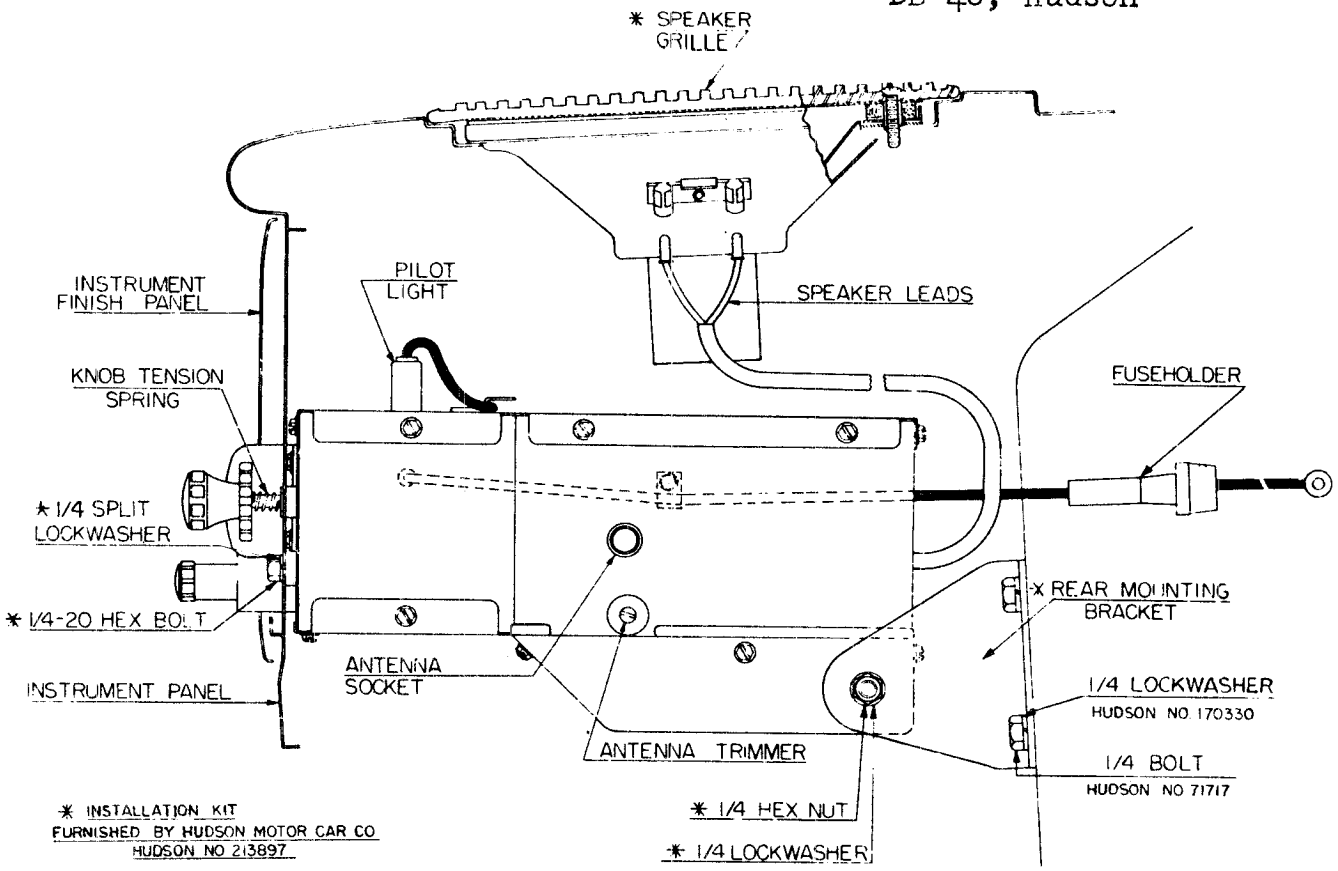

Fig. 2. Mounting Details and Connections

INSTALLATION INSTRUCTIONS

1. Install the antenna. (Complete instructions are furnished with each kit.)
2. Remove door on left hand side of instrument panel by removing the three screws from the back.
3. Remove ornament from center of trim panel above radio opening by means of removing the two face screws.
4. Remove the instrument finish panel and remove the escutcheon plug from the panel.
5. Remove the two bolts, Hudson No. 71717, from the fire wall and install the rear mounting bracket No. 12-1410. Do not tighten the bracket at this time. (Fig. 2.)
6. With the dial end of the receiver up, push the receiver up between the instrument panel and the air hopper. Turn the radio until the knob shafts slide through the openings in the instrument panel and the tapped spacers provided on the front plate of the set line up with the two corresponding holes in the instrument panel. Bring the receiver forward as far as it will go. (Fig. 2.)
7. With the receiver held in this position start the two ¼ x 20 x ½ fillister head screws, with lockwashers, into the holes.
8. Slip the elongated hole in mounting bracket over the stud on the set and install lockwasher and nut.
9. Before locking the receiver securely in position, place the instrument finish panel into position over the clock and speedometer and note whether or not the radio and trim panel are centered correctly. If not, move the radio until the dash trim panel and radio dial escutcheon assembly are in alignment. Then permanently fasten set in position by tightening the two front screws and the nut and bolts on the rear mounting bracket. Replace instrument finish panel and fasten securely.
10. Connect the "A" lead of the set to the battery terminal of the circuit breaker, mounted on the instrument panel brace over the steering column (Fig. 3).

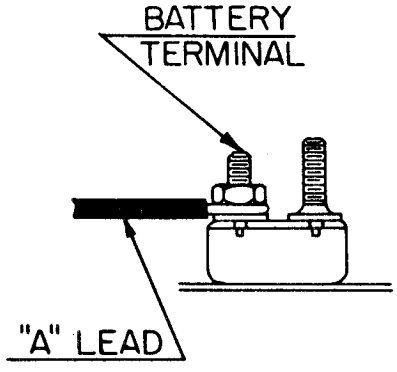

Fig. 3

MODELS 6MH889, Ch. 6E89;
DB-48, Hudson

11. Plug in antenna cable (Fig. 2).
12. Remove speaker cover plate, and pull speaker leads through opening in dash.
13. Plug speaker leads into pin jack mounted on speaker. Make sure green lead plugs into green spotted pin jack.
14. Lower speaker into position, and line up with holes in the instrument panel. Place speaker grille, included in radio package, over speaker, making sure the mounting holes line up, then fasten securely with the four chrome plated screws provided in kit.
15. Place tone control knob onto shaft, put on volume control knob, tighten set screw (Fig. 1). Be sure there is no binding.
16. Place knob tension spring No. 80-594 over the tuning shaft. Put on trim ring and press on tuning control knob as far as it will go. Tighten set screw (Fig. 1).
17. Replace ornament and door.
18. **IMPORTANT:** Turn the receiver on and allow it to operate for approximately fifteen minutes in order for it to reach normal operating temperature. Tune in a weak station near 1200 Kc. With a small screw driver adjust the antenna trimmer, located on the right side of the receiver for maximum volume (Fig. 2)

INTERFERENCE ELIMINATION

IMPORTANT: Use the utmost care in the following operations to insure freedom from motor noise. Be sure that good ground contacts are made between the interference condensers and the car body. If necessary, clean away paint or dirt with emery paper. Tighten all nuts and bolts securely.

1. Remove the mounting screw of the voltage regulator and under this screw mount the condenser No. 22-1537. Connect the lead to the voltage regulator "A" terminal. (Fig. 4.)
2. Install suppressor No. 63-1252 in center of hole of distributor cap. Place high tension lead in top of suppressor. Be sure the suppressor and the lead are fastened securely. (Fig. 5.)
3. Remove bolt on the right side of the ignition coil. Mount condenser No. 22-1537 under this bolt. Connect lead to coil terminal marked (—). (Fig. 6.)

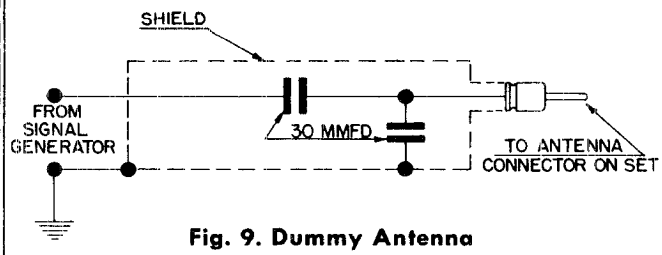

Fig. 9. Dummy Antenna

Fig. 9 shows the schematic of a recommended dummy antenna, closely resembling actual antenna capacity, to be used in series with signal generator leads when aligning the R.F. section of the receiver.

ALIGNMENT

Maximum performance depends on accurate alignment of the receiver; therefore follow these instructions carefully.

CAUTION: Make all alignment adjustment to the receiver with the volume control set at maximum, and the tone control in the treble position. Reduce the signal intensity as much as possible at the signal generator. Connect the output meter across the voice coil.

I.F. ALIGNMENT PROCEDURE

1. Remove top and bottom covers from receiver.
2. Set signal generator to 265 Kc.
3. Apply signal from generator through a .1 Mfd. dummy to 7B8 converter grid. (Pin No. 6 on socket.)
4. Adjust I.F. trimmers A, B, C, and D in order named for maximum output. Repeat the operation to assure accurate alignment. Some units have I.F. transformers that, are slug tuned. In this case adjust I.F. slugs E, F, G, and H in order named for maximum output and repeat the operation to assure accurate alignment. (Figs. 7-8.)

R.F. AND OSCILLATOR ALIGNMENT

1. Connect signal generator leads through dummy, illustrated in Fig. 9, to antenna lead in socket on receiver. This is important.
2. Set signal generator to 535 Kc.
3. Tune set to 535 Kc.
4. Adjust oscillator trimmer C-9 (Fig. 8) for maximum response.
5. Set signal generator to 1400 Kc.
6. Tune set to 1400 Kc.
7. Adjust converter trimmer C-7 (Fig. 8) and antenna trimmer C-2 (Fig. 7) for maximum response.
8. If dial calibration is off after making above adjustments, a correction can be made by tuning eccentric screw at fulcrum of dial pointer. (Fig. 7.)

CORE OR COIL REPLACEMENT ONLY

WARNING: The following adjustments are to be made ONLY if a core or coil is replaced.

The steel clamp collar normally grips the core spring and before a core is screwed in or out this tension must be released.

TO REMOVE CORE:

Remove the steel clamp collar using stubby nosed pliers by pressing the lugs of the collar together. Using core alignment tool, part number S-13064, screw the core spring down to the support bracket. With your fingers, screw the core spring past the bracket and lift out of the coil.

TO REPLACE CORE:

Place the core in the coil, screw the core spring into and past the support bracket. Use core tuning wrench, part number S-13064.

1. Set signal generator to 1675 Kc.
2. Connect signal generator leads through dummy, illustrated in Fig. 9, to antenna receptacle on the receiver.
3. Set receiver dial to 1600 Kc. (maximum high frequency end of dial).
4. Screw the cores completely out of the antenna coil, the converter coil, and the oscillator coil.
5. Adjust oscillator trimmer C-9 (Fig. 8) at 1675 Kc.
6. Adjust converter trimmer C-7, and antenna trimmer C-2 (Figs. 7 and 8) for maximum output reading.
7. Replace cores to their approximate original position.
8. Set signal generator dial and receiver dial to 1400 Kc.
9. Adjust oscillator core L-5 (Fig. 8) to scale at 1400 Kc.
10. Adjust the antenna core L-2, and converter core L-3 (Fig. 7) for maximum output reading.
11. Set signal generator to 600 Kc.
12. "Rock in" shunt oscillator coil L-6 (Fig. 8) for maximum output reading. This should be done only as a last resort. This is the same as rocking in the padder condenser on a general condenser receiver.
13. Check receiver at 1400 Kc. for calibration and gain. If the receiver is off scale or weak, repeat operations 9, 10 and 11.
14. After alignment is complete, the maximum high frequency tuning range should be checked. If the range is greater or less than 1605 Kc., the lug stop near the volume control should be bent to limit the frequency coverage to 1605 Kc.
15. Replace the steel clamp collar over the threaded insulating bushing.

IMPORTANT: After reinstalling the receiver in the car, allow it to operate for approximately 15 minutes to reach normal operating temperature. Extend antenna to maximum. Check the antenna trimmer alignment on a weak station at approximately 1400 Kc.

MODEL 6MN988, Nash

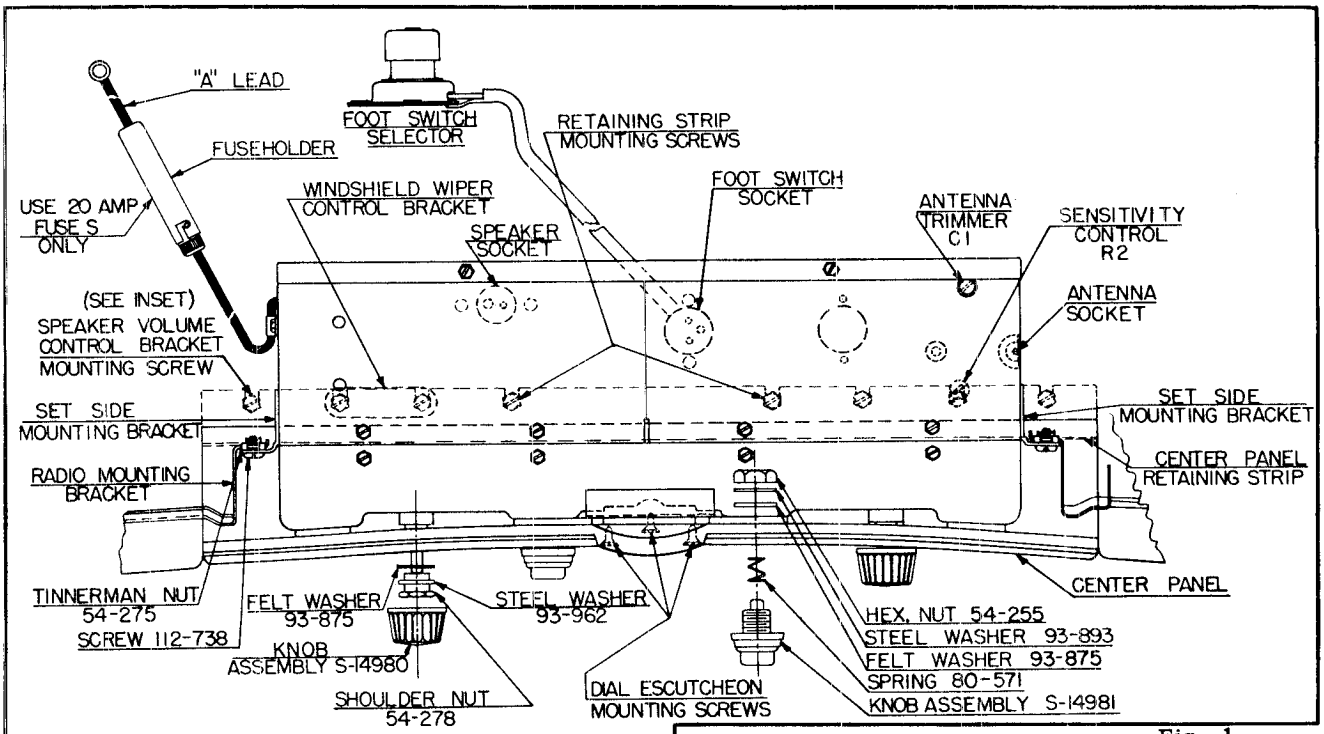

Fig. 1

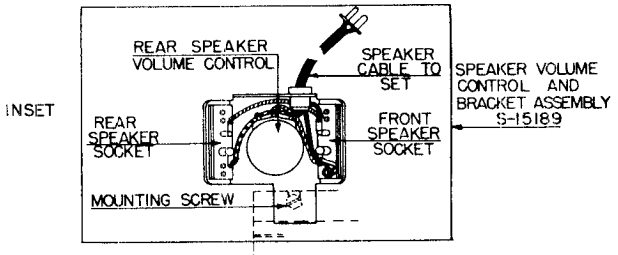

RECEIVER INSTALLATION

Figures 1 and 4, illustrating the installed receiver, the escutcheon plate, and the control knobs, are given here to facilitate removal and reinstallation of this receiver when service or repair is necessary.

To take the receiver from the car, disconnect the rear speaker control bracket, the 'A' lead, speaker cable, antenna cable, and foot switch control cable. Remove the control knobs and mounting nuts, and washers from the center panel. Loosen the 8/32 hex-head retaining strip mounting screws and remove the center panel. Remove the four #112-738 10/32 machine screws from the car radio mounting brackets. (Fig. 1)

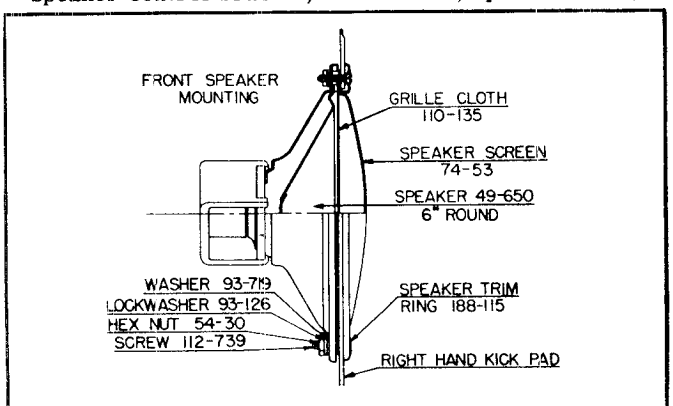

Fig. 2

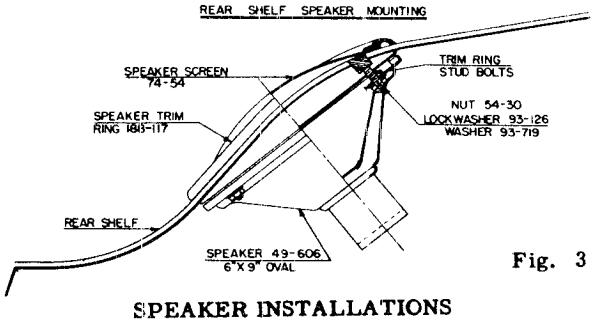

Fig. 3

SPEAKER INSTALLATIONS

To take out front speaker, remove the right side kick pad, and remove the four lock washers #93-126, four nuts #54-30, four screws #112-739, and trim ring #188-115, that holds the speaker to the kick pad. Figure 2.

To take out the rear speaker, remove the four flat washers #93-719, four lock-washers #93-126, and four hex-nuts #54-30, that holds the speaker to the underside of the rear shelf. Figure 3.

OPERATION

The purpose and position of each control is shown in Fig. 3. To turn the receiver on, turn the volume control knob to the right until it clicks and the dial is illuminated. Rotation of the knob to the right increases the volume. To turn the receiver off, turn the volume control knob to the left until it clicks.

©John F. Rider

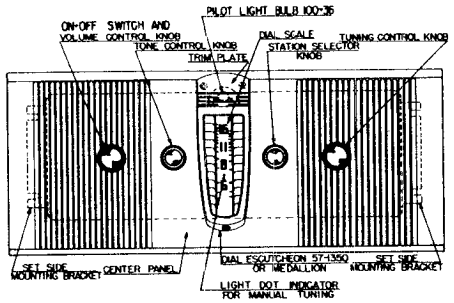

Fig. 4

MANUAL TUNING

To tune set manually, push the station selector knob until the light dot on the dial scale is illuminated. It is only necessary for the manual tuning knob to be turned to select stations.

TONE CONTROL

The tone control has four positions. Any one of these positions can be selected by pushing the tone control knob.

MUTING CIRCUIT

Lightly pressing either the station selector knob or the foot control switch mutes the receiver. This action is accomplished by shorting out the speaker voice coil.

REPLACEMENT OF DIAL LIGHT

NOTE: The top dial light can be replaced while the set is installed in the car by removing the escutcheon trim plate.

When replacing this light, be careful to adjust the black cardboard shield to a position where the slot directs the light on the dial pointer and not on the scale background. (Fig. 4)

AUTOMATIC TUNING

Pressing the station selector knob repeatedly will cause the tuning mechanism to change through a cycle of six positions. The five automatic positions may be set for favorite local stations, while the sixth position at which the light dot on the dial scale is illuminated, may be used for selecting stations manually.

Using the manual tuning position as a reference point, the remaining five positions may be adjusted in succession to any desired dial setting. However in order to simplify the identification of the stations, it is advisable to set the tuner in sequence according to the frequencies of the stations, beginning with the station broadcasting at the lowest frequency and progressing to the station broadcasting at the highest frequency.

Turn the receiver on and allow it to operate for at least 15 minutes in order for each part to reach normal operating temperature before making the proper setting.

1. Press the station selector knob repeatedly until the light dot on the dial scale appears. Press the station selector knob once more to get the tuner to the No. 1 position.

2. To select the station desired, pull the tuning control knob outward and turn at the same time. Tune very carefully for clearest reception.

3. Press station selector knob, pull and hold tuning control knob outward, and tune in station desired for No. 2 position. Use same proceedure for positions No. 3, 4, and 5.

INTERFERENCE ELIMINATION

There should be no motor noise or interference from the ignition circuit if the receiver has been installed in the car according to the instructions furnished with it. The interference suppression equipment may be checked for proper installation by referring to the following illustrations:

The "A" lead should be connected to the terminal block near the steering column behind instrument panel as shown in figure 5.

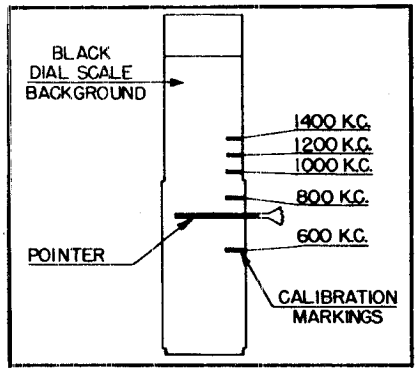

Fig. 13

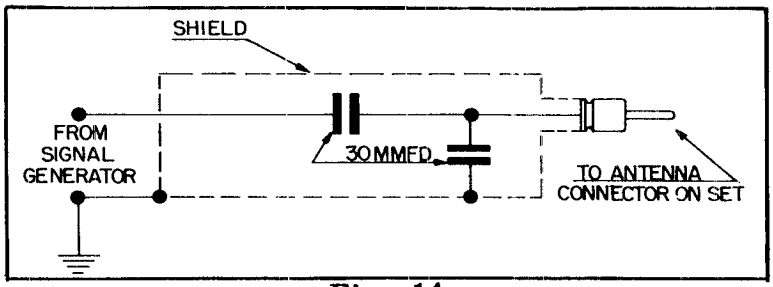

Fig. 14

©John F. Rider

Figure 14 shows the schematic of a recommended dummy antenna, closely resembling actual antenna capacity, to be used in series with signal generator leads when aligning the R. F. section of the receiver.

ALIGNMENT

Maximum performance depends on accurate alignment of the receiver, therefore follow these instructions carefully.

CAUTION: Make all alignment adjustments to the receiver with the volume control set at maximum. Reduce the signal intensity as much as possible at the signal generator. Connect the output meter across the voice coil.

I.F. ALIGNMENT PROCEDURE

1. Remove front and rear covers from receiver.
2. Set signal generator to 465 Kc.
3. Apply signal from generator through a .1 Mfd. dummy to 7B8 converter grid. (Pin No. 6 on socket)
4. Adjust I.F. trimmers, A, B, C, and D in order named for maximum output. (Fig. 12) Some units have I.F. transformers that are core tuned. In this case adjust primary and secondary I.F. cores from the top of the I.F. cans with core alignment tool 68-7. Repeat the operation to assure accurate alignment.

R.F. AND OSCILLATOR ALIGNMENT

Use the markings on the dial scale background as calibration points during alignment. Figure 13

1. Connect signal generator leads through dummy, illustrated in Fig. 14, to antenna lead in socket on receiver. This is important.
2. Set signal generator to 600 Kc.
3. Tune set to 600 Kc.
4. Adjust oscillator trimmer C-10 (Fig. 12), for maximum response.
5. Set signal generator to 1400 Kc.
6. Tune set to 1400 Kc.
7. Adjust converter trimmer C-7, and antenna trimmer C-1 (Fig. 12) for maximum response.
8. If dial calibration is off after making above adjustments, a correction can be made by tuning eccentric screw at fulcrum of dial pointer. (Fig. 11)

TO ADJUST OR REPLACE THE ADJUSTING SPRING AND CORE

1. Remove the top cover from the receiver.
2. Remove 7A7 R.F. tube, 7B8 converter tube, and 7A7 I.F. tube.
3. When bushing tension clips 19-165 are used, remove them from the cross arm insulating bushing with bent nose pliers. (Fig. 12)
4. Put automatic tuner in manual position and set the tuner carriage all the way out to the high frequency position or with the cores out of the coils.
5. With core alignment tool, No. S-13064, screw the antenna core back all the way, at the same time using the fingers to guide it out of the automatic unit. With the fingers, remove core by turning core spring past and through the cross arm insulating bushing.
6. Screw the converter and oscillator cores completely out of the coils. Set antenna tuner carriage to half way position. Screw the converter and oscillator cores back all the way, at the same time using the fingers to guide them between the I.F. cans and out of the tuner unit. With the fingers, remove the cores by turning them past and through the cross arm insulating bushing.
7. To replace cores, set tuner carriage at half way position. With the fingers, guide the oscillator and converter cores between the I.F. coils and screw the core springs through the cross arm insulating bushing. Set tuner carriage to high frequency position and also using the fingers, screw the antenna core spring through the cross arm insulating bushing. Use core alignment tool No. S 13064 for further adjustments.
8. Replace tubes and top cover.
9. After all adjustments or replacements are completed, be sure to replace the bushing tension clip. When bushing clips are not used, glue core springs with speaker cement.

ALIGNMENT PROCEDURE AFTER CORE OR COIL REPLACEMENT.

WARNING: The following adjustments are to be made only after a core or coil is replaced.

1. Set signal generator to 1675 Kc.
2. Connect signal generator leads through dummy, illustrated in Fig. 14 to antenna receptacle on the receiver.
3. Set receiver dial to 1600 Kc. (Maximum high frequency end of dial.)
4. Screw the cores completely out of the antenna coil, the converter coil, and the oscillator coil.
5. Adjust the oscillator trimmer C-10 (Fig. 12) at 1675 Kc.
6. Adjust the converter trimmer C-7, and antenna trimmer C-1 (Fig. 12) for maximum output reading.
7. Set signal generator dial and receiver dial to 1400 Kc.
8. Replace cores to their approximate original position (so that the cores project about 11/16 of an inch from the end of the coil form).
9. Adjust the oscillator core L-5 (Fig. 12) to scale at 1400 Kc.
10. Adjust the antenna core L-2, and converter core L-3 (Figs. 11 and 12) for maximum output reading.
11. Set signal generator at 600 Kc.
12. "Rock in" shunt oscillator coil L-6 (Fig. 11) for maximum output reading. This should be done only as a last resort. This is the same as rocking in the padder condenser on a gang condenser receiver.
13. Check receiver at 1400 Kc. for calibration and gain. If the receiver is off scale or weak, repeat operations 9, 10, and 11.
14. After alignment is complete, the maximum high frequency tuning range should be checked. If the range is greater or less than 1605 Kc., the lug stop should be bent to limit the frequency coverage to 1605 Kc. (Fig. 12)

IMPORTANT: After reinstalling the receiver in the car, allow it to operate for approximately 15 minutes to reach normal operating temperature. Extend antenna to maximum. Check the antenna trimmer alignment on a weak station at approximately 1400 Kc.

ALIGNMENT PROCEDURE

Operation	Connect Oscillator To	Dummy Antenna	Input Signal Frequency	Band	Set Dial To	Adj. Trimmers	Purpose
1 (a)	Pin 1 (grid) on 12AU6 limiter	.05 Mfd.	10.7 Mc. Unmodulated	FM 100		L9 coil slug Primary discr.	Align primary of discriminator for maximum reading.
2 (b)	Pin 1 (grid) on 12AU6 limiter	.05 Mfd.	10.7 Mc. Unmodulated	FM 100		L10 coil slug sec. of discr.	Adjust secondary of discriminator for zero reading.
3 (c)	Pin 1 (grid) on 12BA6 2nd IF.	.05 Mfd.	10.7 Mc. Unmodulated	FM 100		L8 Prim. of 3rd IF trans.	Align 3rd IF transformer for maximum reading.
4 (c)	Pin 1 (grid) on 12BA6 1st IF.	.05 Mfd.	10.7 Mc. Unmodulated	FM 100		L6 and L7 Prim. and Sec. of 2nd IF trans.	Align 2nd IF transformer for maximum reading.
5 (c)	Pin 7 (grid) on 12AT7 converter tube socket	.05 Mfd.	10.7 Mc. Unmodulated	FM 100		L4 and L5 Prim. and Sec. of 1st IF transformer	Align 1st IF transformer for maximum reading.
6 (c) (d)	Antenna Post FM (Remove line ant)	270 ohms	98 Mc. Unmodulated	FM 100	98 Mc.	L3 Osc. Coil Slug	Set Oscillator to dial scale
7 (c) (d)		270 ohms	98 Mc. Unmodulated	FM 100	98 Mc.	L2 Det. Coil Slug	Align det. stage to maximum reading.

IMPORTANT

Alignment of this chassis will in most cases be unnecessary unless an IF or RF transformer is replaced or the adjustments have been tampered with.

Correct alignment can only be made if the following procedure is followed:

A vacuum tube voltmeter with an isolation resistor of 2,000,000 ohms in series with the hot lead will serve for FM adjustments. This lead should be shielded.

The signal generator output should be kept just high enough to get an indication on the meter.

(a) Vacuum Tube Voltmeter Lug 7 on discriminator transformer to chassis (half discriminator load).
(b) Vacuum Tube Voltmeter Lug 5 on discriminator transformer to chassis (full discriminator load).
(c) Vacuum Tube Voltmeter from Limiter Grid to Chassis.
(d) Loosen Slugs by applying a hot iron to the cement.

TUBE AND TRIMMER LOCATION

To The Service Man:

The 7F03 chassis incorporates a superheterodyne circuit with two stages of IF, on the FM Band. There is one stage of RF amplification on the FM Band.

When adjustments are made on the 7F03 or any AC-DC chassis, a line isolation transformer (110 V input to 110 V output) is recommended in order to avoid a "hot" chassis. If an isolation transformer is not available, check the AC voltage between chassis and bench ground, and if there is any indication of voltage, reverse the plug before handling the set.

RF Alignment: The tuning slugs are attached to threaded shafts and the slugs are varied in the field of the coils by turning the shafts clockwise or counter-clockwise. After adjustment the shafts must be secured with a drop of speaker cement.

IF Alignment: The alignment slugs in the IF transformers are threaded and screw into the coil forms. The slugs are slotted for a small size fiber screw driver. Do not press hard on the aligning tool or the threads in the coil forms will strip and adjustment will be impossible.

IF Alignment: Because of the wide band pass, it is desirable to use a FM signal generator and a cathode ray oscilloscope when aligning the IF channel. The instruction book for the Zenith Model 800 Signal Generator (Form Z8001) covers complete FM alignment procedure. If visual alignment equipment is unavailable, reasonably accurate alignment can be made by following the procedure outlined below.

Discriminator Alignment: When the secondary of the discriminator is aligned (operation 5) use sufficient signal input to get a good positive and negative indication before setting the slug for zero reading. A center zero indicating meter is recommended for this adjustment, but is not absolutely necessary. Reversing the leads of a non-zero center meter, or observing closely when the meter starts to go to the left (negative) of zero will give the same results.

ALIGNMENT PROCEDURE

Operation	Connect Oscillator To	Dummy Antenna	Input Signal Frequency	Band	Set Dial To	Adj. Trimmers	Purpose
1	Pin 7 12AT7 Converter	.05 Mfd.	455 KC. Modulated	BC	600 Kc.	L-9, 10, 13, 14, 17 and 18	Align I. F. channel for maximum output.
2	2 turns loosely cpld. to wavemagnet		1600 Kc. Modulated	BC	1600 Kc.	C4	Set oscillator to dial scale.
3	2 turns loosely cpld. cpld. to wavemagnet		1400 Kc. Modulated	BC	1400 Kc.	C2 and C3	Align det. and ant. stages.
4 (a)	Pin 1 (grid) on 12AU6 limiter.	.05 Mfd.	10.7 Mc. Unmodulated	FM 100		L19 coil slug Primary discr.	Align primary of discriminator for maximum reading.
5 (b)	Pin 1 (grid) on 12AU6 limiter.	.05 Mfd.	10.7 Mc. Unmodulated	FM 100		L20 coil slug sec. of discr.	Adjust secondary of discriminator for zero reading.
6 (c)	Pin 1 (grid) on 12BA6 2nd. IF.	.05 Mfd.	10.7 Mc. Unmodulated	FM 100		L15 and L16 Prim. and Sec. of 3rd. IF transformer	Align 3rd. IF transformer for maximum reading.
7 (c)	Pin 1 (grid) on 12BA6 1st. IF.	.05 Mfd.	10.7 Mc. Unmodulated	FM 100		L11 and L12 Prim. and Sec. of 2nd. IF transformer	Align 2nd. IF transformer for maximum reading.
8 (c)	Pin 7 (grid) on 12AT7 converter tube socket	.05 Mfd.	10.7 Mc. Unmodulated	FM 100		L7 and L8 Prim. and Sec. of 1st. IF transformer	Align 1st. IF Transformer for maximum reading.
9 (c) (d)	Antenna Post F (Remove line ant.)	270 ohms	98 Mc. Unmodulated	FM 100	98 Mc.	L5 Osc. Coil Slug	Set Oscillator to dial scale.
10 (c) (d)		270 ohms	98 Mc. Unmodulated	FM 100	98 Mc.	L3 and L2 Det. and RF coil Slugs	Align det. and ant. stages to maximum reading.

IMPORTANT

Alignment of this chassis will in most cases be unnecessary unless an IF or RF transformer is replaced or the adjustments have been tampered with.

Correct alignment can only be made if the following procedure is followed:

A vacuum tube voltmeter with an isolation resistor of 2,000,000 ohms in series with the hot lead will serve for FM adjustments. This lead should be shielded.

An AC output meter connected across the primary or secondary of the output transformer will be satisfactory for all AM adjustments.

The signal generator output should be kept just high enough to get an indication on the meter.

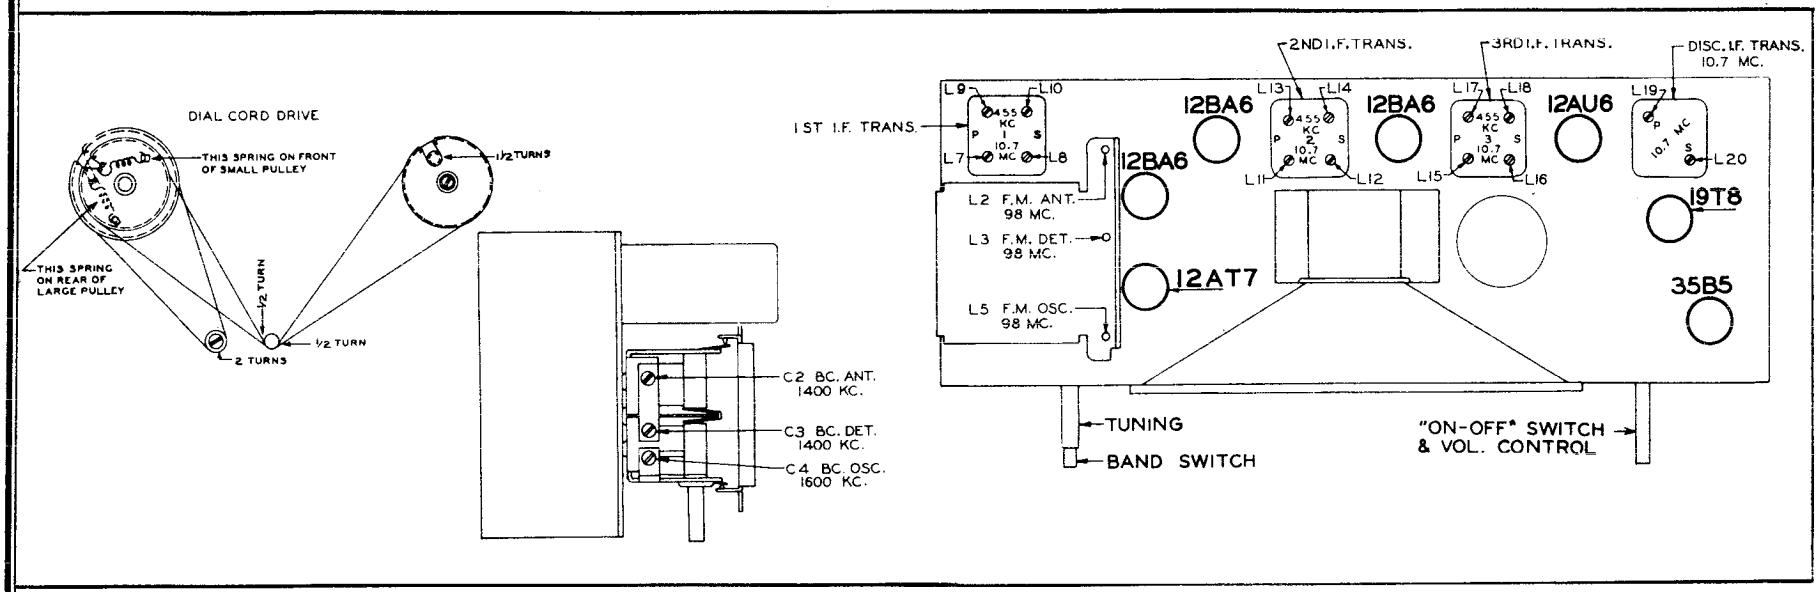
(a) Vacuum Tube Voltmeter Lug 6 on discriminator transformer to chassis (half discriminator load).

(b) Vacuum Tube Voltmeter Lug 3 on discriminator transformer to chassis (full discriminator load).

(c) Vacuum Tube Voltmeter from Limiter Grid to Chassis.

(d) Loosen Slugs by applying a hot iron to the cement.

© John F. Rider



TUBE AND TRIMMER LOCATION

The 7F01 chassis incorporates a superheterodyne circuit with two stages of IF, and one stage of RF amplification on all bands.

When adjustments are made on the 7F01 or any AC-DC chassis, a line isolation transformer (110 V input to 110 V output) is recommended in order to avoid a "hot" chassis. If an isolation transformer is not available, check the AC voltage between chassis and bench ground, and if there is any indication of voltage, reverse the plug before handling the set.

AM Alignment: The alignment of this chassis on the standard broadcast band is conventional. The alignment slugs in the IF transformers are threaded and screw into the coil forms. The slugs are slotted for a small size fiber screw driver. Do not press hard on the aligning tool or the threads in the coil forms will strip and adjustment will be impossible.

FM RF Alignment: The tuning slugs are attached to threaded shafts and the slugs are varied in the field of the coils by turning the shafts clockwise or counter-clockwise. After adjustment the shafts must be secured with a drop of speaker cement.

FM IF Alignment: The same type of tuning slugs for aligning the AM IF Amplifier are used for the FM I.F.'s. Observe the same precautions when making adjustments.

FM Discriminator Alignment: When the secondary of the discriminator is aligned (operation 5) use sufficient signal input to get a good positive and negative indication before setting the slug for zero reading. A center zero indicating meter is recommended for this adjustment, but is not absolutely necessary. Reversing the leads of a non-zero center meter, or observing closely when the meter starts to go to the left (negative) of zero will give the same results.

7 (c)	Pin 1 (grid) on 12BA6 1st IF.	.05 Mfd.	10.7 Mc. Unmodulated	FM 100		L10 and L11 Prim. and Sec. of 2nd IF transformer	Align 2nd IF transformer for maximum reading.
8 (c)	Pin 7 (grid) on 12BE6 converter tube socket.	.05 Mfd.	10.7 Mc. Unmodulated	FM 100		L6 and L7 Prim. and Sec. of 1st IF transformer.	Align 1st IF transformer for maximum reading.
9 (c)	Antenna Post FM (Remove line ant.)	270 ohms	98 Mc. Unmodulated	FM 100	98 Mc.	L3 Osc. Coil Slug	Set Oscillator to dial scale.
10 (c) (d)		270 ohms	98 Mc. Unmodulated	FM 100	98 Mc.	L4 Det. Coil Slug	Align det. stage to maximum reading.

IMPORTANT

Alignment of this chassis will in most cases be unnecessary unless an IF or RF transformer is replaced or the adjustments have been tampered with.

Correct alignment can only be made if the following procedure is followed:

A vacuum tube voltmeter with an isolation resistor of 2,000,000 ohms in series with the hot lead will serve for FM adjustments. This lead should be shielded.

An AC output meter connected across the primary or secondary of the output transformer will be satisfactory for all AM adjustments.

The signal generator output should be kept just high enough to get an indication on the meter.

(a) Vacuum Tube Voltmeter Lug 6 on discriminator transformer to chassis (half discriminator load).

(b) Vacuum Tube Voltmeter Lug 3 on discriminator transformer to chassis (full discriminator load).

(c) Vacuum Tube Voltmeter from Limiter Grid to Chassis.

(d) Loosen Slugs by applying a hot iron to the cement.

TUBE AND TRIMMER LOCATION

The 7F04 chassis incorporates a superheterodyne circuit with two stages of IF, on the FM Band, and one stage on the AM Band. There is one stage of RF amplification on the FM Band.

When adjustments are made on the 7F04 or any AC-DC chassis, a line isolation transformer (110 V input to 110 V output) is recommended in order to avoid a "hot" chassis. If an isolation transformer is not available, check the AC voltage between chassis and bench ground, and if there is any indication of voltage, reverse the plug before handling the set.

AM Alignment: The alignment of this chassis on the standard broadcast band is conventional. The alignment slugs in the IF transformers are threaded and screw into the coil forms. The slugs are slotted for a small size fiber screw driver. Do not press hard on the aligning tool or the threads in the coil forms will strip and adjustment will be impossible.

FM RF Alignment: The tuning slugs are attached to threaded shafts and the slugs are varied in the field of the coils by turning the shafts clockwise or counter-clockwise. After adjustment the shafts must be secured with a drop of speaker cement.

FM IF Alignment: The same type of tuning slugs for aligning the AM IF Amplifier are used for the FM IF's. Observe the same precautions when making adjustments.

FM IF Alignment: Because of the wide band pass, it is desirable to use a FM signal generator and a cathode ray oscilloscope when aligning the FM IF channel. The instruction book for the Zenith Model 800 Signal Generator (Form Z8001) covers complete FM alignment procedure. If visual alignment equipment is unavailable, reasonably accurate alignment can be made by following the procedure outlined below.

FM Discriminator Alignment: When the secondary of the discriminator is aligned (operation 5) use sufficient signal input to get a good positive and negative indication before setting the slug for zero reading. A center zero indicating meter is recommended for this adjustment, but is not absolutely necessary. Reversing the leads of a non-zero center meter, or observing closely when the meter starts to go to the left (negative) of zero will give the same results.

1	Pin 7 12BE6 Converter	.05 Mfd.	455 KC. Modulated	BC	600 Kc.	L8, 9, 12, 13	Align I. F. channel for maximum output.
2	2 turns loosely cpld. to wavemagnet		1600 Kc. Modulated	BC	1600 Kc.	C 3	Set oscillator to dial scale.
3	2 turns loosely cpld. to wavemagnet		1400 Kc. Modulated	BC	1400 Kc.	C 2	Align antenna stage.
4 (a)	Pin 1 (grid) on 12AU6 limiter,	.05 Mfd.	10.7 Mc. Unmodulated	FM 100		L15 coil slug Primary discr.	Align primary of discriminator for maximum reading.
5 (b)	Pin 1 (grid) on 12AU6 limiter.	.05 Mfd.	10.7 Mc. Unmodulated	FM 100		L16 coil slug sec. of discr.	Adjust secondary of discriminator for zero reading.
6 (c)	Pin 1 (grid) on 12BA6 2nd IF.	.05 Mfd.	10.7 Mc. Unmodulated	FM 100		L14 Prim. of 3rd IF trans.	Align 3rd IF transformer for maximum reading.
7 (c)	Pin 1 (grid) on 12BA6 1st IF.	.05 Mfd.	10.7 Mc. Unmodulated	FM 100		L10 and L11 Prim. and Sec. of 2nd IF transformer	Align 2nd IF transformer for maximum reading.
8 (c)	Pin 7 (grid) on 12BE6 converter tube socket.	.05 Mfd.	10.7 Mc. Unmodulated	FM 100		L6 and L7 Prim. and Sec. of 1st IF transformer.	Align 1st IF transformer for maximum reading.
9 (c)	Antenna Post FM (Remove line ant.)	270 ohms	98 Mc. Unmodulated	FM 100	98 Mc.	L4 Osc. Coil Slug	Set Oscillator to dial scale.
10 (c) (d)		270 ohms	98 Mc. Unmodulated	FM 100	98 Mc.	L3 Det. Coil Slug	Align det. stage to maximum reading.

IMPORTANT

Alignment of this chassis will in most cases be unnecessary unless an IF or RF transformer is replaced or the adjustments have been tampered with.

Correct alignment can only be made if the following procedure is followed:

A vacuum tube voltmeter with an isolation resistor of 2,000,000 ohms in series with the hot lead will serve for FM adjustments. This lead should be shielded.

An AC output meter connected across the primary or secondary of the output transformer will be satisfactory for all AM adjustments.

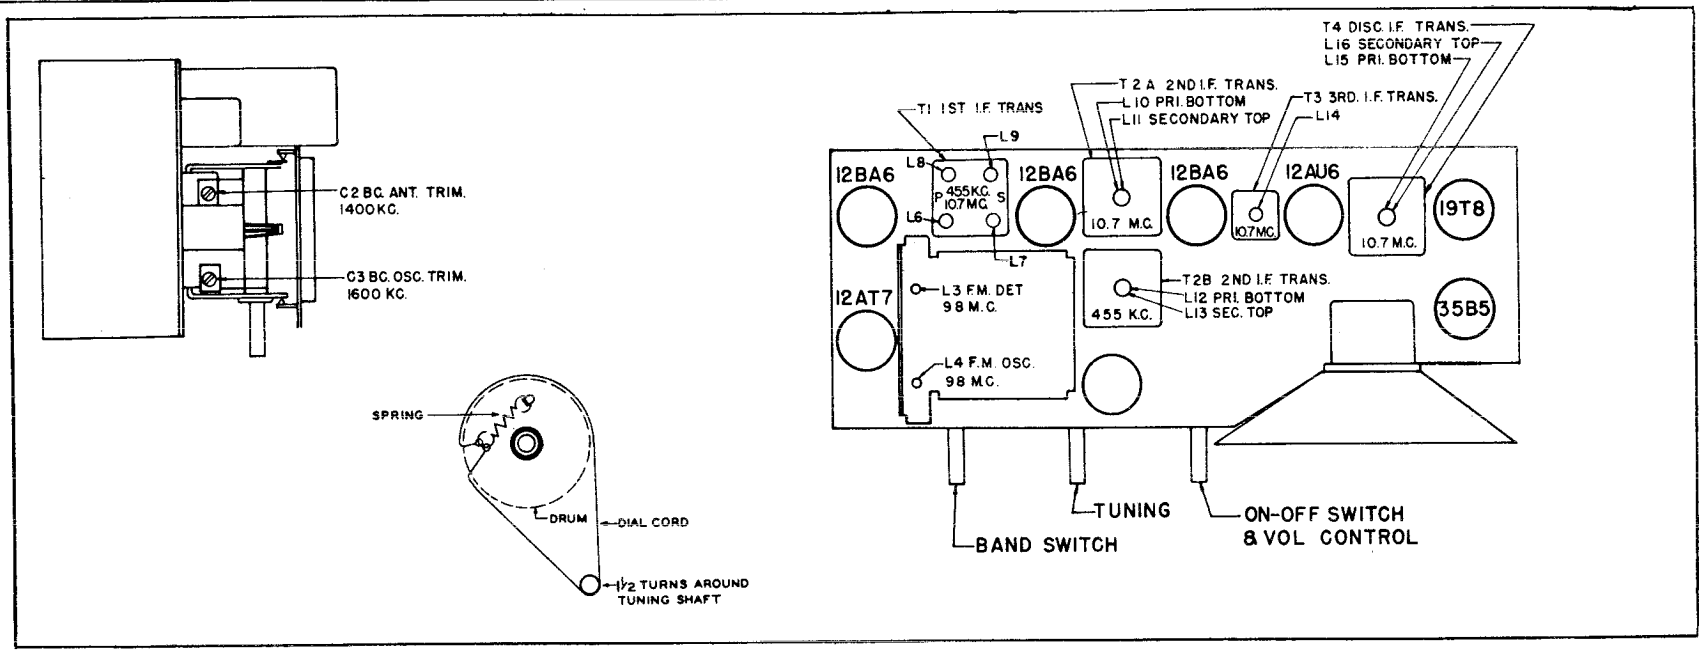
The signal generator output should be kept just high enough to get an indication on the meter.

(a) Vacuum Tube Voltmeter Lug 7 on discriminator transformer to chassis (half discriminator load).

(b) Vacuum Tube Voltmeter Lug 5 on discriminator transformer to chassis (full discriminator load).

(c) Vacuum Tube Voltmeter from Limiter Grid to Chassis.

(d) Loosen Slugs by applying a hot iron to the cement.



TUBE AND TRIMMER LOCATION

The 7F04Z chassis incorporates a superheterodyne circuit with two stages of IF, on the FM Band, and one stage on the AM Band. There is one stage of RF amplification on the FM Band.

When adjustments are made on the 7F04Z or any AC-DC chassis, a line isolation transformer (110 V input to 110 V output) is recommended in order to avoid a "hot" chassis. If an isolation transformer is not available, check the AC voltage between chassis and bench ground, and if there is any indication of voltage, reverse the plug before handling the set.

AM Alignment: The alignment of this chassis on the standard broadcast band is conventional. The alignment slugs in the 1st. IF transformer are threaded and screw into the coil form. The slug is slotted for a small size fiber screw driver. Do not press hard on the aligning tool or the threads in the coil forms will strip and adjustment will be impossible. The remaining IF transformers are of a different design in which the primary and secondary are stacked. The upper coil is the secondary and the lower the primary. When adjusting these I.F. transformers the tuning wrench 68-7 can be inserted into the top slug, rotated until maximum output is obtained and then dropped down to the lower slug and the same operation repeated. The tuning wrench is so designed that turning one slug does not affect the adjustment of the other.

FM RF Alignment: The tuning slugs are attached to threaded shafts and the slugs are varied in the field of the coils by turning the shafts clockwise or counter-clockwise. After adjustment the shafts must be secured with a drop of speaker cement.

FM IF Alignment: The same type of tuning slugs for aligning the AM IF Amplifier are used for the FM IF's. Observe the same precautions when making adjustments.

FM IF Alignment: Because of the wide band pass, it is desirable to use a FM signal generator and a cathode ray oscilloscope when aligning the FM IF channel. The instruction book for the Zenith Model 800 Signal Generator (Form Z8001) covers complete FM alignment procedure. If visual alignment equipment is unavailable, reasonably accurate alignment can be made by following the procedure outlined below.

FM Discriminator Alignment: When the secondary of the discriminator is aligned (operation 5) use sufficient signal input to get a good positive and negative indication before setting the slug for zero reading. A center zero indicating meter is recommended for this adjustment, but is not absolutely necessary. Reversing the leads of a non-zero center meter, or observing closely when the meter starts to go to the left (negative) of zero will give the same results.

ALIGNMENT PROCEDURE

Operation	Connect Oscillator To	Dummy Antenna	Input Signal Frequency	Band	Set Dial To	Adj. Trimmers	Purpose
1	Pin 2 12AT7 Converter	.05 Mfd.	455 Kc. Modulated	BC	600 Kc.	L8, 9, 12, 13	Align I. F. channel for maximum output.
2	2 turns loosely cpld. to wavemagnet		1600 Kc. Modulated	BC	1600 Kc.	C3	Set oscillator to dial scale.
3	2 turns loosely cpld. to wavemagnet		1400 Kc. Modulated	BC	1400 Kc.	C2	Align antenna stage.
4 (a)	Pin 1 (grid) on 12AU6 limiter.	.05 Mfd.	10.7 Mc. Unmodulated	FM 100		L15 coil slug Primary discr.	Align primary of discriminator for maximum reading.
5 (b)	Pin 1 (grid) on 12AU6 limiter.	.05 Mfd.	10.7 Mc. Unmodulated	FM 100		L16 coil slug sec. of discr.	Adjust secondary of discriminator for zero reading.
6 (c)	Pin 1 (grid) on 12BA6 2nd. IF.	.05 Mfd.	10.7 Mc. Unmodulated	FM 100		L14 Prim. of 3rd. IF trans.	Align 3rd. IF transformer for maximum reading.
7 (c)	Pin 1 (grid) on 12BA6 1st. IF.	.05 Mfd.	10.7 Mc. Unmodulated	FM 100		L10 and L11 Prim. and Sec. of 2nd. IF transformer	Align 2nd IF transformer for maximum reading.
8 (c)	Pin 2 (grid) on 12AT7 converter tube socket.	.05 Mfd.	10.7 Mc. Unmodulated	FM 100		L6 and L7 Prim. and Sec. of 1st. IF transformer.	Align 1st. IF transformer for maximum reading.
9 (c)	Antenna Post FM (Remove line ant.)	270 ohms	98 Mc. Unmodulated	FM 100	98 Mc.	L4 Osc. Coil Slug	Set Oscillator to dial scale.
10 (c) (d)		270 ohms	98 Mc. Unmodulated	FM 100	98 Mc.	L3 Det. Coil Slug	Align det. stage to maximum reading.

IMPORTANT

Alignment of this chassis will in most cases be unnecessary unless an IF or RF transformer is replaced or the adjustments have been tampered with.

Correct alignment can only be made if the following procedure is followed:

A vacuum tube voltmeter with an isolation resistor of 2,000,000 ohms in series with the hot lead will serve for FM adjustments. This lead should be shielded.

An AC output meter connected across the primary or secondary of the output transformer will be satisfactory for all AM adjustments.

The signal generator output should be kept just high enough to get an indication on the meter.

(a) Vacuum Tube Voltmeter Lug 7 on discriminator transformer to chassis (half discriminator load).

(b) Vacuum Tube Voltmeter Lug 5 on discriminator transformer to chassis (full discriminator load).

(c) Vacuum Tube Voltmeter from Limiter Grid to Chassis.

(d) Loosen Slugs by applying a hot iron to the cement.

TUBE AND TRIMMER LOCATION

The 7F02 chassis incorporates a superheterodyne circuit with two stages of IF, on the FM Band, and one stage on the AM Band. There is one stage of RF amplification on the FM Band.

When adjustments are made on the 7F02 or any AC-DC chassis, a line isolation transformer (110 V input to 110 V output) is recommended in order to avoid a "hot" chassis. If an isolation transformer is not available, check the AC voltage between chassis and bench ground, and if there is any indication of voltage, reverse the plug before handling the set.

AM Alignment: The alignment of this chassis on the standard broadcast band is conventional. The alignment slugs in the IF transformers are threaded and screw into the coil forms. The slugs are slotted for a small size fiber screw driver. Do not press hard on the aligning tool or the threads in the coil forms will strip and adjustment will be impossible.

FM RF Alignment: The tuning slugs are attached to threaded shafts and the slugs are varied in the field of the coils by turning the shafts clockwise or counter-clockwise. After adjustment the shafts must be secured with a drop of speaker cement.

FM IF Alignment: The FM IF transformers in this receiver are of the new permeability tuned type. The advantage of an I.F. transformer of this type is its extreme stability under various humidity and temperature conditions. The upper coil is the secondary and the lower the primary. When adjusting these I.F. transformers the tuning wrench 68-7 can be inserted into the top slug, rotated until maximum output is obtained and then dropped down to the lower slug and the same operation repeated. The tuning wrench is so designed that turning one slug does not affect the adjustment of the other.

FM IF Alignment: Because of the wide band pass, it is desirable to use a FM signal generator and a cathode ray oscilloscope when aligning the FM IF channel. The instruction book for the Zenith Model 800 Signal Generator (Form Z8001) covers complete FM alignment procedure. If visual alignment equipment is unavailable, reasonably accurate alignment can be made by following the procedure outlined below.

FM Discriminator Alignment: When the secondary of the discriminator is aligned (operation 5) use sufficient signal input to get a good positive and negative indication before setting the slug for zero reading. A center zero indicating meter is recommended for this adjustment, but is not absolutely necessary. Reversing the leads of a non-zero center meter, or observing closely when the meter starts to go to the left (negative) of zero will give the same results.

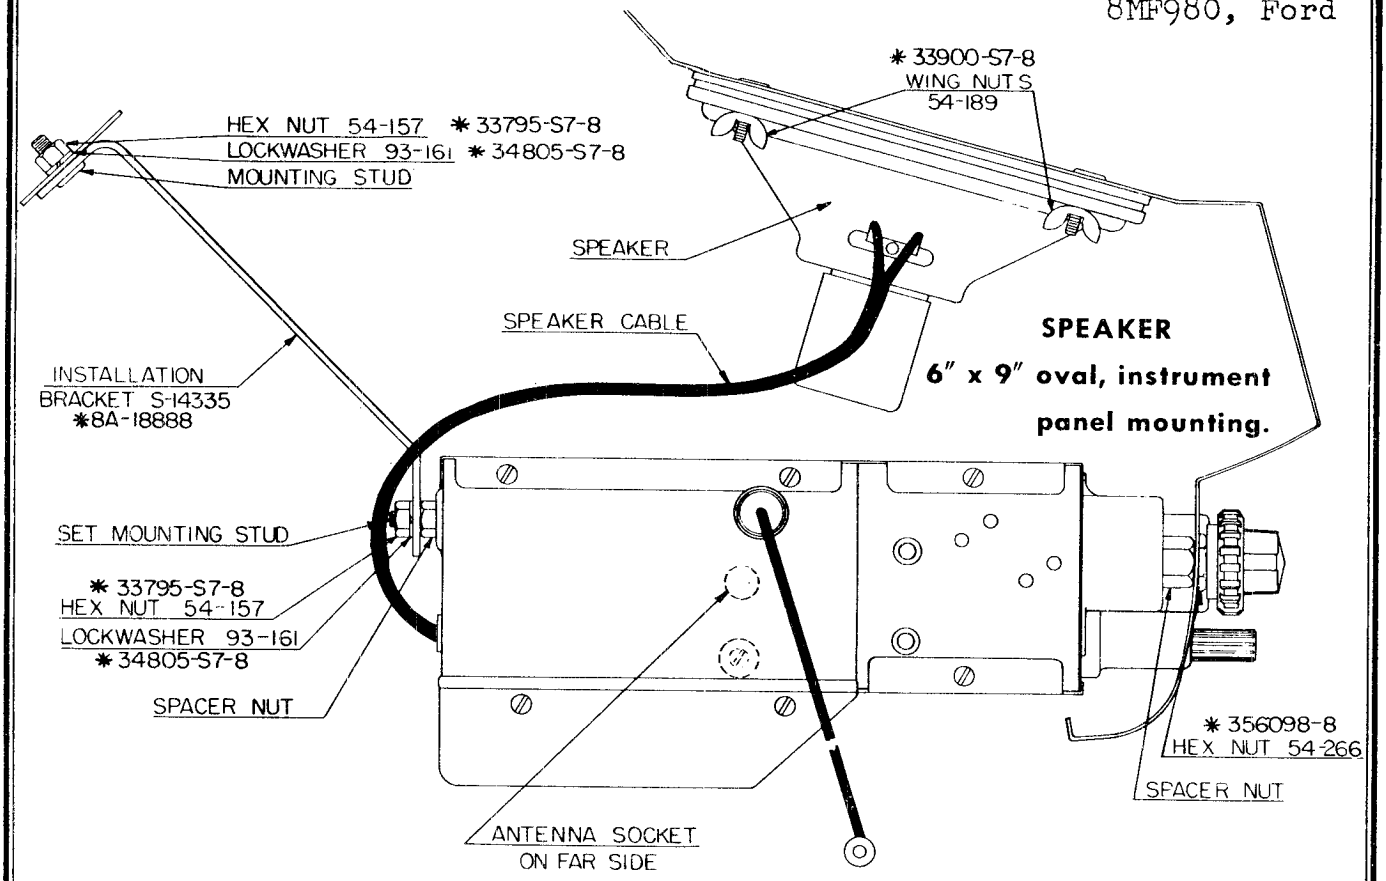

Fig. 1. Set Installed, Cut Away View

RECEIVER INSTALLATION

Figures 1 and 2, illustrating the escutcheon plate, control knobs and the installed receiver, are given here to facilitate removal and reinstallation of the receiver when service or repair is necessary.

1. Disconnect the "A" lead, the speaker cable, and the antenna from the receiver. (Fig. 1.)
2. Remove the volume control, tone control, trim and tuning knobs from the set. Remove the two front hex-nuts 54-266. Disconnect the bottom of the set rear mounting bracket S-14335 by removing the hex-nut 54-157, and lockwasher 93-161 from the set rear mounting stud, and take the set from its position behind the instrument panel. (Fig. 1.)
3. To take the speaker from behind the instrument panel remove the four 8-32 wing-nuts No. 54-189. (Fig. 1.)

OPERATING INSTRUCTIONS

TO TURN RADIO ON:

The radio is connected to the accessory terminal of the ignition switch, therefore, it is necessary to turn the ignition key to the left, if the engine is not running, before turning the radio on. Press any one of the five automatic push buttons. (Fig. 2.) Allow approximately 20 seconds for the receiver to reach operating temperature.

To turn the receiver off, press the "Off" push button (Fig. 2).

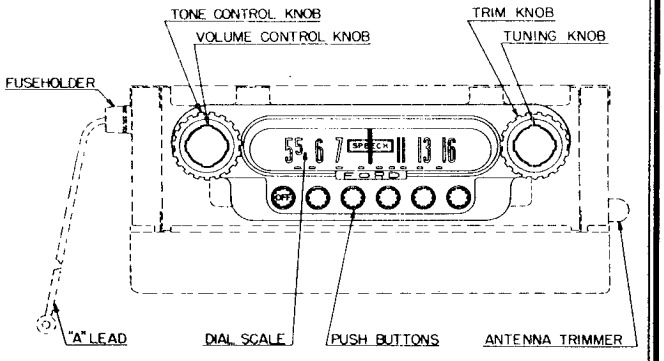

Fig. 2. Front Panel View

MANUAL TUNING:

To operate the manual tuning control simply turn the tuning knob. (Fig. 2.) When tuning in a station, be sure to tune to the exact frequency for the best tone quality.

VOLUME CONTROL:

Turn the volume control knob for the desired volume. (Fig. 2.)

TONE CONTROL:

The tone control knob is located directly behind the volume control knob. Turning this control to the right or left will change the tone of the receiver. The control has four positions. The position to which the control is set is indicated in the window in the center of the dial scale.

* Indicates Ford part number.

© John F. Rider

MODELS 8MF880, 8MF980, Ford

AUTOMATIC TUNING:

There are five automatic tuning push buttons located to the right of the "Off" push button. (Fig. 2.)

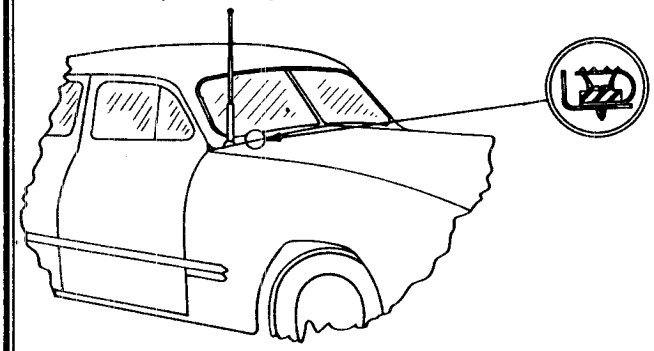
The five buttons may be adjusted in succession to any desired dial setting. To simplify the identification of the stations, it is advisable to set the buttons in sequence according to the frequencies of the stations, beginning with the station broadcasting at the lowest frequency and progressing to the station broadcasting at the highest frequency.

To adjust the automatic tuning push buttons:

1. Turn the receiver on and allow it to operate for at least 15 minutes in order for each part to reach normal operating temperature.
2. Tune in the station desired for number 1 position by turning the tuning knob. (Fig. 2.) Be sure to tune to the exact frequency to insure the best tone.
3. Loosen the number one push button, located nearest the "OFF" push button (Fig. 2) by turning it counterclockwise with your fingers not more than two turns. If the push button is completely unscrewed, the plunger assembly, inside the receiver, may come apart. Then it will be necessary to remove the radio from the car, open the case, and reassemble the plunger.
4. Press the button in as far as it will go.
5. Release the number 1 button and tighten it by turning it clockwise with your fingers.
6. Use the same procedure for adjusting positions 2, 3, 4, and 5. When the five automatic tuning push buttons have been adjusted to the five desired stations, any one of the five stations can be instantly tuned in by pressing the automatic push button that is adjusted to it.

INTERFERENCE SUPPRESSION

There should be no motor noise or interference from the ignition circuit if the receiver has been installed in the car according to the instructions furnished with it. The interference suppression equipment may be checked for proper installation by referring to the following illustrations:



REMOVE SCREW FROM HOOD PAD ON COWL AT LOCATION SHOWN AND INSTALL HOOD BONDING SPRING 80-145 WITH SCREW 112-365. *51A-18870
*32923-S7-8

Fig. 3

The hood bonding spring No. 80-579 should be installed on the cowl at the location shown in Fig. 3.

The generator condenser, No. 22-1601, should be mounted under the top assembly bolt on the rear end plate of the generator, and the lead connected to the ARMATURE terminal of the generator. (Fig. 4.)

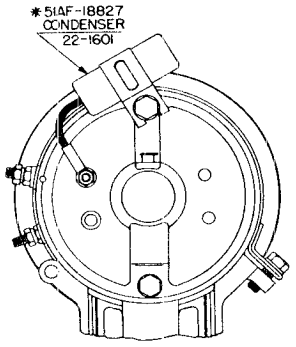


Fig. 4

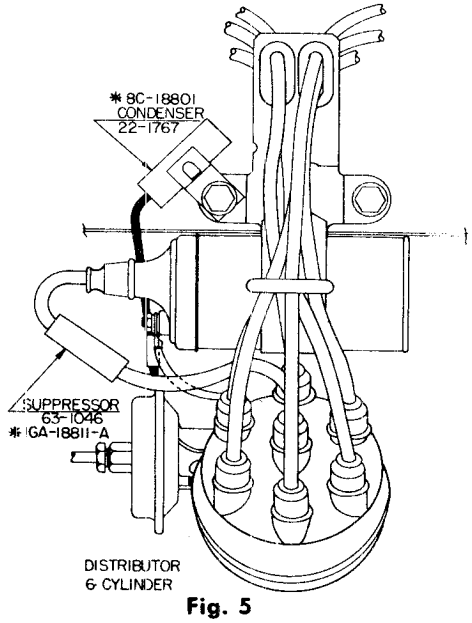

Fig. 5

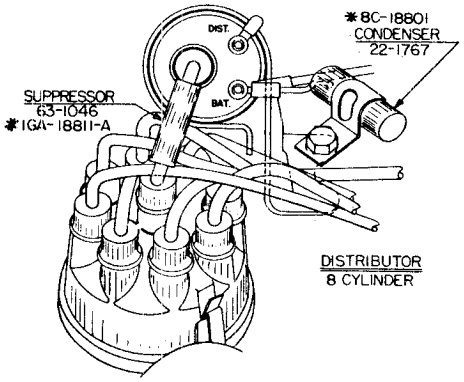

Fig. 6

The suppressor, No. 63-1046, should be in the high tension wire, approximately 1½ inches from the distributor cap. (Figs. 5 and 6.) The ignition coil condenser, No. 22-1767, should be connected to the BAT, terminal of the ignition coil. (Figs. 5 and 6.)

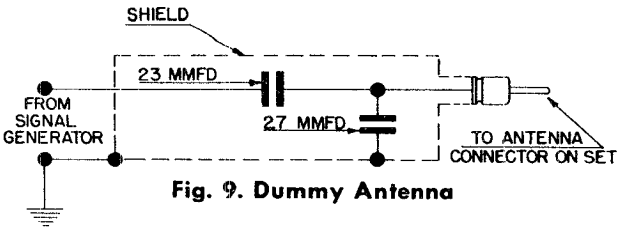

Fig. 9. Dummy Antenna

Figure 9 shows the schematic of a recommended dummy antenna, closely resembling actual antenna capacity, to be used in series with signal generator leads when aligning the R.F. section of the receiver.

ALIGNMENT

Maximum performance depends on accurate alignment of the receiver; therefore follow these instructions carefully.

CAUTION: Make all alignment adjustment to the receiver with the volume control set at maximum, and the tone control in the treble position. Reduce the signal intensity as much as possible at the signal generator. Connect the output meter across the voice coil.

I.F. ALIGNMENT PROCEDURE

1. Remove top and bottom covers from receiver.
2. Set signal generator to 265 Kc.
3. Apply signal from generator through a .1 Mfd. dummy to 7B8 converter grid. (Pin No. 6 on socket.)
4. Adjust I.F. trimmers A, B, C, and D in order named for maximum output. (Fig. 8.) Some units have I.F. transformers that are slug tuned. In this case adjust I.F. slugs E, F, G, and H in order named. Repeat the operation to assure accurate alignment. (Figs. 7 and 8.)

R.F. AND OSCILLATOR ALIGNMENT

1. Connect signal generator leads through dummy, illustrated in Fig. 9, to antenna lead in socket on receiver. This is important.
2. Set signal generator to 535 Kc.
3. Tune set to 535 Kc.
4. Adjust oscillator trimmer C-10 (Fig. 8), for maximum response.
5. Set signal generator to 1300 Kc.
6. Tune set to 1300 Kc.
7. Adjust converter trimmer C-7, R.F., trimmer C3 and antenna trimmer C-1 (Fig. 8) for maximum response (Figs. 7 and 8).
8. If dial calibration is off after making above adjustments, a correction can be made by tuning eccentric screw at fulcrum of dial pointer. (Fig. 7.)

TO ADJUST OR REPLACE THE ADJUSTING SPRING AND CORE

1. Remove the top and bottom covers from the receiver. Remove the escutcheon assembly.
2. With pliers remove the bushing tension clip from the cross arm insulating bushing.
3. With core alignment tool, part No. S-13064, screw the core in, or out, to the desired position.
4. After all adjustments or replacements are completed, be sure to replace the bushing tension clip.

ALIGNMENT PROCEDURE AFTER CORE OR COIL REPLACEMENT

WARNING: The following adjustments are to be made only after a core or coil is replaced.

1. Set signal generator to 1675 Kc.
2. Connect signal generator leads through dummy, illustrated in Fig. 9, to antenna receptacle on the receiver.
3. Set receiver dial to 1600 Kc. (Maximum high frequency end of dial.)
4. Screw the cores completely out of the antenna coil, the R.F. coil, the converter coil, and the oscillator coil.
5. Adjust the oscillator trimmer C-10 (Fig. 8) at 1675 Kc.
6. Adjust the converter trimmer C-7, R.F. trimmer C3, and antenna trimmer C-1 (Figs. 7 and 8) for maximum output reading.
7. Set signal generator dial and receiver dial to 1300 Kc.
8. Replace cores to their approximate original position (so that the cores project about 1 1/16 of an inch from the end of the coil form).
9. Adjust the oscillator core L-5 (Fig. 7) to scale at 1300 Kc.
10. Adjust the antenna core L-2, R.F. core L3, and converter core L-4 (Fig. 7) for maximum output reading.
11. Set signal generator to 600 Kc.
12. "Rock in" shunt oscillator coil L-7 (Fig. 7) for maximum output reading. This should be done only as a last resort. This is the same as rocking in the padder condenser on a gang condenser receiver.
13. Check receiver at 1300 Kc. for calibration and gain. If the receiver is off scale or weak, repeat operations 9, 10, and 11.
14. After alignment is complete, the maximum high frequency tuning range should be checked. If the range is greater or less than 1605 Kc., the lug stop near the volume control should be bent to limit the frequency coverage to 1605 Kc.

IMPORTANT: After reinstalling the receiver in the car, allow it to operate for approximately 15 minutes to reach normal operating temperature. Extend antenna to maximum. Check the antenna trimmer alignment on a weak station at approximately 1300 Kc.

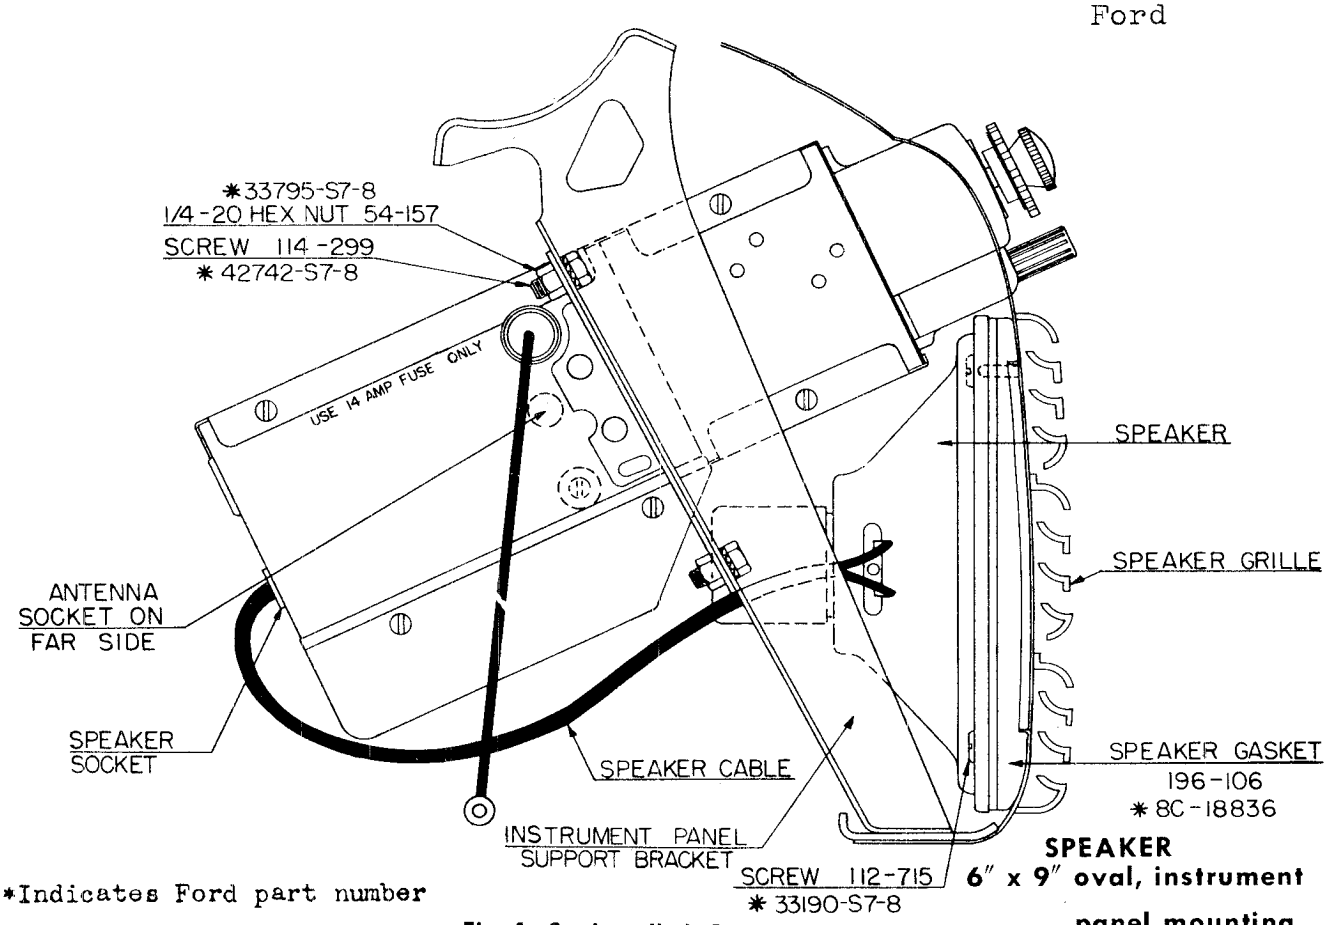
MODEL 8MF881, Ford



*Indicates Ford part number

SPEAKER
6" x 9" oval, instrument panel mounting.

Fig. 1. Set Installed, Cut Away View

RECEIVER INSTALLATION

Figures 1 and 2, illustrating the escutcheon plate, control knobs and the installed receiver, are given here to facilitate removal and reinstallation of the receiver when service or repair is necessary.

1. Disconnect the "A" lead, the speaker cable, and the antenna from the receiver. (Fig. 1.)
2. Remove the four ¼" screws No. 114-299, and take the set from its position behind the instrument panel. (Fig. 1.)
3. To take the speaker from behind the instrument panel remove the two screws No. 112-715. (Fig. 1.)

OPERATING INSTRUCTIONS

TO TURN RADIO ON:

The radio is connected to the accessory terminal of the ignition switch, therefore, it is necessary to turn the ignition key to the left, if the engine is not running, before turning the radio on. Press any one of the five automatic push buttons. (Fig. 2.) Allow approximately 20 seconds for the receiver to reach operating temperature.

To turn the receiver off, press the "Off" push button (Fig. 2.)

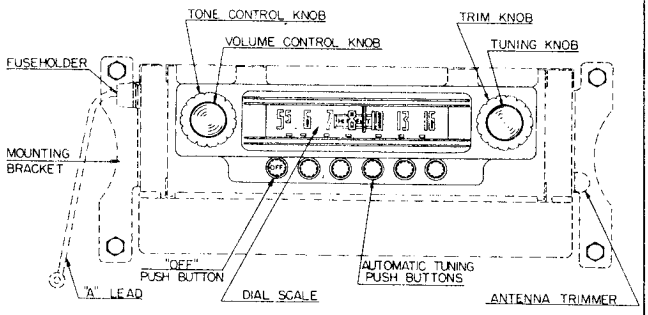


Fig. 2. Front Panel View

MANUAL TUNING:

To operate the manual tuning control simply turn the tuning knob. (Fig. 2.) When tuning in a station, be sure to tune to the exact frequency for the best tone quality.

VOLUME CONTROL:

Turn the volume control knob for the desired volume. (Fig. 2.)

TONE CONTROL:

The tone control knob is located directly behind the volume control knob. Turning this control to the right or left will change the tone of the receiver. The control has four positions. The position to which the control is set is indicated in the window in the center of the dial scale.

© John F. Rider

MODEL 8MF881,
Ford

AUTOMATIC TUNING:

There are five automatic tuning push buttons located to the right of the "Off" push button. (Fig. 2.)

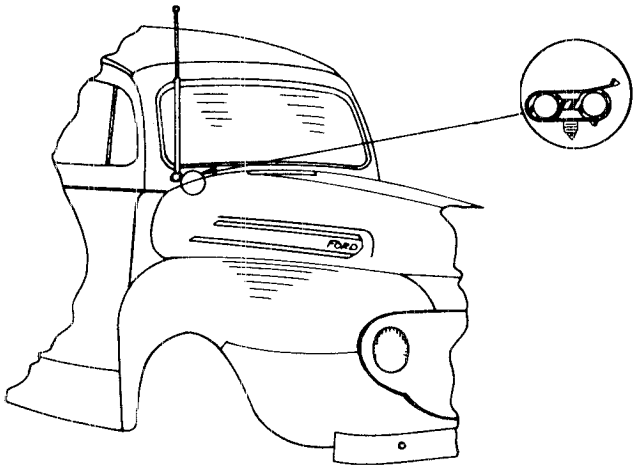
The five buttons may be adjusted in succession to any desired dial setting. To simplify the identification of the stations, it is advisable to set the buttons in sequence according to the frequencies of the stations, beginning with the station broadcasting at the lowest frequency and progressing to the station broadcasting at the highest frequency.

To adjust the automatic tuning push buttons:

1. Turn the receiver on and allow it to operate for at least 15 minutes in order for each part to reach normal operating temperature.
2. Tune in the station desired for number 1 position by turning the tuning knob. (Fig. 2.) Be sure to tune to the exact frequency to insure the best tone.
3. Loosen the number one push button, located nearest the "OFF" push button (Fig. 2) by turning it counterclockwise with your fingers not more than two turns. If the push button is completely unscrewed, the plunger assembly, inside the receiver, may fall apart. Then it will be necessary to remove the radio from the car, open the case, and reassemble the plunger.
4. Press the button in as far as it will go.
5. Release the number 1 button and tighten it by turning it clockwise with your fingers.
6. Use the same procedure for adjusting positions 2, 3, 4, and 5. When the five automatic tuning push buttons have been adjusted to the five desired stations, any one of the five stations can be instantly tuned in by pressing the automatic push button that is adjusted to it.

INTERFERENCE SUPPRESSION

There should be no motor noise or interference from the ignition circuit if the receiver has been installed in the car according to the instructions furnished with it. The interference suppression equipment may be checked for proper installation by referring to the following illustrations:



REMOVE SCREW FROM HOOD PAD ON COWL AT LOCATION SHOWN AND INSTALL HOOD BONDING SPRING 80-579 *51A-18870 WITH SCREW 112-365 *32923-S7-8

Fig. 3

The hood bonding spring No. 80-579 should be installed on the cowl at the location shown in Fig. 3.

The generator condenser, No. 22-1601, should be mounted under the top assembly bolt on the rear end plate of the generator, and the lead connected to the ARMATURE terminal of the generator. (Fig. 4.)

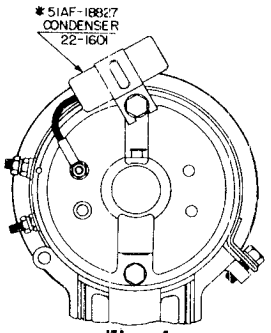


Fig. 4

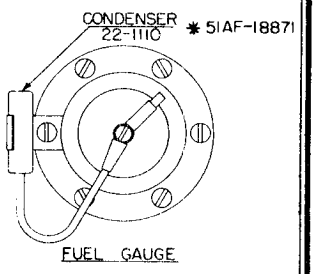

Fig. 5

A condenser, Part No. 22-1110, should be connected to the fuel gauge tank unit. (Fig. 5.)

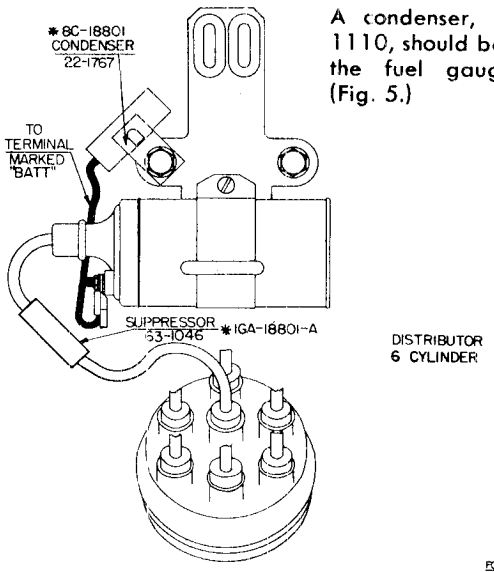

Fig. 6

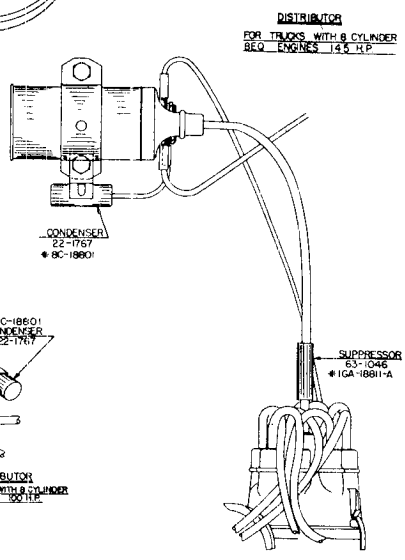

Fig. 6B

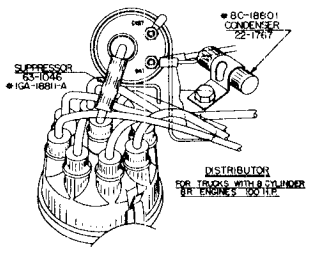

Fig. 6A

The suppressor, No. 63-1046, should be in the high tension wire, approximately 1½ inches from the distributor cap. (Figs. 6, 6A and 6B.) The ignition coil condenser, No. 22-1767, should be connected to the BAT, terminal of the ignition coil. (Figs. 6, 6A and 6B.)

MODEL 8MF881,
Ford

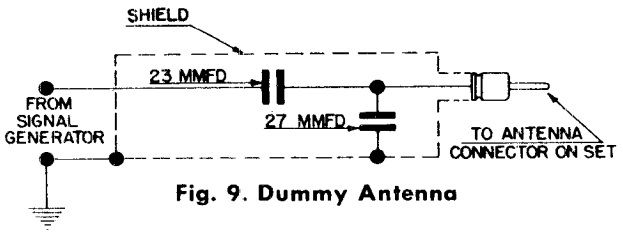

Fig. 9. Dummy Antenna

Figure 9 shows the schematic of a recommended dummy antenna, closely resembling actual antenna capacity, to be used in series with signal generator leads when aligning the R.F. section of the receiver.

ALIGNMENT

Maximum performance depends on accurate alignment of the receiver; therefore follow these instructions carefully.

CAUTION: Make all alignment adjustment to the receiver with the volume control set at maximum, and the tone control in the treble position. Reduce the signal intensity as much as possible at the signal generator. Connect the output meter across the voice coil.

I.F. ALIGNMENT PROCEDURE

1. Remove top and bottom covers from receiver.
2. Set signal generator to 265 Kc.
3. Apply signal from generator through a .1 Mfd. dummy to 7B8 converter grid. (Pin No. 6 on socket.)
4. Adjust I.F. trimmers A, B, C, and D in order named for maximum output. (Fig. 8.) Some units have I.F. transformers that are slug tuned. In this case adjust I.F. slugs E, F, G, and H in order named. Repeat the operation to assure accurate alignment. (Figs. 7 and 8.)

R.F. AND OSCILLATOR ALIGNMENT

1. Connect signal generator leads through dummy, illustrated in Fig. 9, to antenna lead in socket on receiver. This is important.
2. Set signal generator to 535 Kc.
3. Tune set to 535 Kc.
4. Adjust oscillator trimmer C-10 (Fig. 8), for maximum response.
5. Set signal generator to 1300 Kc.
6. Tune set to 1300 Kc.
7. Adjust converter trimmer C-7, R.F. trimmer C3 and antenna trimmer C-1 (Fig. 8) for maximum response (Figs. 7 and 8).
8. If dial calibration is off after making above adjustments, a correction can be made by turning eccentric screw at fulcrum of dial pointer. (Fig. 7.)

TO ADJUST OR REPLACE THE ADJUSTING SPRING AND CORE

1. Remove the top and bottom covers from the receiver. Remove the escutcheon assembly.
2. With pliers remove the bushing tension clip from the cross arm insulating bushing.
3. With core alignment tool, part No. S-13064, screw the core in, or out, to the desired position.
4. After all adjustments or replacements are completed, be sure to replace the bushing tension clip.

ALIGNMENT PROCEDURE AFTER CORE OR COIL REPLACEMENT

WARNING: The following adjustments are to be made only after a core or coil is replaced.

1. Set signal generator to 1675 Kc.
2. Connect signal generator leads through dummy, illustrated in Fig. 9, to antenna receptacle on the receiver.
3. Set receiver dial to 1600 Kc. (Maximum high frequency end of dial.)
4. Screw the cores completely out of the antenna coil, the R.F. coil, the converter coil, and the oscillator coil.
5. Adjust the oscillator trimmer C-10 (Fig. 8) at 1675 Kc.
6. Adjust the converter trimmer C-7, R.F. trimmer C3, and antenna trimmer C-1 (Figs. 7 and 8) for maximum output reading.
7. Set signal generator dial and receiver dial to 1300 Kc.
8. Replace cores to their approximate original position (so that the cores project about 1 1/16 of an inch from the end of the coil form).
9. Adjust the oscillator core L-5 (Fig. 7) to scale at 1300 Kc.
10. Adjust the antenna core L-2, R.F. core L3, and converter core L-4 (Fig. 7) for maximum output reading.
11. Set signal generator to 600 Kc.
12. "Rock in" shunt oscillator coil L-7 (Fig. 7) for maximum output reading. This should be done only as a last resort. This is the same as rocking in the padder condenser on a gang condenser receiver.
13. Check receiver at 1300 Kc. for calibration and gain. If the receiver is off scale or weak, repeat operations 9, 10, and 11.
14. After alignment is complete, the maximum high frequency tuning range should be checked. If the range is greater or less than 1605 Kc., the lug stop near the volume control should be bent to limit the frequency coverage to 1605 Kc.

IMPORTANT: After reinstalling the receiver in the car, allow it to operate for approximately 15 minutes to reach normal operating temperature. Extend antenna to maximum. Check the antenna trimmer alignment on a weak station at approximately 1300 Kc.

RECEIVER INSTALLATIONS

Figures 1, 1A, 2 and 2A, illustrating the escutcheon plates, control knobs and the installed receivers, are given here to facilitate removal and reinstallation of the receivers when service or repair is necessary.

To take the receiver from the car:

1. Remove the plenem chamber of the heater (Model 8L Lincoln only), by removing the two sheet metal screws at each end of the chamber.
2. Disconnect the "A" lead at the set. Remove the speaker plug from the set and disconnect the antenna.
3. Loosen the top of the set installation bracket, and remove the bottom of the bracket from the set. (Figs. 2-2A.)
4. Remove the 8/32 wingnuts and lockwashers from the instrument panel support brackets. (Figs. 2-2A.)

To take the speaker from the Model 8H Lincoln, pry off the trim strip along the bottom edge of the speaker grille. Remove the three sheet metal screws from the lower edge of the speaker grille, and remove the grille. Remove the two 8/32 hex nuts and flat washers holding the speaker in place. (Fig. 2A.)

To take the speaker from the Model 8L Lincoln, remove the two stamped wingnuts from the stud bolts on the rear of the instrument panel. (Fig. 2.)

OPERATING INSTRUCTIONS

TO TURN RADIO ON:

The radio is connected to the accessory terminal of the ignition switch, therefore, it is necessary to turn the ignition key to the left, if the engine is not running, before turning the radio on. Press any one of the five automatic push buttons. (Figs. 1, 1-A.) Allow approximately 20 seconds for the receiver to reach operating temperature.

To turn the receiver off, press the "Off" push button. (Fig. 1.)

MANUAL TUNING:

To operate the manual tuning control simply turn the tuning knob. (Figs. 1, 1A.) When tuning in a station, be sure to tune to the exact frequency for the best tone quality.

VOLUME CONTROL:

Turn the volume control knob for the desired volume. (Figs. 1, 1A.)

TONE CONTROL:

The tone control knob is located directly behind the volume control knob. Turning this control to the right or left will change the tone of the receiver. The control has four positions. The position to which the control is set is indicated in the window in the center of the dial scale.

AUTOMATIC TUNING:

There are five automatic tuning push buttons located to the right of the "Off" push button. (Figs. 1, 1A.)

The five buttons may be adjusted in succession to any desired dial setting. To simplify the identification of the stations, it is advisable to set the buttons in sequence according to the frequencies of the stations, beginning with the station broadcasting at the lowest frequency and progressing to the station broadcasting at the highest frequency.

To adjust the automatic tuning push buttons:

1. Turn the receiver on and allow it to operate for at least 15 minutes in order for each part to reach normal operating temperature.
2. Tune in the station desired for number 1 position by turning the tuning knob. (Fig. 1.) Be sure to tune to the exact frequency to insure the best tone.
3. Loosen the number one push button, located nearest the "OFF" push button (Fig. 1.), by turning it counterclockwise with your fingers not more than two turns. If the push button is completely unscrewed, the plunger assembly, inside the receiver, may fall apart. Then it will be necessary to remove the radio from the car, open the case, and reassemble the plunger.
4. Press the button in as far as it will go.
5. Release the number 1 button and tighten it by turning it clockwise with your fingers.
6. Use the same procedure for adjusting positions 2, 3, 4, and 5. When the five automatic tuning push buttons have been adjusted to the five desired stations, any one of the five stations can be instantly tuned in by pressing the automatic push button that is adjusted to it.

INTERFERENCE SUPPRESSION

There should be no motor noise or interference from the ignition circuit if the receiver has been installed in the car according to the instructions furnished with it. The interference suppression equipment may be checked for proper installation by referring to the following illustrations:

The hood bonding spring No. 80-579 should be installed on the cowl at the location shown in Fig. 3.

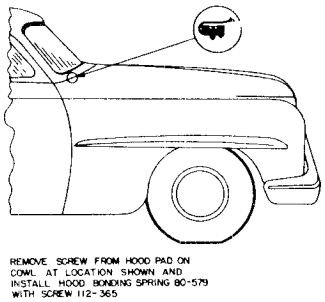

Fig. 3

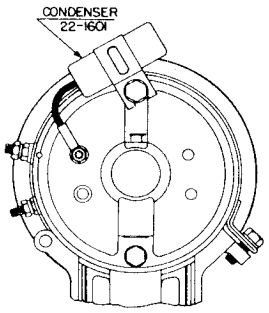

Fig. 4

The generator condenser, No. 22-1601, should be mounted under the top assembly bolt on the rear end plate of the generator, and the lead connected to the ARMATURE terminal of the generator. (Fig. 4.)

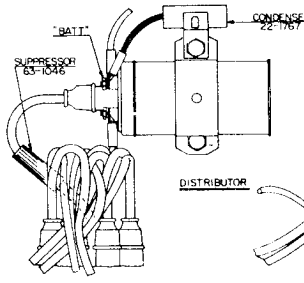

Fig. 5

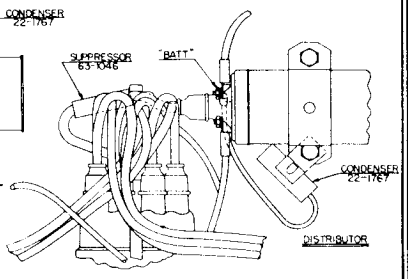

Fig. 6

The suppressor, No. 63-1046, should be in the high tension wire, approximately 1½ inches from the distributor cap. (Figs. 5 and 6.) The ignition coil condenser, No. 22-1767, should be connected to the BAT. terminal of the ignition coil. (Figs. 5 and 6.)

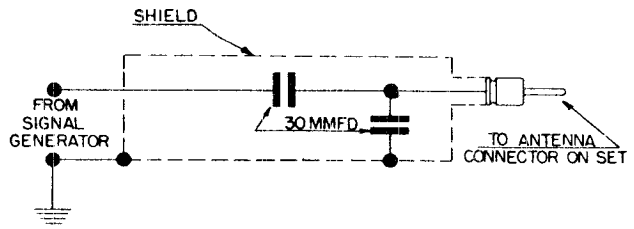

Fig. 9. Dummy Antenna

Figure 9 shows the schematic of a recommended dummy antenna, closely resembling actual antenna capacity, to be used in series with signal generator leads when aligning the R.F. section of the receiver.

ALIGNMENT

Maximum performance depends on accurate alignment of the receiver; therefore follow these instructions carefully.

CAUTION: Make all alignment adjustment to the receiver with the volume control set at maximum, and the tone control in the treble position. Reduce the signal intensity as much as possible at the signal generator. Connect the output meter across the voice coil.

I.F. ALIGNMENT PROCEDURE

1. Remove top and bottom covers from receiver.
2. Set signal generator to 265 Kc.
3. Apply signal from generator through a .1 Mfd. dummy to 7B8 converter grid. (Pin No. 6 on socket.)
4. Adjust I.F. trimmers A, B, C, and D in order named for maximum output. (Fig. 8.) Some units have I.F. transformers that are slug tuned. In this case adjust I.F. slugs E, F, G, and H in order named. Repeat the operation to assure accurate alignment. (Figs. 7 and 8.)

R.F. AND OSCILLATOR ALIGNMENT

1. Connect signal generator leads through dummy, illustrated in Fig. 9, to antenna lead in socket on receiver. This is important.
2. Set signal generator to 535 Kc.
3. Tune set to 535 Kc.
4. Adjust oscillator trimmer C-10 (Fig. 8), for maximum response.
5. Set signal generator to 1300 Kc.
6. Tune set to 1300 Kc.
7. Adjust converter trimmer C-7, R.F. trimmer C3 and antenna trimmer C-1 (Fig. 8) for maximum response (Figs. 7 and 8).
8. If dial calibration is off after making above adjustments, a correction can be made by tuning eccentric screw at fulcrum of dial pointer. (Fig. 7.)

TO ADJUST OR REPLACE THE ADJUSTING SPRING AND CORE

1. Remove the top and bottom covers from the receiver. Remove the escutcheon assembly.
2. With pliers remove the bushing tension clip from the cross arm insulating bushing.
3. With core alignment tool, part No. S-13064, screw the core in, or out, to the desired position.
4. After all adjustments or replacements are completed, be sure to replace the bushing tension clip.

ALIGNMENT PROCEDURE AFTER CORE OR COIL REPLACEMENT

WARNING: The following adjustments are to be made only after a core or coil is replaced.

1. Set signal generator to 1675 Kc.
2. Connect signal generator leads through dummy, illustrated in Fig. 9, to antenna receptacle on the receiver.
3. Set receiver dial to 1600 Kc. (Maximum high frequency end of dial.)
4. Screw the cores completely out of the antenna coil, the R.F. coil, the converter coil, and the oscillator coil.
5. Adjust the oscillator trimmer C-10 (Fig. 8) at 1675 Kc.
6. Adjust the converter trimmer C-7, R.F. trimmer C3, and antenna trimmer C-1 (Figs. 7 and 8) for maximum output reading.
7. Set signal generator dial and receiver dial to 1300 Kc.
8. Replace cores to their approximate original position (so that the cores project about 1/16 of an inch from the end of the coil form).
9. Adjust the oscillator core L-5 (Fig. 7) to scale at 1300 Kc.
10. Adjust the antenna core L-2, R.F. core L3, and converter core L-4 (Fig. 7) for maximum output reading.
11. Set signal generator to 600 Kc.
12. "Rock in" shunt oscillator coil L-7 (Fig. 7) for maximum output reading. This should be done only as a last resort. This is the same as rocking in the padder condenser on a gang condenser receiver.
13. Check receiver at 1300 Kc. for calibration and gain. If the receiver is off scale or weak, repeat operations 9, 10, and 11.
14. After alignment is complete, the maximum high frequency tuning range should be checked. If the range is greater or less than 1605 Kc., the lug stop near the volume control should be bent to limit the frequency coverage to 1605 Kc.

IMPORTANT: After reinstalling the receiver in the car, allow it to operate for approximately 15 minutes to reach normal operating temperature. Extend antenna to maximum. Check the antenna trimmer alignment on a weak station at approximately 1300 Kc.

MODEL 8MM890, Ch. 8E90,
Lincoln-Mercury

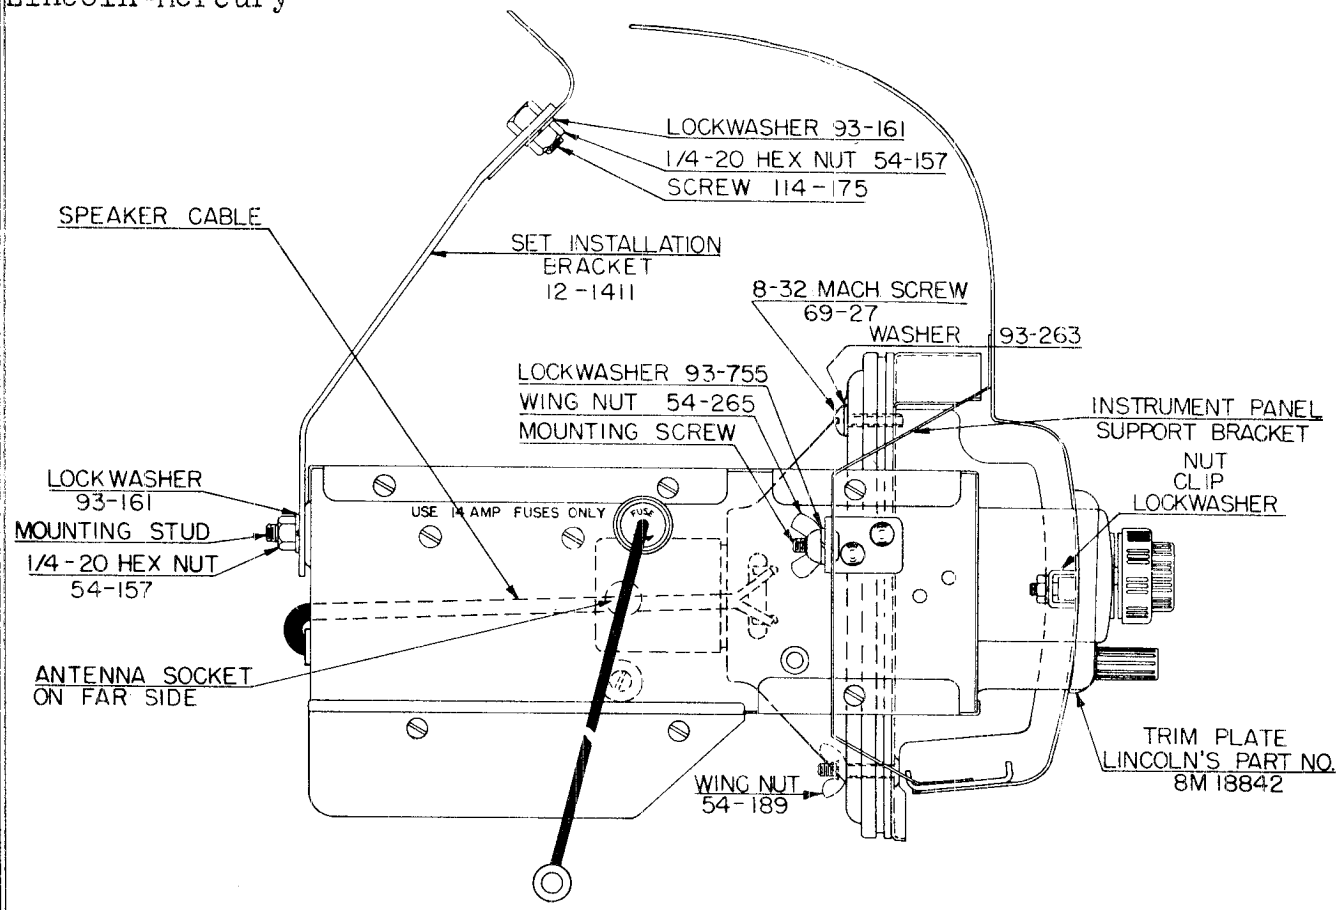

Fig. 1. Set Installed, Cut Away View

RECEIVER INSTALLATIONS

Figures 1 and 2, illustrating the escutcheon plate, control knobs and the installed receiver, are given here to facilitate removal and reinstallation of the receivers when service or repair is necessary.

1. Disconnect the "A" lead at the set. Remove the speaker plug from the set and disconnect the antenna.
2. Loosen the top of the set installation bracket, and remove the bottom of the bracket from the set. (Fig. 1.)
3. Remove the 8/32 wingnuts and lockwashers from the instrument panel support brackets. (Fig. 1.)

To take the speaker from the car, remove the stamped wingnut and the 8/32 machine screws from the rear of the instrument panel. (Fig. 1.)

OPERATING INSTRUCTIONS

TO TURN RADIO ON:

The radio is connected to the accessory terminal of the ignition switch, therefore, it is necessary to turn the ignition key to the left, if the engine is not running, before turning the radio on. Press any one of the five automatic push buttons. (Fig. 2.) Allow approximately 20 seconds for the receiver to reach operating temperature.

To turn the receiver off, press the "Off" push button (Fig. 2.)

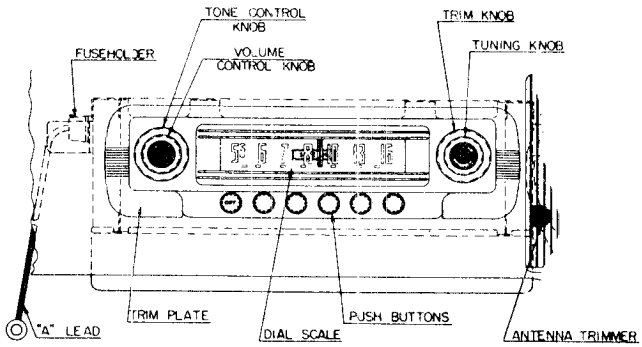

Fig. 2. Front Panel View

MANUAL TUNING:

To operate the manual tuning control simply turn the tuning knob. (Fig. 2.) When tuning in a station, be sure to tune to the exact frequency for the best tone quality.

VOLUME CONTROL:

Turn the volume control knob for the desired volume. (Fig. 2.)

TONE CONTROL:

The tone control knob is located directly behind the volume control knob. Turning this control to the right or left will change the tone of the receiver. The control has four positions. The position to which the control is set is indicated in the window in the center of the dial scale.

© John F. Rider

AUTOMATIC TUNING:

There are five automatic tuning push buttons located to the right of the "Off" push button. (Fig. 2.)

The five buttons may be adjusted in succession to any desired dial setting. To simplify the identification of the stations, it is advisable to set the buttons in sequence according to the frequencies of the stations, beginning with the station broadcasting at the lowest frequency and progressing to the station broadcasting at the highest frequency.

To adjust the automatic tuning push buttons:

1. Turn the receiver on and allow it to operate for at least 15 minutes in order for each part to reach normal operating temperature.
2. Tune in the station desired for number 1 position by turning the tuning knob. (Fig. 2.) Be sure to tune to the exact frequency to insure the best tone.
3. Loosen the number one push button, located nearest the "OFF" push button (Fig. 2) by turning it counterclockwise with your fingers not more than two turns. If the push button is completely unscrewed, the plunger assembly, inside the receiver, may fall apart. Then it will be necessary to remove the radio from the car, open the case, and reassemble the plunger.
4. Press the button in as far as it will go.
5. Release the number 1 button and tighten it by turning it clockwise with your fingers.
6. Use the same procedure for adjusting positions 2, 3, 4, and 5. When the five automatic tuning push buttons have been adjusted to the five desired stations, any one of the five stations can be instantly tuned in by pressing the automatic push button that is adjusted to it.

INTERFERENCE SUPPRESSION

There should be no motor noise or interference from the ignition circuit if the receiver has been installed in the car according to the instructions furnished with it. The interference suppression equipment may be checked for proper installation by referring to the following illustrations:

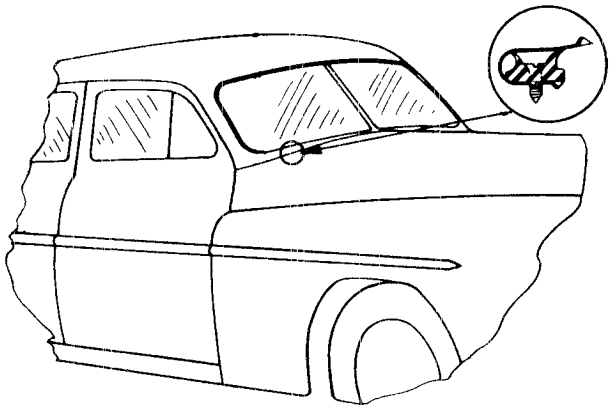

Fig. 3

The hood bonding spring No. 80-579 should be installed on the cowl at the location shown in Fig. 3.

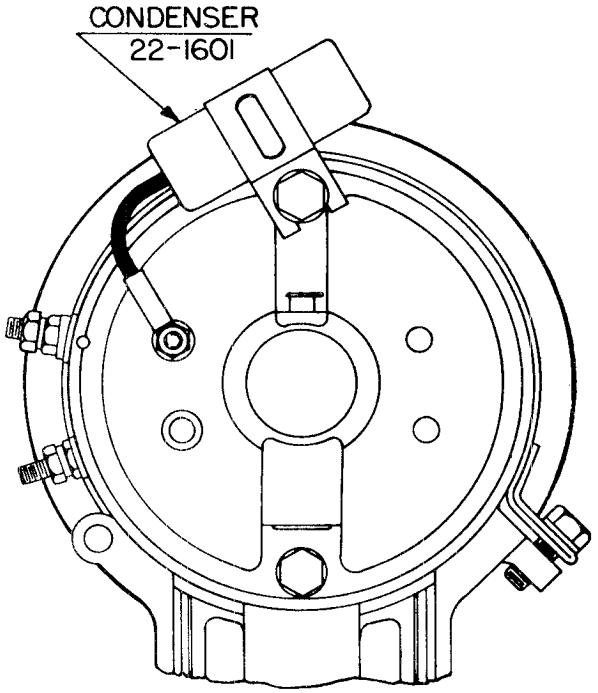

Fig. 4

The generator condenser, No. 22-1601, should be mounted under the top assembly bolt on the rear end plate of the generator, and the lead connected to the ARMATURE terminal of the generator. (Fig. 4.)

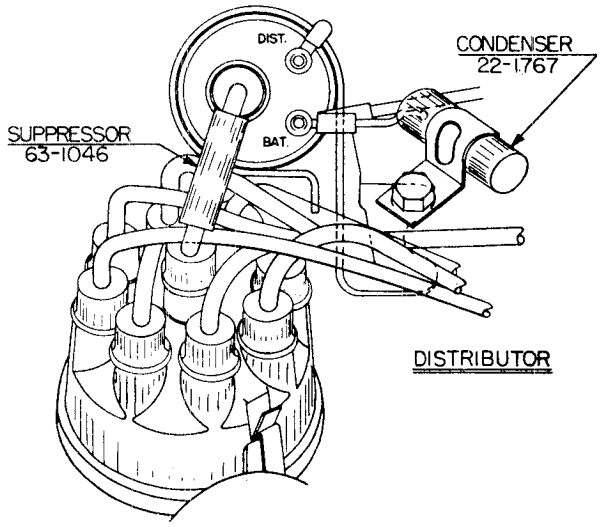

Fig. 5

The suppressor, No. 63-1046, should be in the high tension wire, approximately 1½ inches from the distributor cap (Fig. 5). The ignition coil condenser, No. 22-1767, should be connected to the BAT. terminal of the ignition coil. (Fig. 5.)

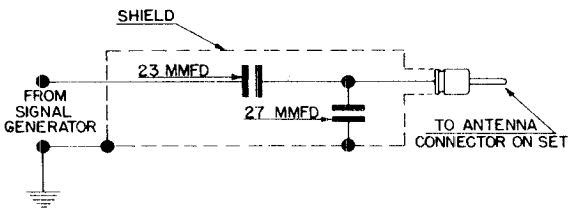

Fig. 8 Dummy Antenna

Figure 8 shows the schematic of a recommended dummy antenna, closely resembling actual antenna capacity, to be used in series with signal generator leads when aligning the R.F. section of the receiver.

ALIGNMENT

Maximum performance depends on accurate alignment of the receiver; therefore follow these instructions carefully.

CAUTION: Make all alignment adjustment to the receiver with the volume control set at maximum, and the tone control in the treble position. Reduce the signal intensity as much as possible at the signal generator. Connect the output meter across the voice coil.

I.F. ALIGNMENT PROCEDURE

1. Remove top and bottom covers from receiver.
2. Set signal generator to 265 Kc.
3. Apply signal from generator through a .1 Mfd. dummy to 7B8 converter grid. (Pin No. 6 on socket.)
4. Adjust I.F. trimmers A, B, C, and D in order named for maximum output (Fig. 7). Some units have I.F. transformers that are slug tuned. In this case adjust I.F. slugs E, F, G, and H in order named for maximum output. Repeat the adjustments to assure accurate alignment. (Figs. 6 and 7.)

R.F. AND OSCILLATOR ALIGNMENT

1. Connect signal generator leads through dummy, illustrated in Fig. 8, to antenna lead in socket on receiver. This is important.
2. Set signal generator to 535 Kc.
3. Tune set to 535 Kc.
4. Adjust oscillator trimmer C-10 (Fig. 7), for maximum response.
5. Set signal generator to 1300 Kc.
6. Tune set to 1300 Kc.
7. Adjust converter trimmer C-7, R.F. trimmer C3 (Figs. 6 and 7) and antenna trimmer C-1 (Fig. 7) for maximum response.
8. If dial calibration is off after making above adjustments, a correction can be made by tuning eccentric screw at fulcrum of dial pointer. (Fig. 6.)

TO ADJUST OR REPLACE THE ADJUSTING SPRING AND CORE

1. Remove the top and bottom covers from the receiver. Remove the escutcheon assembly.
2. Remove, with pliers, the bushing tension clip from the cross arm insulating bushing.
3. With core alignment tool, part No. S 13064, screw the core in, or out, to the desired position.
4. After all adjustments or replacements are completed, be sure to replace the bushing tension clip.

ALIGNMENT PROCEDURE AFTER CORE OR COIL REPLACEMENT

WARNING: The following adjustments are to be made only after a core or coil is replaced.

1. Set signal generator to 1675 Kc.
2. Connect signal generator leads through dummy, illustrated in Fig. 8, to antenna receptacle on the receiver.
3. Set receiver dial to 1600 Kc. (Maximum high frequency end of dial.)
4. Screw the cores completely out of the antenna coil, R.F. coil, the converter coil, and the oscillator coil.
5. Adjust oscillator trimmer C-10 (Fig. 7) at 1675 Kc.
6. Adjust converter trimmer C-7, R.F. trimmer C3, and antenna trimmer C-1 (Figs. 6 and 7) for maximum output reading.
7. Set signal generator dial and receiver dial to 1300 Kc.
8. Replace cores to their approximate original position (so that the cores project about 1/16 of an inch from the end of the coil form).
9. Adjust oscillator core L-5 (Fig. 6) to scale at 1300 Kc.
10. Adjust the antenna core L-2, R.F. core L3, and converter core L-4 (Fig. 6) for maximum output reading.
11. Set signal generator to 600 Kc.
12. "Rock in" shunt oscillator coil L-7 (Fig. 6) for maximum output reading. This should be done only as a last resort. This is the same as rocking in the padder condenser on a gang condenser receiver.
13. Check receiver at 1300 Kc. for calibration and gain. If the receiver is off scale or weak, repeat operations 9, 10, and 11.
14. After alignment is complete, the maximum high frequency tuning range should be checked. If the range is greater or less than 1605 Kc., the lug stop near the volume control should be bent to limit the frequency coverage to 1605 Kc.

IMPORTANT: After reinstalling the receiver in the car, allow it to operate for approximately 15 minutes to reach normal operating temperature. Extend antenna to maximum. Check the antenna trimmer alignment on a weak station at approximately 1300 Kc.

The I.F. transformers incorporated in this receiver are of the new permeability tuned type. The advantage of an I.F. transformer of this type is its extreme stability under various humidity and temperature conditions. The upper coil is the secondary and the lower the primary. When adjusting these I.F. transformers the tuning wrench 68-7 can be inserted into the top slug, rotated until maximum output is obtained and then dropped down to the lower slug and the same operation repeated. The tuning wrench is so designed that turning one slug does not affect the adjustment of the other.

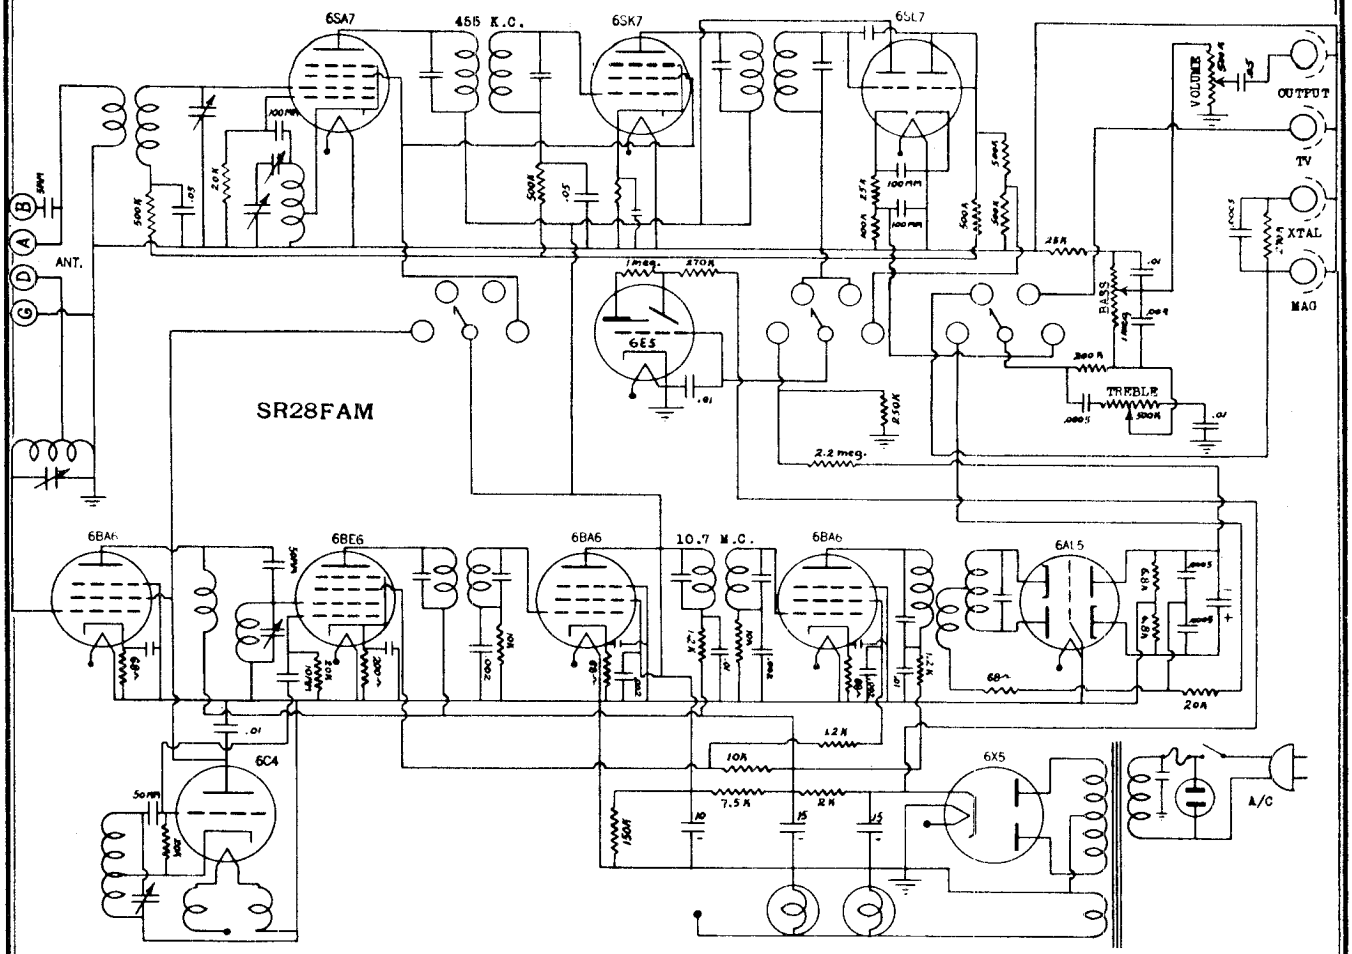
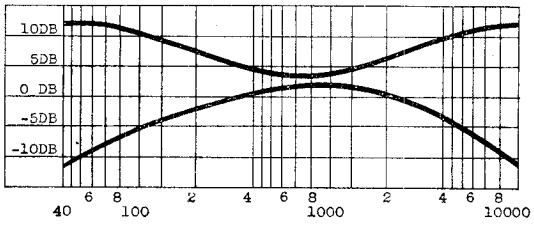
MODEL SR28FAM



The electronic circuit is a dual Superhet designed to operate into an amplifier adjusted for acoustically flat response.

Full range bass and treble controls make it possible to diminish or augment any major portion of the audible scale allowing for an unsurpassed flexibility of tone pattern (Fig. 1.)



SR28FAM embodies such features as tuned Infinite Impedence type AM detection.

Electron ray tuning indicator as a visual tuning aid.

Complete shielding for the elimination of strays.

Input jacks for Magnetic phono pickup, Crystal pickup, and TV audio channel on selector Control Switch.

Average output: .4 volts.

Licensed under patents of Hazeltine Laboratories, Inc., and others.

Tubes: 3, 6BA6; 1 each 6BE6; 6C4, 6AL5, 6SL7GT, 6SA7, 6SK7, 6E5, 6X5.

Power Consumption: 50 watts, 110-125 volts, 50-60 cycles.

CAUTION

VENTILATION IS EXTREMELY IMPORTANT. No multi-tube unit should be housed in an insufficiently ventilated cabinet. Damage to the unit and the cabinet will result.

USE ONLY 1 AMP. FUSE.

ANTENNA REQUIREMENTS.

For best non-directional standard AM broadcast results a single wire five to ten feet in length connected to antenna terminal "A" will be sufficient. Additional selectivity to this efficient input circuit would tend to restrict the wide band reception capabilities of the Infinite Impedence type detector.

For best F.M. results a 100 M.C. dipole should be installed well above surrounding obstructions. The twisted 300 ohm line from the dipole should be connected to antenna terminals "D" and "G". ("G" also grounds unit.)

A console type folded dipole is supplied with the tuner and will prove a satisfactory substitute in most cases where an external dipole is impractical.

INPUT JACKS.

All phono or TV audio signals as well as the AM and FM radio are subject to the volume and tone controls of the tuner.

The jack marked MAG is the phono input for the new variable reluctance cartridge with its properly compensated pre-amplifier.

XTAL is the phono input for a standard crystal pickup.

The TV jack makes it possible to channel the audio of a television tuner thru the radio's amplifier and speaker.

The OUTPUT jack should be connected to the high impedence input control (250,000 to 500,000 ohms) of a quality audio amplifier. Use the prepared shielded lead supplied with the tuner. Choose a speaker capable of wide range reproduction.

A.C.POWER. SR28FAM is completely powerized for 110-125 volts 50-60 cycles. The power switch (on the Volume Control) also controls the A.C.recepticle on the back of the chassis for convenience in amplifier installation.

©John F. Rider

MODELS 171, 172

TUNING RANGE

This receiver is designed to operate over the standard broadcast band which extends from 535 to 1620 Kilocycles (KC) (185 to 560 Meters).

ALIGNMENT PROCEDURE

GENERAL DATA. The alignment of this receiver requires the use of a test oscillator that will cover the frequencies of 455, 600, 1400 and 1620 KC and an output meter to be connected across the primary or secondary of the output transformer. If possible, all alignments should be made with the volume control on maximum and the test oscillator output as low as possible to prevent the AVC from operating and giving false readings.

CORRECT ALIGNMENT PROCEDURE. The intermediate frequency (I.F.) stages should be aligned properly as the first step. After the I.F. transformers have been properly adjusted and peaked, the broadcast band should be adjusted.

I.F. ALIGNMENT. Remove the chassis and loop antenna from the cabinet and set them up on the bench so that they occupy exactly the same respective position on the bench as they did in the cabinet. Care should be taken to have no iron or other metal near the loop. Do not make this set-up on a metal bench. With the gang condenser set at minimum, adjust the test oscillator to 455 KC and connect the output to the grid of the first detector tube (12SA7) through a .05 or .1 mfd. condenser. The ground on the test oscillator should be connected to the ground buss, indicated on the circuit diagram. Align all three I.F. trimmers to peak or maximum reading on the output meter.

BROADCAST BAND ALIGNMENT. Connect the test oscillator to a dummy loop which can be made by coiling 2 turns of hookup wire about 6" in diameter. Place this dummy loop about a foot from the loop on the receiver and in the same plane as the receiver loop. With the gang condenser set at minimum capacity, set the test oscillator at 1620 KC, and adjust the oscillator (or 1620 KC trimmer) on the gang condenser. Next—set the test oscillator at 1400 KC, and tune in the signal on the gang condenser. Adjust the antenna trimmer (or 1400 KC trimmer) for maximum signal. Next set the test oscillator at 600 KC, and tune in signal on condenser to check alignment of coils.

POWER SUPPLY. This receiver is designed to operate on any alternating current supply (AC) ranging from 110 to 120 volts, 50 to 60 cycles; or on any direct current supply (DC) ranging from 110 to 120 volts.

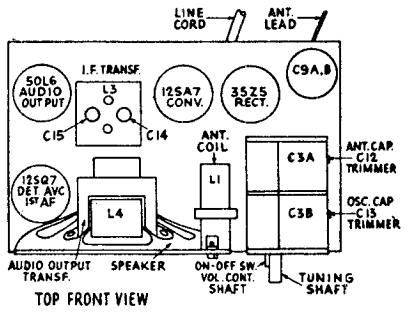
ALL RESISTANCES IN OHMS UNLESS OTHERWISE NOTED. ALL VOLTAGE AND RESISTANCE MEASUREMENTS MADE WITH RESPECT TO CHASSIS GROUND WITH 166 V AC LINE V VOLTAGE.

I-F Alignment

Connect an output meter across the voice coil. Connect the signal generator to the primary of the antenna transformer through a 100-$\mu\mu$f capacitor.

Set the signal generator to 455 kc and fully mesh the receiver tuning capacitor.

Keep the receiver volume control at maximum and the output of the signal generator sufficient to give a readable deflection on the output meter and adjust i-f trimmers C15 and C14 for maximum.



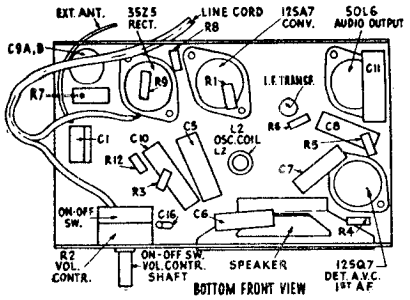
The top front view of the Air King A400, showing tubes and trimmer locations.

R-F Oscillator Adjustment

Keeping the same setup as used for i-f alignment, set the signal generator for 1600 kc and adjust oscillator trimmer C13 for maximum output.

Set signal generator and receiver for 1400 kc and adjust antenna trimmer C12 for maximum output.

The parts layout and alignment points are shown in the accompanying diagrams.



The bottom front view of the Air King A400, showing parts layout.

Bendix 1217B, 1217D

Model 1217B appears on *pages 19-9 through 19-19 of Rider's Manual Volume XIX* and Model 1217D appears on *pages 19-20 through 19-33 of Rider's Manual Volume XIX*. Hum can be corrected by removing the shielded lead between the two chassis from the plug assembly and running it in through a separate connector. All of the hum pickup is taking place at the eight-prong plug on the radio chassis. With the cable running in through the chassis about two inches away from the plug assembly, the hum level is so low as to be almost unmeasurable.

Crosley 9-212B

This model is the same as Model 9-209 appearing on *pages 19-19 through 19-21 of Rider's Volume XIX*.

Espey 509

This model is the same as Model 7B1, appearing on *pages 18-1,2 of Rider's Volume XVIII*, except for the following changes Capacitor C55 (10 $\mu\mu$f) connected from pin 1 of the 7F8 tube to ground has been removed. The 0.003-μf capacitor C9 has been changed to 1500 $\mu\mu$f.

The position of the trimmers has been changed. Looking at the front of the set, they are: C49 (broadcast trimmer), C51 (f-m oscillator), C50 (broadcast oscillator), and C52 (f-m r-f trimmer).

A coil has been placed in the cathode lead of the 7Q7 tube before this lead is connected to C50. Capacitor C53 (15 $\mu\mu$f) has been changed to a variable capacitor and is now connected between L5 and ground, instead of across L5. The junction of C50 and the cathode lead of the 7Q7 tube is connected to the ground side of this capacitor.

The 22,000-ohm resistor, R51, connected between R13 and ground has been eliminated. The side of C19 that is not connected to R13 is grounded directly. The side of the tone control, R14, previously connected to C19 has been left open. R20 has been changed from a 470,000-ohm resistor to a 1-megohm variable resistor. The movable arm of R20 is now connected to pin 5 of the 7F7 tube, and one side of R20 is connected to the junction of C21, C22, and C23. C56, the 1500-$\mu\mu$f capacitor across the filaments of the 6BA6 tube, has been removed.

Farnsworth K-084, K-086, K-289

The first two models appear on *pages 18-6 through 18-12 of Rider's Volume XVIII*. The following changes have been made in production. Model K-289 incorporates these changes.

A 3-gang tuning capacitor is used, necessitating changes in the r-f amplifier circuit. The 100,000-ohm resistor connected to the grid (pin 1) of the 6AG5 r-f amplifier has been changed in value to 1 megohm. The lead which was formerly connected from the bottom of this resistor to the junction of resistors 7 and 8 (1 megohm and 4.7 megohms, respectively) is now connected directly to resistor 4 (100,000 ohms) and to D5 of switch section 2 rear. Resistors 7 and 8 have been eliminated.

The band-pass coil and the 470-$\mu\mu$f capacitor which were connected between the plate (pin 5) of the 6AG5 tube and the third grid (pin 8) of the 6SB7Y oscillator convertor tube have been removed. A connection has been made from the plate of the 6AG5 tube through a 100-$\mu\mu$f capacitor to D3 of switch section 2 rear. The third grid of the 6SB7Y is still connected to D2 of switch section 2 rear. The 100,000-ohm resistor, which was formerly connected between D1 of switch section 2 rear and the junction of D4 of the same switch section and the 1000-ohm resistor, has been removed. There is a connection from D1 of switch section 2 rear and C1 of switch section 2 front, indicated on the schematic by the black dot on these connections.

The 0.005-μf capacitor connected to C7 of switch section 2 front has been removed, as has the wave trap and 100-$\mu\mu$f capacitor connected to C1 of the same switch section. The third section of the ganged tuning capacitor is connected between C1 and ground, and is shunted by the f-m converter trimmer, and also by a band-pass coil (49) in series with a 0.05-μf capacitor. A 100,000-ohm resistor is connected from the junction of this capacitor and coil to D4 of switch section 2 rear. A 0.01-μf capacitor in series with a coil is connected from this common ground point to the junction of the 4700-ohm resistor and the r-f choke in the plate circuit of the 6AG5 r-f amplifier. A 47,000-ohm resistor has been connected in the line going between A3 of switch section 1 front and the junction of the 47,000-ohm resistor, the 470,000-ohm resistor, and the 100-$\mu\mu$f capacitor in the filter circuit of the a-m detector.

The following step should be included in the a-m alignment table on *page 18-1* between steps 6 and 7.

Step	*Connect Generator*	*Set generator At*	*Set Gang At*
6A	Ex. Ant. Binding Post	1500 kc.	1500 kc.
Adjust		*To Obtain*	
BC R-F Trimmer		Maximum Output	

The following additions should be made to the parts list.

Ref. No.	Part No.	Description
27	25456	60-$\mu\mu$f ceramic capacitor
34	25182	0.1-μf tubular capacitor, 200 volts
39	26277	Tuning capacitor
46	13766	Loop antenna (GK-084, -088; K-084)
46	13784	Loop antenna (GK-086, -087; K-086, -289)
47	38932	F-m antenna coil
50	25181	0.05-μf tubular capacitor, 200 volts
51	38933	F-m converter coil
52	38934	F-m oscillator coil
69	31175	Speaker
73	42185	Pilot lamp, 250 ma (K-084, -086)
73	42187	Pilot lamp, Mazda 55 (K-289)
	22147	Pickup cable (GK-084, -088; K-084)
	22150	Pickup cable (GK-085, -086, -087; K-086, -289)
	31421	A-m dial glass (K-084, -086)
	31422	F-m dial glass (K-084, -086)
	31453	A-m dial glass (K-289)
	31454	F-m dial glass (K-289)
	31431	Dial escutcheon (K-084, -086)
	31452	Dial escutcheon (K-289)
	92192	Dial drive cord (45 inches)
	37014	Drive drum
	54091	Band switch lever (K-084, -086)
	54310	Band switch lever (K-289)
	59451	Knobs (K-084, -086)
	92228	Dial background (K-084)
	60665	Escutcheon backing (K-289)
H-283-1		Cabinet and carton for K-084 (walnut)
H-283-2		Cabinet and carton for K-084 (blonde)
H-285-1		Cabinet and carton for K-086 (walnut)
H-285-2		Cabinet and carton for K-086 (blonde)
H-315		Cabinet and carton for K-289

©John F. Rider

Farnsworth Chassis C-170, C-194, C-216, C-201

These chassis are used in Models GK-100, GK-102, GK-103, and GK-104, appearing on *pages 17-3 through 17-10 of Rider's Volume XVII*. These chassis are listed as follows:

Model	*Chassis*
GK-100	C-170
GK-102	C-194
GK-103	C-216
GK-104	C-201

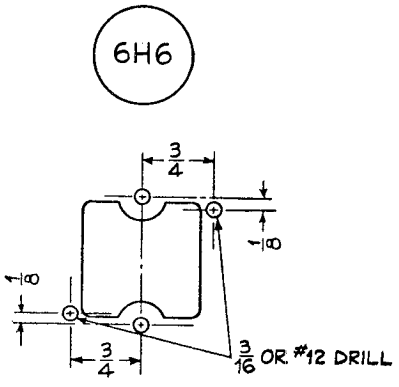
Farnsworth GK140 Series

This model appears in *Rider's Manual XVI, pages 16-6 through 16-11*. The following procedure is conducive to increased sensitivity, noise rejection, broader tuning, and reduced thermal drift of the f-m section of the GK140 series combination instrument.

To reduce drift, change the oscillator grid coupling capacitor (grid of 6C4 to the oscillator coil) from 50 $\mu\mu$f zero temperature coefficient to 40 $\mu\mu$f N-1400 temperature coefficient. The part number of this replacement is 25442. Change the oscillator padder capacitor (oscillator coil to f-m gang section) from 55 $\mu\mu$f N-330 to 55 $\mu\mu$f zero temperature coefficient. This new part number is 25441. These changes will necessitate slight realignment of the f-m converter and oscillator. To make these modifications, use the following procedure:

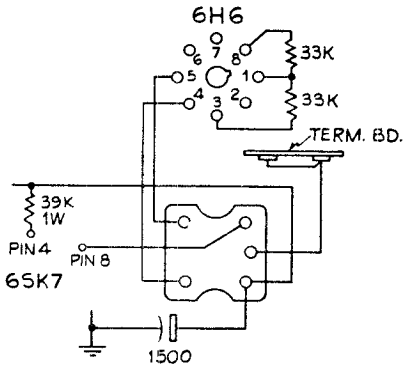
Clip out two 330,000-ohm, ½-watt resistors connected between the ratio detector transformer (next to the 6H6 socket) and the terminal board, one 5,000-$\mu\mu$f mica capacitor between the B-supply for the transformer and ground and two 6,000-ohm, ½-watt resistors connected to the 6H6 socket. Clip four leads connected to the transformer. Remove the ratio detector transformer and replace with the transformer No. 38879. To do this, it is necessary to drill two new holes as shown in the accompanying diagrams.

After the transformer is connected (make leads as short as possible) connect two 33,000-ohm, ½-watt resistors, Part No. 77183, one between pin No. 8 on the 6H6 socket and ground, and the other between Pin No. 3 and ground (short leads). Connect a 1,500-$\mu\mu$f capacitor, No. 25273, between the B-supply to the transformer and ground. Connect a 0.002-μf. 600-volt capacitor, No. 25185, between ground and the point where the 22,000-ohm, ½-watt resistor connects to the shielded lead on the terminal board by the 6H6 socket.



The 3/16-inch holes pointed out here must be drilled to accomodate transformer 38879 in the Farnsworth GK140 series.

This completes the changes. It is now necessary to align the i.f.'s on f.m. Connect a voltohmyst on the AVC line (Pin 3 on 6H6 socket through a 1-megohm resistor).



The circuit of the Farnsworth GK140 series as it appears after modification.

Connect the a-m signal generator, set at 10.7 mc, to the grid of the 6SK7 which feeds the diode transformer. Connect the output meter across the voice coil of the speaker. Turn the bottom slug next to the chassis of the diode transformer out as far as possible. Tune the top slug for maximum output (negative voltage) on the voltohymst. Move the generator to the grid of the second i-f amplifier. Detune the slug under the chassis by turning it out as far as possible. Tune the top slug for maximum voltage, next tune the bottom slug for maximum voltage. In each step do not use an input greater than necessary to give three volts AVC. Move the signal generator to the grid of the first i-f amplifier. Detune the bottom f-m slug (nearest corner of can) by turning it out as far as possible. Tune the top slug (nearest corner of can) for maximum voltage, next tune the bottom slug for maximum voltage. Move the signal generator to the 6AG5 converter grid and tune the first i-f transformer as described previously. With the generator still hooked to the 6AG5 grid and modulated with 400 cycles and with about 200 microvolts input, adjust the slug next to the chassis on the diode transformer for maximum output voltage on output meter, which is across the voice coil.

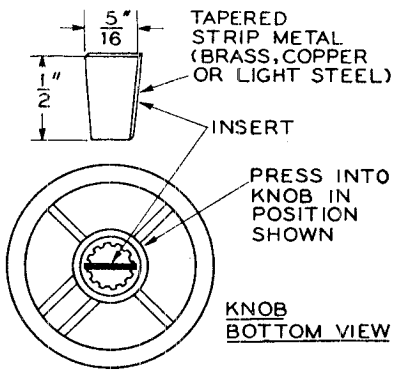
Farnsworth GK-266, K-699, Chassis C-152, GK-267, K-267 Chassis C-153

These models are the same as Models EK-263 and EK-264, which appear on *pages 15-7 through 15-9 of Rider's Volume XV*, except for the cabinets. The parts list should be amended to include the following:

Ref. No.	*Part No.*	*Description*
39	94235	Output transformer, GK-266, GK-267, K-267, K-669
41	38533	Loop antenna, EK-264, GK-267, K-267
41	38997	Loop antenna assembly, K-669
41	38894	Loop antenna assembly, GK-266
47	81169	Speaker, K-669
47	81170	Speaker, GK-266, GK-267, K-267
	31318	Dial glass, EK-264, GK-267, K-267
	31280	Dial glass, EK-263, EK-265, GK-266, K-669
	59211	Dial escutcheon, EK-264, GK-267, K-669, K-267
	59199	Dial escutcheon, EK-263, EK-265, GK-266
	58587	Dial background, GK-266, K-669
	58586	Dial background, GK-267, K-267
H-278-1		Cabinet and packing, GK-267, walnut
H-278-2		Cabinet and packing, GK-267, blonde
H-277-1		Cabinet and packing, GK-266, walnut
H-277-2		Cabinet and packing, GK-266, blonde
H-317		Cabinet and packing, K-669
	59134	Knob for walnut cabinets
	59450	Knobs for GK-266, GK-267, blonde

Farnsworth P7, P9, P10, Capehart

These models appear on *pages 19-19 through 19-33 of Rider's Volume XIX*. The program control knob on these models turns a switch with detent contacts. If this knob is not pushed down to grip a substantial portion of the knurled shaft, the inside of the knob may become reamed out and in time lose its ability to grip the shaft sufficiently to actuate the switch.



Method of wedging the program control knobs of the Farnsworth P7, P9, P10, so they grip the shaft.

If such a condition occurs and there is no replacement knob handy, refer to the accompanying diagram and the following:

A piece of metal strip 5/16" × ⅜" or ½" should be wedged tightly into the center of the knob. When the knob is placed over the shaft, the metal insert will engage the shaft slot.

Improved knob gripping can sometimes be obtained by slightly spreading the shaft slot. Care must be exercised in doing this however. If the shaft slot is spread too far, it is likely to break or be spread unevenly, thereby imparting an undesirable "wobbly motion" when turned.

If hum is encountered in the 35P7 or in any instrument using the P7, P9, or P10 chassis, it may be due to either a gaseous or aged 6T8 that is used as the 1st audio amplifier, or a signal that is being picked up on the power line because of a faulty 0.005-μf, 600-volt capacitor, Part No. 25031, located between the unbuffered side of the line and ground.

©John F. Rider

Farnsworth P71

This model appears on *pages RCD. CH. 19-1 through 19-10 of Rider's Manual Volume XIX*. The following changes should be noted in the parts list:

Part No.

07594 Turntable assembly, changed to 15241

64437 Tone arm counterbalance spring, changed to 64343.

Part number **44064**, phono motor, has been deleted. This is shown on *pages RCD. CH.19-5*. It is available as Part Number **11437** only. Motor parts, Numbers **15237, 37241,** 54308, 64471, and **92335**, are no longer available as separate parts. If any of these are required, a complete motor assembly, No. 11437, must be ordered.

Farnsworth P72 Record Changer

This record changer may be found on *pages RCD.CH. 18-25 through RCD.CH. 18-9 of Rider's Volume XVIII*. A production change has been made in the Surfa-Sonic Control. The 0.02-μf capacitor has been changed to 0.1 μf. The 3,300-ohm resistor has been changed to 2,200 ohms.

The following have been deleted from the parts list:

Part No.	*Description*
25276	0.02 μf, 200 v
77240	3,300 ohms, ½ w

The following have been added to the parts list:

25182	0.1 μf, 200 v
77184	2,200 ohms, ½ w

Farnsworth P71, P72, P73

Model P71 appears on *pages RCD.CH.19-1 through 19-10 of Rider's Manual Volume XIX*, and Models P72 and P73 appear on *pages RCD. CH. 18-1 through 18-9 of Rider's Manual Volume XVIII*. There appears to be some misunderstanding concerning the correct nomenclature of parts numbers 58854 and 64467. Part 58854 is correctly titled "Starting Lever Spring". The function of this part is to exert the proper amount of tension on part 58853, starting reset lever, which in turn performs the dual purpose of transmitting the motion of the trip mechanism to the starting lever, thus setting the starting lever in the proper position for starting the change cycle and also resetting the starting and reject levers, after the change cycle has started, to their proper positions. Part 64467 performs the operation of transmitting the motion from the reject button mechanism to the reject lever, thus starting the change cycle. Part 64467 is referred to in the parts list as the "Trip Spring". In order to avoid future misunderstanding, the nomenclature of this part has been changed to read—Part #64467, Reject lever spring.

Farnsworth 41E Capehart Record Changer

This record changer may be found on *pages RCD.CH. 18-25 through RCD.CH. 18-46 of Rider's Volume XVIII*. The change cycle is placed into operation when the trip finger releases the mercury switch dog (part number 561222). If, for any reason, a changer should fail to cycle properly and, upon checking, the trip mechanism is found to be operating normally, it is suggested that the top of the mercury switch Reset Lever (part number 561221) be examined to make sure that it is smooth. Many hours of operation may tend to wear a groove in the top of the Reset Lever which would tend to hold the dog in place, thus resisting the action of the trip mechanism. This condition is caused by normal wear due to friction between the two parts.

When this condition is found, it is recommended that the mercury switch Reset Lever be replaced by a new one. The new stock has been hardened to provide longer operating life.

In an early production run, a mercury switch with a metal shell or housing was used. Due to the slow action and greater angle of drop necessary to actuate this switch, it has since been replaced by one using a glass housing or bulb. Changers employing the metal-housed mercury switch should be checked for positive switch action, especially if it has been reported that the changer cycles continuously, or more than once for a single tripping action.

In such cases, it is recommended that the metal switch be replaced with the more positive glass bulb type (part number 90147). The contacts of the Play Control switch must be set so that positive contact is made when the play control knob is set in OFF position. In this position the contact points must be OPEN.

It is not necessary to remove the play control to adjust these contacts on the majority of the Model 41-E changers now in use. A 5/16" diameter observation hole has been added to the back of the play control housing directly in line with the contact points. With the changer on the service bench, it is an easy matter to insert a screwdriver or a pair of long nose pliers and bend the contact springs slightly.

This operation is a little more difficult with the changer in the cabinet, as there is only about a 3-inch clearance between the back of the play control housing and the side of the cabinet. A small inspection mirror, a "knob" type screwdriver and a penlite will be helpful in making these adjustments when the changer is in the cabinet.

Federal 1021, 1031, 1032, and 1540

These models are the same as Model 1030T, appearing on *pages 16-5 through 16-8 of Rider's Volume XVI*, except for the cabinets.

Federal 1024TB

This model appears on pages *17-1 through 17-3 of Rider's Volume XVII*. Some sets have been equipped with a 12SK7 tube as an i-f amplifier instead of the 6SS7. This gives better performance.

Federal 1027, 1035

These models are the same as Model E1025TB, appearing on *pages 16-1 through 16-4 of Rider's Volume XVI*, except for the cabinets.

Federal 1028TB, 1029

These models are the same as Model 1024TB, appearing on *pages 17-1 through 17-3 of Rider's Volume XVII*, except for the following changes. A 12SK7 tube is used as the i-f amplifier instead of the 6SS7. The cathode resistor (R2) of the i-f amplifier can be either 1500 ohms or 750 ohms. C17 can be either 470 $\mu\mu$f or 1000 $\mu\mu$f. R13 (in filament lead) has been eliminated, and pin 2 of the 50L6GT tube connected to pin 7 of the 35Z5GT tube.

Federal 1034

This model is the same as Model 1024TB, appearing on *pages 17-1 through 17-3 of Rider's Volume XVII*, except for the cabinet.

General Electric 41, 42, 43

These models appear on *pages 17-12 through 17-15 of Rider's Volume XVII*. To increase the sensitivity at certain points on the broadcast and shortwave bands, a 470-$\mu\mu$f capacitor, C111, catalog number UCU-544, has been added between terminals 3 and 5 on the first i-f transformer. On early production sets without this capacitor, the following should be done:

1. This capacitor should be added between terminals 9 and 10 of wafer #6 on the band switch.
2. The orange, green, and black leads from terminals 5, 3, and 8 of the first i-f transformer to the band switch should be grouped together and pressed to chassis.
3. C108, a 0.02-μf bypass capacitor, ground end, should be removed and grounded under the mounting lug of the first i-f plate coil.

General Electric 50

This model appears on *pages 15-1 through 15-4 of Rider's Volume XV*. Add to the description of catalog number RAU-009 Cabinet—plastic cabinet, the color "Brown Mottle." Also, add the following to the parts list:

Cat. No.	*Description*
RAU-017	Cabinet—plastic cabinet (black)
RAU-018	Cabinet—plastic cabinet (dark ivory)
RAU-019	Cabinet—plastic cabinet (ivory and red)
RAU-024	Cabinet—plastic cabinet (white urea)

General Electric 118, 119

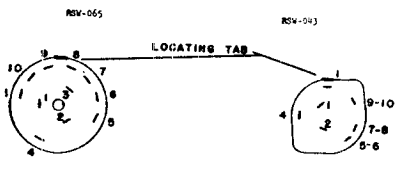
These models appear on *pages 19-8 through 19-10 of Rider's Volume XIX*. The green grid lead and blue plate lead of the first i-f transformer must be dressed as far as possible to the rear of the chassis and against the chassis. Coupling capacitor C24 should never lie against either of these leads. This will eliminate any possibility of r-f leakage into the phono-preamplifier which causes stations to be heard while operating the phonograph.

The following changes should be made in the parts list. Add P2 under symbol for RJP-003. Delete: RCN-014, C26, Capacitor—phenolic, for Model 118. Add to UCC-045: C26, Capacitor, 0.05 μf, 600 v., paper, for Model 118.

General Electric 118, 119M, 119W

These models appear on *pages 19-8 through 19-10 of Rider's Manual Volume XIX*. The phono radio switch S1, catalogue number RSW-043 has been changed to RSW-065 and the new switch is wired as follows:

Connect terminals 1 and 3 together. Connect terminals 5 and 6 together. Connect terminals 7 and 8 together and then connect terminals 9 and 10 together. The leads may then be transferred from the old switch to the corresponding terminals on the new switch RSW-065, as shown in the accompanying diagram.



General Electric 118, 119.

General Electric 145

This model appears on *pages 19-13 through 19-16 of Rider's Volume XIX.* The B battery minus connection is made to the dummy lug 5 on the switch shown in Fig. 2.

General Electric 150

This model appears in *Rider's Manual Volume XIX on pages 19-10 through 19-12.*

If a condition of parasitic oscillation with strong signals and high volume setting, characterized by whistles and distorted output is reported on late production models in the gray cabinet the following change will correct the condition:

Change the grid return of the i-f amplifier by moving bus wire lead on #2 lug of first i-f transformer to pin #5 of the r-f amplifier (1T4), instead of pin #5 of the i-f tube. This changes the bias of the i-f amplifier from zero volts to minus 1.4 volts.

The following replacements should be made in the catalogue numbers:

Delete the following parts:

Old Cat. No.	*New Cat. No.*	*Symbol*	*Description*
URD-009	URE-009	R1	Resistor - 330 ohms, 1 w., carbon*
RCE-069	RCE-087	C2A,B,C	Capacitor - Electrolytic capacitor
RCW-3013	RCW-3015	C11	Capacitor - Electrolytic capacitor*
RHB-004	RHB-009		Monogram Button**
RLL-029	RLL-034		Loop - Antenna loop
SJS-068	RJC-016		Speaker Contact and Lead
		RAB-080	Cabinet Back - Plastic (ivory)
		RAU-041	Cabinet - Plastic (ivory)

Add the following parts:

RAB-081		Cabinet Back - Plastic (gray)
URD-045	R5	Resistor - 680 ohms, ½ w., carbon*
RHS-010		Tube shield*
UCC-625	C12	Capacitor - 0.005 μf, 600 v., paper*
UCC-635	C9	Capacitor - 0.05 μf, 600 v., paper*
RHM-052		Clip - Clip for loop antenna

*Applies to receivers with chassis number greater than 100,000.
**The new button is attached to the cabinet by means of glue.

For chassis numbers up to 55,000 the capacitors C10, 100 μμf, and C12, 0.005 μf, were not connected according to the schematic diagram. Their B- connections were made to the left side of the switch S1B, together with the capacitors C2A and C2B. This was done to prevent a howling sound when the power switch S1 is turned off.

For chassis numbers from 60,000 to 70,000 the capacitors C10 and C12 were wired according to the schematic diagram. However, the wiring of the capacitors C2A and C2B has been changed. It was found that, under certain circumstances, these capacitors added their charge to the peak of the line voltage, causing a current surge which was capable of damaging any tube. Therefore, the negative sides of the two capacitors (C2A and C2B) were connected to the right side of the switch S1B (B- line) and the positive side of C2B was connected to the terminal of the S2A switch which is connected to the B+ line of the receiver. Now the charge can leak off after the set is disconnected from the power supply. The following replacement has been made in the parts list:

Connecting pin SJS-008 for the loop antenna has been changed to RJC-001.

General Electric 160

This model appears on *pages 19-17 through 19-21 of Rider's Manual Volume XIX.* The following change in parts list should be noted:

Change catalogue number RTO-003 to read RTC-003 T5 Transformer-charging transformer.

GE 201, 202

Since there are electrically identical, these models have been added to the listing for Models 200, 203, and 205 which appears in *Rider's Volume XVIII, pages 18-19 and 18-20.*

The following items have been added to the parts list:

RAU-001 Cabinet—ivory (plastic), model 201

RAU-023 Cabinet—brown (plastic), model 202

The Beam-a-Scope cabinet back listed as RAB-003 also applies to models 201 and 202

General Electric 230, Kaiser-Frazer

This model appears on *pages 18-26 through 18-28 of Rider's Volume XVIII.* When rough manual tuning action is experienced, it is usually traced to insufficient spacing between the end of the center shaft of the turret assembly and the guide rod bracket near the tuning shaft. Production requirements call for one or more (as required) brass shim washers at this point for smooth tuning action. Where rough tuning is experienced, a thin "C" washer slipped onto the end of the center shaft of the turret in addition to the brass shim washers will relieve binding and result in smoother tuning action.

GE 230, 233

Model 230 appears in *Rider's Volume XVIII on pages 18-26 through 18-28* and Model 233 in the same Volume, *pages 18-29 through 18-36.* To the replacement parts list for these two models add RMX-120, Coil Cap Retaining Spring and Screw.

A quantity of these are used to service the antenna r-f or oscillator-converter coil and shield assemblies where the tabs have been broken. The spring is placed upon the assembly to form a bridge. Bearing upon the coil and held by the small self-tapping screw through the hole in the shield, the bridge retains the coil within its shield in lieu of tabs.

While early production receivers of Model 233 were wired as shown in the schematic, late production changes revise the power supply circuit as follows:

R24 has been deleted and the circuit for C30 is completed by connecting its free end to the secondary winding lead going to pin 5 of the rectifier, V8, so that C30 appears across the secondary of T4. Resistors R26 and R27 are connected in series with one another and across the primary winding of T4. The junction of the resistors is grounded.

To conform with these production changes, Cat. Part URE-073, R24 is deleted from the replacement parts list and item URD-023, R26 and R27, 82 ohms, ½ w., carbon resistor is added.

Cat. No. RMX-123, pushbutton locking screw is also added. This screw locks the pushbutton device for automatic station tuning and has a knurled head and threaded end.

Cat. No. RCY-028 for C1 has been changed for an improved antenna trimmer, 8-480 μμf, used in late production, listed RCY-052. This item allows knob adjustment of the antenna trimmer for which a knob is available under Cat. No. RDK-158.

General Electric 233, Kaiser-Frazer

This model appears on *pages 18-29 through 18-36 of Rider's Manual Volume XVIII.* In cases where the volume and tuning control shafts appear too short to accomodate the shaft parts and knobs, a formed lip which is bent forward in the escutcheon opening of the instrument panel will be found to obstruct receiver installation. This lip may be removed by either filing or bending it back.

In instances where the hole for the receiver mounting bracket has not been accurately located, it is possible that the receiver is positioned a bit too far toward the front of the car to allow the receiver control shafts to come through instrument panel holes to their maximum extent. If the "knock out" hole for the mounting brackets screw must be drilled, make certain it is accurately positioned.

In case of pushbutton sticking, check for and remove any burrs from the bottom of the cast grille for pushbutton openings. A binding tuning shaft will also cause the pushbottons to stick or fail to return to their normal positions. To clear shaft from binding, enlarge the tuning shaft opening using a reamer, or a rat tail file.

If the receiver is dead, check installation wiring to make certain the correct lead is connected to the ignition and instrument light switch respectively. If the receiver lead that should go to the instrument light control is connected to the ignition switch, the receiver will not operate though pilot lamps will light.

Check the loudspeaker plug connection. Though the plug pin receptacles in the speaker lead connector are arranged in such a manner to be polarized, it is often that the operator neglects to align the receptacles with respect to the male plug pins at the speaker. Forcing together of the incorrectly aligned parts is liable to cause the male pins to break through into the thin walls of the non-conducting adjacent holes of the speaker plug, resulting in open circuit wiring to the loudspeaker.

Exposure of the radio receiver to such dampness as water drain-leaks upon the receiver components and wiring, results in voltage breakdown at tube sockets (especially the 6V6 output tubes), or the shorting of capacitors and resistors. The r-f trimmer strip at the center of the receiver will also be affected, causing the radio to become weak or dead. Water leaks around the windshield, and screw head holding the set mounting bracket to the cowl should be well sealed against water draining upon the receiver. A thorough check for probable leaks and the necessary steps taken to prevent their occurrence should be taken at the time of the initial radio receiver installation.

A lower than normal battery voltage can be the cause of the radio to be weak or fail to operate. The receiver will not function properly if the battery voltage measures less than 5.8 volts.

The following changes in production wiring should be noted in the schematic diagram:

Capacitor C28 has been changed to the left side of switch, S1, at the junction of C27 and the switch connection. The ground lead of C28 is connected to chassis ground.

©John F. Rider

GE 210, 211, 212

These models appear in *Rider's Volume XVIII, pages 18-21 through 18-25.* In the schematic diagram C12 is shown as 22 μμf. This should be corrected to read 20 μμf. C12 is listed correctly in the replacement parts list as Cat. No. RCW-3016, 20 μμf.

The following items should be added to the replacement parts list:

RII-021—Insulator — Textolite (to insulate the volume control from chassis)

RII-022—Insulator — Textolite (to insulate the band switch from chassis)

In the tube and trimmer location shown on page 18-25, the secondary tuning slug of T6 is available through the top of the can, while the primary tuning slug of T6 is available through the holes in the bottom of the can.

General Electric 219, 220, 221

These models appear on *pages 15-28 through 15-31 of Rider's Volume XV.* In the parts list, catalog number RLL-003 should be identified as a replacement loop assembly only for Models 219 and 220. Catalog number RLL-025 should be added as the loop assembly for Model 221.

General Electric 250, 260

Model 250 appears on *pages 15-32 through 15-36 of Rider's Volume XV.* Model 260 appears on *pages 16-6 through 16-12 of Rider's Volume XVI.* The following should be added to the parts list for both models: Hinge pin for cover, catalog number RMP-011.

General Electric 321A

This model is the same as Model 321 Late, appearing on *pages 15-46 and 15-52 of Rider's Volume XV.*

General Electric 356, 357, 358

These models appear on *pages 18-40 through 18-44 of Rider's Volume XVIII.* The following changes should be made in the parts list. Under UCC-025, remove symbols C43, C65, C70. Add to UCC-026 symbols C43, C65, C70.

General Electric 356, 357, 358; 376, 377, 378

Models 356, 357, and 358 appear on *pages 18-40 through 18-44 of Rider's Volume XVIII.* Models 376, 377, and 378 appear on *pages 19-36 through 19-41 of Rider's Volume XIX.* When an old type construction 6BE6 (date coded 8/17 or before) is replaced with a new type construction 6BE6 (dated 8/22 or later) it is necessary that the f-m oscillator choke coil L8 be a 13½-turn coil (catalogue number RLF-012) instead of the 17-turn coil that was used in early production models.

General Electric 376, 377, 378

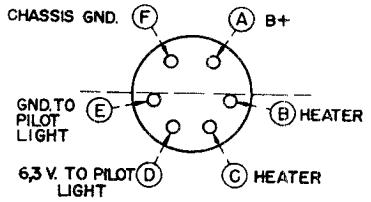
These models appear on *pages 19-36 through 19-41 of Rider's Volume XIX.* The f-m choke, L8, in the cathode circuit of the 6BE6 oscillator converter tube, V2, was listed under catalog number RLF-007. Due to a production change, this choke now becomes RLF-012.

Delete URD-033, R12, Resistor—220 ohms, ½ w., carbon. Add URD-037, R12, Resistor—330 ohms, ½ w., carbon. Add RCW-3009, C37, Capacitor—20.5 μμf. ±5%, ceramic. Delete UCW-2011, C37, Capacitor—20 μμf, ceramic. Add symbol number P4 to RJP-003. Delete P3 and P4 (Plug—preamplifier power plug) from RJP-004. Add RJP-005, P3, Plug—preamplifier power plug.

General Electric 417, 417A

Model 417 appears on *pages 16-16 through 16-19,* and *pages 16-21 through 16-24 of Rider's Volume XVI.* Model 417A appears on *pages 17-27,28 through 17-38 of Rider's Volume XVII.* These changes are in reference to the wiring of Phono Preamp Plug RJP-005.

Since some of the plugs supplied are inconsistent with specifications regarding the identification notch often referred to in wiring guides, this notch must be disregarded for indentification purposes to avoid confusion. While in some receiver productions the position of this key notch will differ from others, nevertheless, all receiver productions are wired the same in respect to the polarized system of prong arrangement.



Phone Preamp Plug RJP-005 in the GE 417, 417A should be wired as shown.

When replacing the plug RJP-005, it is only necessary to follow the simple wiring rule as used in all receiver production where the cluster of four prongs is first located within one-half the area of the plug base as determined by the imaginary center line. Next, locate the two remaining prongs as viewed from the prong end of the plug and begin the wiring in a clockwise direction as indicated by the letter designations in the accompanying diagram. The letters A, B, C, etc., in the diagram, are keys to wiring points, as referred to in the various published receiver circuit diagrams.

Magnavox AMP-101C

This model is the same as Model AMP-101A on *pages 17-1 and 17-2 of Rider's Volume XVII,* except for the following changes in parts values.

Ref. No.	*Description*	*Part. No.*
2-1	Capacitor, paper, 0.1 μf 600 v.	250152G33
2-2	Capacitor, paper, 0.1 μf, 600 v.	250152G33
8	Resistor, composition, 15,000 ohms, ±10%, ½ w.	230084G76
9	Resistor, composition, 100,000 ohms, 10%, ½ w.	230084G86

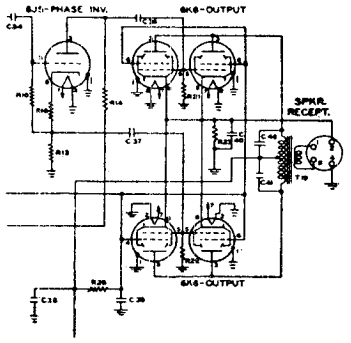
Magnavox AMP 111D, AMP 111E

These models are the same as Model AMP 111, appearing in *Rider's Volume XVIII, pages 18-4 through 18-7,* except for the following parts value changes:

Ref. No.	*Description*	*Part. No.*
9	Capacitor, paper, 0.03 μf, 400 V	250152G25
22	Resistor, composition, 22,000 ohms, ±10%, ½W	230084G78

Hoffman C501 and C511, Chassis 108

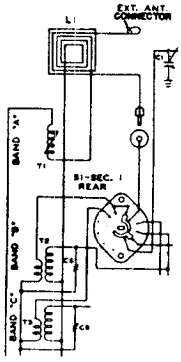
These models are the same as Model A501, Ch. 108S, appearing on *pages 15-6 through 15-10 of Rider's Manual Volume XV,* except that four 6K6 beam-power tubes are used in push-pull parallel in the output stage instead of the two push-pull 6V6's. The change is indicated in the accompanying diagrams. The alignment is still the same as given on *page 15-9.*



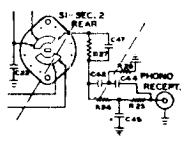
6K6 tubes for Hoffman C501 and C511.

The parts list should be changed to read as follows:

Symbol	*Description*	*Hoffman Number*
C47, C23, C24, C25	100μμf, ± 20%, mica	4000
C28, C32	0.005μf, 600 volt, tubular paper	4102
C29, C30	10μf, 450 volt, tubular electrolytic	4203
C31, C33, C34	0.01μf, 400 volt, tubular paper	4112
C41, C46	0.001μf, 600 volt, tubular paper	4104
C43	0.01μf, 600 volt, tubular	4103
C42, C44	330μμf, ± 10%, mica or ceramic	4010
C45	650μμf, ± 10%, mica or ceramic	4011
L1	Loop antenna	55210
LS	12" speaker, electrodynamic	9044
R2, R17	22,000 ohm, ± 20%, ½ w	4501
R3, R27	2.2 megohm, ± 20%, ½ w	4502
R4	10,000 ohm, ± 10%, 2 w	4503
R11	4,700 ohm, ± 20%, ½ w	4543
R12, R18	47,000 ohm, ± 20%, ½ w	4504
R23	500 ohm, ± 20%, 3 w	4550
R28	1,500 ohm, ± 5%, 6 ½ w	4701
R13, R14, R24, R25	47,000 ohm, ± 5%, ½ w	4537
R26	22,000 ohm, ± 5%, ½ w	4538
T10	Output transformer	5108



Antenna connection changes for Hoffman C501 and C511.



Circuit changes for Hoffman C501 and C511.

Ketay RP570T

This model appears in the *Miscellaneous section, page 15-3 of Rider's Manual Volume XV.* This model is listed in the Indexes as RP507T. It should read RP570T.

© John F. Rider

Magnavox AMP-109B, AMP-109C, AMP-109D

These are the same as Model AMP-109 on *pages 18-1,2 through 18-3 of Rider's Volume XVIII*, except for the following changes. In Model AMP-109D, only, the 4-ampere, 250-volt fuse has been removed from the a-c line. Pin number 1 of the changer motor receptacle is now connected to the bottom of the primary of the a-c transformer. A 4-ampere, 250-volt fuse is connected from the bottom of the primary of the a-c power transformer to the high side of the a-c power socket. This side of the a-c power socket is also connected to pin 1 of the speaker socket.

The following parts have been substituted:

Ref.No.	*Part No.*	*Description*
3	250152G33	Capacitor, tubular, 0.1 μf, 600 v.
4	250152G33	Capacitor, tubular, 0.1 μf, 600 v.
22	230084G21	Resistor, composition, 22,000 ohms, ½ w. (AMP-109B only)
22	230084G18	Resistor, composition, 6,800 ohms, ½ w. (AMP-109C & D only)

Magnavox CR197 Series

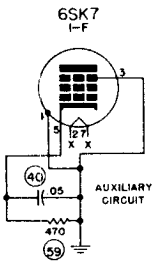
Models CR197, CR197A, and CR197B appear on *pages 16-1, 2 through 16-7 of Rider's Manual Volume XVI*. The schematics and parts lists for Models CR197C, CR197D, and CR197E are similar to those listed above except for the following changes:

Part No. 8 is now connected from ground to the junction of 24, 83, and 99, in all models.

Part No. 9 is now connected from ground to the junction of 25, 85, and 99, in all models.

The value of Part No. 13 has been changed from 20 $\mu\mu$f to 13 $\mu\mu$f in all models.

Resistor 61 has been deleted in Models CR197D and CR197E, as shown in the accompanying diagram.



Circuit changes for the Magnavox CR197D and CR197E.

Part No. 106, a 6-volt socket, has been added between the filament connections and the lamps in Model CR197E only.

The supplement to the parts list is as follows:

Part No.		*Magnavox Part No.*
	CR197A	
32	Capacitor, paper, 0.02 μf, 600 v	250152G37
49	Omitted	
61	Resistor, composition, 2,200 ohms, ½ w	230084G15
65	Resistor, composition, 10,000 ohms, ½ w	230084G19
88, 89, 90,91	Omitted	
99	Switch, rotary band selector	160172G1
106	Omitted	
	CR197B	
32	Capacitor, paper, 0.02 μf, 600 v	250152G37
49, 88, 89, 90, 91, 106	Omitted	
	CR197C	
19	Capacitor, molded mica, 680 $\mu\mu$f, ±10%	250159G131
32, 49, 65	Omitted	
88	Resistor, composition, 680,000 ohms, ±10%, ½ w	230084G90
99	Switch, rotary band selector	160172G1
106	Omitted	
	CR197D	
19	Capacitor, molded mica, 680 $\mu\mu$f, ±10%	250159G131

89	Resistor, composition, 150,000 ohms, ±10%, ½ w	230084G88
90, 91	Omitted	
106	Socket, 6 volt	189788G1

Magnavox CR198 Series

Chassis CR198, CR198A, and CR198B appear on *pages 16-5 through 16-11 of Rider's Manual Volume XVI*. The schematic diagrams and the parts lists for Chassis CR198C, CR198D, CR198E, CR198F, CR198H, and CR198J are the same as those for CR198, CR198A, and CR198B except for the changes that are noted below.

Item No. 13 has been changed from 20 $\mu\mu$f to 13 $\mu\mu$f.

Section 1 front of item 99 is the same for all models except for J. This wafer is shown in Figure 1.

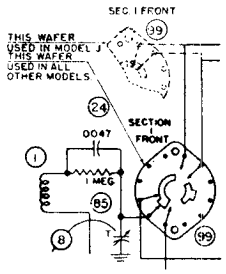

Fig. 1. Wafer used in Magnavox CR198 Series.

The position of item 12 has been changed for model J only. Capacitor 12 for model J has been removed from across item 4 and inserted in the wafer lead to the junction of items 4 and 43. In all other models, it remains in parallel with item 4.

Resistor 91 has been inserted from the tap of item 97 to item 91. Its value is shown in the accompanying table.

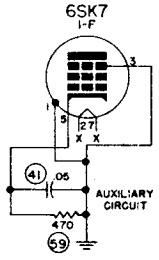

Fig. 2. Auxiliary Circuit for Magnavox CR198 Series.

Resistor 62 has been deleted from all models except CR198A, CR198B, and CR198C. The auxiliary circuit is shown in Figure 2.

The connection from item 99, section 2 rear, to the cathode and grid leads of the 6J5, 1st a-f stage, has been deleted. Resistor 83 is now connected between pins 1 and 5 of the 6J5, in all models except CR198A. The values are given in the accompanying table.

Table of electrical values for Magnavox CR198 Series.

ITEM NO	ELECTRICAL VALUES						
	CR 198 A	CR 198 B	CR 198 D	CR198E	CR198F	CR198H	CR198J

62	2200	2200	OMITTED - SEE AUXILIARY CIRCUIT				
90	OMITTED	OMITTED	OMITTED	OMITTED	6.8 MEG	330K	330K
91	OMIT -	OMIT	OMIT	OMIT	OMIT	10K	10K

Items 48, 90, and 89 have been added as shown in Figure 3. Item 48 appears in Models CR198H and CR198J only. Its value is 0.001 μf.

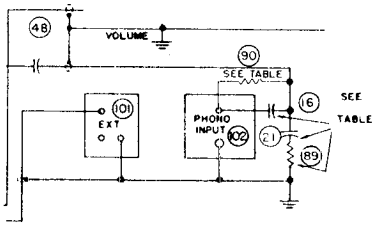

Fig. 3. Circuit changes for Magnavox CR198 Series.

The 6-volt socket, item 106, has been inserted across the filament leads in models CR198E, CR198F, CR198H, and CR198J.

The positions of items 8 and 9 for all models have been changed from the transformer side of the *R-C* filter to ground, to the wafer side and to ground.

Magnavox CR-202 Series

These models appear on *pages 18-16 through 18-25,26 of Rider's Manual Volume XVIII*. Two resistors, R143 and R144, have been added to Ch. CR-202C. R143 is connected between C41 and the junction of R118 and C64. R144 is located between the junction of R142, R113, and C40, and the rotary band switch 153.

The parts list should be amended to include the following:

Ref. No.	*CR-202A*	*Part No.*
34	Capacitor, mica 510 $\mu\mu$f, ± 5%	250159G64
40	Capacitor, mica 300 $\mu\mu$f, ± 10%	250159G88
41	Capacitor, mica, 510 $\mu\mu$f, ± 5%	250159G64
113	Resistor, comp, 82,000 ohms, ½ w, ±10%	230084G85
124	Resistor, comp, 220,000 ohms, ½ w, ±10%	230084G27
142	Omitted	
143	Omitted	
144	Omitted	
	CR-202B	
142	Resistor, comp, 3.3 megohm, ½ w	230084G34
	CR-202C	
40	Capacitor, mica, 0.002 μf, ±10%	250160G68
41	Capacitor, mica, 0.0015 μf, ±10%	250160G66
124	Resistor, comp, 470,000 ohms, ½ w	230084G94
143	Resistor, comp, 33,000 ohms, ½w, ±10%	230084G80
144	Resistor, comp, 150,000 ohms, ½w	230084G26
	CR-202D	
124	Resistor, comp, 470,000 ohms, ½ w	230084G94

©John F. Rider

Magnavox CR-208C

This model is the same as Model CR-208 appearing on *pages 17-13 and 17-25,26 through 17-31 of Rider's Volume XVII*, except for the following changes. Capacitor 15 has been changed in value from 510 $\mu\mu$f to 150 $\mu\mu$f. A 150,000-ohm resistor (80) has been connected in series with capacitor 15. Capacitor 16 and resistor 72 in series with it have both been omitted. Capacitor 17 has been changed from 510 μf to 150 μf. A 33,000-ohm resistor (79) has been connected in series with capacitor 17. Resistor 71 has been changed from 220,000 ohms to 470,000 ohms.

The following changes have been made in the parts list:

Ref. No.	*Description*	*Part No.*
15	Capacitor, fixed mica, 220 $\mu\mu$f, 500 v	250160G68
16	Omitted	
17	Capacitor, fixed mica, 1500 $\mu\mu$f, 500 v	250160G66
71	Resistor, composition, 470,000 ohms, ±10% ½ w.	230084G94
72	Omitted	
79	Resistor, composition, 33,000 ohms, ±10%, ½ w.	230084G80
80	Resistor, composition, 150,000 ohms, ±10%, ½ w.	230084G88

Majestic 6FM769, 6FM783, Ch. 6C14D

Model 6FM783 is a 1949 styled, 6-tube, using Oak and Milwaukee record changers, console combination using a cabinet similar to Model 8FM783, which appears on *pages 17-17, 18 through 17-22 of Rider's Manual Volume XVII* and on *page C18-4 of Rider's Manual Volume XVIII*. Model 6FM769 is a 1949 styled, 6-tube, console combination using the Aero record changer.

For voltages, alignment, and chassis parts refer to data on Model 6FM773 which appears on *pages 18-3 through 18-4 of Rider's Manual Volume XVIII*. The output transformer, T3, is located on the speaker instead of on the chassis. The parts list remains the same except for the following changes:

Symbol	*Part No.*	*Description*
L1	S-2017	Loop antenna assembly (BC only)
	117-108	Dial scale, glass
	117-109	Dial scale, background
	129-65	Dial scale clips, (6 req'd)
	133-34	Dial pointer
	15-91	Socket, speaker
	115-61	Cabinet, console-Model 6FM783
	115-70	Cabinet, console-Model 6FM769-mahogany
	21-24	Oak record changer (6FM783)
	21-31	Milwaukee record changer (6FM783)
	21-36	Aero record changer (6FM769)
	22-63	Speaker, 8" PM
	122-57	Escutcheon plate
	128-63	Knob, tuning
	128-68	Knob, tone
	128-69	Knob, volume
	128-80	Knob, bandswitch
	120-60	Spring, for knobs
	123-39	Cabinet back Model 6FM783
	123-40	Cabinet back Model 6FM769

Motorola CR7

This model is the same as Model CR6, appearing on *pages 15-9 and 15-10 of Rider's Volume XV* and *pages 16-1 through 16-8 of Rider's Volume XVI*.

Noblitt-Sparks Chassis RE-202, RE-231

These chassis are used in Models 555, 555A, 552N, and 552AN, appearing on *pages 16-1 through 16-4 of Rider's Volume XVI*.

Meck Chassis 4D7

Chassis 4D7 is used in models DA-601, DB-602. This chassis is similar to model DA-601, which appears on *page 19-5 of Rider's Manual Volume XIX*. The 4D7 differs from the 6B8 in the following ways: Capacitors C1, C2 and C7 have been deleted. A capacitor, designated as C2, has been inserted in place of C7. Resistor R1 has been removed from across the junctions of R2 and R3, and L1 and C2, and is now located in the cathode lead of the pentode (12BA6, 12SG7). Capacitor C5 is connected from the plate lead of the tetrode (50B5, 50L6) to ground. The parts list is given below, with the exception of those parts that are identical to those for the DA-601.

Symbol	*Part No.*	*Description*
C2	CP-14203	Capacitor, paper, tubular, 0.02μf, 400v
R1	RC-10680	Resistor, carbon, 68 ohms, ⅓w
R2	RC-11003	Resistor, carbon, 100,000 ohms, ⅓w
R4	RC-11005	Resistor, carbon, 10 megohms, ⅓w
R5, R6	RC-14703	Resistor, carbon, 470,000 ohms, ⅓w
R7	RC-11500	Resistor, carbon, 150 ohms, ⅓w
R8	RC-32001	Resistor, carbon, 2,000 ohms, ⅓w
L1	TRF10017-A	Antenna coil
C4	CP-12502	Condenser, paper, tubular, 0.005μf, 200v.
C3	CP-12202	Condenser, paper, tubular, 0.002μf, 200v.

RCA Q109, Ch. RC-602

This model appears on *pages 18-3 through 18-10 of Rider's Volume XVIII*.

On some sets the filter capacitor C44 has two sections of 15 μf and one section of 20 μf at 450 volts and one section of 20 μf at 25 volts. The capacitor specified in the Q109 service data has three sections of 10 μf at 450 volts and one section of 20 μf at 25 volts. Use the specified capacitor (Stock No. 33014) if replacement is required.

RCA Q109, Q109X, Ch. RC-602, RC-602A

These models appear on *pages 18-3 through 18-10 of Rider's Volume XVIII*. The following should be added to the parts list under Chassis Assemblies.

72996 Capacitor—molded paper, 0.05μf, 600 v. (C53)

30787 Resistor—fixed composition, 47,000 ohms, ½ w. (R26)

RCA RP-176 Record Changer

This record changer appears on *pages RCD.CH. 17-1 through RCD.CH. 17-12 of Rider's Volume XVII*. The method of attaching the pivot arm spring (Ref. #75) has been changed. The stud (Ref. #74) is no longer being used. A curved spring which clips into the inside rear of the tone arm is used in its place. The timing notch originally in the rim of the main cam and gear is no longer used. A small metal projection has been added to the inside of the rim of the main cam and gear for the same purpose. The indention in the hub of the main cam and gear into which a projection on the ratchet lever fits may also be used for timing purposes.

Add the following stock number to the parts list: 73198—Curved spring for anchoring pivot arm spring.

RCA RP-178 Series

This model appears in *Rider's Manual Volume XVIII on pages RCD.CH. 18-14 through RCD.CH. 18-28*.

The RP-178 record changer is for operation on 105-125 volts, 60 cycles, a.c. A conversion spring (Stock No. 73158) may be used for 50-cycle operation. The RP-178-2 is the same as RP-178 except for a motor (Stock No. S-4283) for 105-125 volts, 25 cycles, a.c. This has been manufactured only for Canadian use. The RP-178-3 is the same as RP-178 except for a motor (Stock No. S-4773) for 105-125 volts or 210-250 volts, 60 cycles, a.c., and a 6 prong plug (Stock No. 11953). A conversion spring (Stock No. S-4774) may be used for 50-cycle operation.

The following should be added to the parts list:

Stock No. *Description*

73158 Spring - Spring sleeve for converting 60-cycle motors to 50-cycle operation

RCA 8BX5, 8BX54, 8BX55; Ch. RC-1059, RC-1059A

These models appear on *pages 19-5 through 19-9 of Rider's Volume XIX*. The position of the battery pack in these models affects the loop inductance. When the battery is removed, the loop inductance will increase and the sensitivity will decrease because of improper electrical tracking of the loop circuit with the oscillator.

When a battery is temporarily unavailable, a sheet of aluminum 8½" long by 3-5/8" wide and from 0.020" to 0.050" thick may be placed in the position occupied by the battery so that it is lying flat on the bottom of the cabinet. This sheet of aluminum has an effect on the loop inductance similar to the effect caused by the battery and will, therefore, return the performance of the loop to approximately the same as obtained when a battery is installed. If aluminum is not available, brass may be substituted with approximately the same performance. DO NOT USE STEEL OR IRON since the performance will be adversely affected. If desired, the sheet of aluminum may be waxed to the inside bottom of the case. DO NOT PLACE ANY WAX, CEMENT, OR OTHER MATERIAL ON THE LOOP WINDINGS.

For the reasons mentioned, the battery as well as the chassis must be properly installed in the case when realigning the oscillator and antenna circuits. Failure to do this will result in extremely poor performance because of improper tracking. It is, of course, necessary to remove the chassis from the case for i-f alignment.

Since the first i-f stage employs neutralization by means of capacitor C7, incorrect alignment of the primary of transformer T2 will result if stage-by-stage alignment procedure is employed. Follow the alignment procedure on *page 19-5* to assure correct alignment.

The following changes have been made in the parts list.

Delete:

73144 Hinge—

Add:

74180 Hinge—cabinet hinge (2 required)

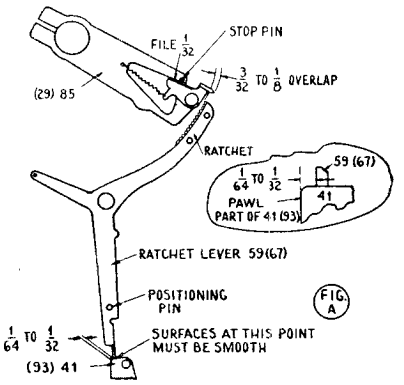
It has been found that the detent used on the original hinge (73144) caused strain on the cabinet which might result in breakage of the cabinet or back if roughly handled. The new hinge (74180) does not have this detent.

©John F. Rider

RCA Record Changers RP-176, RP-177 Series

Model RP-176 may be found on *pages RCD.CH. 17-1 through RCD.CH. 17-12 of Rider's Volume XVII.* The RP-177 Series appears on *pages RCD.CH. 18-1 through RCD.CH. 18-13 of Rider's Volume XVIII.* The numbers in the following discussion refer to the item numbers in the service data for Model RP-176. The numbers in parentheses refer to the item numbers of the RP-177 series.

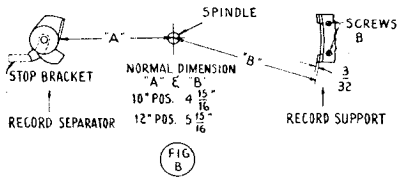
When the changer shows failure to trip, or pre-tripping characteristics, the following should be done: The engagement of items 59 (67) and 41 (93) must be 1/64" to 1/32"—file or bend positioning pin of item 59 (67) to obtain proper engagement. The engaging surfaces of items 59 (67) and 41 (93) must be smooth and free of burrs. Stone the surfaces if required—if the surfaces are rough, the tone arm jumps into the label when the mechanism trips. The overlap between the trip pawl of item 85 (29) and the ratchet of item 59 (67) must be 3/32" to 1/8".



Tone arm travel over the record label can be corrected by following these instructions.

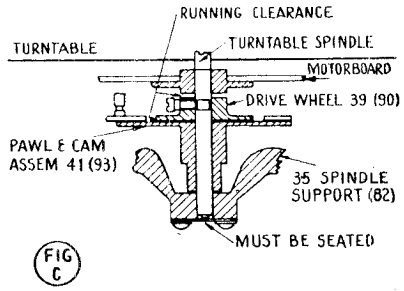
If the tone arm travels over the record label, try the following procedure. While holding the pawl of item 41 (93) disengaged from the ratchet lever 59 (67), place the tone arm in the eccentric groove of a record with the turntable running. The tone arm should swing back and forth freely. Should the tone arm jump the eccentric groove and sweep over the label, more overlap is needed between the pawl of trip lever 85 (29) and the ratchet of item 59 (67). This can be obtained by filing approximately 1/32" from the trip pawl as indicated in Fig. A.

If the spacing between the record posts need adjustment, refer to *page RCD.CH. 17-3* (*RCD.CH. 18-6*), adjustments B and C, and Fig. B accompanying. Set the record separator post, as described in the service data, in the 10-inch position. Adjust the 10-inch position of the record support by means of the screws "*B*," so that



The spacing between the record posts may be adjusted as indicated above.

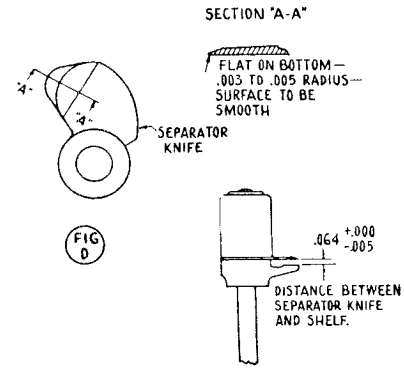
the *A* and *B* dimensions indicated in Fig. B are obtained. Set the record support to the 12-inch position, and adjust by means of the screws "*B*" so that dimension *B* indicated on Fig. B is obtained. Bend the stop bracket so that dimension *A* indicated on Fig. B is obtained.



To prevent binding of the turntable, it should be adjusted as shown.

If the turntable should bind, refer to Fig. C and the following procedure. The spindle must be seated in spindle support 35 (82). The turntable must be parallel to the motorboard. A running clearance must be provided between drive wheel 39 (90) and spindle support 35 (82) and also between drive wheel 39 (90) and pawl and cam assembly 41 (93).

Record damage may be caused by incorrect spacing between the record separator shelf and knife or by an improperly shaped knife edge. Refer to Fig. D.



SECTION "A-A"
FLAT ON BOTTOM— .003 TO .005 RADIUS— SURFACE TO BE SMOOTH
SEPARATOR KNIFE
FIG. D
.064 +.000 -.005
DISTANCE BETWEEN SEPARATOR KNIFE AND SHELF.

Adjust the spacing between the record separator shelf and the knife to prevent record damage.

RCA 8BX65, Ch. RC-1040C

This model is the same as Model 8BX6 which appears in *Rider's Volume XVIII on pages 18-11 through 18-14,* except for the finish of the metal case parts. Model 8BX6 has an aluminum finish and Model 8BX65 has a gold finish. Replacement parts are identical except for the following which are used on Model 8BX65 only:

Stock No.	*Description*
73879	Back - Case back complete with center strip, feet, and spring latch
73878	Front - Case front complete less shutter
73875	Link - Carrying handle link group, consisting of two links, two shafts and four drive screws (two groups required)
73876	Screw - No. 8-32 x 5/16" screw to hold case together (Located under carying handle, two required)
73877	Shutter - Case shutter

RCA 8BX6, 8BX65, Chassis RC-1040C

These models appear on *pages 18-11 through 18-14 of Rider's Volume XVIII.* The parts list should be changed as follows:

Add: 71040 Socket—2 contact female socket for external loop

Delete: Speaker assembly 92577-3.
73123 Speaker—4" PM Speaker

Use Stock No. 71058 Speaker (4" x 6") as replacement.

RCA 8BX6, Chassis RC-1040D

This model is the same as the model using Chassis No. RC-1040C, appearing in *Rider's Volume XVIII on pages 18-11 through 18-14,* except that the external loop antenna socket is omitted on RC-1040D.

RCA 8R71, 8R72, 8R74, 8R75, 8R76; Ch. RC-1060, RC-1060A

These models appear on *pages 19-10 through 19-15 of Rider's Volume XIX.* The second i-f transformer (T3) used in these receivers may be stamped 970435-2 or 970435-5. The d-c resistance (8.2 ohms) of the windings indicated on the schematic is for transformer 970435-2. The d-c resistance of the same windings in transformer 970435-5 is 12 ohms.

The number of turns of dial drive cord on the tuning knob shaft has been changed from 3½ turns to 4½ turns.

The following changes have been made in the parts list.

Delete:

73363	Transformer
71033	Washer
71034	Washer

Add:

74019	Transformer—second i-f transformer, dual (T3)
73333	Washer — insulating washer — extruded — for mounting output transformer (2 required)
73332	Washer—insulating washer—flat—for mounting output transformer (2 required)

In some instruments, speakers stamped 92572-4W have been used as a substitute for the specified speaker (92572-2W). For replacement use the specified speaker (stock number 72201).

In some chassis, two 3300-ohm resistors are connected in parallel as a substitute for the 1500-ohm resistor, R22. In other chassis, two 820-ohm resistors are connected in series as a substitute for this resistor.

RCA 8R71 to 8R76, Ch. RC-1060, RC-1060A; 9W101, 9W103, Ch. RC-618B

Models 8R71 to 8R76 appear on *pages 19-10 through 19-15 of Rider's Manual Volume XIX* and Models 9W101 and 9W103 appear on *pages 19-35 through 19-44* of the same Volume.

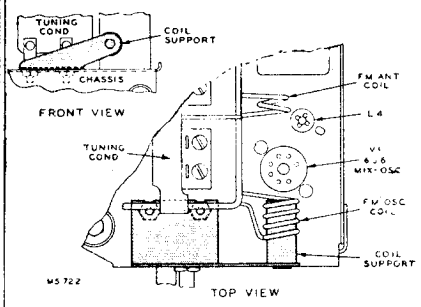
Some ceramic capacitors C11 (5 $\mu\mu$f) have been used which have a color code of black-green-black. The capacitor is correct, but the color code is incorrect. The normal color code of this capacitor is green-black-white.

©John F. Rider

RCA 8R71, 8R72, 8R74, 8R75, 8R76, 8V90, 8V91

Models 8R71, 8R72, 8R74, 8R75, and 8R76 appear in *Rider's Manual Volume XIX on pages 19-10 through 19-15* and Models 8V90 and 8V91 appear in the same Volume on *pages 19-16 through 19-25.*

To insure greater oscillator stability a support has been added for the f-m oscillator coil as illustrated in the accompanying diagram. Adjustment of the coil is



Coil Support

A support has been added to insure greater oscillator stability for the f-m oscillator coil for the RCA Models 8R71, 8R72, 8R74, 8R75, 8R76, 8V90, 8V91.

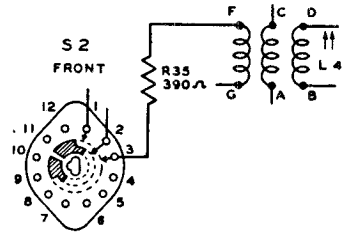
made as described in the Service Data. After adjustment the coil is cemented to the coil support.

The following is added to the parts list:

74202 Support—Polystyrene coil support complete with mounting bracket.

RCA 8V112, Chassis RC-616

This model appears on *pages 18-17 through 18-24 of Rider's Volume XVIII.* To minimize the possibility of "A" band oscillation and to reduce interference, a resistor (R35) has been added in the mixer grid circuit as shown in the accompanying diagram.



A 390-ohm resistor has been added in the mixer grid circuit of the RCA 8V112 to reduce interference.

In late production sets C42 has been changed from 22 μμf to 15 μμf and R18 has been changed from 22,000 ohms to 18,000 ohms. This change was made to prevent oscillation at the high end of the f-m band.

Add the following to the parts list:

Resistor — fixed composition, 390 ohms, ±10%, ½ watt (R35)

RCA 8V112, Chassis RC-616, RC-616F

The schematic diagram for this model, which is contained in *pages 18-17 through 18-24 of Rider's Volume XVIII,* is in error in showing the connection of R22. It should be shown connected to C18A instead of to the RED lead of the output transformer.

In order to provide adequate lead length, resistor R10 (56,000 ohms) has been changed from ½ watt to 1 watt.

Chassis RC-616F, used in the second production of these instruments, is very similar to Chassis RC-616 except for the following:

First Production RC-616

Four position selector switch
M.M.—PHONO—AM—FM
Aux. input jack is not used

Second Production RC-616F

Five position selector switch
AUX.—M.M.—PHONO—AM—FM
Aux. input jack is used

Except for the following replacement parts, all parts are identical.

74163 Selector switch is used in place of 73608 (switch S1, S2)

74164 Control panel decal for mahogany or walnut instruments is used in place of 73764 decal

74354 Control panel decal for blonde instruments is used in place of 73765 decal

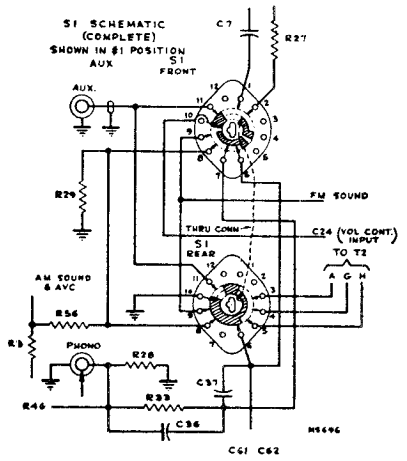


Fig. 1. (Above) shows the selector switch used in RCA Chassis RC-616F. Fig. 2. (Below) The simplified circuit of the selector switch in the #2 position.

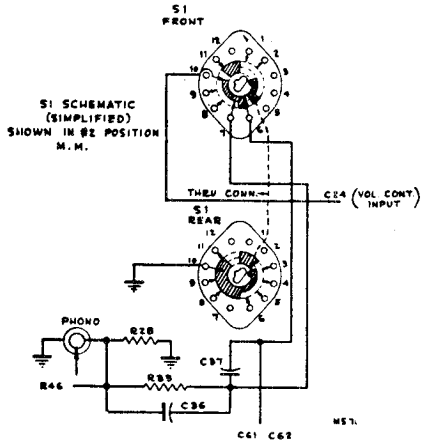
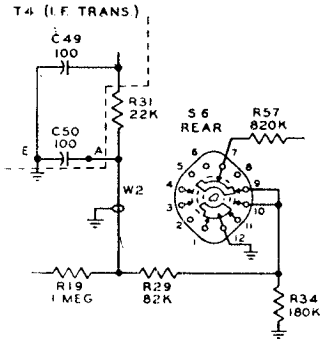


Figs. 1 and 2 show the selector switch S1 used in Chassis No. RC-616F. The connections to S2 are identical in both chassis. Note that position #2 (M.M.) of RC-616F corresponds to position #1 (M.M.) of RC-616. No connections are made through S2 in AUX. position.

RCA 8V151, Ch. RK-121C

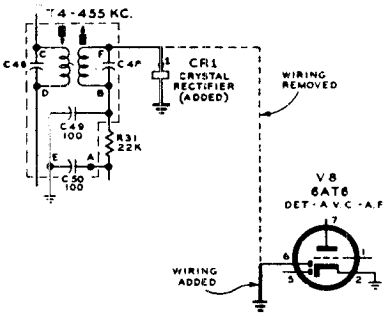
This model appears on *pages 18-25 through 18-40 of Rider's Manual Volume XVIII.* In the diode load circuit, R29 (270,000) should be deleted—R20 (82,000) and R34 (180,000) should be added, as shown in the accompanying diagram.



Diode Load Circuit for RK-121C.

The wiring diagram is incorrect in the wiring of the range switch. The illustration below shows the changes which should be made.

Late production models of Chassis No. RK-121C use a crystal rectifier for a-m detection instead of the diode plate (pin 6 of V8) of 6AT6 as shown.



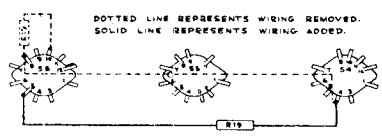
Crystal Rectifier for RK-121C.

Service Caution: (1) Maintain a minimum lead length of ¾ inch on the crystal leads. Excess heat from a soldering iron will damage the crystal, (2) the normal voltage existing in this circuit should never be exceeded when testing or trouble shooting, and (3) maintain polarity of crystal.

The following change has been made in the parts list.

Add:

54374 Rectifier—crystal rectifier (CR1)



Change in Wiring of RCA 8V151.

An addition to the Parts List under Miscellaneous is:

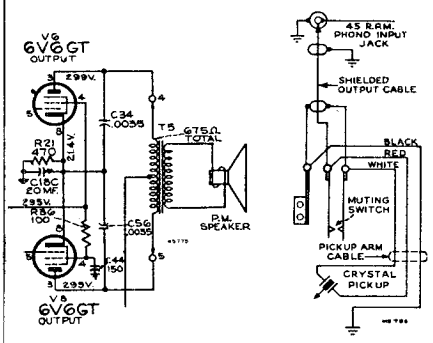
74312 Ornament — Wood fibre ornament for front of cabinet.

©John F. Rider

RCA 9W101, 9W103, 9W105

These models appear on *pages 19-35 through 19-44 of Rider's Manual Volume XIX.*

A capacitor (150 $\mu\mu$f-C44) has been added between the screen grid terminal of V8 (6V6GT) socket and chassis as shown in the accompanying illustration. This was



Output Tubes Circuit Pickup Arm Cable Models 9W101, 9W103, 9W105

done to eliminate spurious audio oscillation.

The simplified schematic diagrams (phono position) on page *19-39* show C34 and C56 connected to ground. They should be shown connected to the cathodes of the 6V6GT tubes as shown in the accompanying illustration.

To improve f-m stability one dial lamp is now connected to pin #2 of V9 (6X5GT). Previously both were connected to pin #2 of V8 (6V6GT).

Speakers stamped 92569-1WX have been used as a substitute for 92569-5W speakers in Model 9W101; 92569-1WX speakers have a 2.2-ohm voice coil; 92569-5W speakers have a 3.2-ohm voice coil.

The following additions have been made to the parts list:

48125 Capacitor—Ceramic, 150 $\mu\mu$f (C44) Same as C7, C19, C38, C50, C53
13867 Cap—Dust cap
36145 Cone—Cone and voice coil assembly
5039 Plug—4 prong male plug for speaker
71145 Suspension—Metal cone suspension
37899 Transformer—Output transformer (T3)

Note: When replacing complete speaker order Stock No. 73635 (92569-5W).

37396 Grommet—Rubber grommet for mounting speaker (3 required)—for Model 9W103
73896 Loop—Loop antenna complete for Models 9W101 and 9W103 (previously listed for 9W101 and 9W105).

The RP-168A-1 record changer pickup arm cable now being used is a three wire cable (RED-WHITE-BLACK). In some instruments the black wire is omitted or a shielded wire may be used as shown in 9W101, 9W103, 9W105 Service Data. The latest connection diagram is shown in the accompanying illustration.

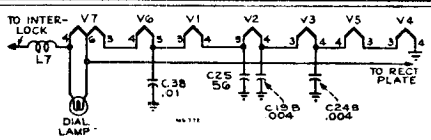
RCA 8X53, 65X1, 65X2, RC-1064

Model 8X53 appears on *pages 18-41 and 18-42 of Rider's Volume XVIII* and Models 65X1 and 65X2 appear on *pages 15-61 and 15-62 of Rider's Volume XV.*

The number of turns of dial cord on the tuning shaft has been increased from 2-¼ turns to 3-¼ turns.

RCA 8X71, 8X72

These models appear on *pages 19-30 through 19-34 of Rider's Manual Volume XIX.* A capacitor (0.01 μf-C38) has been added between pin #3 of V6 (35C5) and chassis. The revised heater connection



Heater Connections—Models 8X71, 8X72

schematic diagram is illustrated in the accompanying diagram.

The following have been added to the parts list:

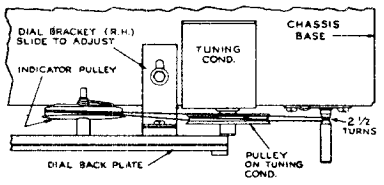
71923 Capacitor—Tubular, 0.01 μf, 200 v. (C38) same as C23, C36.

RCA 75ZU, Ch. RC-1063A

This model appears on *pages 19-45 and 19-46 of Rider's Manual Volume XIX.* A groove approximately 1/16 inch deep by ⅛ inch wide is now included on the outer rim of the bakelite station selector indicator pulley, Stock No. 73060.

If trouble is encountered with the drive cord coming off this pulley, either of the following corrections may be applied:

(a) Position the pulley in relation to the gang drum by the adjustment provided on the long support bracket for the dial back plate assembly so that the drive cord occupies the position indicated in the accompanying illustration.



Dial Drive Cord of RCA 75ZU.

(b) Replace the pulley with one incorporating the groove indicated above.

The service data for the 50-cycle version of Radiola 75ZU will apply to this instrument except:

RP-178 record changer only is used.

A conversion spring (Stock No. 73158) is added to the motor spindle shaft for 50-cycle operation.

A decal ("RCA Victor" Stock No. 71984) is added to the front of the cabinet.

These changes apply to the RC-1063B also.

The following have been added to the parts list for instruments using blonde mahogany cabinets:

73722 Knob—Power—Phono—radio switch knob—for blonde instruments
73629 Knob—Tuning Knob—for blonde instruments
73630 Knob—Volume Control Knob—for blonde instruments

RCA 66BX, Ch. RC-1040, RC-1040A, RC-1040B; 8BX5, 8BX54, 8BX55, Ch. RC-1059, RC-1059A; 8BX65, Ch. RC-1040C, RC-1040D; 9BX5, Ch. RC-1059B

Model 66BX appears on *pages 15-87 through 15-88 of Rider's Manual Volume* XV and on *page C17-7 of Rider's Manual Volume XVII.* Models 8BX5, 8BX54, and 8BX55 appear on *pages 19-5 through 19-9 of Rider's Manual Volume XIX.* Models 8BX6 and 8BX65 appear on *pages 18-11 through 18-14 of Rider's Manual Volume XVIII.*

The line-battery switch used in these receivers is of the "slide" type. The actual switch does not have numbered terminals, although the schematic diagrams have numbers indicated. The numbers on the schematic diagrams do not indicate the actual sequence of the terminals on the switch. The accompanying illustrations show the actual sequence of the switch terminals and the corresponding numbers which appear on the schematic diagrams. Figure 1 is the diagram for the 8BX5,

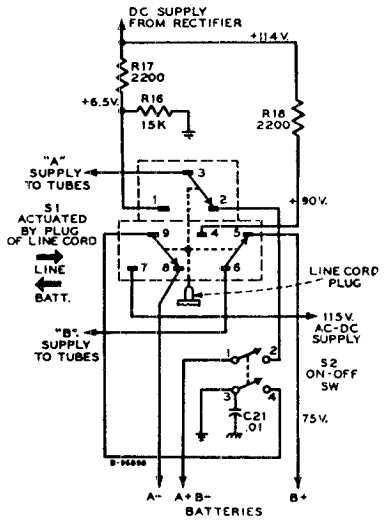


Fig. 1. Line-battery switch for RCA 8BX5.

first production, Ch. RC-1059. Figure 2 applies to models 8BX5, 8BX54, 8BX55, second production, Ch. RC-1059A; 9BX5, first production, Ch. RC-1059B; 9BX5, second production, Ch. RC-1059C. For models 8BX6 and 66BX, the circuit is as shown in Figure 2, except for different resistor numbers and values.

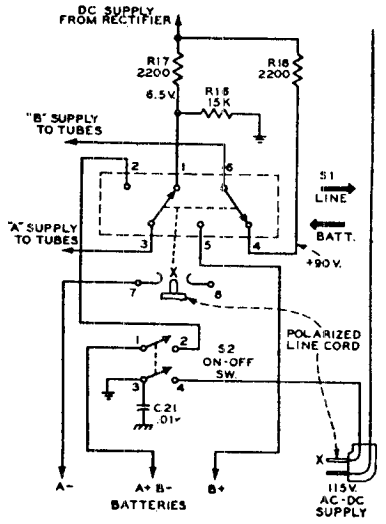

Fig. 2. Line-battery switch for RCA 8BX5, 8BX54, 8BX55, 9BX5, 8BX6, and 66BX.

©John F. Rider

RCA 8X544, 8X545, 8X546, Chassis RC-1065, RC-1065A

These models are the same as Model 8X541, on *pages 18-45 and 18-46 of Rider's Volume XVIII*, except for the color of the cabinets and the parts noted here.

The parts are the same, except for:

73486 Loop — loop and back cover assembly for Models 8X544 and 8X545

73487 Loop — loop and back cover assembly for Model 8X546

Y2096 Cabinet — plastic cabinet — mahogany — complete with station indicator and dial backing disc — for Model 8X544

Y2097 Cabinet — plastic cabinet — walnut — complete with station indicator and dial backing disc — for Model 8X545

Y2098 Cabinet — plastic cabinet — blonde — complete with station indicator and backing disc — for Model 8X546

70429 Grommet — rubber grommet to mount speaker (4 required). This part has been added to Models 8X541, 8X542, 8X543, 8X544, 8X545, 8X546, and 8X547. To reduce microphonics, the speaker is now mounted to the chassis and to the cabinet using rubber grommets. The screws through the grommets should be tightened only enough to obtain a secure assembly.

RCA 68R1, 68R2, 68R3, 68R4, Ch. RC-608; 610V1, Ch. RC-610; 610V2, Ch. RC-610C

The 68R series appear on *pages 16-39 through 16-43 of Rider's Volume XVI*. The 610 series appear on *pages 19-56 through 19-64 of Rider's Volume XIX*.

In locations where 10.7-mc i-f interference (not tunable) is encountered on the f-m band of these receivers, the following may eliminate the condition:

1. Check lead dress (and correct if necessary) to minimize antenna coupling into the i-f amplifier input. Resistor R1 (located on the antenna terminal board) should be dressed on the side of the terminal board away from the 6BE6 1st detector socket, V1.

2. Dress the 6BE6 1st detector plate lead along the shelf base and under C2 (330 $\mu\mu$f) using C2 as a partial shield for this lead.

3. Ground one f-m antenna terminal to the chassis at the terminal board. (Dipole still connects normally.) This is generally more effective than connecting a 10.7-mc series-tuned trap from the f-m antenna terminal to the chassis.

4. Place a tube shield over the 6BE6 1st detector tube, grounding the shield to chassis using as short a ground as possible. Correct for any detuning caused by this method.

5. Correct realignment of circuits is suggested to provide maximum sensitivity, since step 3 may reduce sensitivity slightly.

RCA 75X11, 75X12, 75X14, 75X15, 75X16

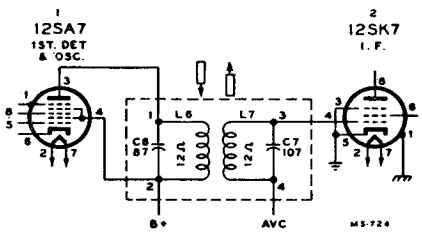
These models appear in *Rider's Manual Volume XVIII on pages 18-49 and 18-50*.

In some chassis a substitute i-f transformer has been used in these models. An adapter plate is riveted to the chassis for mounting purposes. A mounting clip is used to secure the transformer to the mounting plate. The accompanying diagram illustrates the revised schematic.

The following have been added to the Parts List:

73935 Clip—Spring clip for mounting i-f transformers, type 970441

93036 Transformer — First i-f transformer, stamped 970441-1 (C6, C7, L6, L7)



Substitute 1st I.F. Transformer—75X Series

RCA 77U

This model appear on *pages 18-53 and 18-54 of Rider's Volume XVIII*. The following parts should be added to the parts list.

73109 Nut—Tee nut to mount record changer—3 required.

73110 Screw—¼-20 x 1¾" fillister head machine screw to mount record changer.

The service data previously issued for this model also apply to instruments using blonde mahogany cabinets, except for the following parts which are used with such cabinets.

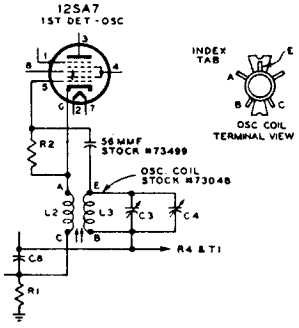
73631 Knob—power, radio and phono switch knob—tan—for blonde instruments.

73629 Knob—tuning knob —tan— for blonde instruments.

73630 Knob—volume control knob—tan —for blonde instruments.

The following voltage and current measurements apply to this model. A selenium rectifier is used. The oscillator grid voltage (pin 5 of the 12SA7) is —10 volts at 600 kc and —11 volts at 1600 kc. Voltages are measured with Chanalyst or VoltOhmyst to common insulated wiring —B). The voltages and currents should hold to within ± 20% with a 117-volt, 60-cycle power supply.

Tube	Plate Voltage	Screen Voltage	Cathode Voltage	Cathode Current
(1) 12SA7 1st det. osc.	92.	92.	—	9.4 ma.
(2) 12SK7 I.F. Amp.	92.	92.	—	13.3 ma.
(3) 6C4 A.F. Amp.	15.	—	—	0.32 ma.
(4) 6AQ6 2nd Det.—AVC—Ph. Inv.	50.	—	—	0.18 ma.
(5) 35L6GT Output	121.	92.	5.6	31.7 ma.
(6) 35L6GT Output	121.	92.	5.6	31.7 ma.



Oscillator coil 73048 is connected into the circuit of the RCA 77U as shown.

In some chassis capacitor C18 is 0.027 μf instead of 0.025 μf as shown on the schematic. In some instruments a substitute oscillator coil has been used. The original coil (70477) uses a capacitive winding (L4) for coupling the oscillator circuit to the oscillator grid (pin 5) of the 12SA7 tube. The substitute coil uses a 56-$\mu\mu$f ceramic capacitor for the same purpose. (L4 is not used.) The accompanying figure shows how this coil is connected into the circuit.

The following changes should be made in the parts list.

Delete:

73007 Condenser—

Add:

73007 Condenser — variable tuning condenser (C3, C4, C6, C7)

RCA 610V1, Ch. RC-610C; 610V2, Ch. RC-610

These models appear on *pages 19-56 through 19-60 of Rider's Volume XIX*. A small quantity of these receivers were shipped with the incorrect loop antennas. The incorrect loops contain approximately 14 turns instead of 17 turns. This reduced inductance causes low sensitivity and poor selectivity, particularly below 900 kc.

Complaint cases of poor sensitivity, poor selectivity, or interference in the form of local station(s) repeating at one or several places on the "A" band (except response at the image frequency) should have the loop checked as one possible cause.

The incorrect loop may peak at the high end of the "A" band but will not peak at lower frequencies. This may be checked by varying the oscillator coil inductance. The correct loop tracks normally across the band.

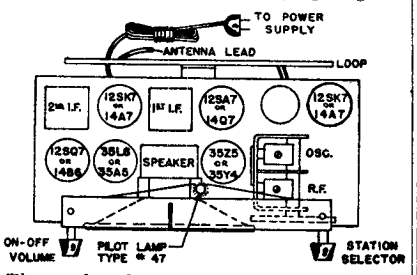
The stock number of the antenna terminal board is 72058. It was listed incorrectly as 70258.

RCA 710V2, Ch. RC-613A

These models appear on *pages 18-55 through 18-60 of Rider's Volume XVIII*. Resistor R15 in the cathode circuit of the type 6AU6 f-m driver stage has been changed from 68 ohms to 120 ohms. This change was made because certain 6AU6 tubes were found to draw grid current at the bias value produced by 68 ohms, which resulted in a decrease in f-m sensitivity.

Regal W800

This model is the same as Model 800 which appears on *page 16-1 of Rider's Volume XVI*. The socket layout for both models is shown in the accompanying diagram.



The socket layout of the Regal Models W800 and 800.

©John F. Rider

RCA 612V1, 612V3, 612V4, Ch. RK-121, RS-123

Models 612V1 and 612V3 appear on *pages 17-31 through 17-43 of Rider's Volume XVII*. Model 612V4 is the same except for the cabinet. Some of these receivers have developed a howl when operating on the f-m band. Howl of this nature is generally a result of vibration from the speaker being transmitted to some component, or series of components, in the oscillator circuit. This vibration causes the oscillator frequency to become modulated, resulting in a howl being emitted from the speaker.

The following are possible causes:

1. Loose elements in the oscillator tube.
2. Loose plates or unequal spacing of rotor and stator plates in the f-m oscillator section.
3. Capacitor C88 should be placed adjacent to the side wall of the r-f shelf and held firmly in place. This may be accomplished by melting wax against the capacitor and the chassis.
4. All oscillator, r-f, and ant. leads should be well separated and arranged to produce the least capacitance change if set breaks into vibration.

When searching for the cause of the trouble, an alignment tool having a high dielectric constant and without a metal tip can be used to probe in the circuit. It is important that the position of the wires and components be changed as little as possible during realignment. During such probing, the air column of the speaker in relation to the chassis must be as near as possible to normal operating position. Failure to maintain such relation may result in false indications of either excessive howl or no howl.

On the RK-121 chassis, starting with serial number 25,000, a 10-ohm carbon resistor has been added between C16 (100 $\mu\mu$f) and terminal number 1 of S4 Front. This resistor has been inserted to eliminate dead spots between 1400 and 1600 kc on the "A" band. This resistor should be added to any early model set developing dead spots, but make certain that the over-all lead length, including the resistor remains the same as before.

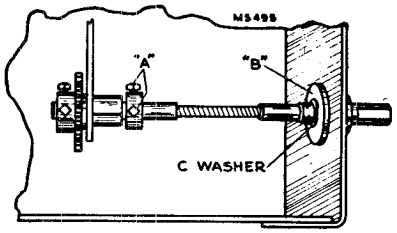


Fig. 1. The early production coupling shaft of the RCA 612V series.

The range switch coupling shaft on the early and late productions differ. To remove the early production coupling shaft, refer to Fig. 1 and the following directions. Loosen square head set screws "A" in collar of shaft, remove "C" washer from shaft at inside of bushing "B", push shaft through bushing to permit removal of "C" washer normally recessed inside bushing. Pull shaft through bushing to inside of chassis.

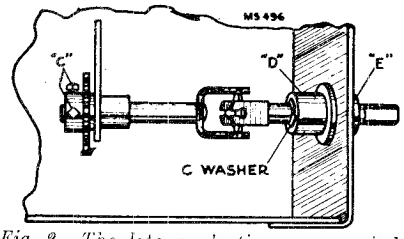

Fig. 2. The late production range switch coupling shaft of the RCA 612V series.

Refer to Fig. 2 for the late production range switch coupling shaft. Loosen square head set screws "C" in collar of gear. Remove nut "E" (on front apron of chassis) from bushing "D". Push shaft and bushing to the rear so that shaft and bushing are clear of the chassis apron. Flex the shaft and pull forward. To remove bushing from shaft, use procedure described for early type shaft.

The brown lead of the dial lamp for phono. operation is at present dressed to contact #3 of S-1 Front, then through the space between the switch rotor and through the bolt spacer. This lead should be dressed between the spacer and the shelf cradle. The bus wire from the "C" band antenna coil to contact #9 of S-1 Rear is to be dressed a distance of ¼ inch from the loop load coil antenna lead (yellow). The f-m antenna lead (yellow) is to be dressed between the switch spacer through the bolt and the switch rotor shaft, keeping clear of the shelf and cradle.

The changes indicated should be made in the parts list. The entire listing of Miscellaneous parts is given for convenience.

Add the following to the parts list:

72119 Escutcheon—Escutcheon only—less screen, window and marker strips—for blonde instruments.

Change 71868 Frame in the parts list to read

71868 Frame—Rollout carriage frame with brackets—less wheels.

The parts list for these models applies to Model 612V4 also except for the following miscellaneous parts:

73719 Back—Cabinet back—blonde—for sides—2 required

73720 Back—Cabinet back—blonde—for center

X1825 Cloth—Grille cloth—for 612V4 blonde

The RP-176A record changer is used.

STOCK No.	DESCRIPTION
	RADIO CHASSIS ASSEMBLIES RK-121
Add:	
72986	Bushing—Threaded bushing for knob end of selector switch coupling shaft (late production).
72984	Plate—Connecting plate for selector switch coupling shafts (late production).
34761	Resistor—10 ohms, ½ watt (R54).
72982	Shaft—Selector switch coupling shaft—switch end (late production).
72983	Shaft—Selector switch coupling shaft—knob end—less threaded bushing (late production).
72951	Shield—Lead tube shield (for V5).

71864	Antenna—Di-pole antenna
72599	Back—Cabinet back for 612V1—for center
72598	Back—Cabinet back for 612V1—sides (2 required)
72590	Back—Cabinet back for 612V3—for center
72579	Back—Cabinet back for 612V3—sides (2 required)
70160	Back—Cabinet back—mahogany—for sides (2 required)—for 612V4
70162	Back—Cabinet back—mahogany—for center—for 612V4
70161	Back—Cabinet back—walnut—for sides (2 required)—for 612V4
70163	Back—Cabinet back—walnut—for center—for 612V4
71888	Bottom—Bottom cover pan: for rollout mechanism
36639	Bracket—Pilot lamp bracket
71874	Bushing—Bushing and washer for large knobs (4 required)
72899	Button—Plug button for rollout assembly sides (2 required)
71884	Button—Push button
72447	Cable—Shielded audio cable complete with plugs
71863	Cable—5 wire moulded antenna lead-in cable
38684	Capacitor—Mica trimmer, on loop, 2-20 mmf. (C1)
X1617	Cloth—Grille cloth for 612V1—wal. or mahog. cabinets
X1624	Cloth—Grille cloth for 612V1—blonde cabinets
X1620	Cloth—Grille cloth—upper—for 612V3—wal. or mahog. cabinet
X1621	Cloth—Grille cloth—lower—for 612V3—wal. or mahog. cabinets
X1628	Cloth—Grille cloth—upper—for 612V3—blonde cabinet
X1629	Cloth—Grille cloth—lower—for 612V3—blonde cabinet
X1667	Cloth—Grille cloth for 612V4
71966	Decal—Trade mark decal (Victrola)
71910	Decal—Trade mark decal (RCA-Victor)
71876	Escutcheon—Escutcheon only less screen, window and marker strips for walnut instruments
71877	Escutcheon—Escutcheon only less screen, window and marker strips for mahogany instruments
71868	Frame—Mounting frame and bracket
71943	Grille—Metal grille—upper—for 612V3
71944	Grille—Metal grille—lower—for 612V3
70165	Grille—Metal grille for 612V4
72069	Grommet—Rubber grommet for mounting loop brackets—part of loop (2 required)
72763	Handle—Pull handle for rollout mechanism

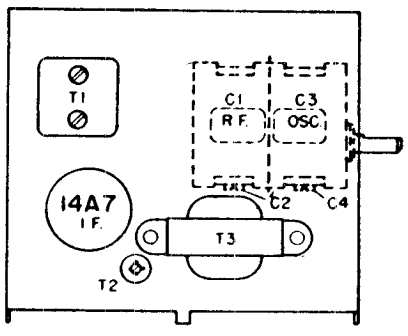
STOCK No.	DESCRIPTION
73031	Hinge—Door hinge L.H. for 612V1 (2 required)
73032	Hinge—Door hinge R.H. for 612V1 (2 required)
71945	Hinge—Door hinge for 612V3—wal. or mahog. cabinets and 612V4 record storage compartment doors (4 required)
73004	Hinge—Door hinge for 612V3—blonde cabinet (4 required)
71764	Hinge—Drop door hinge for 612V1 and wal. or mahog. 612V3 cabinets (2 required)
73001	Hinge—Drop door hinge for 612V3 blonde cabinet (2 required)
73024	Hinge—Drop door hinge for 612V4 (2 required)
70167	Hinge—Speaker compartment door hinge L.H. for 612V4 (2 required)
70166	Hinge—Speaker compartment door hinge R.H. for 612V4 (2 required)
13103	Jewel—Pilot lamp cap
71883	Knob—Tone control knob for wal. or mahog. cabinets
72761	Knob—Tone control knob for blonde cabinet
71821	Knob—Volume control, power switch, selector switch or tuning knob for wal. or mahog. cabinets
72118	Knob—Volume control, power switch, selector switch or tuning knob for blonde cabinets
11765	Lamp—Pilot lamp
71862	Loop—Antenna loop complete (L1, L15, C1)
71969	Marker—Call letter markers
72765	Nut—Speed nut to fasten transparent screen to escutcheon (2 required)
71879	Plate—Backing plate for transparent screen
71881	Plate—Call letter marker plate
72764	Plate—Backing plates (1 set) for pullout handle
30868	Plug—2 contact female plug for power cable
71967	Plug—9 contact female plug for power cable
32641	Plug—3 prong male plug for loop cable
71968	Plug—9 prong male plug for power cable
31048	Plug—Phono plug for audio cable (2 required)
71890	Pull—Door pull for 612V1 (2 required)
71946	Pull—Door pull for 612V3
73034	Pull—Door pull for 612V4
71891	Pull—Drop door pull for 612V1
71873	Retainer—Rubber retainer to mount record changer (2 required)
71878	Screen—Transparent screen
36422	Socket—3 contact female socket for loop cable
38873	Spring—Conical spring to mount record changer (4 required)
71867	Spring—Retaining spring for push button
30900	Spring—Retaining spring for knobs
71869	Spring—Braking spring for right rear wheel (612V1 and 612V3 early prod.)
71870	Spring—Braking spring for left rear wheel (612V1 and 612V3 early prod.)
71865	Spring—Spring to hold flexible cable from mechanism
71866	Stop—Rollout carriage stop consisting of disc, rubber sleeve and spacer
73060	Stop—Drop door fall supports metal stop for 612V4
70164	Stop—Stop for drop door for 612V4
72396	Stop—Stop for speaker compartment doors for 612V4
71892	Strike—Cabinet doors strike and catch
71880	Strip—Retaining strip for call letter marker plate
71889	Support—Drop door fall support—for 612V1 (2 required)
72999	Support—Drop door fall support—R.H.—for 612V3 wal. or mahog. cabinets
73000	Support—Drop door fall support—L.H.—for 612V3 wal. or mahog. cabinets
73002	Support—Drop door fall support—R.H.—for 612V3 blonde cabinet
73003	Support—Drop door fall support—L.H.—for 612V3 blonde cabinet
*72940	Support—Drop door fall support—L.H. for 612V4
*72939	Support—Drop door fall support—R.H. for 612V4
71872	Tire—Rubber tire for front rollout wheels
71871	Tire—Rubber tire for rear rollout wheels
-2917	Washer—"C" washer for rubber retainer (2 required)
71875	Washer—Spring washer for fastening front wheels and late production rear wheels
71887	Wheel—Front wheel and tire assembly (2 required)
72858	Wheel—Rear wheel and tire assembly (2 required)—late production only
71886	Wheel—Left rear wheel complete with braking mechanism, less braking spring #71870
71885	Wheel—Right rear wheel complete with braking mechanism, less braking spring *71869
71882	Window—Window for call letter markers

Parts list of the RCA 612V1, 612V3, 612V4

Sears 8070, Ch. 101.817-1A; 8070A, Ch. 101.817-2A

These Models are the same as Model 7070, appearing on *pages 17-2, 17-3, and 17-15 of Rider's Volume XVII*, except for the following changes. The appearance only of the parts have been changed in Ch. 101-817-1A.

In Ch. 101.817-2A, capacitor C17 has been changed in value from 0.05 μf to 0.01 μf. Resistor R8 has been changed in value from 100 ohms to 150 ohms. The second i-f transformer has been changed from capacitor tuning to slug tuning. The new parts number is R65374. The location of the trimmers is shown in the accompanying diagram.



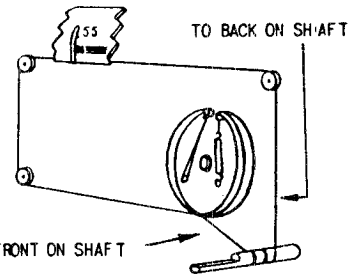
The trimmer locations of the Sears Chassis 101.817-1A and 101.817-2A.

©John F. Rider

Sears 8020, Chassis 132.841

This model appears on *pages 18-56 through 18-60 of Rider's Volume XVIII.* It has been discovered that the dial cord on some of these receivers binds. If the dial cord is strung as shown on *page 18-58,* continued turning of the tuning knob in a clockwise direction, after the pointer has reached the right-hand end of the dial, will cause the tuning shaft to turn in the cord and the cord will slide back on the shaft toward the chassis. Then, when the knob is turned in the counterclockwise direction, the cord will travel farther back on the shaft and have a tendency to come in contact with the chassis and bind on the shaft.

If the cord is wound from back to front on the tuning shaft, as shown in the accompanying figure, it will travel away from the chassis when the knob is turned in a counterclockwise direction and the binding will not occur.



When the dial cord of the Sears 8020 is wound from back to front on the tuning shaft, the cord will not bind on the chassis.

If excessive hum is encountered, try disconnecting the low-voltage section of the electrolytic capacitor, part number N21744, which is the cathode bypass capacitor on the 50L6GT output tube. Substitute a separate 20-μf, 25-v. capacitor for this section.

Some of the original electrolytic capacitors had the sections wound in improper sequence, so there was capacitive coupling between the input high-voltage section and the low-voltage cathode bypass section. This condition would cause excessive hum in the receiver output. It is probable that this condition will be found only on the later production sets of this model.

Sears 8011, Ch. 132.840

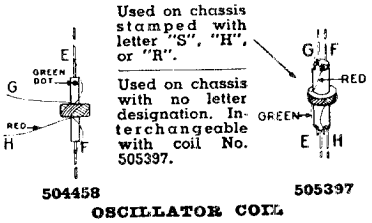
This model is the same as Model 8010, Ch. 132.840, appearing on *page 19-26 of Rider's Manual Volume XIX,* except for the following changes. Model 8010 has a brown cabinet and knobs, while Model 8011 has an ivory cabinet and knobs. Parts which are different from the 8010 are as follows: N21092-1 Cabinet less front trim assembly N21204-3 Knob, control, volume and tuning.

Stewart-Warner A51T Series

These models are the same as Model A51T1, appearing on *pages 17-4 through 17-6 of Rider's Volume XVII.* The code listings for these models are:

Model	*Code*
A51T1	9020-A
A51T2	9020-B
A51T3	9020-C
A51T4	9020-D

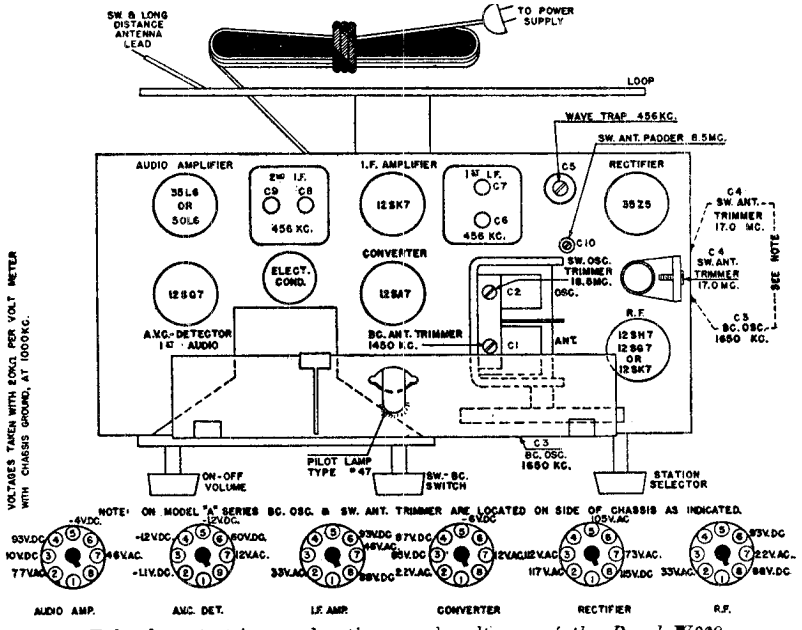
On chassis which have the letters H or R stamped on the rear surface adjacent to the model numbers, the rotor of the gang tuning capacitor is grounded instead of being connected to the AVC line. Oscillator coil 505397 (see accompanying diagram) is used on chassis which are stamped with the letters "S", "H", or "R".



Oscillator coil for Stewart-Warner A51T series.

Regal W900

This model is the same as Model 900 which appears on *pages 16-2 and 16-3 of Rider's Volume XVI.* The socket layout and voltages for both models are shown in the accompanying diagram.

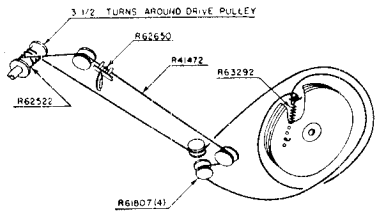


Tube layout, trimmer locations, and voltages of the Regal W900.

Sears 101.809 Series

These chassis are all the same as Model 7080, Ch. 101.809, appearing on *pages 16-1, 16-4, 16-5, and 16-8 of Rider's Volume XVI,* except for the following changes.

Models 8083, 8083A, Ch. 101.809-1A. Pushbuttons have been added. The record changers used in these models are all different. Resistor R5, 330,000 ohms, formerly across the phono pickup socket, has been removed. The dial drive hookup is as shown in the accompanying diagram.

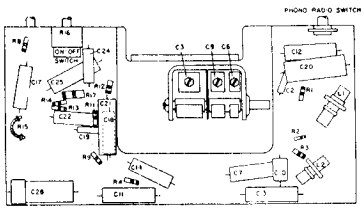


The dial drive hookup for the Sears Chassis 101.809-1A.

All resistors which were 1/3 watt are now 1/2 watt. All capacitors, except C23, C26, and C27, now have a voltage rating of 600 volts. A 6-by-9-inch p-m speaker (R62658) is used, requiring cone and voice coil R62659, and output transformer R62660.

Models 8084, 8084A, Ch. 101.809-1B. Same as Chassis 101.809-1A, except for the record changers.

Models 7080, 7080A, Ch. 101.809-2. Same as Chassis 101.809, except for a new type tone control circuit. A 0.001-μf. capacitor (C24) is connected from the plate (pin 2) of the 7C6 tube to the variable arm of the 2-megohm tone control (R16). The other end of this tone control is connected to the B-line. The parts layout for this chassis is shown in the accompanying diagram.



The parts layout for the Sears Chassis 101.809-2.

Models 8101, 8101A, 8101B, 8101C, 9101, Ch. 101.809-3C. These models are the same as chassis 101.809-2 except for differences in the cabinets, and the fact that different record changers are used.

Stewart-Warner A41T1, Code 9032-A

This is the same as Model A41T1 appearing on *pages 17-1 through 17-3 of Rider's Manual Volume XVII,* except for the following change. Resistor 40, formerly 270 ohms, has been changed to 560 ohms to minimize "B" supply drain. Chassis which incorporate this change have a letter "S" stamped on the rear surface. The new resistor is described as follows:

502127 Resistor—carbon—560 ohms, 1/4 w.

©John F. Rider

Stewart-Warner 61T Series; 9022-T

These models are the same as Model 61T16, appearing on *pages 15-7 and 15-8 of Rider's Volume XV*, except for some changes. The code listings for these models are:

Model	*Code*
61T16	9022-A
61T16W	9022-AW
61T26	9022-B

A 0.01-μf capacitor (45) has been added from the black lead (center tap) of the loop antenna to ground. A 0.05-μf capacitor (46) has been connected from the cathode of the 12SF7 tube to the AVC line. A 390-ohm resistor (44) has been connected in shunt with the pilot lamp.

The following should be added to the parts list:

Diagram No.	*Part No.*	*Description*
45	502151	Capacitor—0.01 μf, 400 v.
46	502153	Capacitor—0.05 μf, 200 v.
44	502140	Resistor—carbon 390 ohms, ¼ w.
37	504756	Transf.—output, for speaker with prefix Y.
	504758	Transf.—output, for speaker with prefix Z.

	504759	Cone and voice coil, spkr. with prefix Z.
	504782	Cone and voice coil, spkr. with prefix C.
	502502	Back for cabinet, Model 9022T
	500385	Cabinet—ivory, Model 61T16W
	502476	Cabinet—ivory, Model 9022T
	502506	Clamp—dial scale mtg., Model 9022T
	502553	Knob—ivory, Model 61T16W
	502564	Knob—ivory, Model 9022-T

Stewart-Warner A61C and A61CR Series

The following models are the same as Model A61CR1, appearing on *pages 17-3 and 17-7 and 17-8 of Rider's Volume XVII*, except for the record changers and cabinets. The parts list for these models appears on *page 17-3*. This information was inadvertently left out of the index and should be inserted.

The parts list appearing on *page 17-3* should be amended to include the following:

Model numbers and code numbers:

	506269 Lid (less hardware) for Model A61CR9
	506270 Lid less hardware) for Model A61CR10
	506418 Lid (less hardware) for Model A61CR5
	506419 Lid (less hardware) for Models A61CR6, A61CR7, A61CR7X, A61CR7PW & A61CR7LPWX
	507179 Lid (less hardware) for Models A61CR16 & A61CR16LP
	507180 Lid (less hardware) for Models A61CR12 & A61CR12LP
	507181 Lid (less hardware) for Models A61CR13 & A61CR13LP
	507182 Lid (less hardware) for Models A61CR14 & A61CR14LP
	507183 Lid (less hardware) for Models A61CR15 & A61CR15LP
	505456 Lid support for Models A61CR2, A61CR2LP, A61CR8, A61CR9, A61CR10, A61CR11, A61CR16 & A61CR16LP
	505463 Lid support for Models A61CR1, A61CR1LP, A61CR4, A61CR4X, A61CR4LP & A61CR4LPX
	506074 Lid support for Models A61CR17 & A61CR17LP
	506422 Lid support for Models A61CR5, A61CR6 A61CR7, A61CR7LPA, A61CR12, A61CR12LP, A61CR13, A61CR13LP, A61CR14, A61CR14LP, A61CR15 & A61CR15LP
	505469 Light diffusing strip
	505717 Needle—phonograph; for standard record (used on "A"-505650, & "VM"-505339 record changers)
	507401 Needle—phonograph; for standard and "LP" records (used on "W"-506910 record changer)
	507406 Needle—phonograph; for standard and "LP" records (used on "VM"-506911 record changer)
	507748 Needle—phonograph (used on "R"-507556 record changer)
	507749 Nut—retains needle (used on "R"-507556 record changer)
	500966 Plug—phono. pick-up cable
	501031 Plug for phono. motor cable
	505686 Pointer
	505487 Rail for drawer; Model A61CR3 (supplied in sets)
	506234 Rail for drawer; Model A61CR21 (supplied in sets)
	119087 Ring for dial cord
	113463 Rubber pad for mtg. chassis
	79905 Screw—#8x1½" for loop mounting
	79993 Screw—#8x1¼" for mtg. chassis
	505716 Screw—set for phono needle (used on "VM"-505339 & "A"-505650 record changers)
	507404 Screw—set for phono. needle (used on "W"-506910 record changer)
	503588 Shaft & Drum for dial
	505313 Shaft—tuning
	505653 Shield for phono. pick-up cable Connector
	505722 Shield—light
	116690 Socket—octal base
	160039 Socket—phono. plug
	160392 Socket—octal (rectifier)
	505307 Socket & phono. motor cable
	505459 Socket—dial lamp
	505854 Socket for phono. pick-up cable Connector
	505161 Spring—tension
	506276 Stop for door; Models A61CR17 & A61CR17LP
	111456 Washer—spring washer for tuning shaft

The parts list of the Stewart Warner A61C and A61CR series.

Tele-Tone Chassis A

Models 123, 125, 127, and 131 are the same as Model 100, Chassis A, which appears on *page 15-2 of Rider's Volume XV.*

Tele-Tone Chassis D

Models 110, 119, 124, 126, and 132 are the same as Model 117, Chassis **D**, appearing in *Rider's Volume XV, page 15-4.*

Tele-Tone Chassis U

Models 172 and 176 are the same as Model 156, Chassis U, which appears on *page 17-4 of Rider's Volume XVII.*

Tele-Tone Chassis W

Models 154, 155, 173, and 177 are the same as Model 152, Chassis W, which appears on *pages 17-2 and 17-3 of Rider's Volume XVII.*

Templetone H-127

This model is the same as Model G-725, appearing on *pages 17-3 through 17-6 of Rider's Volume XVII.*

United Motors 982421

This model appears on *pages 19-44 through 19-49 of Rider's Manual Volume XIX.* The following service parts have been changed after serial #1-38500.

Illus. No.	*Production Part No.*	*Service Part No.*	*Description*
6	1219508	1219508	1st i-f coil assy.
7	1219509	1219509	2nd i-f coil assy.
25	7240724	M908	Electrolytic
25A			20 μf, 25 v.
25B			20 μf, 400 v.
25C			20 μf, 400 v.
28	7237836	E202	0.002 μf, 600 v. tubular
48	1213217	A101	100 ohms, ½ w.
	1218107	5233	6SR7
	1213793	5241	6V6GT
	7237751	5229	6SK7
	7237752	5222	6SA7

Watterson RC-4581

This model is the same as Model 4581 appearing on *page 15-1 of Rider's Volume XV.*

Western Auto D2718 Series B, Serial No. 137000 Up

This model is the same as Model D2718, appearing on *pages 17-20 through 17-23 of Rider's Volume XVII,* except for the following changes. Capacitor C30, formerly connected from the junction of R-16, C-29, and pin 8 of the 12SQ7 tube to pin 2 of the 35Z5GT rectifier tube, is connected from the same junction to the center tap (pin 3) of the filament of the 35Z5GT rectifier tube.

The part number of capacitor C16 and C20 should be changed from 47X446 to 47X466. The value remains the same. Part number 17X96, celluloid crystal, should be added to the parts list.

Western Auto D4832-B

This model appears on *pages 18-69 through 18-72 of Rider's Volume XVIII.* The "B" chassis of this model differ from the "A" chassis by a change in the value of resistor R-4 from 220,000 ohms to 10,000 ohms.

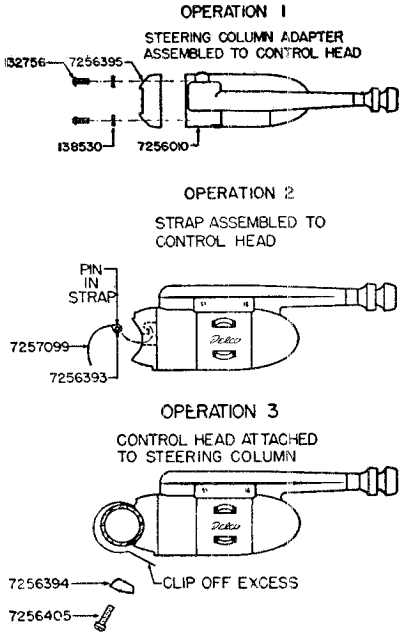
The new part number and description are as follows:

R-4 B-85103 10,000 ohms, 0.5 w.

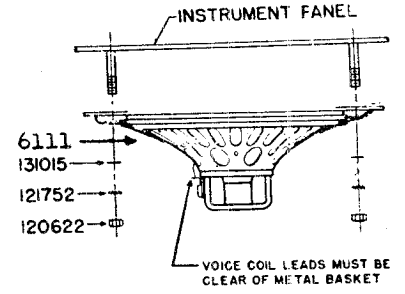
United Motors R-705

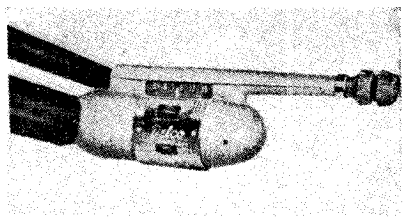
This model appears on *pages 17-1 through 17-6 of Rider's Volume XVII.* This receiver may be installed in the 1949 Fords by using parts from the adapter parts package number 4428. It is necessary to use the Delco universal speaker, part number 6111—6″ × 9″ eliptical speaker, in place of the speaker supplied with the radio set. This speaker should be returned to your stock under part number 6104.

The parts that are to be used from adapter package 4428, are shown in the following operations.



OPERATION 4: Remove the tips from speaker cable and solder ends to 6″ × 9″ speaker terminals.





The various operations necessary to install United Motors Model R-705 in the 1949 Fords, as well as the assembled control head are illustrated.

Westinghouse H-125, H-126, H-127

Models H-125 and H-126 appear in *Rider's Volume XV, pages 15-8 through 15-10.* Several changes were made in the chassis of these two models in late production. A 35L6GT output tube replaces the 35A5. The electrical characteristics of the tubes are similar except for a difference in tube bases and connections. An isolating network consisting of a 470-ohm resistor (44) and a 0.02-μf capacitor (14) has been inserted in the plate and screen voltage supply line for the r-f and converter stages. In the circuit, the rotor plates of the tuning and trimmer capacitors are now connected directly to chassis ground rather than to the AVC line.

Model H-127 is the same as the previous models with a burgundy and gold cabinet. The following items should be added to the parts lists for these models:

14	RCP10W2203A	Capacitor, 0.02 μf
44	RC20AE471M	Resistor, 470 ohms 0.5 watt
	V-3711-2	Case Assembly, center (H-126 and H-127)
	V-3991	Cover, left hand (H-127)
	V-3992	Cover, right hand (H-127)
	V-3498-2	Handle Assembly (H-127)
	V-3481-2	Knob (H-127)
	V-3333-2	Medallion (H-127)
	V-3455-2	Dial (H-127)

Westinghouse H-164, H-166, H-166A, H-167

These models appear on *pages 18-12 through 18-19 of Rider's Volume XVIII.*

To reduce hum in later production of these models, a de-coupling network was inserted in the plate circuit of the 6AT6 a-m detector, avc and a-f amplifier tube. This network consists of a 100,000-ohm ½ watt resistor (RC20AE104K) and a 0.1 μf 400 volt resonant type capacitor (V-5442-1). The resistor is inserted between the plate load resistor (R11) and the B plus line, and the capacitor is connected from the junction of R11 and the new resistor to ground.

Westinghouse H-183, H-183A

These models appear on *pages 19-15 through 19-17 of Rider's Manual Volume XIX.* An error exists in the schematic diagram. The value of R9 in the converter circuit should be 3,300 ohms instead of 300 ohms.

The position of C20 in the circuit has been changed. On some chassis this capacitor was connected across the primary of the output transformer as shown on the schematic diagram. In later production, the capacitor is connected from the plates to the cathodes of the parallel 25L6GT output tubes.

Westinghouse H-186, H-187

These models appear on *pages 18-26 through 18-30 of Rider's Volume XVIII.*

To reduce hum in later production of these models, a de-coupling network was inserted in the plate circuit of the 6AT6 AM detector, AVC and A-F amplifier tube. This network consists of a 100,000 ohm ½ watt resistor (RC20AE104K) and a 0.05 μf 400 volt capacitor (RCP10W4503A). The resistor is inserted between the plate load resistor (R13) and the B plus line, and the capacitor is connected from the junction of R13 and the new resistor to ground.

©John F. Rider

Westinghouse H-202, H-204

These models appear on *pages 19-24 through 19-28 of Rider's Manual Volume XIX*. The schematic diagram shows C12 and R17 in series between the a-m antenna terminal and the top of L17. R17 should connect to the bottom of L17 rather than to the top of L17.

Westinghouse H-188, Ch. V-2133

This model appears on *pages 19-18 and 19-19 of Rider's Volume XIX*. Short wave interference may be cured by replacing the 0.05-μf resonant capacitor (C7) with a 0.1-μf standard paper capacitor of 200 volts or higher rating.

The 220,000-ohm resistor, R11, which was previously connected between the common negative line and the chassis, is not being used on late chassis.

The switch, SW1, is incorrectly shown on the schematic diagram and parts list as a D.P.S.T. switch. Actually, it is a S.P.S.T. switch, and it interrupts only one side of the a-c line, the side which connects to the common negative line.

In later production, a V-6199-2 2nd i-f transformer was used in place of the V-5686 2nd i-f transformer listed. Although the new transformer is smaller than the original one, it is directly interchangeable through the use of a V-5426 mounting clip. The new transformer is slug-tuned and has one adjustment hole in the top of the can and one in the bottom of the can. The terminals are marked by numbers which are equivalent to the colors on the old transformer as follows: 1 equals green, 2 equals white, 3 equals blue, and 4 equals red. For replacement purposes, order the V-6199-2 2nd i-f transformer and V-5426 mounting clip.

Some chassis may use a V-5686 i-f transformer in place of the V-5685 1st i-f transformer; however, the V-5685 transformer as listed in the parts list should be ordered for replacement of the 1st i-f.

The following items should be added to the parts list:

Part No.	*Description*
V-6199-2	Transformer, 2nd i-f, (L6, L7, C19, C20)
V-5426	Clip, i-f mounting
V-1160-2	Cabinet, ivory
V-5778-2	Baffle and grille cloth assembly for ivory cabinet
V-5779-2	Grille, for ivory or black cabinet

Note: The V-1160-1 cabinet listed in the parts list is a black cabinet, and the V-5778-1 baffle and grille cloth assembly is for use with the black cabinet.

Westinghouse H-190, H-191, H-191A

These models appear on *pages 19-20 through 19-23 of Rider's Manual Volume XIX*. In later production, the cathode resistor, R3, for the 6BA6 1st i-f amplifier was removed and the cathode connected directly to ground. In addition, a 0.0022-μf mica capacitor (RCM30B222M) was connected across the 6BA6 2nd i-f amplifier cathode resistor, R4.

On some chassis, V-5596 "HI-KAP" capacitors are substituted for the following capacitors:

V-5040-15 (C7, C8, C9, C10, C11)
V-5040-11 (C19, C20, C21).

In the parts list, the part number of "Pull, door, phono (H-191 and H-191A)" should be changed to V-5877-1 and the part number of "Pull, door, record compartment (H-191 and H-191A)" should be changed to V-5877-2. These part numbers were reversed. Also, the part number of "Hinge, L.H." should be changed to V-6603-1, and the part number of "Hinge, R.H." should be changed to V-6603-2.

Westinghouse H-204A

This model appears on *pages 19-24 through 19-28 of Rider's Manual Volume XIX*. On some chassis, V-5595 "HI-KAP" capacitors are substituted for V-5040-13 (C51, C52, C53, C54, C55, C56, C57) capacitors. The substitution was made for convenience in production, and the receiver operation is not affected.

Westinghouse H-210, H-211; Ch. V-2144, V-2144-1

These models appear on *pages 19-33 through 19-35 of Rider's Volume XIX*. If the dial pointer has a tendency to bind, lubricate the two dial pulleys with record changer lubricant and move the dial cord tension spring to another hole in the drum to increase the tension.

If the dial pointer rattles, glue a piece of bumper material (cork and rubber composition) 1/8" thick and about ½" square between the right-hand pulley rivet on the dial background and the front of the chassis.

In later production models, the resistance of the 12BA6 i-f amplifier cathode resistor, R3, was changed to 668 ohms. The part number of the new resistor is RC20AD680J. In addition, the resistor, R12, in the lead from pin 5 of the 35W4 was deleted from the circuit, and a direct connection was made in lieu of the resistor.

The tuning shafts used in later production have a wider groove for the dial cord. With these shafts, there are 3¼ turns of dial cord around the shaft rather than 2¼ turns as indicated on the dial-drive drawing.

Zenith S-11468

Model S-11468 may be found in the Record Changer section of *Rider's Volume XV, pages RCD.CH. 15-1 through RCD. CH. 15-9*.

The following instructions deal with repairing erratic landing of the needle of Model S-11468. In the first production of this non-intermixer record changer, a neoprene cork-tipped lift pin, Part No. S-13056, was used to stabilize the set down or landing of the needle on the run-in groove of the record. The weight of the tone arm and the friction plate, riding on the neoprene tip of the lift pin was relied on to provide effective braking action. Grease or oil on the neoprene tip of the lift pin will cause erratic landing of the tone arm on the record. To remove the oil or grease, clean the pin tip and friction plate with carbon tetrachloride and roughen with fine sandpaper.

Later production S-11468 changers have a spring type brake on the tone arm shaft and use an all metal lift pin, Part No. S-13086. Erratic landing, where the arm swings sharply to the center of the record or beyond, may be caused by an incorrect locating bushing. Replace with a 94-415 bushing.

If the tone arm skips grooves and repeats, the vertical hinge on the tone arm may be too tight, causing the arm to hang slightly. This prevents the needle from exerting enough pressure on the record to follow the record grooves. To free the hinge, use a pair of long nose pliers and bend the horizontal spring "U" bracket until it pivots freely, Be certain that the connecting lead to the crystal cartridge is dressed so that it does not interfere with either the vertical or horizontal movement of the tone arm. *This is important.*

Excessive center hole wear on records is caused by a sharp edge or burrs on the spindle shelf. The edge of the record shelf must be perfectly smooth and slightly rounded. Check the edge, and if sharp, smooth out with fine sandpaper.

Zenith 5DO and 5RO Series, Chassis 5C01, 5C02, and 5C04

These models appear on *pages 15-8 and 15-9 of Rider's Volume XV*.

Alternate tubes are used in the 5C01 chassis. A single chassis may contain octal, lock-in, and miniature button tubes. The alternate lineups are as follows.

Original	*Alternate*	*Alternate*
12SA7GT	12BE6	14Q7
35Z5GT	35W4	
12SK7	12BA6	
12SQ7	12AT6	
50L6GT	50B5	

If the oscillator should shift, replace the 220-ohm oscillator coupling resistor (R8) with a 1000-ohm resistor. When the oscillator drops out at the low end of the band, remove the 10,000-ohm grid leak resistor (R1) from the common return (B—) and connect it instead to the cathode of the converter. If audio oscillation occurs in the early model, disconnect the 0.0005-μf capacitor (C13) from the common return and connect it to the cathode of the 50L6GT output tube, as shown in the late model schematic on *page 15-8*. Remove the 250-$\mu\mu$f capacitor (C20) that is connected from the plate to the cathode of the 50L6GT output tube. When hum and microphonics appear, check for a grounded tuning capacitor frame to the cabinet ventilator plate.

The letter "V" after a chassis number indicates that an aluminum chassis is used

Zenith Chassis 6C05, 6D0 Series

This chassis appears in *Rider's Volume XV, pages 15-2, 15-28, and 15-29*.

There will be variations in the tube line-up for different 6C05 chassis. A single chassis may contain octal, lock-in, and miniature button tubes. If an original tube is replaced with an alternate, the socket must also be replaced.

Original	*Alternate*	*Alternate*
12SJ7GT		
12SA7GT	12BE6	14Q7
12BA6		
12SQ7GT	12AT6	
35L6GT		
35Z5GT	35W5	

If the oscillator shifts, replace R3 (220 ohms) with a 1,000-ohm resistor.

If the oscillator drops out at the low end of the band, disconnect R1 (10,000 ohms) from the negative return and connect to the cathode of the converter tube.

For audio oscillation, disconnect C14 from the negative return and connect to the cathode of the 35L6GT. Take out C21 (connected from the plate to cathode of the 35L6GT).

If there is oscillation at 910 kc, change C5 (negative return to chassis) from 0.05 to 0.1 μf.

Check for grounded tuning capacitor frame in case of oscillation, hum, and poor sensitivity. Correct by inserting cork or rubber pad between rear capacitor frame and chassis. Cement in place.

The letter "V" as in Chassis number 6C05V, indicates that an aluminum chassis is used.

©John F. Rider

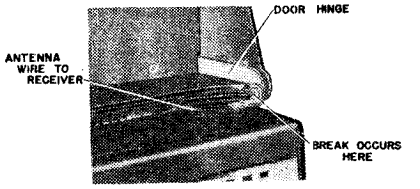
Zenith 4G800 Chassis 4E41

This model appears in *Volume XVII of Rider's Manuals, pages 17-1 and 17-2.* The On-Off switch #85-433 does not completely break contact on some receivers when the lid is closed, causing battery drain. To correct this condition, saw one plastic switch knob 46-736 into 1/16" lengths and place a length on the switch shaft, and then replace the knob. This will force the switch down far enough when the lid is closed to break contact and disconnect the batteries.

In some cases the calibration pointer touches the metal front of the cabinet, thus putting the gang at an a-c potential and causing a hum. To correct this condition place a fibre washer #93-323 between the pointer and the metal dial front. This fibre washer between the metal front panel and the dial pointer, completely prevents this "shorting" condition.

In very rare cases, when hum is encountered and cannot be corrected in any other manner, changing the 1S5 tube is suggested.

On later production runs the 3Q4 tube was replaced with a 3V4 tube. The circuit remains the same in this case. However, the wiring to the tube base has been altered. The 3Q4 is not interchangeable with the 3V4 because of socket connections.



Enough extra lead length should be left when replacing the wavemagnet lead on the Zenith 4G800 so that a break does not occur at the point indicated.

In some cases when the front lid of the receiver is open, the receiver will cut in and out or sometimes be entirely dead. The wire from the wavemagnet to the front door hinge may break at the hinge connection. To correct this condition, remove the handle and resolder these leads, being quite certain that solder is not allowed to run back on the antenna lead and that enough extra antenna lead is allowed for flexing to prevent breakage when the door is open as illustrated in the accompanying diagram.

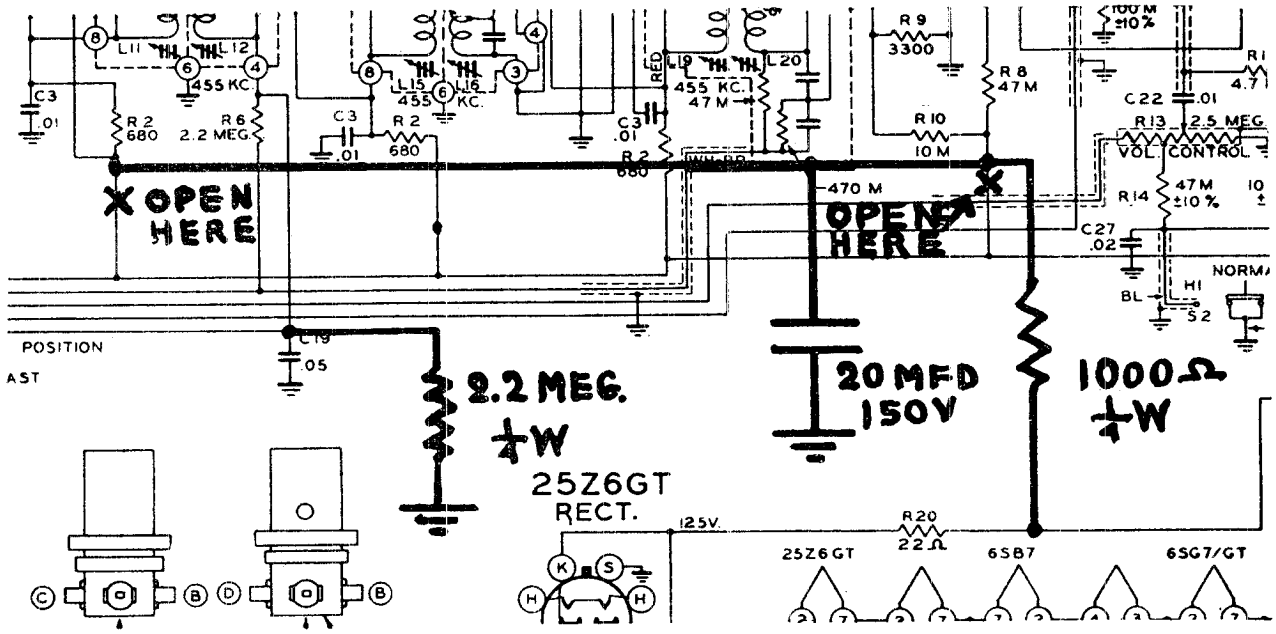
Zenith 6G801, Chassis 6E40

This model appears in *Rider's Volume XVIII, pages 18-7, 18-8, and 18-10.* In some cases when microphonics are encountered they can be eliminated by replacing one or more of the tubes. The offending tube can be located by turning the set on with the volume advanced and the set tuned to an off-station position. Then gently tap each tube, the one emitting the loudest "ping" is the defective item.

Zenith 8H023, 8H034, Chassis 8C01

These models appear on *pages 15-71 to 15-74 of Rider's Volume XV.* The rushing noise that occurs when the volume control is turned to minimum is caused by a poor connection from the grid element to the grid cap of the 6S8GT tube. A hot iron and a little flux on the grid cap will remove the high-resistance solder joint.

If the f-m oscillator drifts, check for a red dot on the oscillator tuning-slug wire. If the wire is unmarked, replace with one which has a red dot. If the receiver flutters on f.m., this may be cured by installing a 22-1635, 20-μf, 150-V capacitor and two 1/4-watt resistors, 63-583, 1000 ohms, and 63-600, 2.2 Megohms, as indicated in the accompanying diagram.



Drift in the f-m oscillator of the Zenith 8H023 may be corrected by making the changes indicated.

©John F. Rider

Zenith 9H881, 9H882, 9H885, 9H888, Ch. 9E21

These models appear on *pages 19-22 through 19-29,30 of Rider's Volume XIX.* If capacitor C-4, 0.05 μf, in series with the wavemagnet is open, the signals will be weak and the addition of an external antenna will not appreciably improve the signal strength. The replacement of this capacitor with a new 0.05 μf capacitor usually clears up the trouble.

If the phonograph is dead, check resistor R-14, 10,000 ohms, ½ watt, for intermittent operation. Due to movement of the r-f shelf when the band switch is operated, this resistor sometimes becomes intermittent, thus opening the phono circuit.

In most cases when aligning these models, it is not necessary to change or make any alterations in the i-f or discriminator trimmers. These trimmers are quite stable, and the only change recommended in alignment is that of the r-f section.

Be very sure to dress the tone control wires away from the pulley and dial cord. If these are not dressed away, binding and dial slipping will result.

If static is present when tuning in a station, check and see if the silver foil on the paper tube shield is tightly wrapped on the cardboard form. Sometimes this foil unwraps from the cardboard form and lies against the gang plates, creating static.

Zenith 6R886Z, Chassis 6E02Z

Model 6R886Z is the same as Model 6R886 which appears in *Rider's Manual Volume XVII, pages 17-16 and 17-17,* except that a tone control has been added, as illustrated in the accompanying diagram.

The following parts were added:

S-14667	Dial pointer and pulley assy.
S-14670	Tone control brkt. and lug assy.
12-1490	Cover plate support
22-827	0.1 μf 200 v.
46-688	Tone control knob
57-1398	Escutcheon

Changes in the Zenith 6R886Z.

63-1653	Tone control
78-793	Socket-octal tube
85-438	Phono-Radio switch
125-66	Rubber grommet
166-41	Rubber bumper
188-34	Retaining ring.

Zenith Chassis 6C01, 6D0 Series

Chassis 6C01, 6D0 Series, which appears on *page 15-26 of Rider's Volume XV,* will contain variations in the tube line-up. A single chassis may contain octal, lock-in, and miniature button tubes. If an original tube is replaced with an alternate, the socket must also be replaced.

Original	*Alternate*
35Z5G/GT	35W4
12SQ7GT	12AT6

When replacing speakers, use a speaker with the same code letter (49U, AG etc.) as the original otherwise a low-pitch hum may be produced. If a speaker with a different code is used, R10 (feedback resistor) may have to be changed. With 49U, H, or AG speakers, R10 is 390,000 ohms. When using a 49CS549 speaker, R10 must be 680,000 ohms. R10 is 330,000 ohms for all other speakers.

To repair this set when it produces a howl, change the 14C7 tube, which is probably microphonic.

For oscillation, hum, and poor sensitivity, check for grounded tuning capacitor frame. Correct by inserting a rubber pad between the capacitor frame and chassis. Cement in place.

Zenith 8G005 Series

These models appear on *pages 15-63 through 15-70 of Rider's Volume XV.* All receivers of this series are similar. Different letters after the numbers 8G005 indicate differences in the cabinet only, except for Model 8G005BT. The latter is an export-standard model and employs a 220-120-volt changeover switch in the rear of the chassis. Otherwise, it is the same as the rest of the series.

Zenith 6G001, 6G001YX, Chassis 6C40, 8G005, 8G005YX, Chassis 8C40

Model 6G001 appears on *pages 15-30 and 15-31 of Rider's Volume XV.* Model 8G005 appears on *pages 15-63 through 15-70 of Rider's Volume XV.* The On-Off switch must be in the Off position whenever the line plug is inserted into the changeover switch on the rear of the chassis. Failure to do this may cause flashing and possible burn-out of the output tubes.

Intermittent operation may be caused by the wavemagnet snap connectors being sprung, causing a poor contact. Poor wavemagnet contact is made through the cabinet hinge.

The letter "X" after the model number (6G001YX, 8G005YX) indicates that an aluminum cabinet is used.

MODELS RC195, RC196, RC197, RC210. RC211, RC212

RC195, RC196, RC197 RECORD CHANGERS

A very small quantity of record changers with model numbers RC195, RC196, RC197 were produced. These Record Changers are early production version of the RC210, RC211, and RC212 Record Changers. The only difference between them is that on the RC195, RC196, and RC197 Record Changers, no provision was made for automatically playing 7-inch records. (Centerpost is not removable and pickup arm does not have size selector knob.)

OPERATING INSTRUCTIONS

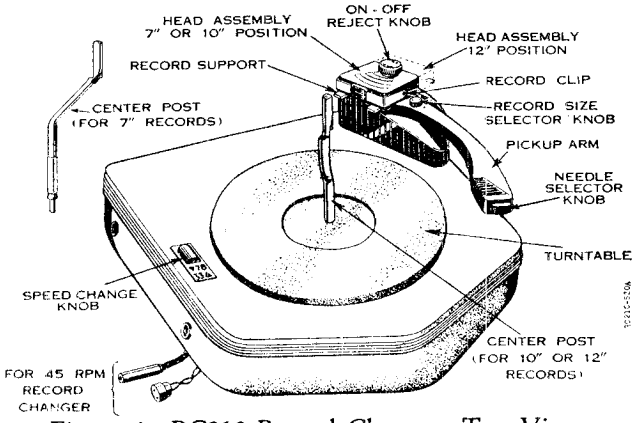

Figure 1. RC210 Record Changer, Top View.

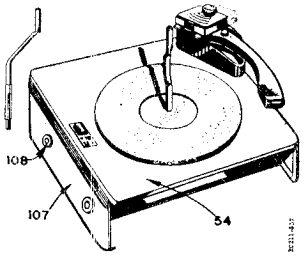

Figure 2. RC211 Record Changer

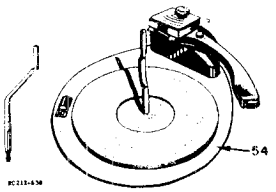

Figure 3. RC212 Record Changer

This Admiral Record Changer will automatically play a series of ten 7-inch, twelve 10-inch, or ten 12-inch records of either the 78 RPM, or the new 33 RPM type. The records must be of one size and type for each loading.

Models RC210 and RC211 can also be used, in connection with the Admiral 45 RPM Record Changer, to play the new 7-inch, 45 RPM records. Two plugs have been provided to allow for connecting it to the Admiral 45 RPM Record Changer.

SETTING NEEDLE SELECTOR AND SPEED CHANGE KNOBS

Rotate the pickup arm cartridge, by turning the needle selector knob which extends out from the front of the pickup arm. The small arrow next to the "33" and "78" indicates the direction in which the knob must be rotated. When turning this knob to either the "78" or the "33" position, make certain that it is turned until it reaches its stop.

For playing 78 RPM records, move the speed change knob to the "78" position; for playing 33 RPM records, move it to the "33" position. When moving the speed change knob, make certain that it clicks or snaps into position.

Be certain that the needle selector knob and speed change knob are both set for "78", or are both set for "33"

SETTING FOR SIZE OF RECORD

SELECTING CENTERPOST: This record changer is designed to be used with either of two centerposts. The centerpost which has a curved portion in the center is the centerpost for 10-inch and 12-inch records. The second centerpost is bent approximately 45 degrees and is to be used for automatically playing 7-inch records.

To change centerposts it is only necessary to lift the centerpost from its socket. Place one hand on the turntable while pulling out the centerpost with the other hand.

SETTING HEAD ASSEMBLY: In order to play 7-inch or 10-inch records, rotate the head assembly so that the embossed design is toward the centerpost. See figure 1. For 12-inch records, rotate the head assembly so that the embossed design is away from the centerpost.

SETTING RECORD SIZE SELECTOR KNOB: To play 7-inch records, turn the Record Size Selector knob to the left so that the figure "7" on the knob is adjacent to the dot on the pickup arm. To play 10-inch or 12-inch records, turn this knob to the right until the figures "10 12" are adjacent to the dot on the pickup arm.

STARTING THE RECORD CHANGER

Do not load 33 RPM records with the standard 78 RPM type. Also, the records must be of the same size (all 7-inch, all 10-inch, or all 12-inch) for each loading.

After setting the head assembly for the correct record size, move the record clip so that it is away from the centerpost before loading the changer.

Place your records over the centerpost so that they rest on its offset. The edge of the bottom record will be held up by the record support.

Move the record clip so that it rests on the top record.

Turn the On-Off Reject knob to the "ON" position.

Press down on the On-Off Reject knob momentarily to the "Reject" position. The bottom record will drop to the turntable and the Record Changer will play the entire stack of records automatically.

REJECTING A RECORD

If you wish to stop playing any record and start playing the next one, merely press down on the On-Off Reject knob momentarily.

STOPPING AND UNLOADING

This Record Changer cannot be turned off, by means of the On-Off Reject knob, during its change cycle. Therefore, after the last record, allow the mechanism to go through its change cycle and start playing over again.

RC211, RC212

THE CHANGE CYCLE

DESCRIPTION OF CHANGE CYCLE
(See Figures 4 and 5)

If at all possible, we recommend that you carefully observe the operation of a changer that is in normal operating condition. It is a good idea to rotate the turntable by hand and repeat the changing cycle until you understand the function of each part. **It is important to note that this changer employs the oscillating type trip, which depends upon the in and out movement of the pickup arm caused by the eccentric groove in the record.**

The changer operates as follows: The changer mechanism is driven during its change cycle by the knurled hub of the turntable rotating the rubber-tired drive wheel (69). During normal playing, the drive wheel is held in a neutral position as illustrated in Fig. 4A, so that the indentation prevents the tire from contacting the knurled hub. The drive wheel (69) is held in this position by the trip stop wire (91A) and the cam stop stud (72A) on the control cam (72).

During the record play and as the needle enters the record eccentric groove, the pickup arm is moving in toward the centerpost. The pawl (103A) is moving across the trip serrations (94). When the eccentric groove in the record causes the pickup arm to move away from the centerpost, the pawl (103A) tends to reverse its direction but its sharp point catches in one of the trip serrations (94) and moves the trip lever (91). As the eccentric groove moves the pickup arm back in toward the centerpost, and then away from the centerpost again, the pawl (103A), again locks in one of the trip serrations, moves the trip lever (91) far enough so that the trip stop wire (91A) is no longer engaged with the cam stop stud (72A). **This oscillating trip action is dependent upon the adjustment of the trip set screw (95).** If it is adjusted properly, the pickup arm will move away from the centerpost, toward the centerpost, and as it comes away the second time the changer will trip and start its change cycle. (See paragraph under heading "Trip Adjustment.") The position of drive wheel (69) at this moment is shown in Figure 4B.

This allows the cycle spring (92) to pull the control cam clockwise (bottom view). Since the control cam (72) and the drive wheel (69) are on the same shaft, the drive wheel is turned so its rubber tire is against the knurled hub of the turntable (see Figure 4B). The turntable now rotates the drive wheel (69) which simultaneously rotates the control cam (72). As soon as changer has been tripped, the trip cocking spring (90) causes the trip lever (91) to return the trip stop wire (91A) to the noraml playing position.

Roller (85) riding on the control cam (72) moves the pivot link (84) which in turn rotates the control plate (83). The rotation of the control plate (83) causes its inclined tab (83A) to ride against the lift rod (28) which lifts the pickup arm from the record. The arm control lever roller and stud (103B) then engages the safety arm (100). Further rotation of the control cam (72) moves the pivot link (84) causing further rotation of the control plate (83) causing the pickup arm to move to the right, clearing the record. This much has taken place in approximately one-third of the total rotation of the control cam.

As the control cam rotates further, its push-off stud (72B) engages with the end of the slot in the pushoff

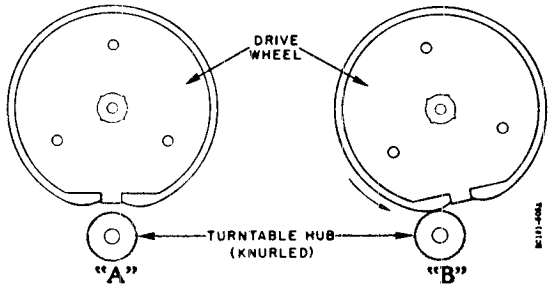

Figure 4. Drive Wheel Positions.

link assembly (76), moving it. This movement is transmitted through the push-off arm (76A) and as a result, the push-off shaft (10) is rotated. This rotates the push-off cam (10A) which in turn slides the push-off plate (11) forward and drops the next record to be played. Note that the record stack rests on the record support shelf (12). The small slide at the top end of the centerpost holds back all records other than the bottom one when the push-off plate (11) moves forward.

As the control cam continues its rotation, the pivot link (84) moves back following the cam, since the roller (85) is kept in contact with the cam by the control plate spring (87). This moves the control plate (83) back, the arm control lever (103) moves the pickup arm to the set-down point for the record to be played. The pickup arm is held above the record because the lift rod (28) is still resting at the top of the inclined tab (83A) on the control plate (83). The set-down point is governed by the set-down adjusting screw (21). (See figure 6.) The shoulder on the set-down arm (104A) holds the pickup arm at the set-down point until it is pushed back by the edge of the control plate engaging the set-down arm stud (104B). The pickup arm is then free and moves down toward the record starting groove.

When the record changer is set to play 7-inch or 10-inch records, the set-down arm (104A) through the tension of the set-down spring (106) moves the arm in toward the centerpost until the return roller and stud (103C) reaches the shoulder of the set-down arm (104A). The pickup arm is held in this position until the control plate (83) engages the set-down arm stud (104B), pushing the set-down arm back, releasing or freeing the pickup arm.

When the changer is set for 12-inch records the size change eccentric (82) moves the set-down and size change assembly (104) so that the arm return roller and stud (103C) does not travel as great a distance along the set-down arm (104A) before it reaches the shoulder. Therefore the pickup arm cannot move in toward the centerpost as far as for 7-inch or 10-inch records, during change cycle.

When the On-Off Reject knob (1) is pressed down, the push-off cam and shaft (10) moves the reject arm (97) down. This movement causes the trip lever (91) to move which prevents the trip stop wire (91A) from engaging the cam stop stud (72A). The change cycle then proceeds in the manner described above.

The change cycle is exactly the same for either speed (33 RPM or 78 RPM) except for the fact that the change cycle time is proportional to the turntable speed (33 RPM or 78 RPM).

©John F. Rider

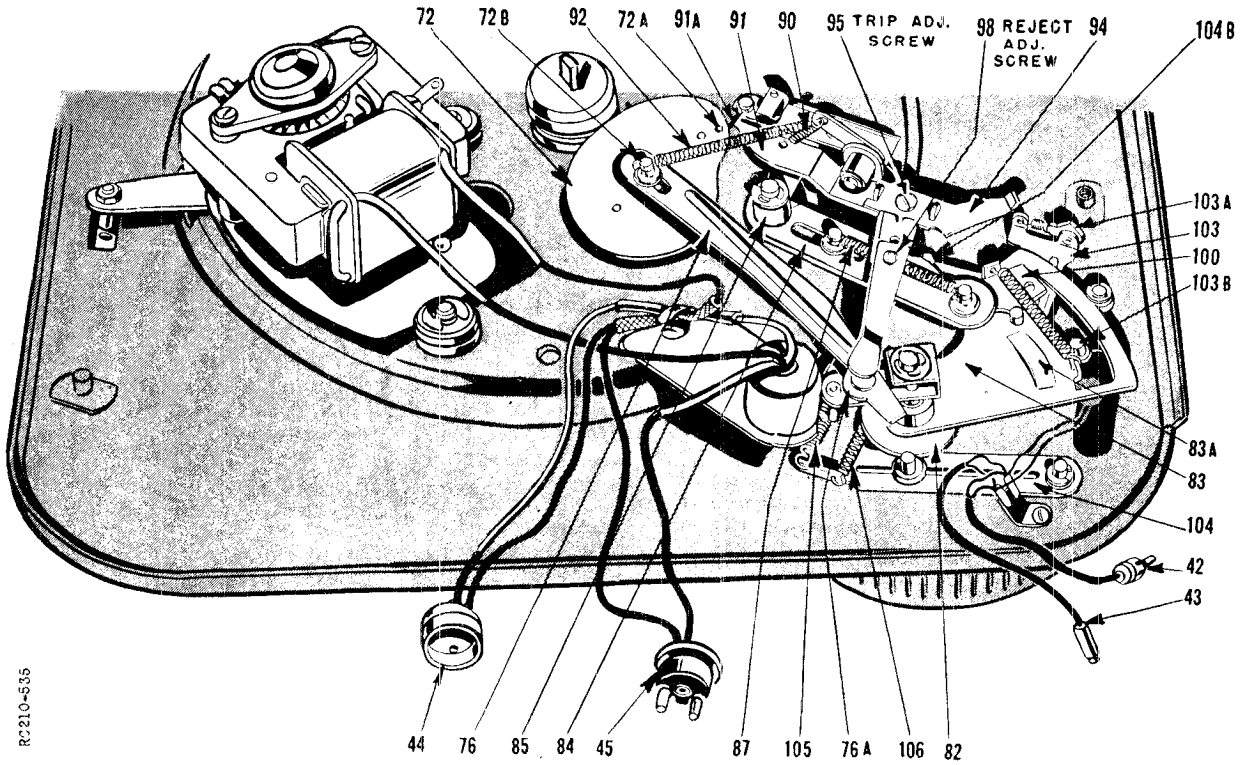

Figure 5. Bottom View Assembled.

Playing 7-inch records automatically is accomplished by removing the centerpost for 10-inch or 12-inch records and inserting the centerpost for 7-inch records. Rotation of the record size selector knob (17) to the position for 7-inch records, rotates the set-down eccentric (23). The set-down eccentric rotates or moves the set-down plate, part of pivot and mounting plate (24), and the pivot spring and hub (29). This in turn moves the arm control lever, studs, and pawl (103) so the pawl (103A) is closer to the lip of the trip serrations (94). This results in moving the end of the pick-up arm closer to the centerpost, by the distance needed for proper set-down on 7-inch records.

ADJUSTMENTS

ADJUSTMENT OF SET-DOWN POINT

Adjustment of the set-down point, for either 7-inch, 10-inch, or 12-inch records, is made by adjustment of the set-down adjusting screw (21), see Figure 6. Screw (21) is accessible through hole in right side of pickup arm. This adjustment must be made with the record size selector knob (17) in the "10.12" position. When turning this knob be sure to turn it all the way (the dot between "10.12" should line up with the indicating dot on the pickup arm) to avoid making the set-down adjustment at the wrong point, resulting in improper set-down on 7-inch records. Turning the set-down adjusting screw (21) in, moves the set-down point of the pickup arm closer to the centerpost and turning the screw out moves it away from the centerpost.

Make the set-down point adjustment as follows:

1. Set record size selector knob (17) to the "10.12" position; be sure the knob is turned all the way to its stop (the dot between "10.12" should line up with dot on pickup arm).
2. Set needle selector knob to either position being certain that the knob is turned to its stop so the needle projects straight down.
3. Set the head assembly to the position for playing 7-inch or 10-inch records.
4. Press down on the On-Off Reject knob (1) momentarily. Rotate the turntable by hand through the change cycle until the pickup arm moves down toward the turntable.
5. Check the distance between the needle point and the near side of the centerpost. For proper set-down on 10-inch records, the distance between needle and centerpost should be between 4⅝" and 4-11/16".
6. Adjust set-down screw (21) and repeat steps 4 and 5 until the proper distance is obtained. If this adjustment is made carefully, the set-down point for 7-inch records and 12-inch records will be automatically correct.
7. Check 12-inch set-down as follows: Set the head assembly to the position for 12-inch records, press On-Off Reject knob momentarily, rotate turntable by hand through the change cycle and check the 12-inch set-down point. The proper distance between the needle point and the near side of the centerpost is between 5⅝" and 5-11/16".
8. Check 7-inch set-down as follows: Set the head assembly to the position for 7-inch and 10-inch records, set the record size selector knob (17) so the dot under the "7" lines up with the locating dot on the pickup arm. (NOTE: In some early production sets, it may be necessary to set the

© John F. Rider

MODELS RC210, RC211, RC212

record size selector knob (17) so that the dots are slightly out of line.) Press the On-Off Reject knob momentarily, rotate the turntable by hand through the change cycle and check the 7-inch set-down point. The proper distance between needle point and the near side of the centerpost is between 3-3/16" and 3¼".

9. If step 7 or step 8 indicates improper set-down on 7-inch records or 12-inch records, make a compromise adjustment for 10-inch record set-down as outlined in steps 3, 4, 5 and 6.

ADJUSTING THE PICKUP ARM HEIGHT (See Figure 6)

This record changer is designed so that when the needle point rests ¼" above the changer pan, the pick-up arm will automatically lift high enough, during change cycle, to clear the top record of a stack of ten 7-inch, twelve 10-inch, or ten 12-inch records on the turntable. With proper pickup arm height setting, the pickup arm will not lift high enough to strike the bottom record of the stack to be played.

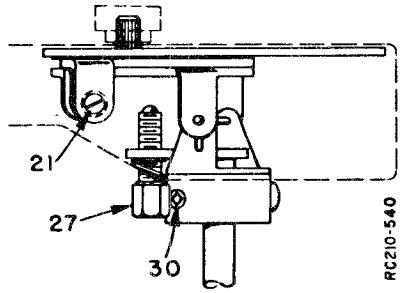

Figure 6. Arm Detail Showing Adjustments.

With the record changer out of change cycle and the pickup arm clear of the turntable, adjust the lift adjusting screw (27) so that the needle rests approximately ¼" above the top of the changer pan. Turning screw (27) in raises the pickup arm; turning it out lowers the arm.

After this adjustment has been made, the record changer should be run through its change cycle a few times to make certain that the pickup arm does not touch the bottom record of the stack to be played. If, for some reason, the arm lifts too high, a compromise adjustment should be made. That is, turn the screw out and lower the pickup arm slightly.

REJECT AND TRIP ADJUSTMENTS

Before making either reject or trip adjustments it is very important to make certain that the reject spring (2) is holding the push-off shaft (10) up, as far as it will go. If this precaution is not observed, erratic reject and trip action may result.

Possible causes of the spring not holding the push-off shaft up are:

a. The On-Off Reject knob (1) may be loose.

b. The reject spring (2) may be broken, missing, slipped down between washer (3) and push-off shaft (10), or has lost its tension.

c. Push-off shaft (10) binding.

REJECT ADJUSTMENT

1. Be sure to read the paragraph under "Reject and Trip Adjustments".

2. Adjust the reject link adjusting screw (98) until there is approximately 1/32 of an inch space between the end of the reject arm (97) and the rivet on the push-off arm and link assembly (76). NOTE: If there is no space between these two parts, it will be possible for the changer to begin its change cycle when the on-off reject knob is turned to the "OFF" position. If there is too much space, the changer may reject erratically.

3. Operate the Record Changer, press the On-Off Reject knob momentarily and check reject action.

TRIP ADJUSTMENT

Since this Record Changer uses the oscillating trip principle to begin its change cycle, it is very important that the trip adjusting screw (95) is properly adjusted. See Figures 5 and 7.

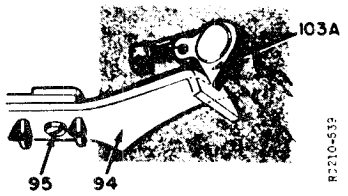

Figure 7. Positioning Trip Serrations.

The trip adjusting screw (95) is properly adjusted when the record changer trips into change cycle after the eccentric groove in the record has caused the pickup arm to move away from the centerpost once or twice, that is, one or two backswings of the pickup arm, before the changer trips into change cycle. Since some eccentric grooves cause greater movement of the pickup arm than others, the changer might trip into change cycle with only one backswing on some records and with two backswings on others.

The ideal adjustment of screw (95) for best operation is when the point of the pawl (103A) is horizontally even or level with the smooth side of the trip serrations (94). NOTE: The point of the pawl will be approximately 3/32 of an inch from the bottom edge of the lip on the trip serrations. See Figure 7.

Adjust the trip adjusting screw (95) as follows:

1. Be sure to read the paragraph under "Reject and Trip Adjustments".

2. Connect record changer motor to power source and turn the On-Off Reject knob on and off as needed to check this adjustment.

3. Adjust trip adjusting screw (95) until the point of the pawl (103A) is horizontally even or level with the smooth side of the trip serrations (94), or until the point of the pawl is 3/32 of an inch from the bottom edge of the lip on the trip serrations. See Figure 7.

4. If the top of the trip stop wire (91A) is not level with the top of the main cam stop stud (72A) as shown in Figure 8, check to see if the trip stop wire is bent slightly. If it is, bend the wire until it is even (level) with the top of the stud.

5. Place a record on the turntable and check to make certain that the changer trips into change cycle with one or two backswings of the arm.

IMPORTANT

The eccentric groove of a record should be used when checking the trip adjustment. Do not lift the pick-up arm and move it in and out by hand.

If the trip adjusting screw (95) is turned out too

© John F. Rider

far, it will take more than two backswings of the pickup arm to trip the changer into change cycle. If the screw (95) is almost all the way out, the changer will not trip. If the screw is turned too far in, there will be excessive drag and wear on the trip serrations, pawl point and on record eccentric grooves. Consequently, the trip adjustment should be made very carefully.

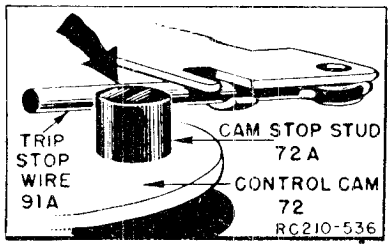

Figure 8. Positioning Trip Stop Wire.

SERVICE AND REPAIR

CAUTIONS

1. **See that the rubber tires on both the drive wheel and the idler wheel are kept clean and free from oil, grease, dirt or any foreign material.** Carbona or carbon tetrachloride may be used for cleaning these parts.
2. The drive wheel assembly (69) appears to be almost identical with that used on the model RC170 and RC170A record changers. **These parts are not interchangeable.**
3. When replacing the rubber tire (68) do not bend the tab on the drive wheel over too far as this may result in the tire catching or rubbing on the drive wheel pressure spring (71).
4. If the On-Off Reject knob (1) cannot be pulled off with the fingers, pry very carefully. The head cover (7) is plastic and if the On-Off Reject knob is pried off, excessive force should not be used.
5. When removing or replacing the pawl spring (102) care should be taken not to stretch it.
6. When removing or replacing the pickup arm (18), always loosen the Allen set screw (30) and lift off the complete assembly. The pivot spring, hub and pin assembly (29) can be removed from the pivot plate assembly (24) and replaced much more readily with the complete pickup arm assembly off of the changer.
7. When replacing the switch mounting bracket (79) or the trip bracket (89) be sure to locate the half punches in the holes in the pan before tightening their mounting screws (80).
8. When replacing the on-off switch assembly (81) care should be used in bending the tab fasteners so that the switch is mounted firmly to the bracket.
9. When replacing or reinstalling the record size selector knob (17), turn the set-down eccentric (23) to the position for 10" and 12" set-down. Then install the knob (17) so that the dot between "10.12" lines up with the locating dot on the pickup arm.

CARTRIDGE AND NEEDLES

The cartridge (34) used in these record changers is especially designed and there are a few things which should be observed when replacing the cartridge (34), needles (36 and 37), or pickup arm cable (40).

When replacing either needle make certain that the correct needle is inserted in the proper "side" of the cartridge. The needle (36) for 33 RPM records is an osmium tipped needle especially designed for playing 33 RPM records. The radius of the point of the 33 RPM needle is only 1/3 of the radius of the point of a standard (78 RPM) needle. If this sharp needle is used on standard 78 RPM records, it has a tendency to "wobble" in the record groove and would possibly damage the standard record groove. A needle for 78 RPM records may possibly damage 33 RPM "microgroove" records because of its tendency to "skate" across a microgroove record. Consequently, care should be taken when replacing needles.

The needle (36) for 33 RPM records is painted red to identify it. The needle guard on the 33 RPM "side" of the cartridge has red color dots to distinguish it from the 78 RPM "side" of the cartridge. The red (33 RPM) needle (36) should be inserted in the side of the cartridge which has the red color dots.

When replacing the cartridge (34) care must be taken when placing the pickup arm cable pinjacks on the cartridge. There must be sufficient slack in the cable to allow the cartridge to rotate. It is also important that the short length of plastic tubing be kept over one terminal.

TWO SPEED MOTOR (67)

The turntable speed of these Record Changers is changed mechanically. When the speed change knob (58) is moved to the "33" position, the speed change arm (56) moves. This causes the 33 RPM drive shaft to pivot and ride against the idler wheel (60). When the speed change knob is moved to the 78 RPM position, the speed change arm causes the 33 RPM drive shaft to pivot away from the idler wheel (60). When the speed change knob (58) is moved, make certain that it "clicks" or "snaps" into position.

Note that the 33 RPM drive shaft is driven by the 78 RPM drive shaft by means of a rubber belt (63). This belt should be clean and free from oil. If the belt is greasy or stretched, it might possibly slip which would cause the turntable speed to vary, resulting in unsatisfactory operation.

When replacing the speed change knob (58), make certain that the shaft in the knob does not touch the sides or ends of the cut-out in the pan. The speed change arm (56) must be installed properly (its half-punches keep the proper angle). If it is not installed correctly, the speed change knob shaft may rub against the edge of the opening in the pan causing rumble and noise pickup. Also, the clearance between the bottom of the speed change knob and the top of the pan should not be less than 1/64 of an inch or more than 3/64 of an inch.

REMOVING THE PLASTIC BASE HOUSING (14)

Should it be necessary to remove the plastic base housing, proceed as follows:

1. Remove retaining rings (86 and 88).
2. Release one end of the index spring (105).

© John F. Rider

MODELS RC210, RC211, RC212

3. Lift the entire head assembly up from the top of the changer.
4. Loosen Allen set screw (30) and lift complete pickup arm assembly off.
5. Remove retaining ring (31) and washer (32).
6. Remove three screws (16) holding base.
7. Lift off the plastic base housing (14).
8. When reassembly has been completed, the pickup arm height should be carefully checked and adjusted, if necessary, by means of the lift adjusting screw (27). The set-down should also be checked and adjusted, if necessary, as outlined under "Adjustment Of Set-Down Point".

REMOVING TURNTABLE (8) AND BEARING ASSEMBLY (49)

To remove the turntable it is only necessary to grasp the turntable by its edges and lift up. Before replacing the turntable, make sure that the recessed part of the drive wheel (69) is towards the centerpost. If necessary, turn drive wheel counterclockwise about a turn so it locks in this position. The pickup arm should be positioned away from the turntable. In replacing the turntable, force is not needed to seat it. Make certain, however, that the idler wheel of the motor has been pushed in towards the centerpost and that the idler wheel is making contact with the inner side of the turntable flange.

The dimensions of the two speed motor are such that three cork washers (47) are used under the turntable hub to keep the turntable from rubbing against the idler wheel drive shafts.

In some cases it may be found that the three cork washers, after considerable use, are compressed so the turntable will rub. To build the stack up, an additional thin cork washer should be used. This fourth cork washer may be placed at the top or bottom of the stack.

The washers (47 and 48) and thrust bearing assembly (49) are removed by sliding them off of the centerpost. In replacing, have them in the order shown in Figure 9.

REMOVING BOTTOM COVER (107)

For Model RC210 only. To remove the bottom cover (107) from the record changer, remove the two rear screws (50) through the bottom. Then press on the front edge of the bottom cover; this frees the changer from the slotted mounting brackets at the front of the bottom cover. To replace bottom cover, reverse above operations.

The changer must float on the springs (51) to prevent microphonic feedback, thus these springs must be re-installed properly. The wider end fits around and hugs the extrusion in the mounting brackets in the bottom cover. The narrow end of the spring fits over the threaded bushing on the changer pan (54). To assure "free floating" of the changer, spacer washers (52) are used under the narrow portion of springs (51).

For Model RC211 only. To remove the bottom cover on this model (RC211), remove the three mounting screws (50), from the top of the changer pan. Then merely lift the changer pan off of the bottom cover (107) being careful to see that lead-in cables and motor leads are disconnected.

When reinstalling the changer pan on the bottom cover be certain the float springs (51) are properly installed. Insert the mounting screws (50). IMPORTANT: These screws must be installed so they travel freely through the extruded holes in the changer pan. If the screws touch the edges of the holes in the pan, a scraping sound will occur when records drop to the turntable and microphonics might also result.

LUBRICATION

Under normal operating conditions, the motor should never require oiling. The rest of the changer, however, should be lubricated with grease whenever it comes into the shop for repairs or adjustment. **All pivot and friction points should be greased adequately but not excessively.** A good automobile chassis grease may be used for this purpose.

The push-off shaft (10), powdered iron roller (85), oilite bearings, (used in the turntable hub and base housing), may be lubricated with SAE No. 20 motor oil.

Care shoull be taken to prevent any of the lubricant from coming into contact with the drive or idler wheel tires. Also be careful, when using oil, that an excess does not seep into the felt of the turntable.

RECORD CHANGER TROUBLE SHOOTING

1. Records Do Not Drop To Turntable Or More Than One Record Drops.

(a) Check the distance between the inside edge of the centerpost (9) and the edge of the record support (12). This distance should be 4-61/64" ± 1/32", in the 10-inch position.

With the centerpost for 7-inch records in place and the head assembly in the 10-inch position, the distance between the inside edge of the centerpost and the edge of the record support should be 3½" ± 1/32". These dimensions are critical and if distance does not meet specifications, bend the centerpost slightly toward or away from the head assembly as needed.

2. Changer Repeatedly Trips Into Change Cycle.

(a) Check for broken trip cocking spring (90), or
(b) Check for broken reject spring (2), or
(c) Check for On-Off Reject knob (1) loose, or
(d) Check for misadjustment of reject adjusting screw (98), or trip adjusting screw (95).

3. Changer Will Not Trip.

(a) Check for broken or loose cycle spring (92),
(b) Check On-Off switch cover (81). If cover is is not assembled to switch properly it may bind push-off link and arm (76) preventing cycle spring (92) from pulling the main cam (72) around, or
(c) Check for misadjusmtent of the trip adjusting screw (95), or
(d) Check for bent trip stop wire (91A), or
(e) Check for broken pawl spring (102).

4. Changer Will Not Reject.

(a) Check adjustment of reject screw (98).

5. Cannot Get Proper Set Down.

(a) Check set-down spring (106), or
(b) Check for broken or loose set-down adjusting spring (22), or
(c) Check for loose pickup arm counter weight screws (20) resulting in erratic set-down. (These screws hold pivot and mounting plate (24) in position).

OPERATING INSTRUCTIONS

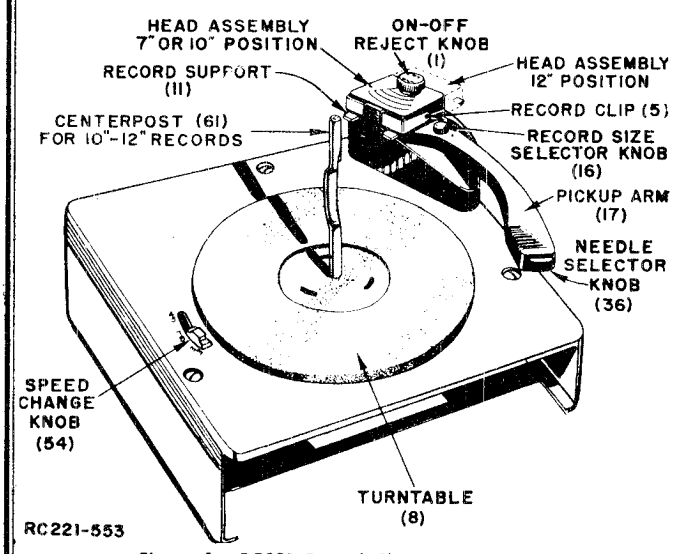

Figure 1. RC221 Record Changer, Top View.

This Admiral Record Changer is designed to automatically play a series of twelve 10-inch or ten 12-inch 78 RPM or 33 RPM records. It will also automatically play ten 7-inch 33 RPM records or twelve of the new 7-inch 45 RPM records, by using an accessory 7-inch centerpost and an accessory 45 RPM Spindle Unit. The records must be of one size and type for each loading.

SELECTING CENTERPOST

To play 78 RPM or 33 RPM records (7-inch, 10-inch or 12-inch), insert the proper centerpost into the socket in the center of the turntable. To remove a centerpost, merely place one hand on the turntable and lift up the centerpost with the other hand. To play 45 RPM 7-inch records, insert the 45 RPM spindle into the socket in the center of the turntable. Turn the spindle counter-clockwise until the "Lock-In Lugs" fall into and lock in the three holes in the turntable. To remove the spindle, hold the turntable stationary, turn the spindle clockwise, then lift it out of the socket.

IMPORTANT: If the 45 RPM spindle is being used for the first time or if the changer does not operate properly on 45 RPM, be sure to read the information given under the heading "45 RPM Spindle Adjustment."

SETTING SPEED CHANGE KNOB

For playing 78 RPM records, move the speed change knob (54) the "78" position; for playing 33 RPM records, move it to the "33" position; for 45 RPM records, move it to the "45" position. When moving the speed change knob, make certain that it clicks or snaps into position.

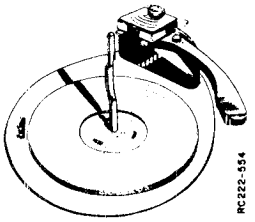

Figure 2. RC222 Record Changer.

SETTING NEEDLE SELECTOR KNOB

To play 78 RPM records, rotate the needle selector knob so the side marked "78" faces up; to play 33 RPM records or 45 RPM records, the side marked "LP" must face up. The small arrows next to the "78" and "LP" indicate the direction in which the knob must be turned. When turning this knob to either position, make certain that it is turned until it reaches its stop.

SETTING HEAD ASSEMBLY

To play any 7-inch or 10-inch records, rotate the head assembly so that its embossed design is toward the centerpost. For 12-inch records, rotate the head assembly so that the embossed design is away from the centerpost.

SETTING RECORD SIZE SELECTOR KNOB

To play any 7-inch records, turn the Record Size Selector knob (16) all the way to the left until it reaches its stop.

To play 10-inch or 12-inch records, turn this knob to the right until it reaches its stop.

LOADING AND STARTING THE RECORD CHANGER

To load 78 RPM or 33 RPM records, place a stack of records so that they rest on the record support (11) and the offset in the centerpost. Do not mix records—play a stack of the same size and type.

To load 45 RPM records, place as many as twelve records over the 45 RPM Spindle, so that they rest on the record supports (67). Be sure that the records are held up by BOTH record supports as shown in figure 9. If the bottom record slips down over one of the record supports, the record may not drop when the changer goes through its change cycle.

REJECTING A RECORD

If you wish to stop playing any record and start playing the next one, merely press down on the On-Off Reject knob momentarily.

STOPPING AND UNLOADING

This Record Changer cannot be turned off, by means of the On-Off Reject knob, during its change cycle. Therefore, after the last record, allow the mechanism to go through its change cycle and start playing over again.

©John F. Rider

THE CHANGE CYCLE

DESCRIPTION OF CHANGE CYCLE FOR 78 RPM AND 33 RPM OPERATION
(See Figures 3, 4 and 5)

If at all possible, we recommend that you carefully observe the operation of a changer that is in normal operating condition. It is a good idea to rotate the turntable by hand and repeat the change cycle until you understand the function of each part.

It is important to note that this changer employs two different types of trip arrangements. For 78 RPM and 33 RPM operation, the oscillating type trip is used, which depends upon the in and out movement of the pickup arm caused by the eccentric groove in the record. For 45 RPM operation, a position type trip is used which trips the changer into change cycle when the pickup arm reaches a given distance from the 45 RPM spindle.

The changer operates as follows: The turntable is driven by the rubber tired idler wheel (58) on the three speed motor. The turntable speed (78 RPM, 33 RPM or 45 RPM) is determined by the diameter of the drive shaft that drives the idler wheel. See figure 3. The 78 RPM drive shaft is a part of the motor armature. The 33 RPM and 45 RPM drive shafts are moved in and out of position mechanically when the speed change knob is moved.

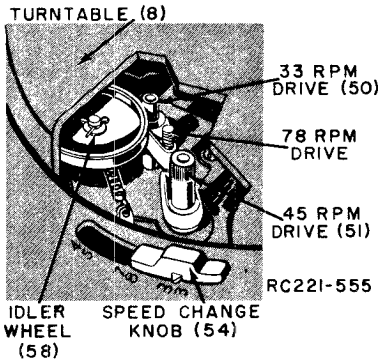

Figure 3. Motor, Showing 3 Drives.

The changer mechanism is driven during its change cycle by the rubber-tired drive wheel (86), which in turn is driven by the knurled hub of the turntable. During normal playing, the drive wheel is held in a neutral position as illustrated in Fig. 4A, so that the indentation prevents the tire from contacting the knurled hub. The drive wheel (86) is held in this position by the trip stop wire (111A) and the cam stop stud (91A) on the control cam (91).

During the record play and as the needle enters the record eccentric groove, the pickup arm is moving in toward the centerpost. The pawl (127B) is moving across the trip serrations (114). When the eccentric groove in the record causes the pickup arm to move away from the centerpost, the pawl (127B) tends to reverse its direction, but its sharp point catches in one of the trip serrations (114) and moves the trip lever (111). As the eccentric groove moves the pickup arm back in toward the centerpost, and then away from the centerpost again, the pawl (127B), again locks in one of the trip serrations, moves the trip lever (111) far

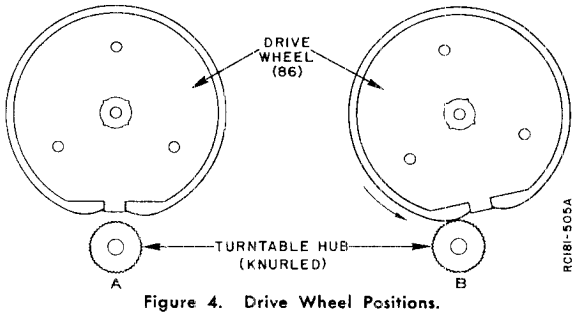

Figure 4. Drive Wheel Positions.

enough so that the trip stop wire (111A) is no longer engaged with the cam stop stud (91A). ***This oscillating trip action is dependent upon the adjustment of the oscillating trip adjusting screw (115).*** If it is adjusted properly, the pickup arm will move away from the centerpost, then toward the centerpost, and as it comes away the second time the changer will trip and start its change cycle. (See paragraph under heading "Oscillating Trip Adjustment.") The position of drive wheel (86) at this moment is shown in Figure 4B.

This allows the cycle spring (112) to pull the control cam clockwise (bottom view). Since the control cam (91) and the drive wheel (86) are on the same shaft, the drive wheel is turned so its rubber tire is against the knurled hub of the turntable (see Figure 4B). The turntable now rotates the drive wheel (86) which simultaneously rotates the control cam (91). As soon as the changer has been tripped, the trip cocking spring (110) causes the trip lever (111) to return the trip stop wire (111A) to the normal playing position.

Roller (105) riding on the control cam (91) moves the pivot link (104) which in turn rotates the control plate (123). The rotation of the control plate (123) causes its inclined tab (123A) to ride against the lift rod (30) which lifts the pickup arm from the record. The arm control lever roller and stud (127C) then engages the safety arm (124). Further rotation of the control cam (91) moves the pivot link (104) causing further rotation of the control plate (123); this moves the pickup arm to the right, clearing the record. This much has taken place in approximately one-third of the total rotation of the control cam.

As the control cam rotates further, its push-off stud (91B) engages with the end of the slot in the push-off link assembly (95), moving it. This movement is transmitted through the push-off arm (95A) and as a result, the push-off shaft (9) is rotated. This rotates the push-off cam (9A) which in turn slides the push-off plate (10) forward and drops the next record to be played. Note that the record stack rests on the record support shelf (11). The small slide at the top end of the centerpost holds back all records other than the bottom one when the push-off plate (10) moves forward.

As the control cam continues its rotation, the pivot link (104) moves back following the cam, since the roller (105) is kept in contact with the cam by the control plate spring (106). This moves the control plate (123) back; the arm control lever (127) moves the pickup arm to the set-down point for the record to be played. The pickup arm is held above the record because the lift rod (30) is still resting at the top of the inclined tab (123A) on the control plate (123). The

© John F. Rider

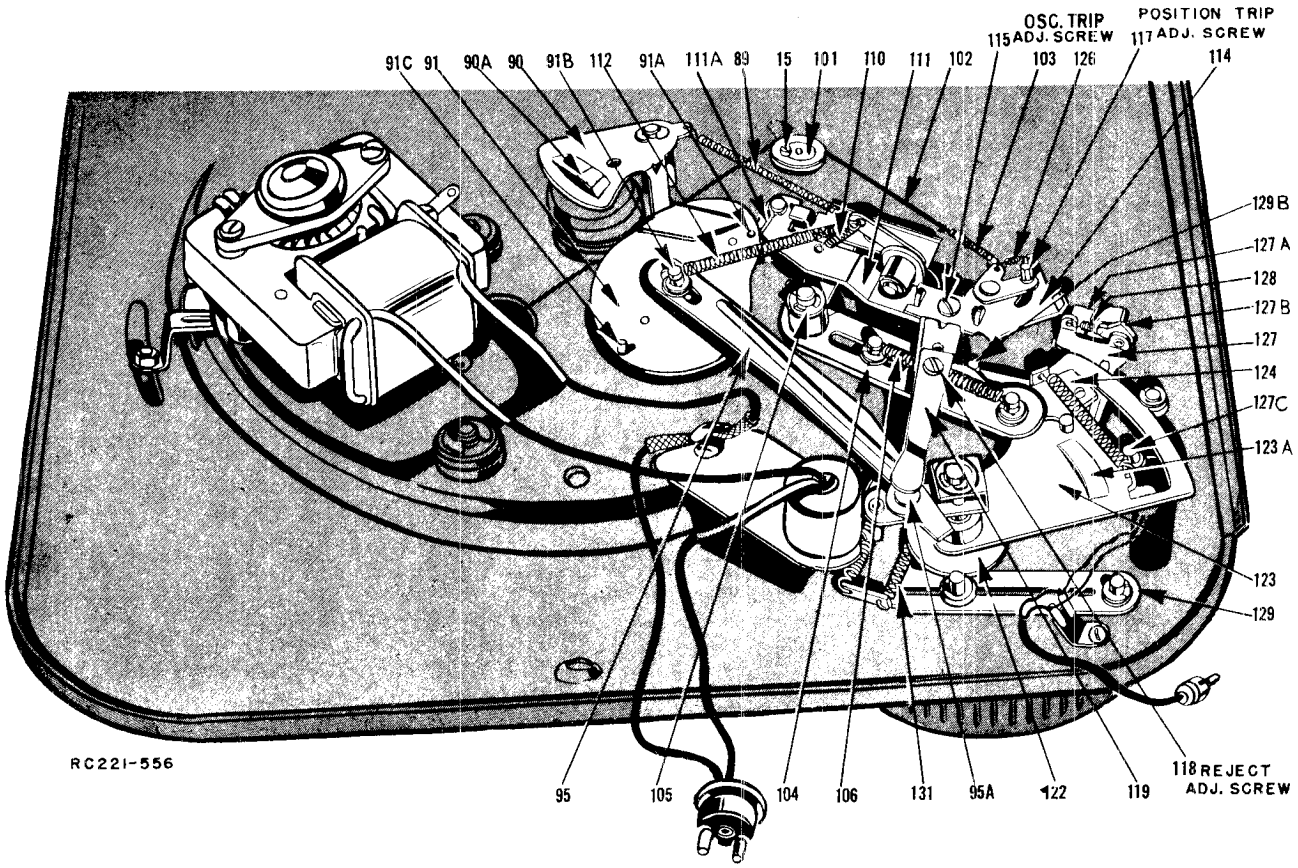

Figure 5. RC221 Bottom View Assembled.

set-down point is governed by the set-down adjusting screw (20). (See figure 10.) The shoulder on the set-down arm (129A) holds the pickup arm at the set-down point until it is pushed back by the edge of the control plate engaging the set-down arm stud (129B). The pickup arm is then free and moves down toward the record starting groove.

When the record changer is set to play 7-inch or 10-inch records, the set-down arm (129A), through the tension of the set-down spring (131), moves the arm in toward the centerpost until the return roller and stud (127D) reaches the shoulder of the set-down arm (129A). The pickup arm is held in this position until the control plate (123) engages the set-down arm stud (129B), pushing the set-down arm back, releasing or freeing the pickup arm.

When the changer is set for 12-inch records the size change eccentric (122) moves the set-down and size change assembly (129) so that the arm return roller and stud (127D) does not travel as great a distance along the set-down arm (129A) before it reaches the shoulder. Therefore the pickup arm cannot move in toward the centerpost as far as for 7-inch or 10-inch records, during change cycle.

When the On-Off Reject knob (1) is pressed down, the push-off cam and shaft (9) moves the reject arm (119) down. This movement causes the trip lever (111) to move which prevents the trip stop wire (111A) from engaging the cam stop stud (91A). The change cycle then proceeds in the manner described above.

The change cycle is exactly the same for either speed (33 RPM or 78 RPM) except for the fact that the change cycle time is proportional to the turntable speed (33 RPM or 78 RPM).

Playing 7-inch (33 RPM) records automatically is accomplished by removing the centerpost from 10-inch or 12-inch records and inserting the centerpost for 7-inch (33 RPM) records. Rotating the record size selector knob (16) to the position for 7-inch records, rotates the set-down eccentric (25). The set-down eccentric rotates or moves the set-down plate, part of pivot and mounting plate (22), and the pivot spring and hub (31). This in turn moves the end of the pickup arm closer to the centerpost and automatically provides for proper set-down on 7-inch records.

DESCRIPTION OF CHANGE CYCLE FOR 45 RPM OPERATION

For 45 RPM operation, the record changer functions in exactly the same manner as described under the heading "Description of Change Cycle for 78 RPM and 33 RPM." However, a few parts not yet described operate when the speed change knob (54) is in the "45" position and the 45 RPM spindle (62) is in place.

Since 45 RPM records do not have an eccentric groove, a position type trip is required to trip the changer into its change cycle. When the speed change knob is moved to the "45" position, the tension on the position trip cord (102) is released. This allows the position trip cocking spring (126) to pull the trip engagement arm (114A) so that the position trip

© John F. Rider

adjusting screw (117) will ride on the position trip incline (127A) as the pickup arm moves toward the centerpost. As the position trip incline (127A) moves across the position trip adjusting screw (117), the trip lever (111) moves, thereby moving the trip stop wire so it is no longer engaged with the control cam stop stud (91A). The changer then goes through its change cycle in the same manner as it does for 33 RPM and 78 RPM operation.

After the control cam (91) has rotated approximately one third of its rotation, the riser control stud (91C) engages the riser plate (90), driving the riser plate counter-clockwise so that its inclined portion (90A) rides across the push-off adjusting shaft (75) on the 45 RPM spindle. This forces the push-off adjusting shaft and the slicer cam and shaft assembly (69), up into the spindle.

As the slicer cam (69A) rises, its sides push the slicers (65 & 66) outward. The slicers move under the second from the bottom record of a stack. The record supports (67) are moved into the spindle simultaneously since the ears of the slicers are fitted into the cut-away section of the record support on the opposite side of the spindle.

When the push-off adjusting shaft (75) reaches the top of the inclined portion of the riser plate (90), the slicers (65 & 66) are fully extended, and the record supports are all the way into the spindle. This allows the bottom record to drop to the turntable while the remainder of the stack is held up by the slicers.

As the control cam continues its rotation, the riser control stud (91C) releases the riser plate (90) and the riser plate is returned to its normal position by the riser plate return spring (89). The record supports (67) and slicers (65 & 66) are returned to their normal position by the record support spring (68) and the slicer springs (64). At this point the record stack drops from the slicers to the record supports.

ADJUSTMENTS

REJECT AND TRIP ADJUSTMENTS

This record changer employs two different types of trip mechanisms to trip it into change cycle. For 78 RPM and 33 RPM operation, an "oscillating" type trip is used. See figure 6. This type of trip depends upon the in and out movement of the pickup arm caused by the eccentric groove in the record.

For 45 RPM operation, a "position" type trip is used. See figure 8. (45 RPM records do not have an eccentric groove.) This type of trip arrangement, trips the changer into change cycle when the pickup arm reaches a given distance from the 45 RPM spindle.

Screw adjustments are provided for both types of trips. However, before making either of the trip adjustments or the reject adjustment, it is very important to make certain that the reject spring (2) is holding the push-off shaft (9) up, as far as it will go. It is also important that there is $\frac{1}{32}$ of an inch clearance between the end of the reject arm (119) and the rivet on the push-off arm and link assembly (95). If these precautions are not observed, erratic reject and trip action may result, or if there is no clearance at the end of the reject arm, the changer may repeatedly trip into change cycle.

Possible causes of the spring not holding the push-off shaft up are:

a. The On-Off Reject knob (1) may be loose.
b. The reject spring (2) may be broken, missing, slipped down between washer (3) and push-off shaft (9), or has lost its tension.
c. Push-off shaft (9) binding.

REJECT ADJUSTMENT

1. Make certain that the push-off shaft (9) is not binding and is being held up, as far as it will go, by the reject spring (2) and the On-Off Reject knob (1).
2. Adjust the reject adjusting screw (118) until there is approximately $\frac{1}{32}$ of an inch space between the end of the reject arm (119) and the rivet on the push-off arm and link assembly (95).
   NOTE: If there is no space between these two parts, it will be possible for the changer to begin its change cycle when the on-off reject knob is turned to the "OFF" position. If there is too much space, the changer may not reject or will reject erratically.
3. Operate the Record Changer, press the On-Off Reject knob momentarily and check reject action.

OSCILLATING TRIP ADJUSTMENT
For 33 RPM and 78 RPM Operation

IMPORTANT: This adjustment must be made properly before making the Position Trip Adjustment.

This record changer uses the oscillating type trip for 78 RPM and 33 RPM operation. See figure 6. In order for the changer to trip properly, the oscillating trip adjusting screw (115) must be properly adjusted. Also, this adjustment affects the position trip adjustment and consequently should be made carefully before attempting the position trip adjustment.

The oscillating trip adjusting screw (115) is properly adjusted when the record changer trips into change cycle after the eccentric groove in the record has caused the pickup arm to move away from the centerpost once or twice, that is, one or two backswings of the pickup arm, before the changer trips into change cycle. Since some eccentric grooves cause greater movement of the pickup arm than others, the changer might trip into change cycle with only one backswing on some records and with two backswings on others.

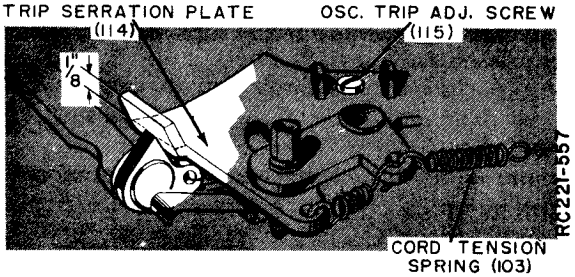

Figure 6. Trip Serration Plate, Showing Oscillating Trip Adjustment.

© John F. Rider

The ideal adjustment of screw (115) for best operation is when the point of the pawl (127B) is horizontally even or level with the smooth side of the trip serration plate (114). NOTE: The point of the pawl should be approximately 1/8 of an inch from the bottom edge of the lip on the trip serration plate. See figure 8.

Adjust the oscillating trip adjusting screw (115) as follows:

1. Make certain that the push-off shaft (9) is not binding and is being held up, as far as it will go, by the reject spring (2) and the On-Off Reject knob (1). Also check for $\frac{1}{32}$ of an inch clearance at the end of the reject arm. See the third paragraph under heading "Reject and Trip Adjustments."
   Check to be sure that the position trip cord (102) is not broken or loose and that the cord tension adjusting cam (101) is not misadjusted.
2. Check to see that the top of the trip stop wire (111A) is even (level) with the top of the control cam stop stud (91A) as shown in figure 7. If the stop wire is not even with the top of the stud, bend the wire until it is even. The trip bracket assembly should be removed before bending the trip stop wire.

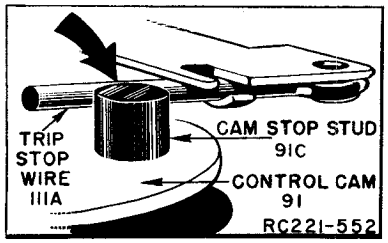

Figure 7. Positioning Trip Stop Wire.

3. Set speed change knob in the "78" or "33" position.
4. Connect record changer motor to power source and turn the On-Off Reject knob on and off as needed to check this adjustment.
5. Adjust trip adjusting screw (115) until the point of the pawl (127B) is horizontally even or level with the smooth side of the trip serrations (114). See figure 6. The point of the pawl should be 1/8 of an inch from the bottom edge of the lip on the trip serrations.
6. Place a record on the turntable and check to make certain that the changer trips into change cycle with one or two backswings of the arm. Three or four backswings may be required on 7-inch 33 RPM records.

Important

The eccentric groove of a record should be used when checking the oscillating trip adjustment. Do not lift the pickup arm and move it in and out by hand.

If the oscillating trip adjusting screw (115) is turned out too far, it will take more than two backswings of the pickup arm to trip the changer into change cycle. If the screw (115) is almost all the way out, the changer will not trip. If the screw is turned too far in, there will be excessive drag and wear on the trip serrations, pawl point and on record eccentric grooves.

POSITION TRIP ADJUSTMENT
For 45 RPM Operation

IMPORTANT: Before making this adjustment, the Oscillating Trip Adjustment should be properly made.

The position trip adjusting screw (117) is properly adjusted when the record changer trips into change cycle when the needle is $1\frac{1}{4}$" to $1\frac{7}{16}$" from the near edge of the 45 RPM spindle or 2" to $2\frac{3}{16}$" from the center of the centerpost hole in the turntable.

Turning the position trip adjusting screw (117) in, moves the trip point away from the 45 RPM spindle. Turning the screw out, moves the trip point closer to the 45 RPM spindle.

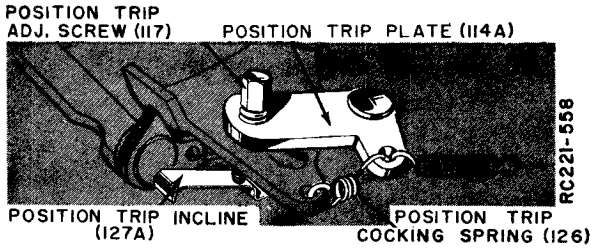

Figure 8. Trip Serration Plate, Showing Position Trip Adjustment.

Adjust the position trip adjusting screw (117) as follows:

1. Make certain that the push-off shaft (9) is not binding and is being held up, as far as it will go, by the reject spring (2) and the On-Off Reject knob (1). Also check for $\frac{1}{32}$ of an inch clearance at the end of the reject arm. See the third paragraph under heading "Reject and Trip Adjustments."
   Check to be sure that the position trip cord (102) is not binding or twisted and that the cord tension adjusting cam (101) is not misadjusted, preventing the position trip cocking spring (126) from pulling the position trip plate (114A) into position.
2. Check to see that the top of the trip stop wire (111A) is even (level) with the top of the control cam stop stud (91A) as shown in figure 7. If the stop wire is not even with the top of the stud, bend the wire until it is even. The trip bracket assembly should be removed before bending the trip stop wire.
3. Check Oscillating Trip Adjustment.
4. Set the Speed Change knob in the "45" position.
5. Connect record changer motor to power source and turn changer on and off as needed to check this adjustment.
6. Adjust position trip adjusting screw so the changer trips at the proper point as given above.

ADJUSTMENT OF SET-DOWN POINT

IMPORTANT: This adjustment must be made with the record size selector knob (16) in the "10.12" position. Also, the head assembly must be in the position for 7-inch and 10-inch records.

Adjustment of the set-down point, for either 7-inch, 10-inch, or 12-inch records, is made by adjustment of the set-down adjusting screw (20), see figure 10. Screw (20) is accessible through hole in right side of pickup arm. When turning the record size selector knob (16) be sure to turn it all the way to avoid making the set-down adjustment at the wrong point, resulting in

© John F. Rider

improper set-down on 7-inch records. Turning the set-down adjusting screw (20) in, moves the set-down point of the pickup arm closer to the centerpost and turning the screw out moves it away from the centerpost.

CAUTION: Normal practice has been to check the set-down points, using records as a gauge. However, due to the large variety of record sizes, it is recommended that the distances specified below are checked to insure proper set-down on all sizes and types of records.

Make the set-down point adjustment as follows:

1. Set record size selector knob (16) to the "10.12" position; be sure the knob is turned all the way to its stop.
2. Set needle selector knob to either position being certain that the knob is turned to its stop so the needle projects straight down.
3. Set the head assembly to the position for playing 7-inch or 10-inch records.
4. Press down on the On-Off Reject knob (1) momentarily. Rotate the turntable by hand through the change cycle until the pickup arm moves down toward the turntable.
5. Check the distance between the needle point and the near side of the centerpost. For proper set-down on 10-inch records, the distance between needle and centerpost should be between 4 5/8" and 4 1/16".
6. Adjust set-down screw (20) and repeat steps 4 and 5 until the proper distance is obtained. If this adjustment is made carefully, the set-down point for 7-inch records and 12-inch records will be automatically correct.
7. Check 12-inch set-down as follows: Set the head assembly to the position for 12-inch records, press On-Off Reject knob momentarily, rotate turntable by hand through the change cycle and check the 12-inch set-down point. The proper distance between the needle point and the near side of the centerpost is between 5 5/8" and 5 1/16".
8. Check 7-inch set-down as follows: Set the head assembly to the position for 7-inch and 10-inch records, set the record size selector knob (16) all the way to the right until it reaches its stop. Press the On-Off Reject knob momentarily, rotate the turntable by hand through the change cycle and check the 7-inch set-down point. The proper distance between needle point and the near side of either of the two small centerposts is between 3 3/16" and 3 1/4". The proper distance from the needle point to the near side of the 45 RPM Spindle is between 2 3/16" and 2 5/8".
9. If step 7 or step 8 indicates improper set-down on 7-inch records or 12-inch records, make a compromise adjustment for 10-inch record set-down as outlined in steps 3, 4, 5 and 6.

ADJUSTING THE PICKUP ARM HEIGHT (See Figures 9 and 10)

This record changer is designed so that when either needle point rests 3/16" above the changer pan, the pickup arm (17) will automatically lift high enough during the change cycle, to clear the top record of a stack of twelve 10-inch, ten 12-inch, ten 7-inch 33 RPM or twelve 7-inch 45 RPM records on the turntable. With proper pickup arm height setting, the pickup arm will not lift high enough to strike the bottom record of the stack to be played.

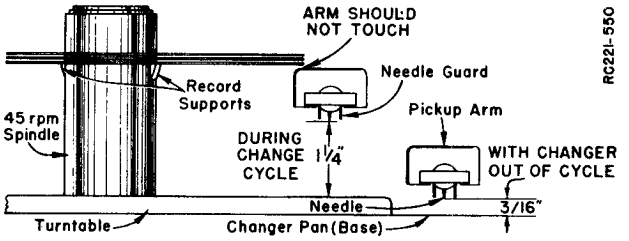

Figure 9. Checking Pickup Arm Height.

With the record changer out of change cycle and the pickup arm clear of the turntable, adjust the lift adusting screw (29) so that the needle rests approximately 3/16" above the top of the changer pan. Turning screw (29) in raises the pickup arm; turning it out lowers the arm. See Figure 10.

After this adjustment has been made, the record changer should be run through its change cycle a few times to make certain that the pickup arm does not lift high enough to touch the bottom record of the stack to be played. This adjustment should be checked with the 45 RPM Spindle in place and a 45 RPM record resting on the record supports (67). See figure 9. If, for some reason, the arm touches the bottom record, a compromise adjustment should be made. Turn the screw out and lower the pickup arm slightly.

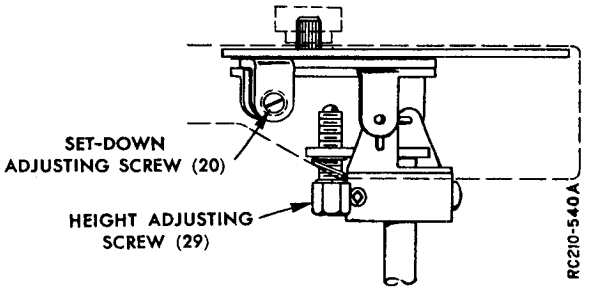

Figure 10. Arm Detail Showing Adjustments.

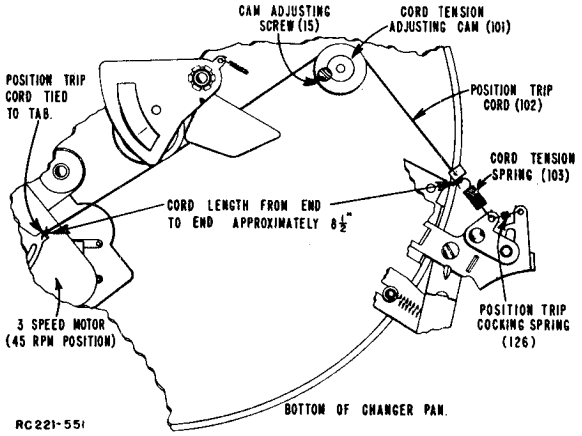
POSITION TRIP CORD TENSION ADJUSTMENT



CAM ADJUSTING SCREW (15)
CORD TENSION ADJUSTING CAM (101)

RC221-551

Figure 11. Adjusting Cord Tension.

An adjustment is provided which compensates for variations in the length of the position trip cord (102).

© John F. Rider

If the position trip cord is being replaced or if the adjusting cam lock screw (15) has come loose, allowing the cord tension adjusting cam (101) to rotate away from its normal position, proceed as follows:

1. Set speed change knob (54) to "45" position.
2. Move the cord tension adjusting cam (101) to just the point where all slack has been removed from position trip cord (102), and there is just a very slight tension on the cord tension spring (103). Do not adjust it so tight as to stretch the position trip cocking spring (126).
3. Tighten the adjusting cam lock screw (15).

ADJUSTING DISTANCE BETWEEN RECORD SUPPORT (11) AND CENTERPOSTS (60 and 61) (See Figures 12 and 13)

To check the distance between the record support (11) and centerposts (60 and 61), proceed as follows:

1. Set the head assembly to the position for 7-inch and 10-inch records. Insert the centerpost (61) for 10-inch and 12-inch records.
2. Hold the centerpost away from the head assembly to take up any play.
3. Measure the distance from the edge of the record support to the inside edge of the offset shelf on the centerpost. If this distance is not between 4-59/64" and 4-63/64", it will be necessary to bend centerpost until proper distance is obtained. NOTE: To bend the centerpost, remove it from the changer, and place the bottom end in a vise. Grasp the centerpost BELOW the offset (with a wrench) and bend it the amount needed in the direction necessary.

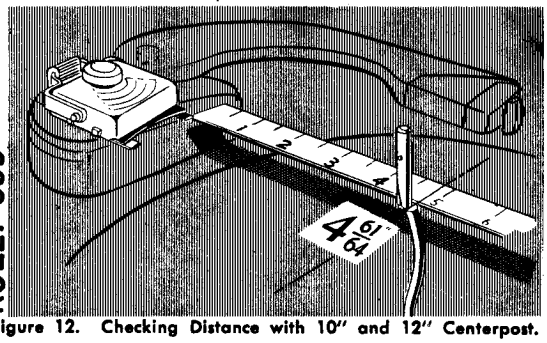

Figure 12. Checking Distance with 10" and 12" Centerpost.

4. With the head assembly in the position for 7-inch and 10-inch records, insert the centerpost (60) for 7-inch 33 RPM records. Then proceed with steps 2 and 3 above and check for a distance of between $3\frac{15}{32}$" and $3\frac{17}{32}$".
5. If this distance is not within the dimensions specified in step 4, bend the centerpost as described in step 3.

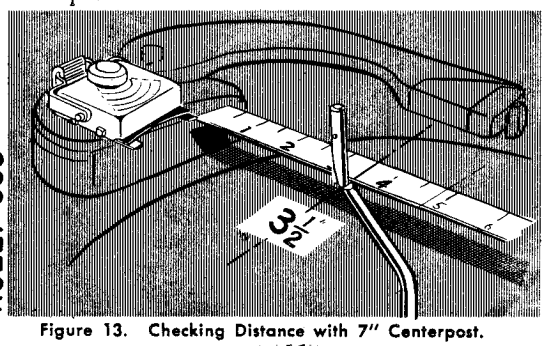

Figure 13. Checking Distance with 7" Centerpost.

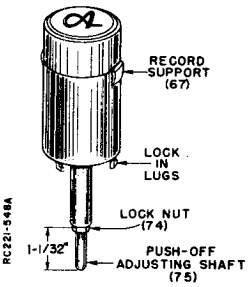
45 RPM SPINDLE ADJUSTMENT

The push-off adjusting shaft (75 is the only adjustment on the 45 RPM Spindle (62). This adjustment is fairly critical and must be made for the individual record changer. The push-off adjusting shaft is pre-set at the factory so that the distance between the end of the shaft and the top of the lock nut (74) is $1\frac{1}{32}$". This adjustment should be satisfactory for most record changers. However, **the adjustment should be checked and adjusted, if necessary, before the 45 RPM Spindle is used.** To check for proper adjustment, proceed as follows:



1. Place the 45 RPM Spindle in the hole in the center of the turntable and turn it so that "lock-in lugs" fall into slots in the turntable (do not lock the lugs into the turntable).
2. Press down on the spindle and CAREFULLY note whether or not the slicers (65 and 66) just start to move out of the spindle.

3a If the slicers do not move when the spindle is pressed down, proceed with step 4.

3b If the slicers start to move out of the spindle as it is pressed down, lift the spindle out, loosen the lock nut (74), turn the push-off adjusting shaft (75) in approximately one turn and then tighten the lock nut. Insert the spindle, press it down and check to see if the slicers still move out. If the slicers move out, repeat this procedure, turning the adjusting shaft in, approximately one turn at a time, until the slicers do not move out when the spindle is pressed down.

4. Insert the spindle and lock it in place. Put a stack of records over the spindle, turn the record changer on and momentarily press the on-off reject knob (1) to the reject position.
5. If the bottom record drops to the turntable, keep rejecting records until the whole stack has been dropped to the turntable. Each record should slide smoothly down the spindle. If all records drop properly, the adjustment is satisfactory.
6. If records do not drop, remove the spindle, loosen the lock nut (74) and turn out the push-off adjusting shaft (75) approximately one turn and repeat steps 1 and 2, check step 3b and then proceed with steps 4 and 5. Repeat this procedure until the records drop properly.

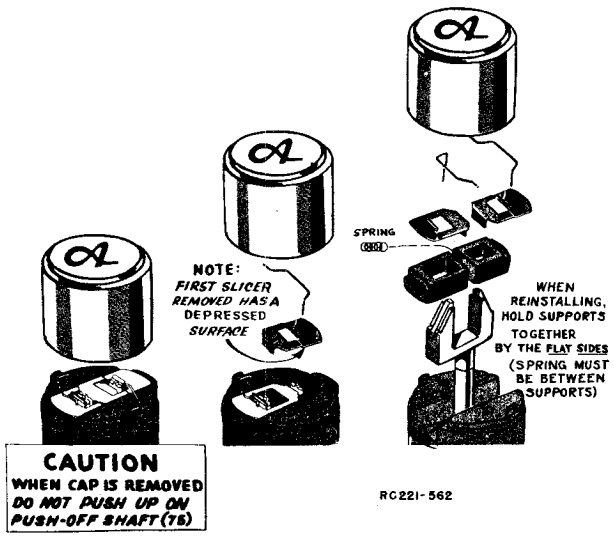
© John F. Rider

SERVICE AND REPAIR

DISASSEMBLING THE 45 RPM SPINDLE
(See Figure 14)

To disassemble the spindle for parts replacement etc., proceed as follows:

1. Remove two screws from the underside of the spindle and lift up the spindle cap. See figure 14a. *CAUTION: When the spindle cap (63) is off, use extra care to keep from accidentally pushing up on the push-off adjusting shaft (75). If this shaft is pushed up, the slicer return springs (64) and slicer may fly off and be lost.*
2. Using a "long nose" pliers or tweezers, remove the slicer spring (64) which holds the top slicer (65) in place. Then remove the top slicer, see figure 14b. (NOTE: This slicer has an offset. It must be removed first when disassembling and installed last when reassembling).
3. Remove the other slicer return spring and the bottom slicer (66).
4. Now, push up on the push-off adjusting shaft (75) until the record supports (67) come up over the top of the spindle.
5. Grasp both record supports with the thumb and two forefingers and lift them off of the slicer cam (69A). Release record supports carefully so record support return spring (68) is not lost.
6. To remove the slicer cam and push-off assembly (69), remove the retaining ring (72) and the push-off return spring (71) from the underside of the spindle and lift the assembly off from the top of the spindle.



SPRING
NOTE:
FIRST SLICER REMOVED HAS A DEPRESSED SURFACE
WHEN REINSTALLING, HOLD SUPPORTS TOGETHER BY THE FLAT SIDES (SPRING MUST BE BETWEEN SUPPORTS)
CAUTION
WHEN CAP IS REMOVED DO NOT PUSH UP ON PUSH-OFF SHAFT (75)
RC221-562

Figure 14. Disassembly of 45 RPM Spindle.

When assembling the spindle, merely reverse the above procedure. When installing the record supports (67) and their return spring (68), place the spring between the record supports (67) and compress the spring enough so the record supports can be slid down over the slicer cam (69A). When installing the slicers (65 and 66) be sure to install the flat slicer (66) first, and then the slicer with the offset (it also has a smaller cut-out).

CARTRIDGE AND NEEDLES

The cartridge (36) used in these record changers is especially designed and there are a few things which should be observed when replacing the cartridge (36), needles (40 and 41), or pickup arm cable (35).

When replacing either needle make certain that the correct needle is inserted in the proper "side" of the cartridge. The needle (41) for "LP" records is an osmium tipped needle especially designed for playing "LP" records. The radius of the point of the "LP" needle is only 1/3 of the radius of the point of a standard (78 RPM) needle. If this sharp needle is used on standard 78 RPM records, it has a tendency to "wobble" in the record groove and would possibly damage the standard record groove. A needle for 78 RPM records may possibly damage "LP" records because of its tendency to "skip" across the fine record grooves. Consequently, care should be taken when replacing needles.

The needle (41) for "LP" records is painted red to identify it. The needle guard on the LP "side" of the cartridge has red color dots to distinguish it from the 78 RPM "side" of the cartridge. The red (LP) needle should be inserted in the side of the cartridge which has the red color dots.

When replacing the cartridge (36) care must be taken when placing the pickup arm cable pinjacks on the cartridge. There must be sufficient slack in the cable to allow the cartridge to rotate. It is also important that the short length of plastic tubing be kept over one terminal.

THREE SPEED MOTOR

The turntable speed of this record changer is changed mechanically by causing one of the three drive shafts (having different diameters) to ride against the idler wheel. See figure 3. The 78 RPM drive shaft is part of the motor armature. The other two drive shafts (33 RPM and 45 RPM) are driven by the 78 RPM drive shaft by two rubber belts (55). These rubber belts (55) and the idler wheel (58) must be kept clean and free from oil. If they become greasy or stretched, they might possibly slip, causing the turntable speed to vary, resulting in unsatisfactory operation.

When replacing the speed change knob (54), make certain that the shaft in the knob does not touch the sides or ends of the cut-out in the pan. If the speed change arm is bent, the speed change knob shaft may rub against the edge of the opening in the pan, causing rumble and noise pickup. Also, the clearance between the bottom of the speed change knob and the top of the pan should not be less than 1/64 or more than 3/64 of an inch.

REMOVING THE PLASTIC BASE HOUSING (13)

Should it be necessary to remove the plastic base housing, proceed as follows:

1. Remove retaining rings (84 and 108).
2. Release one end of the index spring (130).
3. Lift the entire head assembly up from the top of the changer.
4. Loosen Allen set screw (32) and lift complete pickup arm assembly off.
5. Remove retaining ring (33) and washer (34).

© John F. Rider

6. Remove three screws (15) holding base.
7. Lift off the plastic base housing (13).
8. When reassembly has been completed, the pickup arm height should be carefully checked and adjusted, if necessary, by means of the lift adjusting screw (29). The set-down should also be checked and adjusted, if necessary, as outlined under "Adjustment of Set-Down Point."

REMOVING TURNTABLE (8) AND BEARING ASSEMBLY (48)

To remove the turntable it is only necessary to grasp the turntable by its edges and lift up. Before replacing the turntable, make sure that the recessed part of the drive wheel (86) is towards the centerpost. If necessary, turn drive wheel counter-clockwise about a turn so it locks in this position. The pickup arm should be positioned away from the turntable. In replacing the turntable, force is not needed to seat it. Make certain, however, that the idler wheel of the motor has been pushed in towards the centerpost and that the idler wheel is making contact with the inner side of the turntable flange. The idler wheel should be pushed in with a screwdriver or similar flat tool. Do NOT push toward the rear of the changer.

The dimensions of the three speed motor are such that three cork washers (46) are used under the turntable hub to keep the turntable from rubbing against the idler wheel drive shafts.

In some cases it may be found that the three cork washers, after considerable use, are compressed so the turntable will rub. To build the stack up, an additional thin cork washer should be used. This fourth cork washer may be placed at the top or bottom of the stack. CAUTION: If an addition cork washer is used, it may be necessary to make a compensating adjustment on the 45 RPM spindle. See "45 RPM Spindle Adjustment."

The washers (46 and 47) and thrust bearing assembly (48) are removed by sliding them off of the centerpost. Replace in the order shown in Figure 15.

REMOVING CHANGER FROM BOTTOM COVER

Model RC221 only. To remove the changer from the bottom cover of the RC221, remove the three mounting screws (79), from the top of the changer pan. Then merely lift the changer pan off of the bottom cover (136) being careful to see that lead-in cables and motor leads are disconnected.

When reinstalling the changer pan on the bottom cover, be certain that float springs (78) are properly installed. (The wide end of the spring fits around the extrusion on the changer pan.) Insert the mounting screws (79). IMPORTANT: These screws must be installed so they travel freely through the extruded holes in the changer pan. If the screws touch the edges of the holes in the pan, a scraping sound and micro phonics may occur when records drop to the turntable.

REPLACING POSITION TRIP CORD (102)

The position trip cord (102) is ordinary braided silk or nylon dial cord approximately $\frac{1}{32}$" thick. To replace this cord, cut a piece of dial cord about 10" or 12" long and tie one end to the tab on the motor. See figure 11. This is most easily done by either making a slip knot so the knot will tighten when the cord is placed over the tab on the motor and pulled, or removing one end of the idler wheel spring (57) and pivoting the idler wheel and bracket out of the way. Tie the other end of the cord to the cord tension spring (103) so that the distance between the two knots is approximately 8½". Late production record changers have a metal clip (137) to fasten the cord at the tension spring end. After threading the cord under the control cam (91), hook the cord tension spring as shown in the illustration. Then adjust the cam (101) as outlined under "Position Trip Cord Tension Adjustment."

RISER PLATE (90)

The inclined portion of the riser plate (90) was copper plated in later production, to eliminate the possibility of stalling the changer during change cycle (45 RPM operation only).

If the record changer stalls during change cycle, try replacing the riser plate with part number G400A336.

LUBRICATION

Under normal operating conditions, the motor should never require oiling. Also, do NOT use oil on the 45 RPM spindle. The rest of the changer, however, should be lubricated with grease whenever it comes into the shop for repairs or adjustment. *All pivot and friction points should be greased adequately but not excessively.* A good automobile chassis grease may be used for this purpose.

The push-off shaft (9), powdered iron roller ((105), oilite bearings, (used in the turntable hub and base housing), may be lubricated with SAE No. 20 oil.

Care should be taken to prevent any of the lubricant from coming into contact with the drive or idler wheel tires, or the rubber drive belts. Also be careful, when using oil, that an excess does not seep into the felt of the turntable.

45 RPM RECORD SLIPPAGE

The 7-inch 45 RPM records may have a tendency to slip on each other when they are new. This would result in unsatisfactory reproduction which might be confused with results of a varying turntable speed.

In most cases, record slippage can be eliminated by making a series of shallow scratches, with a pen knife or other sharp instrument, on each record label. Another method of correcting this condition would be to place two small pieces of scotch tape, directly across from one another, on each record label.

RECORD CHANGER TROUBLE SHOOTING

Changer Will Not Trip.

1. Check for broken or loose cycle spring (112).
2. Check On-Off switch cover (100). If cover is not assembled to switch properly, it may bind push-off link and arm (95), preventing cycle spring (112) from pulling the control cam (91) around.
3. Check for misadjustment of the oscillating trip adjusting screw (115).
4. Check for bent trip stop wire (111A).
5. Check for broken pawl spring (128).

© John F. Rider

MODELS RC221, RC222

Changer Repeatedly Trips Into Change Cycle.
1. Check for misadjustment of reject adjusting screw (118), or trip adjusting screw (115). See "Reject and Trip Adjustments".
2. Check for broken trip cocking spring (110).
3. Check for broken reject spring (2).
4. Check for loose On-Off Reject knob (1).
5. Check for bent trip stop wire (111A).

Changer Will Not Reject.
1. Check adjustment of reject adjusting screw (118).
2. Check for bent trip stop wire (111A).
3. Check for control cam (91) binding.

Pickup Arm Does Not Set Down Properly
1. Check set down adjustment. See paragraph under heading "Set Down Adjustments."
2. Check for broken or loose set down spring (131).
3. Check for broken or loose set-down adjusting lock spring (21).
4. Check for missing or loose pickup arm counterweight screws (19) resulting in erratic set-down. (These screws hold pivot and mounting plate (22) in position.)
5. Check for taut pickup arm cable (35). The cable must be loose between the pickup arm and the terminal strip (14).

Pickup Arm "Skips" Across Records
1. Check to be sure that cabinet is level.
2. Check for worn needle.

Turntable Rubs Against Motor Drive Shafts
1. Check for missing or compressed cork washer (46 or 47). See discussion under heading "Removing Turntable (8) and Bearing Assembly (48)" in the Service and Repair section.

Changer Trips Into Change Cycle When On-Off Reject Knob Is Turned to Off.
1. Check paragraph under "Reject Adjustment".

Changer Causes Rumble Or Noise
1. Check for broken or missing "float" springs (78).
2. Check for "float" screws (79) rubbing against the edges of the holes in the changer pan.
3. Check for the speed change knob shaft (54) rubbing against the cut-out in the changer pan.

Records Do Not Drop to Turntable or More Than One Record Drops. (33 RPM and 78 RPM operation only.)
1. Check distance between record support and centerpost as described under "Adjusting Distance Between Record Support (11) and Centerposts (60 and 61)"

Changer Trips Into Change Cycle Before Finishing Record (78 RPM and 33 RPM only).
1. Check for broken position trip cord (102 or cord tension spring (103).
2. Check to see that cord tension adjusting cam (101) has not loosened or is misadjusted.

Changer Will Not Trip (45 RPM operation only).
1. Check for broken or missing position trip cocking spring (126).
2. Misadjustment of the position trip adjusting screw (117). See paragraph under heading "Position Trip Adjustment".
3. Broken or bent position trip incline spring (127A).
4. Check to see that position trip cord (102) is not too short or is twisted or binding.
5. Check for misadjustment of the cord tension adjusting cam (101).

Changer Trips Into Change Cycle Before Finishing Record (45 RPM only).
1. Misadjustment of position trip adjusting screw (117). See "Position Trip Adjustment".

Records Do Not Drop to Turntable (7-inch 45 RPM only).
1. Adjust push-off adjusting shaft (75). See paragraph under heading "45 RPM Spindle Adjustment".
2. Check for broken or missing riser plate return spring (89).

Turntable Jumps (Rises) During Change Cycle (45 RPM only).
1. Adjust push-off adjusting shaft (75). See paragraph under heading "45 RPM Spindle Adjustment".

Changer Stalls in Change Cycle (45 RPM only)
1. See "Riser Plate (90)" discussion in the Service and Repair section.

CAUTIONS
1. *See that the rubber tires on both the drive wheel and the idler wheel and both drive belts are kept clean and free from oil, grease, dirt or any foreign material.* Carbona or carbon tetrachloride may be used for cleaning these parts.
2. When handling the idler wheel (58) or drive wheel (86), keep fingers and hands away from the rubber tires. This is also true when handling the rubber drive belts (55). Natural body oils on these parts may possibly cause slippage.
3. When replacing the rubber tire (85) do not bend the tab on the drive wheel over too far as this may result in the tire catching or rubbing on the drive wheel pressure spring (88).
4. If the On-Off Reject knob (1) cannot be pulled off with the fingers, pry very carefully. The head cover (7) is plastic and if the On-Off Reject knob is pried off, excessive force should not be used.
5. When removing or replacing the pawl spring (128) care should be taken not to stretch it.
6. When removing or replacing the pickup arm (17), always loosen the Allen set screw (32) and lift off the complete assembly. The pivot spring, hub and pin assembly (31) can be removed from the pivot plate assembly (22) and replaced much more readily with the complete pickup arm assembly off of the changer. When reinstalling pickup arm assembly or the arm control lever (127) be sure to replace all washers that were used originally.
7. When replacing the switch mounting bracket (98) or the trip bracket (109) be sure to locate the half punches in the holes in the pan before tightening their mounting screws (99).
8. When replacing the on-off switch assembly (100) care should be used in bending the tab fasteners so that the switch is mounted firmly to the bracket.
9. When replacing or reinstalling the record size selector knob (16), turn the set-down eccentric (25) to the position for 10" and 12" set-dowr (all the way to the left). Then install the knot (16) so that the dot between "10.12" lines up with the locating dot on the pickup arm.
10. When disassembling the 45 RPM spindle, do not push up on the push-off adjusting shaft just after removing the spindle cap.

© John F. Rider

In later production, turntable (8) is held in place by a retaining ring (part number 401A286). Remove before lifting turntable.

OPERATING INSTRUCTIONS

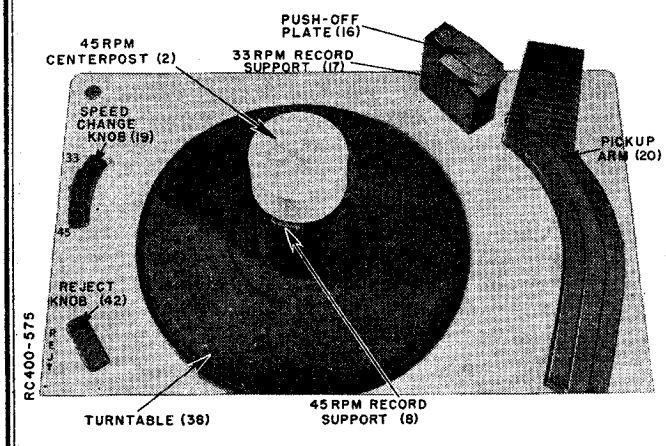

Figure 1. RC400 Record Changer (Top View).

This Admiral Record Changer is designed to automatically play a series of ten 7-inch 33 RPM "Long Play" records or ten 7-inch 45 RPM "Long Play" records. A wide-diameter, plastic centerpost is used for playing 45 RPM records and a conventional, metal centerpost is used for playing 33 RPM records.

SELECTING CENTERPOST

To play 45 RPM records, insert the large diameter (plastic) centerpost (2) into the hole in the center of the turntable (38). While holding the turntable with one hand, turn the centerpost counter-clockwise until the lock-in-lugs fall into and lock in the three slots in the turntable. To remove this centerpost, hold the turntable with one hand and turn the centerpost clockwise; then lift it up.

To play 33 RPM records, insert the small diameter (metal) centerpost (1) into the center of the turntable and press it down until it "locks" in place. To remove this centerpost, merely lift it straight up and out.

SETTING SPEED CHANGE KNOB

To play 45 RPM records, set the Speed Change Knob (19) so that its indicating arrow points to "45". To play 33 RPM records, set this knob so its indicating arrow points to "33". When moving this knob to either position, make sure that the knob "clicks" into position.

This control also has a center ("neutral") position for disengaging the rubber-tired idler wheel (47). The changer pan is not marked "neutral" but the position can be felt when the Speed Change Knob is halfway between "33" and "45". In this position, the compound idler wheel is not in contact with the drive shaft or the turntable. **When the record changer is not going to be used for some time, set the speed change knob in the center position.**

LOADING AND STARTING THE RECORD CHANGER

To load 45 RPM records, place as many as ten over the 45 RPM centerpost so that the bottom record rests on the record supports (8). To load 33 RPM records, place as many as ten over the 33 RPM centerpost so that the bottom record rests on the ledge on the centerpost (1) and the 33 RPM record support (17). Start the changer by turning the Radio-Phono switch on the radio to the "Phono-On" position.

STOPPING AND UNLOADING

Turn changer off by turning Radio-Phono switch on the radio to "Phono-Off" position. Do not turn changer off during change cycle. To unload, merely lift records straight up.

THE CHANGE CYCLE

45 RPM OPERATION
(See Figures 2, 3 and 4)

If at all possible, we recommend that you carefully observe the operation of a changer that is in normal operating condition. It is a good idea to rotate the turntable by hand and repeat the change cycle until you understand the function of each part.

The changer operates as follows: The turntable (38) is driven by the smaller of the two rubber tires on the compound idler wheel (47), riding against the outer rim of the turntable.

The speed of the turntable is determined by the setting of the speed change knob (19). When the knob is in the "45" position, the larger rubber tire on the compound idler wheel (47) rides against the 45 RPM section (larger diameter) of the motor drive shaft. When the knob is moved to "33", the compound idler wheel moves so that the larger tire rides against the 33 RPM section (smaller diameter) of the motor drive shaft. See Figure 2.

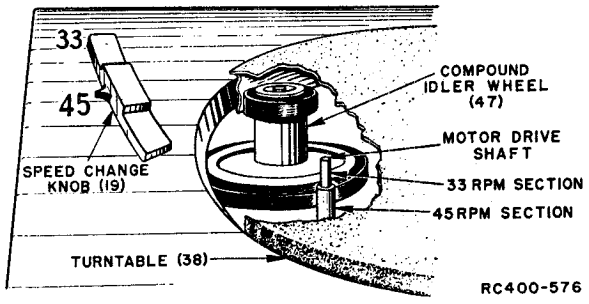

Figure 2. Compound Idler Wheel and Motor Drive Shaft.

The changer mechanism is driven through change cycle by the knurled hub of the turntable rotating the rubber tired drive wheel (36). During normal playing, the drive wheel does not touch the knurled hub of the turntable. See Figure 3A. As the needle enters the record spiral grooves and moves towards the centerpost, the pickup arm lever and stud (72) moves simultaneously and rotates the trip bracket (61) counter-clockwise. Since the trip bracket and drive wheel are

©John F. Rider

on the same shaft, the drive wheel is pivoted approximately 10 degrees counter-clockwise. The rubber tire contacts the knurled hub of the turntable, and is rotated in a counter-clockwise direction. See Figure 3B.

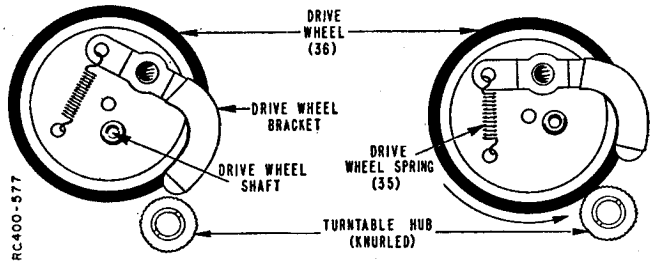

Figure 3A Figure 3B

Drive Wheel Positions.

The drive wheel shaft is fitted through the drive bracket (78) and is mounted OFF CENTER on the drive wheel (36). Due to the cam action of the "off-center" drive wheel (36), rotation of the drive wheel, by the knurled hub of the turntable, forces the drive shaft out. Since the drive shaft is fitted through the drive bracket (78), the drive bracket is pivoted around the drive bracket hub. The cycle spring (76) maintains pressure on the drive bracket so that the drive wheel tire is kept in contact with the knurled hub. After the changer has been tripped and the drive bracket begins to be pivoted by the movement of the drive wheel, the arm lift incline (78A) on the drive bracket moves across the lift rod moving it upward. This lifts the pickup arm off of the record. Stud (78C) on the drive bracket now contacts the pickup arm lever and begins to move it so the pickup arm moves out from the center of the record.

At about this time, the push-off adjusting shaft (15) on the 45 RPM centerpost (2) starts moving up the push-off incline (78B) on the drive bracket (78). See figure 12. This causes the push-off shaft to move up into the centerpost. As the push-off shaft moves into the centerpost. As the push-off shaft moves into the centerpost, the slicers (5 and 6) ride on the incline of the slicer cam and consequently move out of the centerpost. The record supports (8) are also brought into the centerpost as each slicer is hooked to the record support on the opposite side of the centerpost.

As the drive bracket continues to pivot, the pickup arm continues to move away from the record, the slicers (5 and 6) continue to come out, and the record supports continue to pull in. When the pickup arm has moved to the right almost as far as it will go, the record supports (8) have pulled into the centerpost enough to drop the bottom record to the turntable and the slicers are out far enough to hold up the remainder of the stack of records.

The pickup arm lever control stud (72A) riding against the indexing edge of the index bracket (65) controls the movement of the pickup arm. The index bracket (65) and set down spring (64) prevent the pickup arm from moving out too far. (Later in the change cycle the index bracket (65) and set-down spring (64) control the set-down point.)

At this point, the drive wheel (36) has gone through one-half of its rotation and as the drive wheel continues to rotate, the drive bracket (78) will begin to return to its normal (out of change cycle) position.

The set-down spring (64) keeps the pickup arm lever (72) in contact with the arm control stud (78C) on the drive bracket. Therefore as the drive bracket moves back toward its normal position, the pickup arm is moved in toward the set-down point. When the pick-up arm lever stud (72A) has reached the indexing point (notch) in the index bracket, the pickup arm has reached the set-down point and stops moving in toward the centerpost. At this time, the drive bracket has pivoted to a point where the lift rod (32) starts moving down the arm lift incline (78A) in the drive bracket and the pickup arm starts moving down toward the record. When the arm has moved down about halfway, the second stud on the drive bracket (78D) moves the index bracket (65) away from the stud on the pick-up arm lever so that the pickup arm is free to travel in on the lead in grooves on the record.

Almost simultaneously, the push-off adjusting shaft (15) is riding down the push-off incline (78B) on the drive bracket. This allows the push-off return spring (11) on the centerpost to pull the cam and shaft assembly (9) down.

The record supports are forced out of the centerpost by their return spring (7) and the slicers are moved into the centerpost by the slicer return springs (4). When the slicers are all the way in, the stack drops to the record supports (8).

The drive wheel is no longer in contact with the knurled hub but it is rotated approximately 20 degrees further by the drive wheel bracket, which is held against the knurled hub of the turntable by the drive wheel bracket spring (35).

When the drive wheel bracket has rotated past the knurled hub, the drive wheel must be rotated another 10 degrees by the trip bracket (61), or reject lever (43), before it will contact the knurled hub and begin the change cycle. When the reject knob (42) is moved to the "Rej" position, the reject lever roller rotates the drive wheel the necessary 10 degrees and the change cycle begins.

33 RPM OPERATION

The change cycle for 33 RPM operation is exactly the same as for 45 RPM operation, except for change cycle time and the fact that 33 RPM records are supported by the offset on the 33 RPM centerpost and the

©John F. Rider

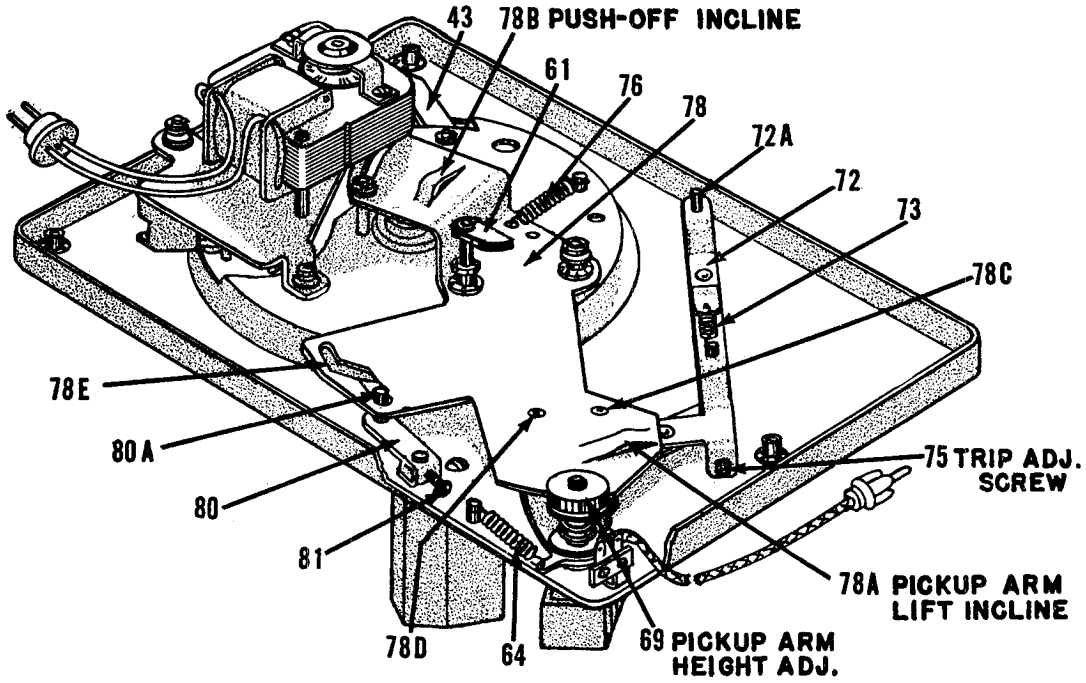

Figure 4. RC400 Bottom View (Assembled).

33 RPM record support (17), and are pushed off by the push-off plate (16).

When the drive bracket (78) has pivoted to the point where the pickup arm is clear of the record, the stud (80A) on the push-off bracket (80) is moved by the slot (78E) in the drive bracket. This movement causes the push-off plate (16) to pivot and push-off the bottom record. The remainder of the records are held back by the small sliding piece at the top of the centerpost. When the drive bracket pivots back to its normal playing position, the push-off bracket stud (80A) follows the slot in the drive bracket and causes the push-off plate to pivot back to its normal position. Then the record stack drops to the record support (17) from the push-off plate (16).

ADJUSTMENTS

TRIP ADJUSTMENT

This record changer employs the position type trip; that is, it trips into change cycle when the needle in the pickup arm reaches a given distance from the center of the record. If the trip is properly adjusted, the record changer will trip into change cycle when the needle is between 2" to 2-3/16" from the center of the hole in the turntable or approximately half way in on the spiral groove in the center of the record.

If the record changer does not trip at the proper position, it will be necessary to adjust the trip adjusting screw (75). See figure 4. Turning this screw in (clockwise) moves the trip point away from the centerpost. Turning it out, moves the trip point nearer to the centerpost.

If the screw is turned all the way out, the changer may not trip. If it is turned in too far, the changer may trip before the record finishes playing.

33 RPM PUSH-OFF ADJUSTMENT
(See Figures 1 and 4)

If 33 RPM records do not drop to the turntable during change cycle, it may be necessary to correct the push-off adjustment.

The push-off is properly adjusted when the leading edge of the push-off plate (16) extends to a maximum of 1/32" beyond the edge of the record support (17) during change cycle.

To make this adjustment, proceed as follows:

1. With the record changer in change cycle, rotate the turntable by hand until the pickup arm STOPS moving away from the centerpost.
2. Loosen the set screw (81) on the push-off bracket (80) and move the push-off plate (16) so that its leading edge extends 1/32" beyond the edge of the record support (17). Then tighten the set screw (81).
3. Load the record changer with 33 RPM records,

© John F. Rider

place the changer in operation and keep rejecting records until the stack has been dropped to the turntable.

4. If records still do not drop properly, repeat steps 1 through 3.

ADJUSTMENT OF SET-DOWN POINT
(See Figures 4 and 5)

This record changer does not have a conventional set-down screw adjustment. The pickup arm should set-down properly unless the Allen set screw (34) on the pivot collar (33) is loosened, or excessive pressure has been applied to the pickup arm.

When properly adjusted for correct set-down, the needle point will set-down between 2-9/16" and 2-10/16" from the near side of the 45 RPM centerpost. (Between 3-5/16" and 3-6/16" from center of the hole in the turntable.) Making this adjustment for 45 RPM records, automatically provides correct set-down for 33 RPM records.

If the pickup arm does not set-down properly, the set-down point adjustment should be made as follows:

1. Insert the 45 RPM centerpost (2); set the speed change knob (19) to the "45" position; move the reject knob (42) to the "Rej" position and then rotate the turntable (clockwise) by hand JUST to the point where the pickup arm stops moving in toward the centerpost and starts moving downward. DO NOT ROTATE THE TURNTABLE BEYOND THIS POINT.

2. Insert a #6 Allen wrench into the Allen set screw (34) on the pivot collar (33) as shown in Figure 5. Do NOT loosen the Allen set screw.

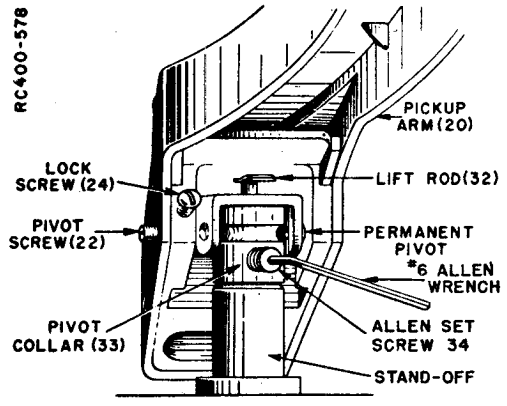

Figure 5. Pickup Arm Mounting Detail.

3. From the underside of the changer, hold the pickup arm lever and trip bracket assembly (72) STATIONARY so that it can not move down or to either side.

4. Slightly loosen the Allen set screw (34).

5. Place a ruler against the near side of the 45 RPM centerpost and then move the pickup arm until the distance between the needle and centerpost is from 2-9/16" to 2-10/16".

6. Tighten the Allen set screw (34) VERY CAREFULLY to avoid moving the pickup arm. Before firmly tightening the Allen set screw, make sure that there is a little space (ten thousandths of an inch) between the pivot collar (33) and the stand-off.

7. Run the record changer through change cycle a few times to make certain that the set-down point adjustment has been properly made.

ADJUSTING THE PICKUP ARM HEIGHT

This record changer is designed so that when the needle rests 1/16" above the changer pan, the pickup arm will automatically lift high enough during change cycle to clear the top record of a stack of ten 33 RPM records on the turntable and will not lift high enough to strike the bottom record of a stack of 33 RPM records to be played.

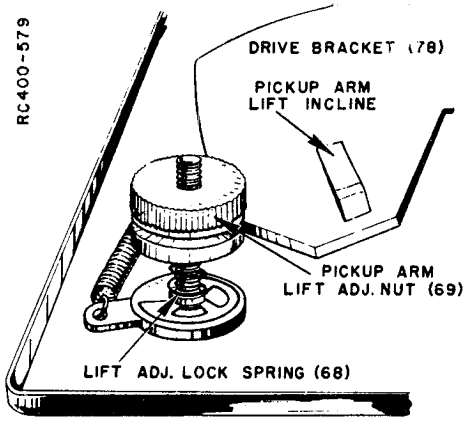

Figure 6. Adjusting Pickup Arm Height.

With the record changer out of change cycle and the pickup arm clear of the turntable, adjust the pickup arm lift adjusting nut (69) (see figure 6), so that the needle rests 1/16" above the top of the changer pan. Turning the nut (69) clockwise raises the pickup arm; turning it counter-clockwise lowers the pickup arm.

To check this adjustment, load the record changer with ten 33 RPM records. Turn the changer on and reject records until the stack has been dropped to the turntable. The pickup arm should not lift high enough

©John F. Rider

to strike the bottom record (of the stack about to be played) but should lift high enough to play the tenth record on the turntable.

If, for some reason, the arm strikes the bottom record or will not lift high enough to play the tenth record, a compromise adjustment should be made. That is, raise the arm slightly to make the arm lift higher or lower the arm slightly to prevent it from striking the bottom record.

45 RPM CENTERPOST ADJUSTMENT

NOTE

This 45 RPM centerpost (G400B410) is very similar to, but is not interchangeable with, the 45 RPM centerpost (G400B329) used in models RC221, RC222. The centerposts can be readily identified by noting that the length of the un-threaded portion of the push-off adjusting shaft (15) is approximately 5/16" in G400B410, and ¾" in G400B239.

If 45 RPM records do not drop to the turntable as they should, or if the turntable stalls during change cycle, it will be necessary to adjust the 45 RPM centerpost (2).

The push-off adjusting shaft (15) is the only adjustment on this centerpost. When properly adjusted, the dimension from the bottom of the adjusting nut (14) to the end of the push-off adjusting shaft (15) is approximately ½ inch. To make an adjustment, proceed as follows:

1. Turn the set off. Push the Reject knob (42) to the "Rej" position. Then rotate the turntable

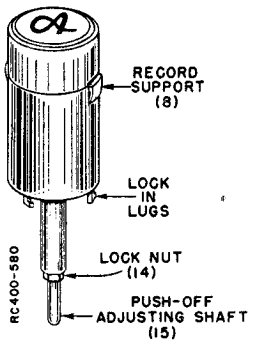

Figure 7. 45 RPM Centerpost.

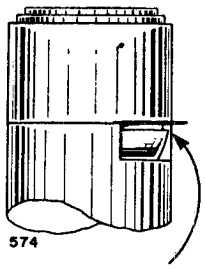
clockwise (to the right) by hand until the pick-up arm moves as far away from the turntable as it will go. Do not continue to rotate the turntable beyond this point.

2. Insert the 45 RPM centerpost and lock it in place.

3. In this position the record supports (8) should be pulled into the centerpost until the top edge of the



Corner of record support (8) must be slightly (1/32") inside centerpost wall.

Figure 8. 45 RPM Centerpost Adjustment.

record supports are just inside the centerpost. You should only be able to see approximately 1/32 of an inch of the centerpost wall. See figure 8.

4. If the record supports do not pull into the centerpost as far as the position shown in figure 8, remove centerpost, loosen the locknut (14) and turn the push-off adjusting shaft out (counter-clockwise) approximately one half turn.

5. Insert the centerpost and check to see if the record supports "pull in" to the proper position. If they do not, repeat tep 4. If they pull in far enough, proceed with step 6.

6. Place a stack of 45 RPM records on the centerpost and turn the record changer on. Push the Reject knob to the "Rej" position and then keep rejecting records until the whole stack has been dropped to the turntable. If each record slides smoothly down the centerpost, the adjustment is satisfactory.

IMPORTANT: If the turntable stalls during change cycle, the push-off adjusting shaft may have been turned out too far. Remove the 45 RPM centerpost and run the changer through change cycle. If the changer does not stall with the centerpost removed, turn the push-off adjusting shaft in about four or five full turns and repeat steps 1 through 6 above.

SERVICE AND REPAIR

DISASSEMBLING THE 45 RPM CENTERPOST

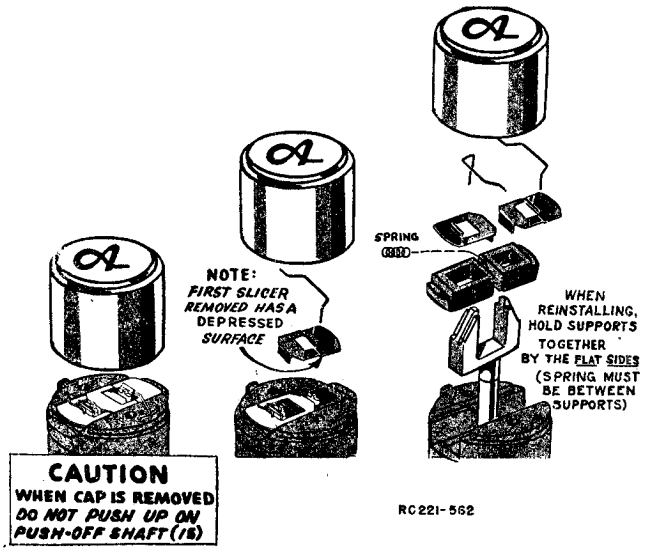
(See Figure 9)

To disassemble the centerpost for parts replacement etc., proceed as follows:

1. Remove screws (12) from underside of centerpost and lift up the centerpost cap (3). See figure 9. *CAUTION: When the centerpost cap (3) is off, use extra care to keep from accidentally pushing up on the push-off adjusting shaft (15). If this shaft is puhed up, the slicer return springs (4) and slicers may fly off and be lost.*

©John F. Rider

MODEL RC400



NOTE:
FIRST SLICER REMOVED HAS A DEPRESSED SURFACE
SPRING
WHEN REINSTALLING, HOLD SUPPORTS TOGETHER BY THE FLAT SIDES (SPRING MUST BE BETWEEN SUPPORTS)
CAUTION
WHEN CAP IS REMOVED DO NOT PUSH UP ON PUSH-OFF SHAFT (15)
RC221-562

Figure 9. Disassembly of 45 RPM Centerpost.

2. Using a "long nose" pliers or tweezers, remove the slicer spring (4) which holds the top slicer (5) in place. Then remove the top slicer. (NOTE: This slicer has an offset. It must be removed first when disassembling and installed last when reassembling).
3. Remove the other slicer return spring and the bottom slicer (6).
4. Now, push up on the push-off adjusting shaft (15) until the record supports (8) come up over the top of the centerpost.
5. Grasp both record supports with the thumb and two forefingers and lift them off of the slicer cam (9A). Release record supports carefully so record support return spring (7) is not lost.
6. To remove the slicer cam and push-off assembly (9), remove the retaining ring (13) and the push-off return spring (11) from the underside of the centerpost and lift the assembly off from the top of the centerpost.

When assembling the centerpost, merely reverse the above procedure. When installing the record supports (8) and their return spring (7), place the spring between the record supports and compress the spring enough so the record supports can be slid down over the slicer cam (9A). When installing the slicers (5 and 6) be sure to install the flat slicer (5) first, and then the slicer with the offset (it also has a smaller cut-out).

REMOVING THE PICKUP ARM
(See Figure 5)

If the pickup arm must be removed for any reason, proceed as follows:

Important

Do NOT loosen the Allen set screw (34) in the pivot collar (33). If the screw is loosened, it will be necessary to make the set-down point adjustment.

1. Loosen the pivot locking screw (24) at the front of the pickup arm counterweight (21).
2. Turn the pivot screw (22) almost all the way out.
3. Move the pickup arm to the right to free the permanent pivot (part of the counterweight) from the pivot hole in the pivot collar (33). In early production changers, it may be necessary to use a slight twisting or "wiggling" motion to free the permanent pivot. When the permanent pivot has been freed, merely lift the pickup arm assembly up and off.

To reinstall the pickup arm assembly proceed as follows:

1. Slide the counterweight down on the pivot collar (33) until the permanent pivot point falls into the pivot hole in the pivot collar. In early production changers, it may be necessary to set the permanent pivot point in the pivot hole and then twist or "wiggle" the arm until the counterweight falls into the proper position.
2. Tighten the pivot screw (22) until it is tight and then back it off just enough so the pickup arm can move up and down freely.
3. Tighten the pivot locking screw (24).

REMOVING TURNTABLE (38) AND THRUST BEARING ASSEMBLY (40)

To remove the turntable first place the speed change knob (19) in the "neutral" position. Being sure that the changer is not in change cycle, move the pickup arm away from the turntable. Then remove the retaining clip (37) on top of the turntable and lift the turntable straight up.

Before replacing the turntable, see that the drive wheel (36) is not against the centerpost socket and move the pickup arm as far as possible from the centerpost. Be sure the speed change knob (19) is in the "neutral" position.

No force is needed to seat the turntable.

Replace the turntable retaining clip (37) on the centerpost socket so that its "turned-up" ends are facing upward and away from the pickup arm.

The cork washers (39) and thrust bearing assembly (40) are removed by sliding them over the centerpost socket. Replace them in the order shown in figure 12.

LUBRICATION

Under normal operating conditions, the motor should never require oiling. Also, do NOT use oil on the 45 RPM centerpost and do NOT oil the roller on the reject lever (43). Any oil on this roller will be transferred to the drive wheel tire when the reject knob is moved to the "Rej" position, which might cause the drive wheel (36) to slip during change cycle. The

©John F. Rider

drive shaft is fitted through an oilite bearing on the drive bracket (78); it also should not require oil.

The rest of the changer, however, should be lubricated with grease whenever it comes into the shop for repairs or adjustment. All pivot and friction points should be greased adequately but not excessively. A good automobile chassis grease may be used for this purpose.

The push-off shaft (16) and the bearing in the turntable hub may be lubricated with SAE No. 20 oil.

Care should be taken to prevent any of the lubricant from coming into contact with the drive or idler wheel tires. Also, be careful when using oil, not to let an excess seep into the felt of the turntable.

CARTRIDGE AND NEEDLE REPLACEMENT

Alternate cartridges, interchangeable when complete with needle, are used in this changer.

In models having cartridge (27), part number 409A300, replace the needle (28), part number 98A15-6, by loosening the knurled nut (29) and withdrawing the old needle. Insert the new needle and tighten the knurled nut. See figure 10.

In models having cartridge (27), part number 409A301, replace the needle (28), part number 98A15-14, by prying downward on the back edge of the needle. Insert the new needle by pressing it into the cartridge. See figure 11.

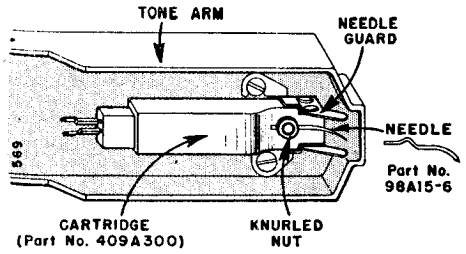


Figure 10. Cartridge 409A300 and Needle Detail.

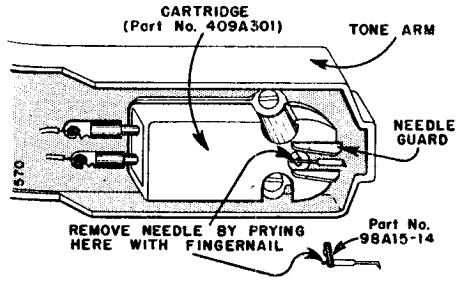

Figure 11. Cartridge 409A301 and Needle Detail.

PARTS LIST

Ref. No.	Part Number	Description
1	G400B 409	33 RPM Centerpost
2	G400B 410	†45 RPM Centerpost Complete
3	403A 1	45 RPM Centerpost Cap
4	414A 35	Slicer Return Spring
5	401A 276	Top Slicer

†This 45 RPM centerpost (G400B410) is very similar to, but is not interchangeable with, the 45 RPM centerpost (G400B329) used in models RC221, RC222. The centerposts can be readily identified by noting that the length of the un-threaded portion of the push-off adjusting shaft (15) is approximately 5/16" in G400B410, and 3/4" in G400B329.

*At the time of publication, 50 cycle conversion parts were not available.

RECORD CHANGER TROUBLE SHOOTING

Changer Will Not Trip Into Change Cycle.

1. Check adjustment of trip adjusting screw (75).
2. Check for broken, loose or weak trip tension spring (73).
3. Check for broken, missing or loose trip adjusting lock spring (74).
4. Check for oil or foreign material on the drive wheel tire (36).
5. Check to see that the drive bracket (78) is free (not binding) to pivot around drive bracket hub.
6. Check for broken cycle spring (76).

Changer Trips Into Change Cycle Before Finishing Record.

1. Check adjustment of trip adjusting screw (75). See paragraph under heading "Trip Adjustment."

Changer Will Not Reject.

1. Check for oil or foreign material on the drive wheel tire (36).
2. Check to see that the drive bracket (78) is free to pivot around the drive bracket hub.

Pickup Arm Does Not Set Down Properly.

1. Check set-down adjustment. See paragraph under "Adjustment of Set-down Point".

Records Do Not Drop to Turntable.

1. If 45 RPM records do not drop, adjust push-off adjusting shaft (15). See paragraph under heading "45 RPM Centerpost Adjustment".
2. If 33 RPM records do not drop, check the push-off adjustment. See paragraph under heading "Push-off Adjustment".

Changer Stalls in Change Cycle.

1. Check for parts binding.
2. If changer stalls with 45 RPM centerpost in place, adjust push-off adjusting shaft (15). See paragraph under heading "45 RPM Centerpost Adjustment".

Turntable Will Not Revolve When Changer Is Turned On.

1. Check position of speed change knob (19). If it is in "neutral" position, the turntable will not revolve.
2. Check for oil or foreign material on the tires of the compound idler wheel (47).
3. Check for broken idler wheel spring (50).

Changer Causes Rumble or Noise.

1. Check for broken or missing "float" springs (58).
2. Check for speed change knob shaft (19) rubbing against the edge of the cut-out in the changer pan.

Pickup Arm "Skips" Across Records.

1. Check to be sure that cabinet is level.
2. Check for worn needle.

CAUTIONS AND SERVICE HINTS

1. See that the rubber tires on both the drive wheel (36) and the compound idler wheel (47) are kept clean and free from oil, grease, dirt or any foreign material. Carbona or carbon tetrachloride may be used for cleaning these parts.
2. When handling the idler wheel or drive wheel, keep fingers and hands away from the rubber tires. Natural body oils on these parts may possibly cause slippage.
3. When the turntable is off, do NOT push the drive wheel (26) against the centerpost socket.
4. If the record changer is not going to be used for some time, place the speed-change knob (19) in the "neutral" position. This will eliminate the possibility of denting the idler wheel tires (47).
5. When disassembling the 45 RPM centerpost, do not push up on push-off adjusting shaft (15), just after removing the centerpost cap (3).
6. When removing the pickup arm, do NOT loosen the Allen set screw (34) in the pivot collar (33).
7. Do not oil the roller on the reject bracket (43). Oil will be transferred to the drive wheel tire (26) possibly causing slippage during change cycle.
8. When replacing the turntable retaining clip (37) be sure to slip it on with the "turned-up" ends facing upward.
9. When removing or reinstalling turntable, make sure that the record changer is not in change cycle and that the speed change knob (19) is in the "neutral" position.

©John F. Rider

Due to the fact that a complete understanding of the proper operation of a record changer is necessary before any attempt be made to repair or effect Service adjustments; we are giving a description of the change cycle of the P-43 Series Capehart Record Changers.

The record shelves are set for the size record to be played (either 10" or 12") by turning either shelf to the position indicated on the decal, then the correct number of records should be placed on the record shelves. (Twelve 10" or ten 12"). The tone arm should be on its rest.

Before loading the records on the shelves they should be examined for rough edges (burrs, flash or chips) and if any burrs are found they should be removed with fine sandpaper.

Move the control switch which starts the phonograph and move the reject button sidewise. The changer will go into cycle lifting the tone arm off the rest and swinging it under the stack. The tone arm should swing clear of the record stack, a record should drop to the hooks, pause, then gently settle to the turntable. The tone arm should swing back and be lowered to the starting groove on the record. When the record is played the above cycle is repeated until the records have been played.

Now let's follow the above cycle through the mechanism.

When the reject button is moved, the Reject Lever (56-877) pushes the Start Lever and Release Trip Assembly (64215) far enough to disengage it from the Starting Lever Assembly (13-38). Due to its construction the Starting Lever (which is part of the Main Cam Assembly) (13-296) tilts down and engages with the Starting Pin (34309) to make the Main Cam Gear mesh with the Spindle Gear (part of 13-297).

The Turntable is screwed onto the Spindle Gear and both are driven through the Idler Pulley (3672) by the Motor. When the cycle is completed the Main Cam Gear disengages from the Spindle Gear because several teeth are left off the Main Cam Gear, this is called the playing position, see Fig. A,

When the Starting Lever engages with the Starting Pin (see above) the Main Cam Assembly is moved forward at the right speed and the correct distance to cause the gears to mesh properly. Then the Main Cam goes through a complete revolution.

©John F. Rider

MODEL P-43

First the Tone Arm is lifted off the record through the Tone Arm Lift Lever (13-303). As soon as it is elevated both the Record Plungers move toward the Spindle to center the record for the drop to the Turntable; if no record is on the shelves the Automatic Switch is turned off, however the cycling switch makes the changer complete the cycle with the Tone Arm in playing position and needle resting on the record. As this happens the Tone Arm Return Lever (09-119) moves the Tone Arm from under the record stack. The Rear Record Plunger moves forward at the same rate of speed as the eccentric portion of the Spindle and the Front Plunger does. This pushes the record off the Rear Shelf where the Rear Record Hook catches it. Both Front and Rear Plunger move backwards at the same rate as the Spindle does, pushing the record off the Front Shelf and dropping it to the Front Hooks, the record pauses here until the Hooks move to center the record in respect to the Spindle. Then both Hooks snap back out of the way, allowing the record to settle gently to the turntable. Next the Tone Arm swings into the proper position and is lowered to the record. A wire feed-in spring acts against the Tone Arm Crank to feed the Tone Arm into the music grooves in case there is no feed-in groove on the record.

To accomplish the record feed there are three sections of the Main Cam, together with the Centering Lever and Rocker Arm Assembly involved. The first section of the Main Cam is a "Boss" illustrated at the end of the Tone Arm Lift Lever in Fig. A. The Second section is the Trip Roller Assembly on top of the Main Cam. The third section is the "slot" in the Tone Arm Lift portion of the cam adjacent to the Trip Roller Assembly.

The action is as follows; As the Main Cam rotates, the "Boss" strikes the Centering Lever and Rocker as shown in Fig. B, this moves the Record Plungers toward the Spindle. Because this pressure is applied through a spring, variations in record diameter are of little consequence. After the Boss passes the Centering Lever, the Trip Roller strikes the Rear Rocker the first time moving the Rear Record Plunger forward and the Front Record Plunger is also moved forward, Fig. C. As the Main Cam moves on, the Record Plungers go to a central position then both move backward, Fig. D, then resume the central position, this is while the record rests on the Hooks. Then the Centering Lever drops into the "Slot" in the Main Cam, Fig. E, the Front and Rear Hooks are suddenly withdrawn from the record and it drops to the Turntable.

As the Tone Arm moves over the record, its motion is transmitted through the Friction Trip to the Friction Trip Lever. When the needle enters the change groove the Starting Lever Release Trip is released by the Friction Trip Lever, this allows the Starting Lever to drop and engage the Starting Pin.

MODEL P-43

In the following five illustrations we are showing the cycle of operation of a P-43 Series Capehart Changer.

Figure A is known as the playing position.

In Figure B the Main Cam has advanced so the "Boss" on the Main Cam has moved the Centering Lever Return Arm away from the cam, which because of the Return Spring causes the Centering Arm thru the Rocker Levers and Plunger Shafts to move the Record Plungers toward the Spindle. Due to the motion being transmitted thru the Return Spring different diameter records are handled equally well. The equalizer spring aids in exactly centering the record in regard to the Spindle. Note, in this illustration the Tone Arm Swing Lever is part way up the Cam Shoulder.

In Fig. C the Trip Roller (part of Main Cam) has advanced to move the rear plunger rocker away from the spindle, at the same time moving the front plunger rocker toward the spindle. Due to the Plunger Shafts, which transmit the motion of the Rockers to the Record Plungers the Record Plungers move in the opposite direction from the Rockers, i.e. Front Record Plunger moves away from the Spindle. This causes the record to be pushed off the Rear Shelf and drop to the Rear Hooks.

Between C & D the Record Plungers go through the central position and assume the position shown in Fig. D where the Rear Record Plunger moves away from the Spindle causing the record to drop to the Front Hooks.

In Fig. E the Centering Lever Return Arm has dropped into the "Slot" in the Main Cam, moving both Plungers Rockers toward the Spindle, causing the Front and Rear Hooks to snap back, permitting the record to settle flat on the turntable. In this illustration the Tone Arm Swing Lever is returning to the normal position.

SERVICE SUGGESTIONS

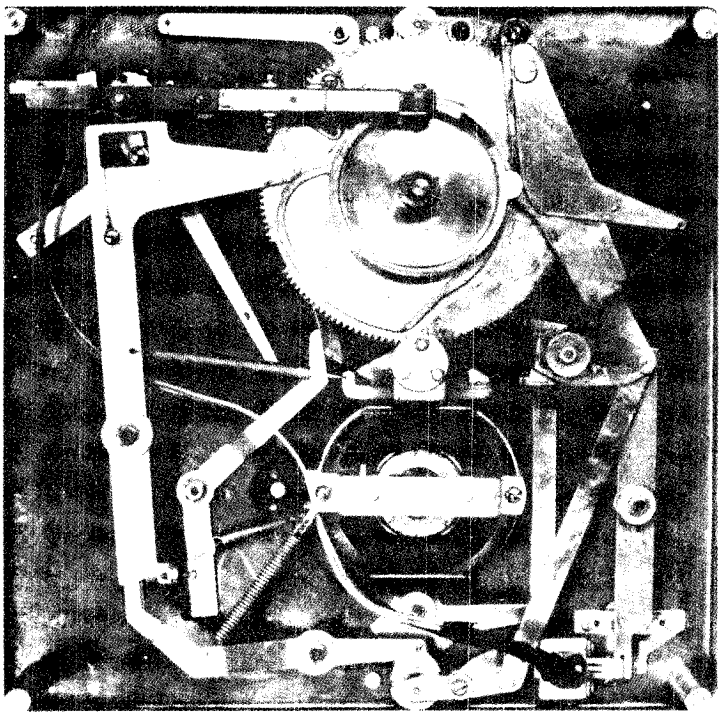

FIGURE B

1. TO REMOVE TURNTABLE 13-299

The Spindle Gear may be wedged, by a screwdriver between it and the Main Cam, to prevent its turning, the Turntable should be unscrewed from the Spindle. When removing the Turntable make certain one of the Spacer Washers is not lost. These Washers often adhere to the Turntable because of an oil film from the Felt Washer 4949. When replacing Turntable make sure it is properly tightened. NEVER USE GAS PLIERS TO HOLD SPINDLE.

2. TO REPLACE OR ADJUST IDLER PULLEY 3672.

First remove Turntable. The Idler Pulley is used to transfer power from the Motor Pulley 3671 to the Turntable. If the Idler Spring tension is incorrect the Turntable speed may be too high or too low, it should fall between 76.59 R.P.M. and 80.00 R.P.M. This tension is adjusted by loosening the Motor Mounting Screw holding the Spring Holder 45176 and turning the Spring Holder until the required tension is secured.

If it is necessary to replace the Idler Pulley remove the Hair Pin Cotter 99-34-14 and the Thrust Washer 50209. After removing the Idler Pulley also remove the Thrust Washer used underneath the pulley. If the Idler Pulley is replaced both Thrust Washers should be also.

When replacing the Pulley a single drop of oil should be used on the Pulley Stud.

CAUTION--Do not allow oil to get on either the Idler Pulley or the Turntable Rim.

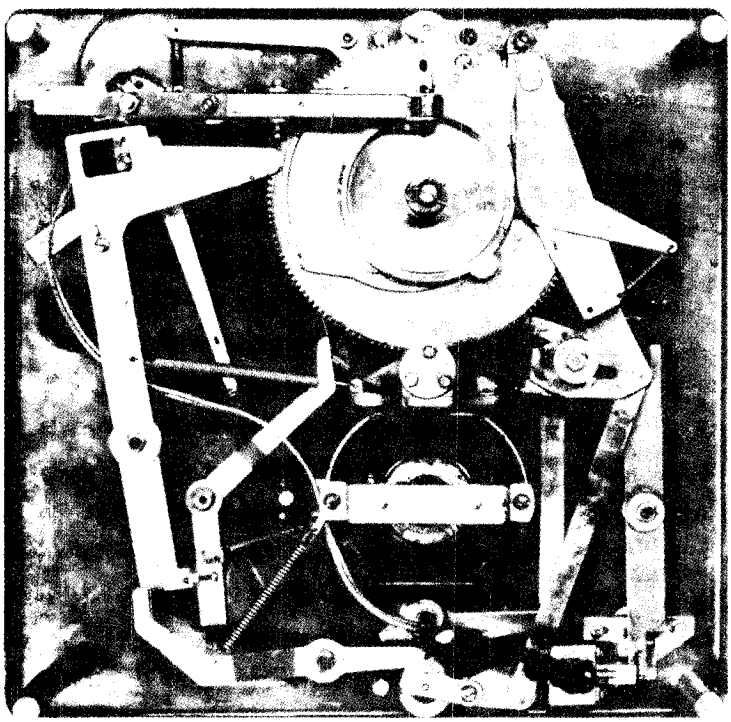

FIGURE C

3. ALIGNMENT OF RECORD SUPPORT SHELVES

The center line of the record shelves should form a straight line, in 10" position which passes through the center of the spindle. The shelves should be exactly 9 and 41/64 inches apart, plus or minus .005", and should be equidistant from the spindle. In the event it becomes necessary to change the spacing of the record shelves it is recommended that shims be used to adjust them. In some cases if oversized or undersized records are used it may be necessary to change the spacing of the shelves.

MODEL P-43

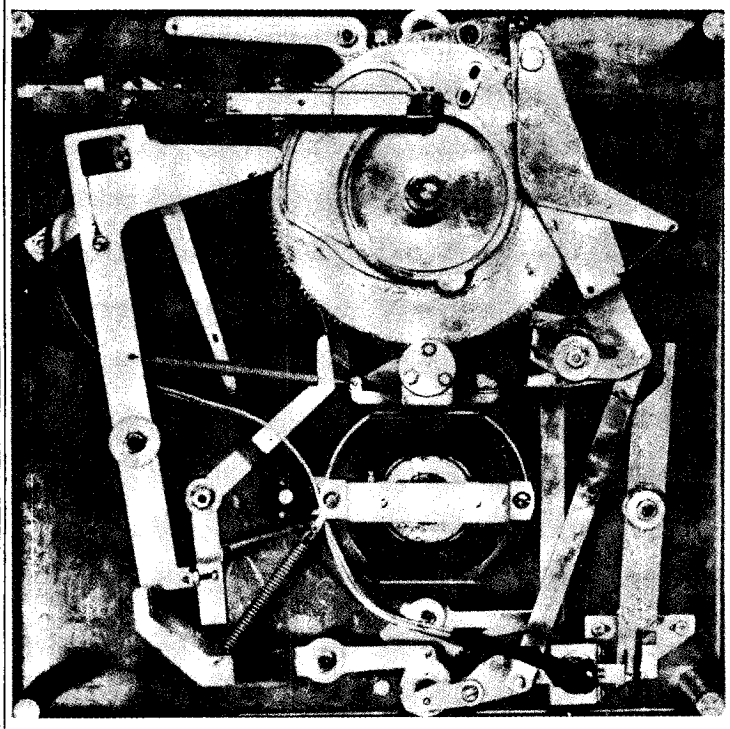

FIGURE D

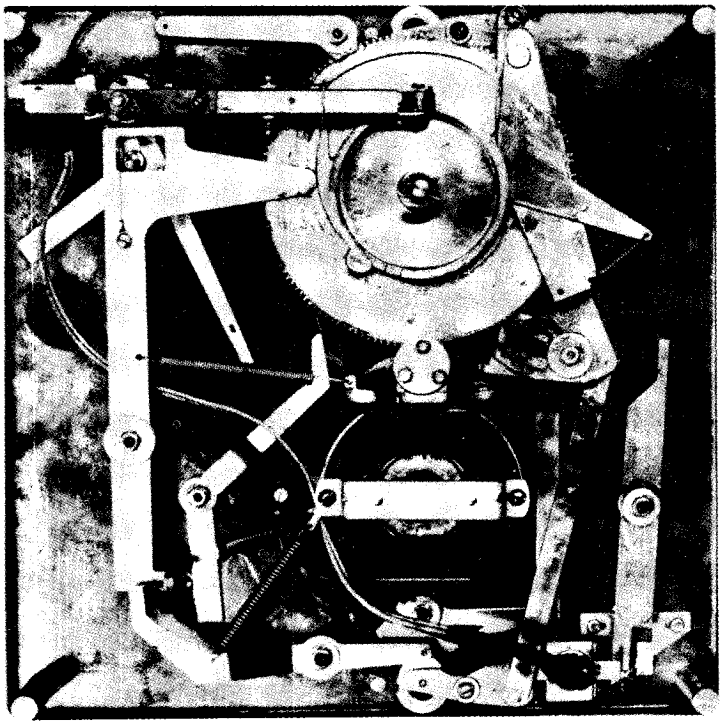

FIGURE E

4. ALIGNMENT OF RECORD SPINDLE

To prevent feedback the Spindle, Gear and Bracket Assembly is rubber mounted and can shift in transit. To reposition the spindle loosen all three mounting screws, position the spindle and tighten all three mounting screws equally; so as not to force the spindle out of place which may happen if one screw is tightened first.

5. SHELF LOCKING LEVER ADJUSTMENTS

The Front Record Shelf 57-111 should be lined up with the record spindle in the 10" position. The Shelf Locking Cam 15-10 is lined up with the center line of the Gear Sector Assembly and adjusted until the Locking Lever 07-26 is properly seated in the Shelf Locking Cam. The Record Shelf should not be permitted to slip when adjusting these parts.

When aligning the Rear Shelf Locking Cam the Locking Lever Hex Head Mounting screw may be loosened to permit the necessary adjustment to properly align the Shelf Locking Cam and Shelf Locking Lever.

6. ADJUSTMENT OF NON TRIP CAM OF STARTING LEVER 13-38 (Fig. 6)

This Cam shown at "A" in (Fig. 6) should be adjusted so that when the machine is in the "Manual" position, the Starting Lever Release Trip 64215 (Fig. 6) will pass over the end of the Starting Lever 13-38 (Fig. 6) without touching. The front end of the Starting Lever must also clear the bottom of the Resetting Dog and the top of the Starting Pin both part of the Spindle Gear 57-8 (Fig. 6).

7. THE TRIP FINGER STOP 46293 (Fig. 2)

The Trip Finger Stop 46293 should be 2-1/4" from the inside of the base plate to the inside face of the 90° bend at the end of the Stop.

8. NEEDLE LANDING

In 10" position, adjust the Tone Arm Crank 66366 (Fig. 5) so the needle lands

©John F. Rider

4-7/8" from center of the Record Spindle. To adjust have record changer in playing position, loosen Tone Arm Set Screw 99-26-16 (Fig. 5) set needle 4-7/8" from center of Record Spindle. Hold Tone Arm Crank firmly against Tone Arm Swing Lever 09-119 (Fig. 2) at the same time hold the Tone Arm Crank firmly up against the Trip finger 46287 (Fig. 5). Tighten the Set Screw 99-26-16. There should be a small amount of play up and down in the tone arm. Next set the 12" drop. To adjust set the record shelves for 12" records and have record changer in playing position. Loosen Lock Nut 99-11-6; which is part of 09-119 and adjust Screw 36-465 until the needle drops 5-7/8" from the center of the Record Spindle. Be sure nut 99-11-6 is tightened after adjustment is made.

9. ADJUSTMENT OF TONE ARM 71-195 (Fig. 4)

With records on the shelves, the top of the pickup arm at the highest point in its return should be 3/16" below the bottom of the bottom record on the shelves.

10. TRIP MECHANISM (Fig. 5)

The proper adjustment of the Trip Mechanism is, when the needle is 1-7/8" from the center of the record spindle, the Trip Finger 05-41 (Fig. 5) trips the Starting Lever Release Trip 64215 (Fig. 6).

To adjust tension loosen Bristol Set Screw 99-28-30 in Upper Collar 43185 (Fig. 5). Turn collar counter clockwise to increase friction (if changer does not trip at end of record) and clockwise to decrease friction (if changer trips before the end of the record). There should never be any more friction than is necessary to move Starting Lever Release Trip 64215 (Fig. 6) off the end of the Starting Lever 13-38 (Fig. 6).

Excessive friction will cause a loud click each revolution of the turntable after a part of the record has been played.

11. STARTING PIN 34309 AND STARTING LEVER 13-38 (Fig. 6)

The Starting Pin 34309 (Fig. 6) is normally driven into the Spindle Gear 57-8 (Fig. 6) until the square end is flush and the pointed end projects about 1/8" and should engage the end of the Starting Lever 13-38 to allow the teeth of the Main Cam to mesh with the Spindle Gear without topping. Two adjustments are possible if the teeth do not engage properly, either drive the Starting Pin in further or bend the end of the Starting Lever.

12. MOTOR SPEED

Due to commercial tolerances it is impossible to secure motors which will run at exactly 78.26 R.P.M. Our limits are from 76.59 R.P.M. to 80.00 R.P.M.

In the event it becomes necessary to get exact speed on one of these changers choose a motor pulley that gives a slightly higher speed than required. Using a fine file reduce the diameter of the motor pulley a little at a time until the required speed is secured.

13. The following simple OILING INSTRUCTIONS will result in a minimum of service calls---

Every six months or once each year, two or three drops of oil should be put on the two felt washers in the Spindle Gear Bracket. One washer is located at the bottom of the Spindle Gear, the other is at the top of the bracket and is accessible by removing the Turntable. Two or three drops of oil on the felts in the Motor. One drop of oil on the Pin for the roller of the Tone Arm Lift Lever. A very light application of White Vaseline on the teeth of the Main Cam, also some on the face of this Cam where the Tone Arm Swing Lever rides. A single drop of oil on the 10" and 12" plungers. Care should be exercised to prevent an excess of oil being used on any part.

No further lubrication on the tone arm bearing will be necessary unless a replacement is made. In this case a thin film of vaseline may be used.

Care should be taken to see that no oil gets on the motor pulley, idler pulley or rim of the turntable. No oil should be used on the Friction Trip Assembly.

Use only a good grade of machine oil with a viscosity of SAE 10.

MODELS P-77, P-777

The Capehart P-77 Record Changer is a dual speed changer designed to operate at either 33 1/3 r.p.m. or 78 r.p.m. This changer is capable of playing 12-inch, 10-inch, or 7-inch records automatically at either speed. Furthermore, 12- and 10-inch records can be played intermixed.

The information herein presented is published in an effort to assist the serviceman in properly preparing the instrument for operation and in effecting any replacement or adjustment which he may be called upon to perform on the long play section of the subject model record changer.

Information or adjustments that are not covered herein are the same as those required for the standard version of this changer (Model P-71), and are already covered in the maintenance manual for the Model P-71 record changer, previously published.

SPECIFICATIONS

Voltage Rating	105 to 125 volts at 60 c.p.s.
Speed	78 r.p.m. and 33 1/3 r.p.m.
Type Pickup	Variable Reluctance
Type Needle	Osmium Point

MICROGROOVE 33 1/3 r.p.m.	MAXIMUM RECORD CAPACITY	STANDARD 78 r.p.m.
10	12-inch records	10
12	10-inch records	12
10	12-inch and 10-inch records intermixed	10
12	7-inch records	12

IMPORTANT

WHEN PUTTING TONE ARMS INTO POSITION ON THEIR MOUNTING - DO NOT PRESS IN ON THE RELEASE BUTTONS. THESE BUTTONS SHOULD ONLY BE COMPRESSED WHEN REMOVING THE TONE ARMS!

IF YOU PRESS THE BUTTONS WHEN TONE ARM IS BEING PRESSED INTO POSITION ON ITS MOUNTING YOU ARE LIKELY TO BEND THE BRONZE LOCKING CATCH!

PREPARING FOR OPERATION

CHECKING

After carefully uncrating the instrument, the following checks should be made before attempting to operate the record changer:

1. Remove all packing material and pieces of tape from the changer compartment.
2. Remove the shipping bolts from the floating mounting panel.
3. See that the changer and mounting panel float freely upon the spring mountings.
4. Check the sliding drawer to see that there is no binding in the roller and that the leads to the changer do not interfere with the action of the drawer.
5. Check both the 78 r.p.m. and 33 1/3 r.p.m. tone arm to see that the needle and pickup has not been damaged.
6. Run changer by hand through cycle to make sure action is free from binding.
7. See that the changer is level. If the changer is not level, use the simple method, described herein, to correct the condition.
8. Check the turntable speed at both 78 r.p.m. and 33 1/3 r.p.m. with a stroboscope record.

LEVELING

1. Remove the four acorn palnuts which hold the changer mounting board to the spring mounts.
2. Lift the changer up from the front. It may or may not be necessary to remove the changer; however, if it is, be sure to remove the electrical connections from the underside before removing the changer.
3. Place a small washer, which can be easily made of soft cardboard (such as a blotter), on the spring mounts on the side which is the lowest. One or more of these washers may be used, depending on the amount the changer was off-level.
4. Set the changer back on the spring mounts, and replace the four acorn palnuts. In this operation, be sure that the wires do not become fouled by either the changer or the slide mechanism.

DESCRIPTION OF SPEED CHANGING ACTION

In order to describe the action of the mechanical motor speed changing action, consider the changer in position for playing standard 78 r.p.m. records. The action of changing the speed from 78 r.p.m. to 33 1/3 r.p.m. and placing the correct tone arm on the changer is actually accomplished with one physical movement.

The Long Play Tone Arm is placed on the Tone Arm Support and pressed down until a definite "click" is heard.

In this one operation, the following action takes place:

1. The Tone Arm being pressed down on the Tone Arm Support causes inter-connection of the contacts from the pickup and the phono-output jack, thus the pickup is connected electrically.
2. The Tone Arm, in addition, when pressed down contacts one of the two switching rods. In this case (switching from 78 r.p.m. to 33 1/3 r.p.m.), it will contact the rod closest to the control button. One of these two rods, depending on which speed the changer is operating at, will at all times be protruding through the top of the main frame, near the tone arm support bracket. The rod is pressed down, by the force exerted by the tone arm being pressed, thus actuating a mechanical switch on the underside of the changer. The action of the rods at one end transmit the rotary motion by means of a drive shaft to a switch arm which is connected to the other end of the drive shaft. This switch arm (or lever) in turn acts to raise or lower the idler pulley (in this case, raise) so that it contacts the proper section of the motor drive shaft for the desired turntable speed.

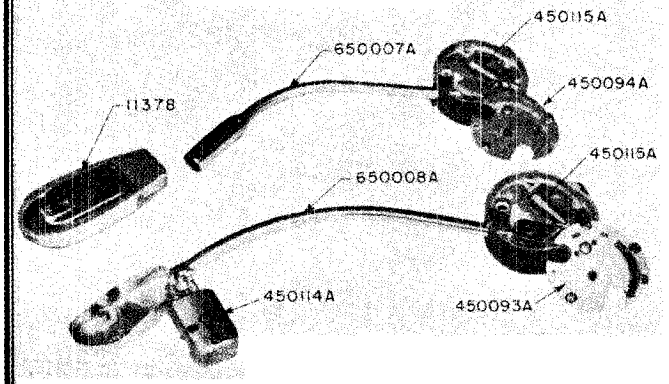

FIGURE 3

ADJUSTMENTS

TONE ARM SET DOWN

When it is necessary to adjust the Tone Arm Set Down so that after the changing cycle is completed, the tone arm will set down properly in the lead-in grooves of the record, the adjustment should be made first for the 7-inch position and at 33 1/3 r.p.m. speed. The procedure to be followed is outlined below:

1. Place the 33 1/3 r.p.m. tone arm in place on the tone arm support.

2. Set the 7-inch Set Down Lever in position against the Tone Arm Interceptor Lever.

3. Make sure that the changer is in the playing position.

4. Loosen the set screw on the Tone Arm Crank (located on the underside of the changer).

It should be stated here that .006 inch spacing is required between the Crank and the main frame (in other words, .006 inch "play" is needed in the tone arm support bracket). It has been found that a small shim, as shown in the sketch following, placed between the crank and the frame will assist in holding this tolerance while the set down adjustment is being made.

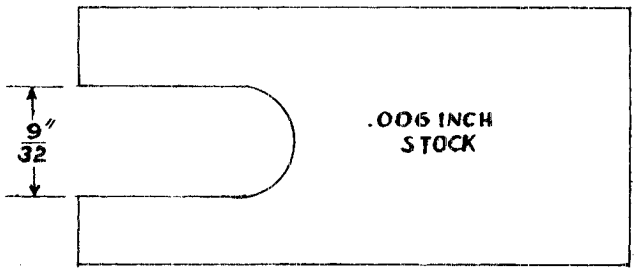

FIGURE 4

5. If the tone arm sets in too far on the record, rotate the tone arm outward slightly while holding the Tone Arm Crank. If the tone arm does not set in far enough, rotate the tone arm inward slightly.

6. Tighten the Tone Arm Crank set screw.

7. Check the set down for a 7-inch record. If the adjustment is not correct, repeat steps 4 and 5.

8. Set the 7-inch Set Down Lever to the 10- and 12-inch record position.

9. Check the tone arm set down for 10-inch and 12-inch records at 33 1/3 r.p.m.

10. If the set down is not correct, adjust by means of the Tone Arm Adjusting Stud (located on the changer base). This adjustment will have no effect on the 7-inch adjustment already made.

11. Set the 78 r.p.m. Tone Arm in place on the Tone Arm Support.

12. Check the set down on 10- and 12-inch records. If the adjustment is not correct, the 78 r.p.m. tone arm may have become slightly bent in handling, and it will be necessary to rebend the arm slightly to provide the proper set down.

THE PUSH RODS

The Push Rods, as shown in Figure 5, should be adjusted between two limits. When the rod is in the "up" position, it should not extend any higher than one-half the thickness of the support bracket plate. This is to insure that the rod does not bind on the Tone Arm Housing. The other limit is that the rod be high enough that when the tone arm housing is pressed down, the switching action will be completed.

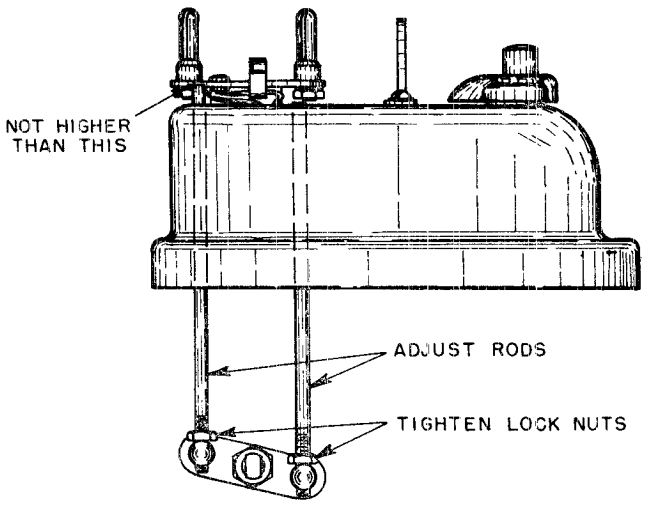

FIGURE 5

©John F. Rider

The rods are adjusted at the factory, and the lock nuts are tightened and secured with Glyptal. If it is necessary to readjust these rods, be sure to tighten the lock nuts and coat them with Glyptal or some similar securing agent.

NEEDLE PRESSURE

This adjustment is accurately made at the factory; therefore, it should not be necessary to readjust the needle pressure under normal operating conditions.

If, for some reason the factory adjustment no longer holds true, the following procedure should be used in readjusting.

The procedure for adjusting the 78 r.p.m. tone arm is the same as for the 33 1/3 r.p.m. tone arm, with exception of the pressure specifications.

There are two adjustments to be made in setting the tone arm for correct needle pressure. These are: The Tone Arm Spring Adjustment (located on the outer side of the tone arm housing), which is adjustable with a small screw driver, and the Tone Arm Sideplay Adjustment (located directly opposite the spring adjustment), which requires a No. 8 Allen Wrench for adjustment. Both adjustments utilize a No. 6 Allen Head Locking Screw to maintain adjustment. The locking screws are located on the underside of the tone arm housing. *See Figure 7.*

Detailed Procedure:

1. Loosen the locking screws on both adjustments.
2. Loosen slightly the Tone Arm Sideplay Adjustment.
3. With a Gram Scale (if adjustment is being made for the 33 1/3 r.p.m. tone arm), test the up and down pressure of the tone arm. *See Figures 8 and 9.* This should be within the limits of 5 to 7 grams. If it is not, adjust the Tone Arm Spring Adjustment screw to provide the correct pressure.

Note: With the 78 r.p.m. Tone Arm, the up and down pressure should be 1⅛ ounce ± ⅛ ounce.

4. Tighten the locking screw for the spring adjustment.
5. Adjust the Tone Arm Sideplay screw to provide approximately 1/32" horizontal play, measured at the pickup.

CAUTION: Do not tighten this screw beyond this limit, as added friction will be exerted which will effect the needle pressure.

6. Tighten the locking screw for the sideplay adjustment.

Lift the micro-groove 33 1/3 r.p.m. tone arm, as shown in Figure 8, approximately ½ inch and make a note of the gram scale reading. Then lower the tone arm approximately ½ inch and again note the reading of the scale, as in Figure 9. The two readings noted are the limits of needle pressure. The actual needle pressure is taken as the average of these two readings. The difference between the two readings is referred to as the Vertical Friction. This should not be more than 2 grams.

WOW AND RUMBLE

The condition known as "wow" is in actuality the result of a variation in speed within each revolution of the turntable. The most common cause of wow in rim drive motors is found to be in the idler drive wheel, either in the bearing or the rubber drive tire. Proper lubrication and elimination of "gumming" will eliminate the bearing as a source of trouble. Some faults of the drive tire which may cause wow are listed as follows:

Oil or grease on the tire—clean with a cloth saturated in carbon tetrachloride.

Dent formed or worn in the tire. This can be caused by pressure of the motor pulley if the changer has remained idle for a long period of time or by the motor pulley if the turntable should become stalled. The remedy in this case is replacement of the idler drive wheel.

Another possible source of wow is in the bearing support washer and its relationship with the turntable hub. This washer is held in place by two screws, the same two screws that are used to fasten the Turntable Hold Down Levers. The washer must be concentric with the turntable hub, otherwise, friction may result. Concentricity of the washer and turntable hub is accurately set at the factory; however, it is possible that the washer will become misaligned when the turntable is removed for servicing purposes. Therefore, it is recommended (to eliminate this source of "wow") when removing or replacing the turntable to loosen only one of the hold down lever screws at a time. In this way the support

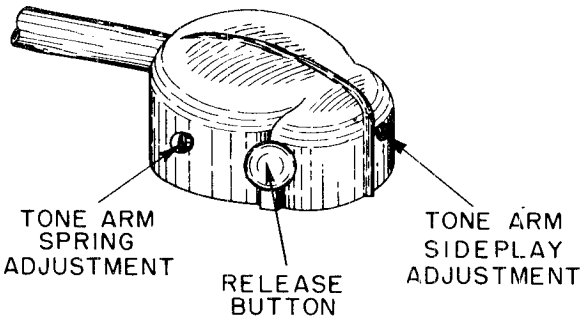

FIGURE 6

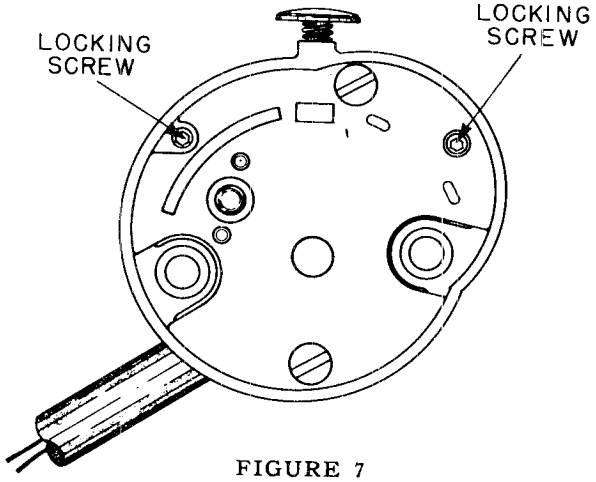

FIGURE 7

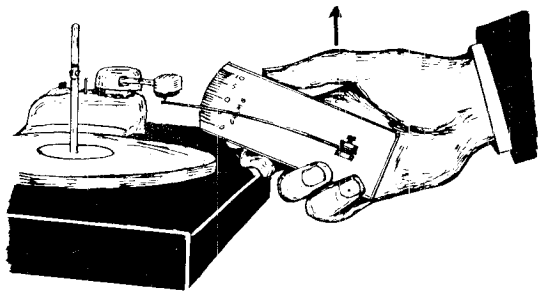

FIGURE 8

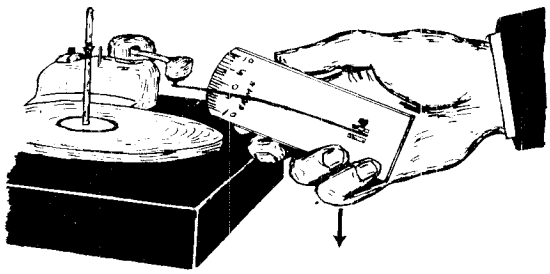

FIGURE 9

©John F. Rider

washer will be at all times held fast by at least one screw. Also it is recommended that care be exercised when replacing the turntable so as not to damage the cork washer and to check the turntable hold down levers to make certain they are not binding on the turntable hub. Both of these points are possible sources of "wow".

"Wow" can also be caused by a warped or dented turntable or by a bent turntable spindle. Care in removing and handling the turntable will tend to eliminate these sources.

"Wow" may also emanate from sources other than the changer itself, for example, the records. Badly warped records will cause a noticeable "wow".

Rumble is a form of amplified noise vibrations resulting from insufficient cushioning of the rotating parts. This results from the fact that a motor will transmit vibration to surroundng objects unless it is adequately "floated". Even then a certain amount of vibration is transmitted to the changer, and it becomes necessary to spring mount the entire changer mounting board. It can be readily seen that when something destroys this cushioning, such as in the condition where the changer drawer is not pushed all the way in and the compartment door touches the drawer pull, or if the power or phono cables to the changer become fouled and are drawn taut, the vibrations will be amplified by the entire cabinet acting as a sounding board.

HORIZONTAL FRICTION

Hold the gram scale in the right hand with the scale divisions facing up.

Press the control button to put the changer in the playing position. As soon as the Tone Arm is set down, turn the instrument off with the On-Off Control on the receiver. This turns the changer off and leaves it in the playing position.

Place a small piece of folded cardboard between the tone arm tube and the tone arm housing to hold the pickup above the turntable.

With the scale pointer bearing against the pickup housing, move the tone arm in toward the spindle (by moving the gram scale) and note the reading of the gram scale in so doing. This reading should not be more than 2 grams.

If the reading is more than 2 grams, it will usually be found that the .006 inch spacing (mentioned in step 4 of Tone Arm Set Down Adjustment) of the tone arm support bracket has not been maintained.

REPLACEMENT OF PICKUP UNITS

The Standard 78 r.p.m. Tone Arm

The *entire pickup housing* on the 78 r.p.m. tone arm is easily removable as the housing plugs into a fixture in the end of the tone arm tube. This facilitates removal and replacement since there are no screws to be removed and solder connections to be made. If it is desired to replace just the pickup cartridge, this can be done by first removing the small spring clip which holds the cartridge in its housing. Next, unsolder the pickup leads from the plug pins in the end of pickup housing. When the new pickup cartridge is placed in the housing, its leads must be soldered to the same plug pins as were those of the old cartridge.

The Micro-Groove 33 1/3 r.p.m. Tone Arm

The pickup housing on this tone arm is not removable. Replacement of the pickup cartridge in the 33 1/3 r.p.m. tone arm is accomplished by removing the two small screws from the underside of the pickup. NO UNSOLDERING is necessary since slip-on connectors are used for connecting the leads to the terminals on the pickup cartridge.

REPLACEMENT OF THE MICROGROOVE NEEDLE

The needle in this 33 1/3 r.p.m. pickup is replaceable. In order to replace the needle, the unit is first removed as described above. An ejecting tool is needed. This can be a straightened paper clip or similar object. Holding the pickup unit in the left hand, with the needle facing down, insert the ejecting tool in the hole in the brass eyelet in the center of the unit, and gently push the needle out. To insert a new needle, place the base pin of the needle in the center hole of the pickup and press down at the *base* of the needle. *Do not* press down on the stylus itself or its shaft. The needle aligns itself properly when pressed down.

CIRCUIT MODIFICATIONS

CAPEHART P-4 INSTRUMENTS

A circuit change is to be incorporated in instruments using the P-4 chassis, when used with the P-77 Long Play Record Changer. The change increases the frequency range of these instruments, and provides increased gain in the Pre-Amplifier. The change follows:

The .01 mfd. condenser (Ref. No. 41), which is connected in series with a 68K resistor from ground to the junction of the 220K and 100K resistors (Ref. Nos. 12 and 5 respectively), in the plate circuit of the 2nd pre-amp stage, has been changed to a .005 mfd., 600V condenser.

CAPEHART P-7 INSTRUMENTS

The Pre-Amplifier Circuit used with P-7 instruments when incorporating the P-77 Long Play Record Changer will be modified in production to provide increased frequency range and audio gain. The change follows:

On the Pre-Amplifier Equalizer Can, the two .01 mfd. condensers (one connected in series with a 33K resistor from the grid of the 2nd pre-amp stage to ground, and the other connected in series with a 68K resistor from the phono output cable to ground), have been changed to .005 mfd., 200V condensers.

MODEL P-777

The Capehart Model P-777 Automatic Record Changer is a three-speed changer, designed to play, automatically, all types of records currently being made. 12-inch, 10-inch or 7-inch records can be played at 78 r.p.m., 45 r.p.m. or 33-1/3 r.p.m. In addition, 12-inch and 10-inch records, designed for the same speed, can be played intermixed.

The information presented herein is intended to supplement the Maintenance Information already issued covering the Model P-77 two-speed record changer. The combination of the two then presents up-to-date preliminary service information on the P-777 record changer. The P-777 is similar to the P-77 in all respects except two; these are the motor assembly and tone arm swing lever assembly. Later production of the P-77 included the revisions to the swing lever assembly; therefore, these changers will differ from the P-777 only in the motor assembly.

A complete parts and price list for the P-777 Record Changer is included herewith.

TONE ARM SET DOWN ADJUSTMENT

(This information applies to P-777 and late production P-77 Changers.)

When it becomes necessary to adjust the Tone Arm Set Down so that, after the changing cycle has been completed, the tone arm will set down properly in the lead-in grooves of the record, the following procedure should be used.

7-INCH RECORDS:

1. Place the Microgroove Tone Arm in position on the tone arm support.
2. Set the 7-inch record Set-Down Lever in position against the Tone Arm Interceptor Lever.
3. Place a 7-inch record (either 33-1/3 r.p.m. or 45 r.p.m.) on the spindle shelf and press the reject button.
4. Observe whether or not the needle lands in the starting groove of the record.
5. If the needle does not land properly, make adjustment to the eccentric stop nut located on the tone arm swing lever spring bracket. This adjustment is accessible from the underside of the changer.
   a. Loosen the small lock nut which secures the eccentric stop.
   b. If the needle lands too far in on the record, rotate the eccentric stop so as to move the swing lever toward the axis of the eccentric stop.
   c. If the needle lands off the edge of the record, rotate the eccentric stop so as to move the swing lever away from the axis of the eccentric stop.
   d. Tighten the lock-nut and secure with Glyptol or a similar fixative.
6. Check the adjustment by observing the set down with a full stack of records.

©John F. Rider

10-INCH AND 12-INCH RECORDS:

1. Check the needle landing for 10-inch records with both tone arms.
2. If needle landing is not correct, adjust by means of the Tone Arm Adjusting Stud (located on the changer base). This adjustment has no affect on the 7-inch record adjustment already made.
3. Check the needle landing for 12-inch records with both tone arms. This, normally, will not require re-adjustment, if the 10-inch adjustment has been properly made.
4. Check the adjustment by observing the set down with a full stack of intermixed 10 and 12-inch records.

POSSIBLE SERVICE PROBLEMS

TONE ARM SET DOWN

1. If the Microgroove Tone Arm cannot be adjusted for proper set down on a 7-inch record, there are two possible causes, as follows:

   a. The tone arm crank has slipped on the tone arm support bracket tube. To be certain of this possibility, place the standard tone arm on the support bracket and observe the needle landing. If the standard tone arm also cannot be adjusted for proper set down, then adjustment should be made by loosening the set screw on the Tone Arm Crank. There is a .006-inch spacing required between the tone arm crank and the main frame; therefore, a .006-inch shim should be used to maintain this spacing while adjustment is being made. After loosening the set screw, hold the crank firmly with one hand and with the other rotate the tone arm in the direction necessary for proper set down. Tighten the set screw on the tone arm crank. A finer adjustment can now be made by the procedure given in Step 5 under "7-inch Records."

   b. The second possible cause is that the Microgroove Tone Arm has become misshapened. This possibility can either be eliminated or proven as in Step 2 by observing the needle landing of the standard tone arm. If the standard tone arm does set down properly and the Microgroove does not, then it is proven that the tone arm crank is in its proper position. Therefore, the Microgroove Tone Arm is not shaped correctly. The remedy is to reshape the Microgroove tone arm by bending the tube slightly until it does set down properly.

2. If the Microgroove Tone Arm can be adjusted properly for 7-inch records, no difficulty will be experienced in adjusting this tone arm for 10-inch and 12-inch records. However, if the standard tone arm cannot be made to set down properly (while the Microgroove arm does set down properly) it can be assumed that the standard tone arm has become misshapened. The remedy in this case is to reshape the standard tone arm to provide proper set down.

BENT TONE ARMS

The possibility of P-777 tone arms (particularly the Microgroove arm) becoming bent in shipment (resulting in improper set down when the instruments are unpacked and checked) is quite unlikely, for the tone arms are carefully packed in a separate carton.

It is possible that there is some slight variation in the relative shapes of the tone arms. It is important that the persons who unpack and check the instruments do not intermix the tone arms from various instruments at the time of unpacking. To have the changer operate with the least amount of prior adjustment, the tone arms which are packed with each particular instrument should be used with that instrument only. The record changer in each instrument is adjusted (at the factory) using the tone arms that are shipped with it.

©John. F. Rider

MODEL P-777

BROKEN TONE ARM LOCK SPRINGS

The main cause of breakage of this lock-on spring results from improper methods of placing and removing the tone arms. The small release button on the tone arm housing is to be used only when removing the tone arm. If this button is depressed when placing the tone arm on the support bracket, the shaft of the button will exert pressure on the top of the lock-on spring, thus bending it as the tone arm is pressed down. It is probable then that when the tone arm is placed on the support again, the spring will not line-up with the hole in the cover plate; therefore, the spring is bent down and broken. Damage to the spring can also result from removal of the tone arm without pressing the release button.

IMPORTANT! Do not press the release button when placing the tone arm on the changer. Do press the release button when removing the tone arm.

MISALIGNED MOTOR BEARINGS

It is possible that the floating bearings in the motor may become misaligned in shipment, resulting in motor noise. This is possible if the changer or instrument is subjected to excessively rough handling in shipment. The bearings can be easily re-aligned by tapping the motor (with the handle of a screwdriver or light tack hammer) while the motor is running.

P-777 PARTS

Ref. No.	Part No.	Description
1	07651	Record Lift Lever Assembly.
2	09353	Reject Button and Plunger Assembly.
3	11378	Pickup & Housing Assembly (78 r.p.m.)
4	11495	Inner Spindle Assembly.
5	13672	Main Cam Assembly
6	13674	Upper Spindle Assembly.
8	13816	Ball Bearing Retainer (for turntable)
9	13825	Tone Switch & Brkt. Assembly (Complete)
10	15195	Compression Lever Assembly.
11	15196	Automatic Stop Switch Assembly.
12	25112	Capacitor, .01 mfd., 200 volt
13	25182	Capacitor, .1 mfd., 200 volt.
14	36857	Hex Nut 1/4-28 (for cam mtg.)
15	36882	H. P. Cotter (1/8" shaft)
16	37155	Spade Bolt (for tone arm lift lever spring)
17	37177-2	Hex Nut 5-40 (for speed change shaft)
18	37203	Spring Washer
19	37332	Special Flat Washer #6 (mtg. reject lever assy.).

PRELIMINARY MAINTENANCE INFORMATION

This information is published for the purpose of aiding the serviceman in properly setting the instrument up for operation and in effecting replacements or adjustments which he may be called upon to perform on those sections of the changer which have to do with its dual speed feature. Information or adjustments which are not covered herein are the same as those required for the standard version of this changer, and are already covered in the maintenance manual for the Capehart Model 41-E Record Changer, previously published.

SPECIFICATIONS

Power Consumption at 117 volts
- Turntable Motor ..... 22 Watts
- Cycling Motor ..... 91 Watts

Voltage Rating .....105 to 125 volts at 60 cycles
Turntable Speed ..... 78 r.p.m. & 33 1/3 r.p.m.
Type Pickup ..... Variable Reluctance
Type Needle ..... Osmium Point

MAXIMUM RECORD CAPACITY

Microgroove 33 1/3 r.p.m.		Standard 78 r.p.m.
16	10 inch or 12 inch records	 16
16	10 inch or 12 inch records (intermixed)	 16
manual	7 inch records	..... manual

SETTING UP FOR OPERATION

After carefully uncrating the instrument, the following checks should be made on the record changer prior to its operation:

1. Remove all packing material and pieces of tape from the changer compartment.
2. Remove the shipping bolts which hold the changer base-plate down during shipment.
3. See that the changer floats freely upon the spring mountings.
4. Check both the 78 r.p.m. and 33 1/3 r.p.m. tone arms to see that the needle and pickup have not been damaged.
5. Check the turntable speed at both 78 r.p.m. and 33 1/3 r.p.m. with a stroboscope record.
6. Refer to the section "41-E2 & 41E Check List".

ADJUSTMENTS

TONE ARM SET DOWN ADJUSTMENT

Check the tone arm height. The pickup needle should barely clear the turntable cover when there is no record on the turntable. The height of the tone arm can be adjusted by means of a small screw, located on the underside of the tone arm housing. The setting of this screw should be secured with Glyptal after the adjustment is made. The adjustment is the same for both the standard and microgroove tone arms and the check should be made with both arms.

©John F. Rider
For additional data: See Farnsworth Model 41-E, Pages RCD.CH. 18-25 through RCD.CH. 18-46

MODEL 41-E2

10-INCH SET DOWN ADJUSTMENT

Allow the changer to deliver a 10" record to the turntable, and let the tone arm move over the record. Just as the changer completes its cycle and the tone arm sets down on the record, stop the changer by turning the "Off-On" switch on the changer to the "Off" position. Lift the pickup end of the tone arm up and move the tone arm away from the spindle; a definite "stop point" will be noticed in so doing. Beyond this "stop point", a spring tension will tend to return the tone arm to the set down position. Hold the tone arm against this "stop point", and turn the 10-inch indexing screw in the direction indicated depending on the direction of the set down adjustment needed. The changer should be allowed to complete at least one more cycle with a 10-inch record to check the adjustment. The adjustment should be checked with both standard and microgroove records using the correct tone arm for each.

12-INCH SET DOWN ADJUSTMENT

The adjustment procedure is the same as that described for the 10-inch adjustment with the exception that a 12-inch record is used, and the 12-inch indexing screw is rotated for adjustment. The adjustment should be checked as before with both standard and microgroove records and tone arms.

ADJUSTMENTS OF THE SPEED SELECTOR PINS

The selector pins or rods, should be adjusted so that there is always at least .015 inch clearance between the top of the pin, when it is in the up position, and the underside of the tone arm housing. This is to ensure that the pin does not bind on the Tone Arm Housing as it moves while playing a record. If both pins are too high when in the up position, the pins can be lowered by placing the paper spacer (Part No. 60674), between the speed switch mounting bracket and the bearing casting. If only one of the pins is too high, this means that the cam shaft has slipped in the cam. The shaft is held in place by two allen head set screws. To adjust, the screws should be loosened and the shaft rotated until the selector pin is at the right height. If the motor speed is set for 78 r.p.m., the selector pin on the right should be in the up position. Tighten the set screws,and switch to the other speed. Check the clearance between the tone arm housing and the other selector pin.

NEEDLE PRESSURE ADJUSTMENT

The needle pressure of both the standard and microgroove tone arms is accurately set at the factory prior to shipment of the instrument; however, if it should become necessary to readjust this setting on either of the two tone arms, the following procedure is offered.

Procedure for adjustment of the standard tone arm is the same as that for the microgroove tone arm, with exception of the pressure specifications.

The adjustment screw is located on the underside of the tone arm housing and is accessible from the rear of the tone arm housing when the tone arm is in place on the changer. A small screw driver is used for adjusting this screw which is arranged so that rotation in a clockwise direction will increase needle pressure and rotation in a counter-clockwise direction will decrease it.

©John F. Rider

NEEDLE PRESSURE ADJUSTMENT - (cont.)

1. Check the tone arm side play. The tone arm should have approx. 1/32" horizontal play, measured at the pickup. If the amount of play does not correspond with this figure, adjustment can be effected by means of the two Allen Head set screws, which form the pivot point for the tone arm tube. The screws are secured with locking nuts, which should be tightened after the side play adjustment is made. This adjustment should be checked for both tone arms.
2. Using a Gram Scale for the Microgroove tone arm, and an Ounce Scale for the standard tone arm, check the up and down pressure of the tone arm in the following manner:
   Lift the tone arm up with the scale approx. 1/2 inch and make a note of the reading. Then lower the tone arm approx. 1/2 inch, and again note the scale readings. The two readings noted are the limits of the needle pressure. The actual needle pressure is taken as the average of these two readings. In the case of the microgroove tone arm, the actual needle pressure should be within the limits of 5 to 7 grams. For the standard tone arm, the specifications are 1 1/8 oz. ± 1/8 oz.
3. If the needle pressure does not come within the specified limits, adjustment should be made on the needle pressure adjusting screws and the pressure re-checked as described in Step 2.

ADJUSTMENT OF THE CONNECTING ROD

The connecting rod should be adjusted so that positive switching is achieved at the Idler Block Assembly. There should be a small amount of play in the rod action. The rod can be shortened or elongated in the following manner:

1. Remove the hair pin cotter which fastens the motor end of the connecting rod to the switching link at the idler block.
2. Loosen the locking nut on the motor end.
3. Rotate the motor end of the connecting rod in or out, depending on whether the rod needs to be shortened or lengthened.
4. Replace the hair pin cotter, and tighten the locking nut.

MODIFICATIONS INCORPORATED IN THE 41-E2 RECORD CHANGER

Certain changes have been made to various parts of this changer, along with the added features of two speed operation. These modifications, listed herein, were incorporated to provide more accurate adjustment to accommodate microgroove records.

TRIP SLIDE ASSEMBLY (PART NO. 09387)

The trip slide assembly has been revised (previous part no. 09176), to provide a more convenient method of trip friction adjustment and to provide a means of adjusting the height of the assembly with respect to the baseplate. A new trip lever bushing is incorporated with a bearing adjusting screw and locking nut. To raise or lower the trip slide assembly, the nut is first loosened and the screw is rotated to provide the correct height. The nut is then tightened to secure the bearing adjustment.

©John F. Rider

MODEL 41-E2

TRIP SLIDE ASSEMBLY (PART NO. 09387) Cont.

Adjustment of the trip friction is provided by rotating the small adjusting screw (Part No. 36278), located in the center of the flat metal trip friction spring (Part No. 51166). Rotating the adjusting screw in a clockwise direction will cause the spring to exert more pressure on the trip pivot pin (Part No. 55465), thus increasing the friction between the trip slide assembly and the automatic stop trip lever.

TURNTABLE HEIGHT ADJUSTMENT

The 41E-2 incorporates an adjustable turntable bearing which enables the height of the turntable to be varied with respect to the baseplate. The new parts added to the changer for this purpose are:

55462 - TURNTABLE ADJUSTING PLATE
37690 - ADJUSTING SCREW
37691 - ADJUSTING NUT

To raise the turntable, the adjusting screw is rotated clockwise, after first loosening the adjusting or locking nut. To lower the turntable, the screw is rotated in the reverse direction. The correct height for the turntable is the same height(± 1/64"), as the milled surface on which is mounted the tone arm support housing.

MAIN CAM SHAFT (PART NO. 650013A)

The main cam shaft has been made in two sections, and a coupling has been provided between the reduction gear box section and the main cam section. The main cam section of the shaft can thus be de-coupled from the motor and reduction gears. The main cam shaft section is fastened in the coupling by means of a small set screw. The set screw should always be tightened on the flat side of the main cam shaft only. This prevents the shaft from slipping within the coupling.

This shaft de-coupling arrangement enables the serviceman to run the changer through cycle by hand, thus facilitating the checking and adjusting of the cycling mechanism.

41E-2 & 41E CHECK LIST

It is important to use a step by step method when checking either the Capehart Model 41-E2 or Model 41E Record Changers. If this method is not followed, it is possible to make one adjustment against the other, which will result in improper operation. This could be the cause for erratic conditions. Therefore, the following list should always be followed in order, referring to the Maintenance Manual on the 41E Record Changer for adjustments, which are not included herein.

TURNTABLE

1. (a). Check height of turntable with respect to the base plate. This is accomplished by placing a straight edge ruler long enough to reach the distance, taking in the diameter of the turntable, to a point along side the tone arm collar assembly. Observation will reveal the tone arm collar is mounted on a milled surface.

©John F. Rider

41E-2 & 41E CHECK LIST (Cont.)

TURNTABLE

1. (a) Cont.)
This milled surface and the ones under the hook post and buckhorn are all milled at the same time and are the same height above the base plate. We call these points bosses and are the points at which we start our measurements. The top of the turntable should be level with this boss. A tolerance of 1/64" high or low would be allowable. For 41-E2, refer to "TURNTABLE HEIGHT ADJUSTMENT".
(b). To remove turntable, remove set screw in turntable shaft housing.

RECORD TRAY

2.(a).Check centering or record lowering tray with respect to turntable. This can be accomplished by placing the record selector lever in the "one side" position, run the record changer through a cycle to a point where the record lowering tray pauses for the second time. Stop the changer by the "on-off" switch at this point. Note the distance between the lowering tray and turntable. This distance must be equal on either side of turntable. Also note the level of the tray at this time. The front points of the 10" felt in the record tray should be level with the turntable cover.
(b). Check for binding between record tray gears. To do this, it will be necessary to disengage the lever connecting the shaft with the quadrant section of the record tray gear, from the record tray slide arm assembly by removing the eccentric shoulder screw. Move tray up and down by hand.
(c). Check 10" rubber bumpers.
(d). Check 10" rubber guard for smooth operation.
(e). Clean and remove rough spots on polished edges and surfaces.

BUCKHORN

3.(a). Check distance from the center of magazine pivot pin mounted in the buckhorn section of the magazine support, to the milled section of the base plate, on which is mounted the record separator hook post. This distance should be 7 9/16", plus or minus 1/16". Also check the distance between buckhorn pivot arms, which should be 13 7/16".

MAGAZINE

4.(a). Check distance between magazine pivot arms. This should be 13 1/4".
(b). Check position of the upper record support on changers incorporating the single knife. The lower points of this support should be even and centered. Changers incorporating the double knife; check the roller and position of assembly.
(c). Check magazine position with respect to lowering tray. Channel grooves will be noted at the base end of the record lowering tray. These were cut for the purpose of allowing the two lowest points of the record magazine to pass when traveling through the change cycle to deliver a record; therefore, it is necessary that these two points are centered within these channels. It will also be noted there are two holes at the back end of these tray channels to allow the level points of the record support bracket to protrude through the record lowering tray. These points should be adjusted to an equal distance with respect to the outside edge of the holes.
(d). Clean and remove rough spots on all polished surfaces and edges.
(e). Check & oil rollers -- Rollers should roll quietly.
(f). Check record reverse arm and guide assembly. Should be parrallel and centered with a 12" record in magazine when changer is stopped at that portion of the cycle where the reverse arm has come in contact with the magazine and rubber bumper.

© John F. Rider

MODEL 41-E2

(g). Check reverse arm fork as it engages the crank pin assembly. Should be centered and engaged so that the jaws extend around the crank pin about 1/8". At this point, check the return position of the magazine with the stop screw located at center and back of the buckhorn support. This would be the adjustment that would determine the clearance of the crank pin. See the 41E manual for adjustments of the travel of the crank pin assembly.

(h). Check linkage--magazine should return against stop snugly.

(i). Check record selector knife.

(j). Check record selector knife as it engages the record separator hook.

(k). Check felts on back side of lower record support casting. If loose, can be the cause of late delivery of records which would cause chipping due to sharp contact with record lowering tray tongue.

(l). Check record "U" Guide assembly.

TONE ARM

5. (a). Check Tone Arm Height. Refer to"Tone Arm Set Down Adjustment", or the 41E

(b). Check the distance of Travel of the tone arm in toward the turntable spindle on a 12" record.

(c). Check pickup for tracking in record grooves.

(d). Check 10" and 12" landing position.

(e). Check feed-in tension spring.

TRIP SLIDE ASSEMBLY

6. (a). Height above base plate should be high enough at the rubber roller end to contact the trip clip on under side of turntable. Refer to "Trip Slide Assembly", or to the 41E Manual.

(b). Slide action should work freely and oil should never be used.

(c). Setting of stop should be set so that it is impossible for the trip clip on turntable to lock with trip slide assembly.

(d). Check rubber roller.

PLAY CONTROL

7. (a). Check play control.

BELOW CHASSIS

GEAR REDUCTION BOX

8. (a). Check adjustment of second reduction gear train. Should be no slack or bobbing of this assembly. This can be determined by under noise of gears.

(b). Check to see that oil has been put in gear box. A maximum of 1 oz. of heavy oil should be put in gear box. The gear should dip into this oil level.

(c). Check for oil leaks.
Check reverse arm mechanism.

(d). Check position of reverse segment with respect to stops and locking assembly.

© John F. Rider

41E-2 & 41E CHECK LIST (Cont.)

TONE ARM MECHANISM

9. (a). Check horizontal and vertical position of tone arm crank assembly also relation to tone arm swing lever.

(b). Check position of tone arm brake spring collar.

(c). Check action of tone arm stop bracket assembly.

(d). Check position of tone arm, lift and swing cam.

(d). Check tone arm trip pin.

MERCURY SWITCH OPERATION

10. (a). Check reset lever and timing with main cam.

(b). Check contact of reset lever & mercury dog.

(c). Check clearance between top of mercury dog and lever extending down through base plate from trip slide arm assembly.

MAIN CAM SHAFT (See "Main Cam Shaft"

11. (a). Check for underplay with record magazine tilted up.

(b). Check action of slide arms of main cam.

(c). Check record selector lever action.

(d). Check cam track switches.

(e). Check lubrication.

ADDITIONAL CHECK LIST FOR 41-E2 ONLY

1. Check Idler Wheel.
2. Check Idler Mounting Assembly .....Part No. 14108.
3. Check connection link Assembly ..... " " 09382.
   Adjust link to divide travel of 33 1/3 r.p.m. to 78 r.p.m.
4. Check Support Bracket, cam & hub assembly..... " " 09385.
   Adjust for equal throw of shift pins under tone arm key.
5. Check vertical tone arm pressure
   Adjust screw in cover plate assembly ..... " " 09381.
6. Check for clearance between tone arm hinge bracket No. 57271, and tone arm housing.
7. Check clearance on friction cork above tone arm crank - should be .005.
8. Check for dirt in tone arm bearing.
9. Check clearance of shift pins against tone arm hinge bracket on 33 1/3 and 78 r.p.m. arms.
10. Check needle--should protrude beyond guard 1/32".
11. Check needle height --
    Should be adjusted to clear turntable with no record.
12. Check trip slide assembly --not to exceed 7 grams.
13. Check motor fan blades--should run true.

MODEL 41-E2

PARTS LIST

Following is a list of new parts and parts that have been revised. Parts that are not listed here are the same as those used in the standard version of this changer, the 41E.

44067 ..... Two Speed Turntable Motor
15246 ..... New Turntable
14100 ..... Tone Arm Assembly (33 1/3 r.p.m.)
14101 ..... Tone Arm Assembly (78 r.p.m.)
11378 ..... Pickup & Housing Assembly (78 r.p.m.)
05160 ..... Pickup & Lead Assembly (33 1/3 r.p.m.)
450148A..... Gear Shaft and Hub Assy.
2003-161 003 #6/32 x 7/16" F.H.M.S.
2085-215 071 #6/32 x 5/8" O.H.M.S.
14108 ..... Idler Mtg. Assy.
55456 ..... Selector Pin
37688 ..... "E" Washer
64492 ..... Selector Spring
60674 ..... Paper Spacer
36926 ..... Washer
62199 ..... Rubber Tone Arm Rest
2003-109-003 #4/40 x 3/8 F.H.M.S.
04135 ..... Tone Arm Support Housing
07721 ..... Speed Switch Support Bracket Assy.
09382 ..... Connecting Rod Ass'y.
05163 ..... Connecting Rod Motor End Assy.
55459 ..... Connecting Rod (Cam End)
55461 ..... Connecting Rod Adjusting Sleeve
54329 ..... Contact Washer
37689 ..... Washer
80528 ..... 3 pr. Plug.
15245 ..... Speed Switch Cam & Hug Assy.
57274 ..... Tone Arm End
37683 051 Pivot Screw #8/32 x 3/8"
2016-005 003 #8/32 Hex Nut
2006-053 051 3/48 x 3/16 F.H.M.S.
04134 ..... Tone Arm Hinge Bracket Assy.
05159 ..... Pickup Housing & Tone Arm Tube Assy.
71244 ..... Microgroove (33 1/3 r.p.m.) Pickup
77195 ..... Resistor (Ins. Car.) 3.3 K 1/2 W

55153..... Pickup Contact Assy.
450150A.... Spacer
650013A.... Main Cam Shaft
55449 ..... Tone Arm Locking Pin
64490 ..... Locking Pin Spring
07700 ..... Mercury Switch Mtg. Brkt. Assy.
09387 ..... Trip Slide Assembly
09381 ..... Cover Plate Assy.
51152 ..... Cover Plate
55450 ..... Spring Adj . Screw
37684 ..... Spring Adjust. Nut
37421 ..... "E" Washer
64489 ..... Adjustment Spring
04136 ..... Tone Arm Hinge Bracket, finish Assy.
2215-201-003 #4 40 x 3/16" Slotted Hex H.M.S.C.

55462... Turntable Adjusting Plate
37690...End Thrust Screw (Turntable
37691.. " " " "Adjustment
55457.. Speed Switch Cam Shaft
57273.. Speed Switch Crank
14107.. Contact "Lead & Plate Assy". (Tone Arm Support)
71238.. Pickup (78 r.p.m.)
59472.. Pickup Housing (78 r.p.m.)
58863.. Retainer Spring
51166.. Trip Friction Spring
55465.. Trip Pivot Pin
55466.. Trip Bearing Adjusting Screw
37692.. Trip Bearing Adjusting Nut
2006-113-003 #4-40 x 1/2" F.H.M.S.

GENERAL

This record changer is designed for a power supply of 105–125 volts, 60 cycles. It operates at two speeds of 78 rpm and 33⅓ rpm and is equipped with one pickup arm head for standard groove records (tan) and one pickup arm head for microgroove records (red). The changer provides manual or automatic playing and takes a one-inch stack of 10- or 12-inch records. When the last record is played, the pickup arm returns to its starting position. The motor has to be switched off manually by the Speed Control Knob.

MANUAL OPERATION

1. Turn the Record Selector Post (1, Figure 1) to the 12-inch position in the direction indicated by the arrow on the post, in order to give more clearance in loading and unloading records. Turn the Selector Switch (23, Figure 1) to Manual.
2. Place a record on the turntable. It may facilitate this operation if the record is slanted, as it is slipped over the spindle with the edge of the record held below the level of the record selector post shelf. Records may be removed in the same manner.
3. Check the pickup cartridge to make certain it is the correct type for use with the record being played. This is important as use of the wrong cartridge will cause excessive record surface wear or even immediate damage to the record.
4. Move the speed control (9, Figure 1) from the OFF position to the 33⅓ or 78 position as required by the type of record. Hereby, the motor switch connects the motor to the power supply, and the disk starts to rotate at the proper speed.
5. Push down the R button (24, Figure 1) in the front right-hand corner of the record changer and gently place the stylus of the pickup arm on the outer groove of the record. Lift the arm just sufficiently to clear the record. If it is raised too high, it may catch, restricting its travel.

AUTOMATIC OPERATION

1. Turn the Record Selector Post (1, Figure 1) to ten or twelve, according to the size of the records used, and turn the Selector Switch (23, Figure 1) to Automatic.
2. With the Record Stabilizer Weight turned back, place a stack of records (one-inch maximum height) on the spindle so that the bottom record rests on the step of the spindle and on the shelf of the Record Selector Post. Turn the record stabilizer weight forward to rest on the edge of the top record.
3. Check the pickup head assembly to make certain it is the correct type for use with the records being played. Move the Speed Control (9, Figure 1) to the 33⅓ or 78 position, as required by the type of records.
4. Depress the R button (24, Figure 1) to reject any record.
5. To stop the phonograph before all records have been played, simply turn the Speed Control (9, Figure 1) to the middle OFF position. The pickup arm may be moved without damaging the mechanism. However, after the last record has been played, the pickup arm is automatically locked in position and should not be touched until it has come to the rest post (25, Figure 1).
6. After playing, entire stack may be removed by the following procedure: Move the Record Stabilizer Weight (3, Figure 1) back out of position, place fingers of both hands under opposite edges of bottom record and lift straight up following the contours of the spindle.

OPERATING PRECAUTIONS

The microgroove records are easily scratched so that it is recommended to use utmost care in handling the pickup arm while setting it on the record.

Be sure that the right cartridge is used with the various types of records (tan for standard records, red for microgroove records).

DO NOT use warped, home-recorded, or odd-size records for automatic operation, but use manual operation.

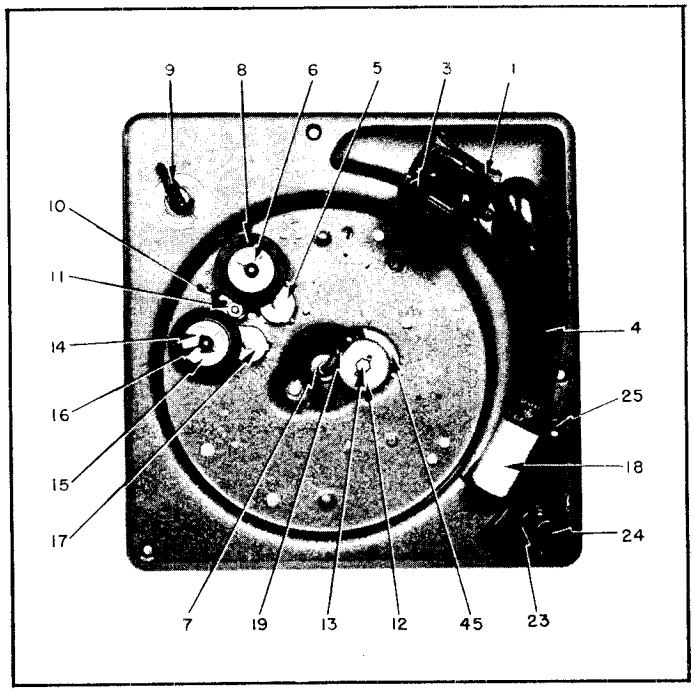

Fig. 1. Top View of Record Changer

© John F. Rider

MODEL P8

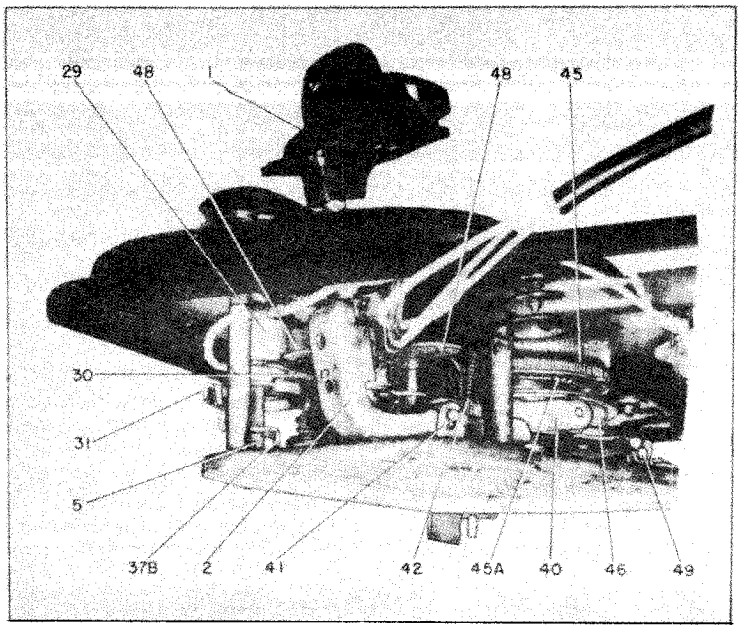

Fig. 2. Underside View of Chassis (Motor End)

DO NOT use force to start or stop the motor or any part of the record changing mechanism.
store the records on the record post or the turntable, as they may warp, especially at higher temperature.
allow any oil or grease on the drive wheel or any rubber part of the changer.
connect the motor to direct-current or to different alternating current supply.

LUBRICATION

Apply light machine oil on:

1. Motor bearings, saturate top and bottom felts.
2. Pickup arm shaft (5, Figure 3). Apply one drop each to bottom bearing point, bracket hole, and hole through main base plate.
3. Ball bearing assembly (7, Figure 1).
4. Idler wheels' felt (6 and 16, Figure 1).

Apply Lubriplate No. 110 with small brush to:

1. Idler wheel linkage (5 and 17, Figure 1).
2. Turntable shaft stud.
3. Pickup arm hinge pins.
4. Knife edge of raising lever.
5. Main cam bearing. For lubrication, the subplate assembly has to be removed.

Apply STA-PUT with a small brush:

1. Teeth of main actuating gear (45, Figure 4).
2. Track of main cam gear (46, Figure 4).
3. Teeth of large and small idler gear (12, Figure 1).
4. Raising lever bracket bearing surfaces (38, Figure 4).

PICKUP

This record changer is equipped with two head assemblies containing two different cartridges—one for standard groove, and one for microgroove records. The pickup and head assembly identified by the red color has to be used for microgroove Long Playing records (33⅓ rpm). The other pickup and head assembly for use with standard groove records is identified by tan color. The pickup head required for the type of record to be played is fitted into its socket at the end of the pickup arm. The cartridge is designed according to the variable reluctance principle which will give superior results from the standpoint of high fidelity, low surface noise, and negligible record wear. The pickup is not interchangeable with a crystal pickup as the ratio of output voltage levels of the two types is in the order of 70 to 1, due to the very low output voltage of the variable reluctance cartridge.

The stylus supplied is of a semi-permanent type. Dust and foreign matter should be removed from the stylus assembly at regular intervals with a soft brush. Make sure the stylus arm is centered between the pole pieces.

CYCLE OF OPERATION

STARTING THE CHANGE CYCLE—The motor is started by movement of the Speed Control Knob (9, Figure 1). The rotating motor bushing (11, Figure 1) drives the Idler Wheel according to the speed selected by the Speed Knob. The bushing has two sections of different diameter which are engaged with the flywheel (8 or 15, Figure 1) corresponding to the position of the Speed Control. This control operates a lever arrangement (5 and 17, Figure 7) which presses the corresponding flywheel against the motor bushing and the rim of the disk. The rotating motor drives the disk by means of the flywheel friction drive. By means of the Gear Wheel on this disk the large Idler Gear (12, Figure 1) is engaged transferring the movement to the smaller Idler Gear which drives the Main Cam Actuating Gear (45, Figure 1). The power of the motor (33, Figure 3) is transferred to the disk by means of friction which is produced by the pressure of the springs (10 and 21, Figure 7). This pressure is applied to the Idler Wheel by means of the Levers (17 and 5, Figure 1). The gear wheel of the Main Cam Actuating Gear (45, Figure 1, or 45, Figure 4) is rotating all the time the motor is switched on and only when this is coupled to the Main Cam Gear (46, Figure 4) the change cycle starts causing the Pickup Arm and the Record Selector Lever to perform the respective movements. This coupling is accomplished by means of a Pawl (46A, Figure 4 and Figure 5) mounted on the Bottom Cam Gear (46, Figure 4, and Figure 5) which presses against the bottom teeth of the Main Cam Actuating Gear (45A, Figure 2). The weight of the lever causes the Pawl (46A, Figure 5) to engage the Main Cam Actuating Gear. Only when this weight is lifted the Pawl moves out of the tooth and disengages the lower Cam Gear (46, Figure 4). This movement of the Pawl is actuated by the left end of the Trip Lever (47, Figure 4). Automatic cycling may be started by pressing on the R button. The Automatic Trip Arm (34, Figure 3) trips the Velocity Trip and Roller Assembly (47, Figure 4). This releases the Actuating Pawl (46A, Figure 5), allowing it to engage the Main Cam Actuating Gear (45, Figure 4) and couples it to the Main Cam Gear (46, Figure 4), driving the mechanism through the change cycle.

CYCLING—A single revolution of the main cam results in a complete automatic cycling of the changer. This includes selection of a record from the stack, lifting the tone arm from its rest position and setting the needle in the first groove of the record.

RECORD FEED—The outer and lower surface of the Main Cam (46, Figure 4) controls the record selection. The wheel on the rocker arm lever follows the variation of the path on the Main Cam and causes by its swinging movement the Selector Arm (2, Figure 4) to push forward and drop a record.

PICKUP ARM MOVEMENT—The shaft at the end of the lever (38, Figure 3) moves along a specially designed path in the lower surface of the automatic trip cam and guides the disk hub and with it the pickup arm. The path is so designed that it swings and

© John F. Rider

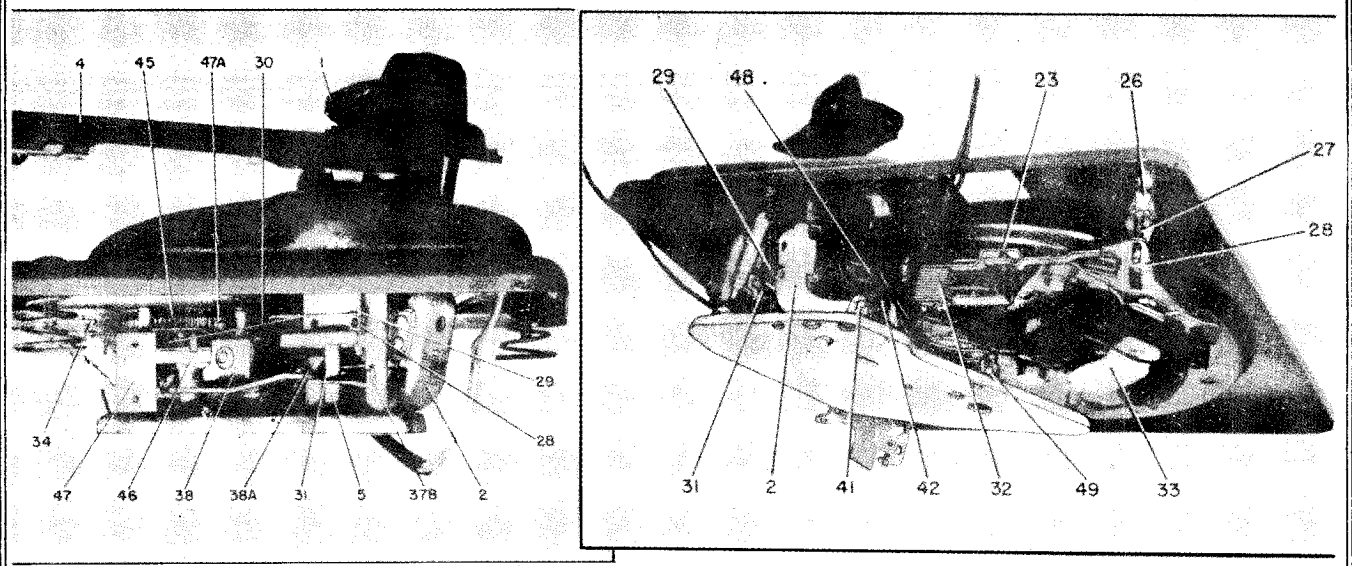

Fig. 3. Underside View of Chassis

lifts the pickup as required. If at the last groove of the record the pickup arm advances 1/8 inch—1/2 inch in revolution, the lever on the pickup arm which is forced to move with it by the weight clutch (29, Figure 3) moves the trip lever which trips the pawl between the turning cam and the automatic trip cam, causing the arm to swing back again.

SERVICE ADJUSTMENTS

A. AUTOMATIC TRIP—When the movement of the Pickup Arm towards the spindle is greater than 1/8 inch in 1/2 revolution of the turntable, the Automatic Trip Arm (30, Figure 3) trips the Velocity Trip and Roller Assembly (47, Figure 4). This releases the Actuating Pawl on the Main Cam Assembly, coupling it with the Main Cam Actuating Gear and, therefore, driving the mechanism through the change cycle. The Automatic Trip Arm follows the movement of the pickup arm through the friction clutch (29, Figure 2). This clutch must be kept free of oil and grease.

B. AUTOMATIC LOCK LEVER—This lever (48, Figure 2) should move up and down freely with no record on spindle. Hook end of the automatic shut-off lock lever (48C, Figure 4) should catch Pickup Arm Raising Disk (31, Figure 3) at the beginning of the cycle to prevent travel of the arm and to cause it to drop on the rest post. The weight of the records moves the spindle through the hole and presses the Spring of the Automatic Lock Lever (48A, Figure 4), thereby lifting this lever. With no records on the spindle, the hook (48C, Figure 4) should clear the Pickup Arm Disk by 1/32 inch with the mechanism at rest. This distance can be adjusted by bending the lip (D, Figure 6) underneath the lever.

C. VELOCITY TRIP—At the completion of the change cycle, the Actuating Pawl (46A, Figure 5) is engaged by the hook end of the Velocity Trip and Roller Assembly (47, Figure 4) which has been returned to its normal position by the reset points on the Main Cam Drive Gear (45B, Figure 4). This hook should be adjusted for about 1/32 inch and 1/64 inch clearance from the bottom of the Main Cam Actuating Gear (45, Figure 5). Greater clearance may permit the Pawl to bounce past the hook and re-engage, causing it to go into another cycle.

D. INDEXING—The eccentric screw, accessible through the top of the Pickup Arm should take care of any normal adjustment. Turn the screw clockwise to index the stylus in towards the spindle and counterclockwise to index the stylus out away from the spindle.

Should further adjustment be necessary, proceed as follows: Operate the mechanism by revolving the turntable manually until the stylus drops to within 1/8 inch of a 10-inch record on the turntable. Check that the notch in the Pickup Arm Raising Disk engages the Pickup Arm Raising Lever (38A, Figure 4). With a No. 8 Bristol wrench in each of the setscrews (point C, Figure 6), alternately loosen one and tighten the other until the stylus rests above the records lead-in groove at the desired point. After completion of this adjustment, see that both setscrews are tightened.

E. PICKUP ARM LIFT—The stylus should approach the top record of a full stack on the turntable with approximately 1/8-inch clearance. Adjust by bending the pickup arm raising lever (38A, Figure 3) at point B (Figure 6). Do not attempt to move Pickup Arm Raising Disk up or down because it would influence the correct working of the Automatic Lock Lever (48, Figure 2). The pickup arm is prevented from falling off the Rest Post (25, Figure 1) by the upturned end of the pickup arm pivot shaft bracket (37B, Figure 4). The clearance between the tongue of the pickup arm raising disk (31, Figure 2) and the bottom of the groove formed by the bracket and the Base Plate Post should be 1/64 inch. In order to obtain proper positioning, bend the bracket up or down. If the bracket is too high, the disk tongue will rub on it when the needle approaches the edge of a 12-inch record. This will have the undesired effect of causing "glide in" on the first grooves of the record.

F. RECORD DROP ADJUSTMENT—As the change cycle is started, the first motion of the inclined outer bottom surface of the Main Cam (46, Figure 4) causes the Record Selector Post (2, Figure 4) to move towards the Spindle about 3/32 inch. This position is maintained until the Pickup Arm has made its full outward lateral excursion, at which time the Record Selector Post again moves towards the spindle, causing the bottom record to drop into playing position. The distance between the Selector Post and the Spindle should be such that with a standard record (9 7/8 inches for 10-inch and 11 7/8 inches for 12-inch) the distance between the edge of the record and the front of the selector arm groove is approximately 1/32 inch. If this distance is too great, records of minimum diameter will not be pushed off the Spindle Step and if it is too short records will be pushed against the Spindle with undue force, causing center hole damage. If the Record Selector Post (1, Figure 1) has been bent back away from the Record Spindle, a standard record might rest on the spindle step with its edge just over the edge of the Record Selector Post shelf. Then at the beginning of the change cycle, the record is pushed off the spindle by the initial movement of the Record Selector Post, so that the record drops on the Pickup Arm. The push-off distance can be easily adjusted by the Screw on the rocker arm (40, Figure 5) which is accessible through the top of the main plate (remove disk!). Turning the screw clockwise diminishes the distance.

G. TO REMOVE THE PICKUP ARM—While holding the Pickup Arm firmly, bend in one end of the blue steel pickup arm hinge brackets while lifting up on the arm. This will release the pickup arm hinge pin. Repeat on the other pickup arm bracket, so that the released arm may be turned over and laid on the turntable.

H. TO REMOVE THE SUB-PLATE ASSEMBLY—In case it is necessary to replace any of the major parts of the sub-plate assembly, this can be removed by the following procedure:

1. Remove the Spindle which is held in by a clip under the sub-plate.
2. Remove the Turntable and the Pickup Arm.
3. Unhook the Rocker Arm Return Spring (42, Figure 2), and remove the Rocker Arm Pivot Pin (41, Figure 2).
4. Remove the holding screws.

TROUBLE SHOOTING CHART

SYMPTOMS	REMEDIES OR CAUSES
TRIPPING	
1. Changer Fails to Trip.	1. Check: (a) Adjustment A. (b) Velocity Trip and Roller Assembly binding (47, Figure 4). (c) Actuating Pawl (46A, Figure 5) stuck. (d) Automatic Trip Lever (30, Figure 3) bent and not hitting the Velocity Trip and Roller Assembly (47, Figure 3). (e) Velocity Trip and Roller Assembly rubbing on the underside of the Main Cam Actuating Gear. (f) Manual trip lever binding. (g) No velocity lead-in groove in center of record. (h) Worn record or needle. (i) Foreign matter in record groove.
2. Changer Trips Continuously.	2. Check: (a) Velocity and Roller Assembly (47, Figure 3) rubbing on Main Cam Actuating Gear (46, Figure 3). (b) Manual Trip Lever binding. (c) Hook end of Velocity Trip and Roller Assembly (47, Figure 3) bent and not engaging Pawl (46A, Figure 5). To be adjusted for about $\frac{1}{64}$ inch clearance from the bottom of the Main Cam Drive Gear. (d) Bakelite Disengage Roller broken on Velocity Trip and Roller Assembly (47A, Figure 4).
3. Changer continues to play last record and does not switch off.	3. Check: (a) Floating Spindle (free up and down movement). (b) Automatic Shut-off Lock Lever (48, Figure 4). Hook end of this arm (48C, Figure 4) should catch the Pickup Arm Rising Disk (31, Figure 3) at the beginning of the cycle to prevent travel of the arm and cause it to drop on the Rest button. This hook should clear the Pickup Arm Rising Disk (31, Figure 3) by $\frac{1}{32}$ inch with the mechanism at rest. Bend lip (D, Figure 6) if necessary to make this adjustment.
4. Manual Trip Fails.	4. (a) Manual Trip Lever Hair Spring bent or broken. (b) Velocity Trip and Roller Assembly binding (47, Figure 4). (c) Actuating Pawl stuck (46A, Figure 5).
GLIDE IN ON 12" RECORDS	Check tension of compression spring (44, Figure 4).
RECORD DROP.	Check adjustment E.
MORE THAN ONE RECORD IS DROPPED.	Check adjustment F.
INDEXING OF ARM.	Check latch of record spindle.
SELECTOR POST ANGLE INCORRECT.	Check adjustment D.
PICKUP ARM MOVEMENT.	Check adjustment F.
NEEDLE SKIPS GROOVES.	Check adjustment E. Check: (a) Record changer not level. (b) Pickup Arm binding. Check vertical and lateral friction. (c) Badly worn record or needle.
PICKUP ARM DROPS OFF THE REST POST.	Check adjustment E.
MOTOR	
1. Motor Does Not Switch Off.	1. (a) Defective Switch mechanism. (b) Defective Switch (do not attempt to repair).
2. Changer is Sluggish or Motor Overheats.	2. (a) Check lubrication—oil, old or gummy. (b) Incorrect line voltage. (c) Defective motor winding.

© John F. Rider

MODEL P10

GENERAL

This single post and single tone arm record changer is designed for dual speed operation (33⅓ or 78 revolutions per minute) from a power source of 110 volts at 60 cycles. It will play the Standard Groove or Microgroove type records for these speeds, a single record at a time or a series of twelve 10-inch or ten 12-inch records or ten records of the two sizes intermixed. *Note: Never stack together the Standard and Microgroove records intermixed for automatic operation* as playing of each type record requires special attention to the pick-up discussed below.

The tone arm is designed to use either of two pick-up heads which are interchanged by a plug arrangement at the end of the tone arm. The pick-up heads are finished in color for identification. The TAN head is used to play Standard Groove records while the RED colored head is for Microgroove reproduction. *Always use the TAN head with Standard Groove records and the RED head with Microgroove records.* Use of the wrong head is certain to result in damage to records and pick-up stylus.

MANUAL OPERATION

1. Turn the Selector switch (23) to the "M" position.

2. With the Record Stabilizer Weight (1) turned back and the spindle in position, place the record on the spindle. The record is then moved slightly to slip over the step in the spindle and lowered to the turntable.

3. Attach to the pick-up arm the correct pick-up head (19) required for the particular type record to be played.

4. Set the Turntable Speed Control (32) to correspond to the speed required by the type of record.

5. Depress the "ON" button (24).

6. Gently place the stylus of the pick-up on the outer groove of record.

7. Upon the end of record playing or to stop recording during manual play, lift the pick-up arm from record and return it to "rest" position. A slight pressure upon the pick-up arm at the rest position will depress the "OFF" button (25) to stop the mechanism.

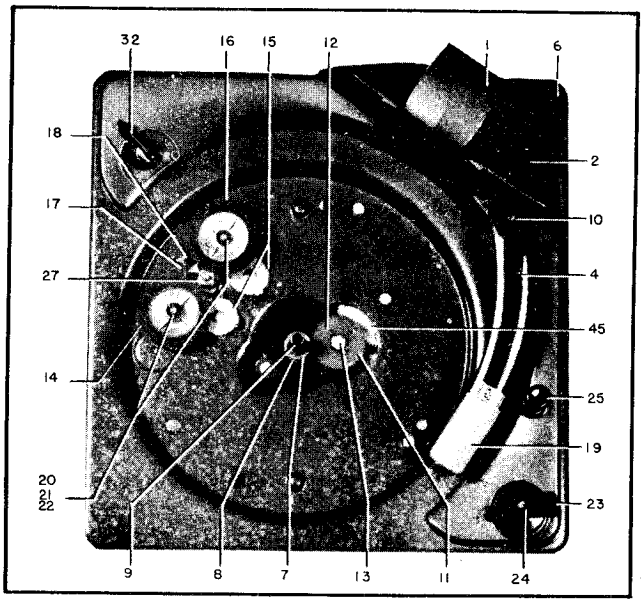

Fig. 1. Top View of Record Changer

8. When through operating the record changer, set the Speed control to the "OFF" position.

AUTOMATIC OPERATION

1. Turn the Selector switch (23) to "A" position.

2. Turn back the Record Stabilizer Weight (1). Place upon the record spindle not more than twelve of the 10-inch records, ten of the 12-inch, or ten records intermixed. The bottom record will rest on the step of the spindle and the record selector shelf (62). Set the Stabilizer Weight (1) forward so that it rests on the edge of the top record.

3. Attach to the pick-up arm the correct pick-up head (19) required for the type records to be played.

4. Set the Speed Control (32) to the setting as required by the type of records used.

5. Depress the "ON" button (24). The record changer will operate automatically without further attention and when the last record has been played, the pickup arm will automatically come to rest upon the "OFF" button (25) turning off the changer mechanism. The automatic shut-off feature applies to standard groove record operation only. The TAN pick-up head, balanced to give a greater needle pressure than required for the RED head as applied to microgroove records, has sufficient weight to trip the "OFF" button mechanism.

6. If it is desired to reject a record selection being played, push down the ON button. The record changer will then immediately shift to play the next record.

7. To stop operation of the record changer at any time during automatic play, lift the pick-up arm off the record and return it to the "rest" position on the OFF button, however, after the last record is being played, the pick-up arm mechanism is automatically locked in position and must either complete the cycle or the "ON" button must be depressed.

8. To remove a stack of records from the turntable, pull out the record spindle, lift off the entire stack of records, and replace spindle.

9. When through operating the record changer, set the Speed control to the "OFF" position.

OPERATING PRECAUTIONS

1. Do not, under any circumstances, connect the motor to a source of direct current or to alternating current other than that specified by the label.

2. Do not allow oil or grease to come in contact with the rubber tired friction drive wheels (14 and 16) or the Automatic Trip Arm (30) and Clutch (29) parts.

3. Never use force to start or stop the motor, or any part of the record changer mechanism.

4. Do not intermix Microgroove records with the Standard Groove type.

5. Make certain the correct pick-up head (19) is used to play the desired records. The TAN head is for Standard Groove recordings, while the RED head is used to reproduce Microgroove recordings.

6. Always make certain that the Speed Control (32) is set to the proper speed position as required for the type of record.

7. Use only records in good condition for automatic operation. For warped, odd size, or home recorded records, play as for manual operation.

8. Do not store the records upon the record post and spindle or on the turntable as they may warp, especially if the temperature is high.

9. When through operating the record changer, make certain the Speed Control (32) is returned to the "OFF" position. This pre-

©John F. Rider

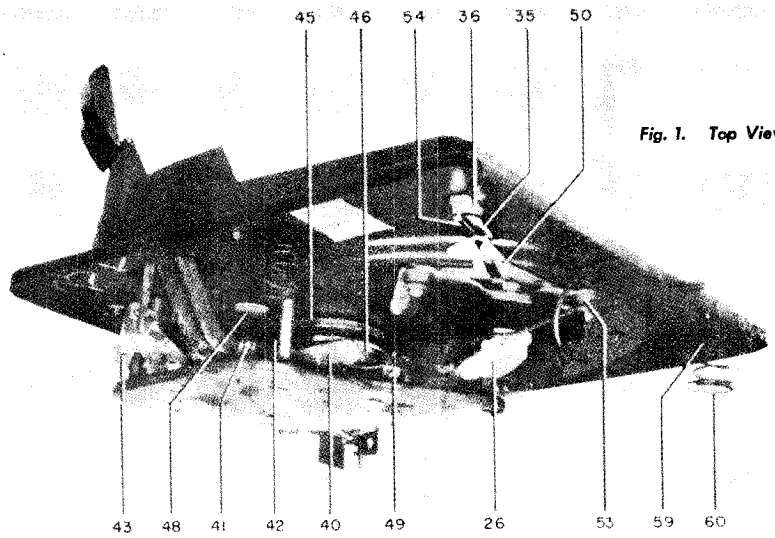

Fig. 1. Top View of Record Changer

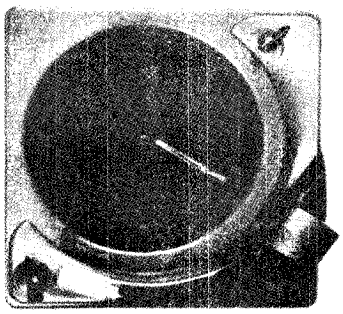

vents a damaging flat surface upon the rubber tired drive wheels otherwise developed as the motor drive shaft bears pressure upon them when the record changer remains idle for long periods engaged in either of the speed positions.

LUBRICATION

Use a light machine oil on the following:

1. Motor bearings, saturate top and bottom felts at end bells.
2. Pick-up arm shaft (5), see Figure 3. Apply one drop each to bottom bearing point, bracket hole, and hole through main base plate.
3. Ball bearing assembly (8). See Figure 1.
4. Idler wheel felt (21). See Figure 1.

Apply Lubriplate No. 110 with a small brush to:

1. Idler wheel linkage (15). See Figure 1.
2. Turntable shaft stud (9). See Figure 1.
3. Pick-up arm hinge pins.
4. Pick-up arm raising lever (38). Apply to edge lifting disk hub (31). See Figure 3.
5. Main cam (46) bearing. See Figure 2. It is necessary to remove the sub-plate assembly to lubricate this bearing.

Apply Sta-Put with a small brush to:

1. Teeth of Main Cam Gear (45). See Figure 4.
2. Channeled undersurface of Main Cam Gear (46). See Figure 4.
3. Teeth of Idler Drive Gears (11 and 12). See Figure 1.
4. Pick-up Arm Raising Lever (38). Apply to bearing surfaces. See Figure 4.

PICK-UP CARTRIDGE

The Model P10 record changer is equipped with two pick-up arm cartridge heads, each containing a General Electric Variable Reluctance Cartridge incorporating a replaceable stylus assembly. The "TAN" colored head is plugged into the end of the pick-up arm to play wide groove records known as the Standard type. The "RED" colored head is similarly inserted into the arm when using the Long Playing Microgroove records.

SERVICE—The stylus assemblies may be removed readily from the cartridge for replacement. Instructions for replacement are supplied with each new Replaceable Stylus Assembly catalogued in the replacement parts lists on the last page of this publication.

To insure optimum performance from the cartridge, its stylus, magnetic pole pieces, and gaps should be cleaned periodically of foreign particles accumulated from the record surfaces. A soft bristle brush similar to Cat. No. RQB-001 should be used to clean these parts. The gap clearance between stylus and each of its pole pieces has been adjusted to be not less than .011 inch. Care should be taken not to disturb this adjustment during service adjustment or cleaning.

CYCLE OF AUTOMATIC OPERATION

The following titled paragraphs describe in sequence each action of the record changer mechanism through the automatic cycle of operation.

INITIATING THE CHANGE OF CYCLE—Depressing the ON Button (24) turns on the Motor Power Switch (33) and triggers the Manual Trip Lever (34). The turntable driven by one of the Idler Wheels (14 or 16) drives the Main Cam Gear (45) through the Idler Coupling Gears (11 and 12).

PAWL TRIP ACTION—The Actuating Pawl upon the Main Cam Assembly (46) engages with the sawtooth serrations on the underside of the Main Cam Gear (45). The main cam assembly is thus driven by the main cam gear whenever the actuating pawl is engaged.

The actuating pawl is tripped directly by the Velocity Trip and Roller Assembly (47) which may be triggered either manually or automatically. The pawl becomes engaged in the cam gear sawtooth and the velocity trip lever is shortly returned to normal position in readiness to disengage the actuating pawl at the end of the main cam cycle. In Manual control the velocity trip and roller assembly is triggered by control of the ON Button (24) through Switch Assembly (33) and Manual Trip Lever (34). During automatic operation of the record changer, tripping is accomplished by action of the Automatic Trip Arm (30) which is driven by the Clutch Friction Weight (29) and Pick-up Arm Shaft Assembly.

PICK-UP ARM MOVEMENT—The underside channeled surface of the Main Cam Assembly (46) controls the pick-up arm movement through the Pick-up Arm Raising Lever (38). The lever follows the channeled contour of the main cam, lifting, turning and lowering the Disk Hub (31) and associated pick-up arm and shaft assembly so that the pick-up is started upon the first record grooves.

This completes the movement of the main cam assembly as the actuating pawl is released by the Velocity Trip and Roller Assembly (47) to be tripped and engaged again upon another record changer cycle.

The Automatic Trip Arm (30), coupled to the pick-up arm and shaft assembly by friction, moves toward the velocity trip and roller assembly as the pick-up arm moves across the record being played. As the last or inner record grooves are reached by the pick-up arm, the automatic trip arm triggers the velocity trip and roller assembly. The velocity trip, in turn, trips the actuating pawl to drive the main cam, beginning a new cycle of record play and returning the pick-up arm onto the first grooves of a next record.

RECORD FEED—Movement of the Rocker Arm Lever and Roller assembly (40) upon the underside and outer edge of the Main Cam Assembly (46) controls the record feed. The attached Record Selector Shelf (62) and associated Record Selector Arm Fingers (61) move to push forward a record from the shelf, off the step of the record spindle, and onto the turntable.

©John F. Rider

MODEL P10

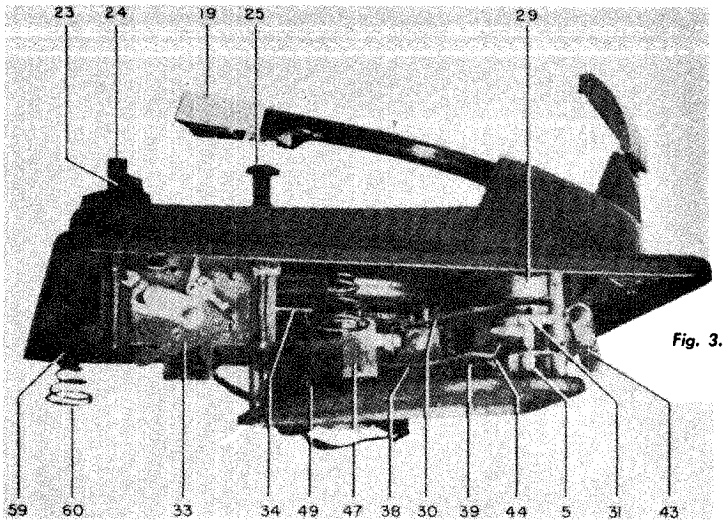

Fig. 3. Right Oblique View of Bottom of Changer

PICK-UP ARM INDEXING—The position of the Record Selector Fingers (61) and attached Index Control Arm (3) just before a record leaves the Record Shelf (62), determines the proper index of the pick-up arm to start upon the first grooves of that particular record.

When a 10-inch diameter record rests upon the record shelf, the record selector fingers are tilted so that the attached index control arm is engaged with the Index Lever Assembly (43). The index lever, by virtue of its compressed spring, forces the Pick-up Arm Raising Lever assembly (38) to follow the outer contour of the channeled undersurface of the Main Cam Assembly (46). Guided by *this contour,* the pick-up arm raising lever lowers the pick-up arm to the proper position upon the first grooves of the *10-inch record.*

A 12-inch record upon the record shelf will depress the record selector fingers, unlatching the attached index control arm from the index lever assembly. This renders the index lever assembly inoperative and results in the pick-up arm raising lever following the inside contour of the channeled undersurface of the main cam assembly as guided by its associated tension springs. In following *this contour,* the pick-up arm raising lever lowers the pick-up arm to the proper position upon the first grooves of the *12-inch record.*

AUTOMATIC SHUT OFF—As the last record leaves the Record Selector Shelf (62) and Record Spindle Step to drop onto the turntable, the bottom of the spindle ceases to bear down upon the end of the Automatic Shut-off Lock Lever (48) directly beneath as a result of all record weight removed from the spindle. This changes the position of the automatic shut-off lock lever so that the hooked segment of its lowered end engages with a segment of the Disk Hub (31), obstructing its normal movement. As a result, the pick-up arm is lowered onto the OFF Button, depressing it to shut off the electrical power to the record changer mechanism.

SERVICE ADJUSTMENTS

A. IDLER WHEEL DRIVE—The turntable is driven by means of one or the other friction idler drive wheels (14 or 16). The driving power is transferred from the motor bushing (27) to the drive wheels and then to the rim of the turntable.

It is important, therefore, that the motor bushing, idler wheels, and rim of turntable be kept clean of grease, oil, dirt, or any foreign matter. Naphtha or an equivalent quick drying solvent is satisfactory for cleaning these parts.

B. AUTOMATIC TRIP—The Automatic Trip Arm (30) follows the movement of the pickup arm through a weight compression clutch (29). When the movement of the pick-up arm (4) toward the record spindle is greater in velocity than $\frac{1}{8}$ inch in $\frac{1}{2}$ revolution of the turntable, the automatic trip arm trips the Velocity Trip and Roller Assembly (47). This releases the actuating pawl on the Main Cam Assembly (46), allowing it to engage the Main Cam Gear (45) to drive the mechanism through the changer cycle.

Normally, the change in velocity of pick-up arm movement occurs at the end of record play, due to the eccentric record lead-in grooves toward the record spindle.

Proper friction between the automatic trip arm and the Disk Hub (31) is essential to correct automatic trip operation. The respective surfaces of clutch weight, automatic trip arm and disk hub surfaces must be kept free of oil or grease.

C. AUTOMATIC LOCK LEVER—The automatic Lock Lever (48) should move up and down freely with no record on the spindle. Normally, its hooked end adjacent to the Pick-up Arm Raising Disk Hub (31) will be raised clear of the disk hub as long as records are upon the spindle. However, after the last record has been played, the hooked end of the automatic lock lever is in a lowered position (due to record weight removed from spindle). In this position, the hook of the lever obstructs further lateral movement of the disk hub and pick-up arm and the pick-up arm is then lowered on to the OFF Button (25) shutting off the changer mechanism. To allow final indexing of the pick-up arm to play the last record as it leaves the spindle and drops onto the turntable, the hooked end to the automatic lock lever must clear the disk hub. This is accomplished for the last record play through the Tab "B" of the lock lever, shown in Figure 5, as it engages with the adjacent tab of the Rocker Arm Lever and Roller Assembly (40). This prevents the lock lever from being lowered which would otherwise obstruct the disk hub movement for the last record play.

For correct adjustment, there should be a clearance of $\frac{1}{32}$ inch between hook end of lock lever and disk hub, with the changer mechanism at rest and no records on the spindle. To make this adjustment, bend the Tab "F" shown in Figure 5. The tab is located on the Base Plate (37) just beneath the automatic lock lever.

D. VELOCITY TRIP—At the completion of the first part of change cycle, the actuating pawl is engaged by the hook end of the Velocity Trip and Roller Assembly (47) which has been returned to its normal position by the reset points on the Main Cam Drive Gear (45). This hook should be adjusted between .005 to .015 inch clearance from the bottom of the main cam drive gear. Greater clearance may permit the pawl to bounce past the hook and re-engage with the main cam gear sawtooth, causing the changer mechanism to operate into another cycle.

E. INDEXING—The eccentric screw (10) accessible through the top of the Pick-up Arm (4) should take care of any normal adjustment. Turn the screw clockwise to index the pick-up stylus in, toward the spindle, or counterclockwise to index the stylus out, away from the spindle.

Should further adjustment be necessary, proceed as follows: Operate the mechanism by revolving the turntable manually until the stylus drops to within $\frac{1}{2}$ inch of a 10-inch record on the turntable. With a No. 8 Bristol wrench in each of the set screws (points D and E, Fig. 5), alternately loosen one and tighten the other until the stylus rests above the records lead-in groove at the desired point.

Make certain both set screws are tightened after adjustment is completed.

The 12-inch position is indexed automatically by the pressure of a 12-inch record on the Record Selector Fingers (61).

©John F. Rider

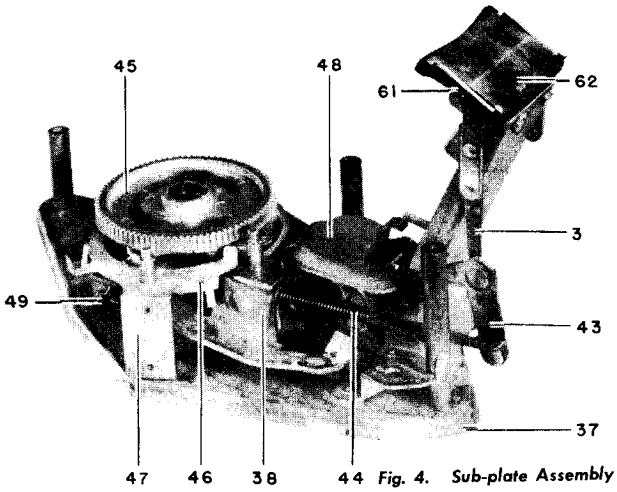

Fig. 4. Sub-plate Assembly

F. PICK-UP ARM LIFT—The stylus should clear the top record of a full stack of records upon the turntable by approximately 1/8 inch in its approach to, or return travel across the record. Adjust by bending the Pick-up Arm Raising Lever (38) at point "C" shown in Figure 5. *Do not attempt to move Pick-up Arm Raising Disk Hub (31) up or down* as this would upset the adjustment of the Automatic Lock Lever mentioned in a previous paragraph.

G. RECORD DROP ADJUSTMENT—The distance between the Record Selector Fingers (61) and the Record Spindle is critical and should be adjusted as accurately as possible. If this distance is too great, records of minimum diameter will not be pushed off the spindle step during the change cycle. If it is too short, records of maximum diameter will either be over the tips of the record selector fingers (resulting in no record drop and improper pick-up arm index), or be pushed against the spindle with undue force, causing center hole of the record to become damaged.

IMPORTANT: Make certain that a standard size record is used in making the adjustments in the following paragraphs. A standard 10-inch record measures 9 7/8 inches ± 1/32 inch in diameter. A standard 12-inch record measures 11 7/8 inches ± 1/32 inch in diameter.

With a standard 10-inch record on the spindle, check the distance between the edge of the record and the front of the record selector fingers. This distance should be approximately 5/32 inch and should be the same for each of the two fingers. With a full stack of records on the spindle, the weight of the records will reduce this distance to about 1/8 inch. Do not attempt to bend the spindle to adjust this distance. Bending the spindle will destroy the relationship between the heel of the spindle off-set and the horizontal plane of the record. This spacing is set to permit only one record at a time to slide between the heel of the off-set and the step of the spindle. Standard records are 0.70 inch to 0.100 inch in thickness and any change in the angle of the spindle will either close the angle of the off-set which will result in torn center labels on thick records, or open the angle permitting two thin records to drop at one time.

The procedure for adjusting the push-off distance is as follows:

1. Remove the four screws under the Main Plate (6) which hold the Center Trim Section (2).
2. Remove the center trim section by lifting it straight and upward.
3. For forward adjustment of the record selector fingers, wedge a screwdriver between the Rocker Arm and Roller Assembly (40) and the Sub Plate (37) in front of the rocker arm pivot. With the heel of the hand bearing upon the Record Selector Shelf (62), push on shelf to bend rocker arm, bringing record selector fingers nearer to record spindle.
4. For backward adjustment, wedge the screwdriver between the rocker arm and the sub-plate in back of the pivot pin. Push on record selector shelf to bend rocker arm, bringing record selector fingers further away from record spindle.
5. After making adjustment, make certain that both selector arm fingers are equidistant from edge of record. A slight twisting of the rocker arm will bring the fingers to the proper position.

PICK-UP ARM REMOVAL AND REPLACEMENT

The following step-by-step procedure may be used in removing the pick-up arm for service and replacement.

1. The spacing spring between the hinge pins of the pick-up arm bracket must be removed by pressing down on its center until it snaps off the pins. This spring was used to prevent the pick-up arm hinge from coming apart during shipment.
2. With a screwdriver or long-nose pliers, bend in one of the blue steel pick-up arm hinge brackets while lifting up on the arm. This will release the hinge bracket from its hinge pin.
3. Repeat step 2 to free opposite hinge bracket.
4. The pick-up arm may now be removed after freeing pick-up cord from clips.
5. In replacing pick-up arm, the above procedure may be followed in reverse. Make certain cord does not become wedged in bracket. The roller at the rear of pick-up arm hinge should pass beneath the lift bracket attached to the record changer deck. The spacing spring need not be replaced unless the unit is to be shipped.

SUB-PLATE ASSEMBLY (REMOVAL AND ASSEMBLY)

In the event that it becomes necessary to replace any of the major parts of the sub-plate assembly (Figure 4), the entire assembly should first be removed from the main plate. Proceed as follows:

1. Remove the record spindle and turntable.
2. Remove four screws holding Center Trim (2) from Main Plate and remove trim.
3. Remove the Record Selector Shelf (62) held to the Rocker Arm and Roller Assembly (40) by the two screws.
4. Detach Rocker Arm Return Spring (42) from main plate.
5. Remove the four No. 8-32 screws holding the sub-plate studs and the main cam gear stud to the main plate.
6. Main plate may be lifted from sub-plate, letting rocker arm drop through opening of main plate.

Reverse the above procedure to reassemble record changer, making certain pick-up arm shaft, sub-plate dowels and other parts are in their proper position.

RECORD SELECTOR SHELF AND ROCKER ARM ASSEMBLY (REMOVAL AND REASSEMBLY)

The Record Selector Shelf and Rocker Arm Lever Assembly (62 and 40) may be removed from the record changer by detaching its Return Spring (42), removing its Pivot Pin (41) and lifting the assembly out from the top of the record changer.

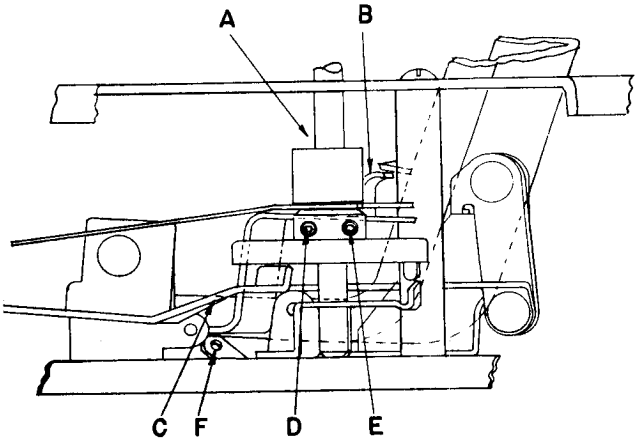

Fig. 5. Adjustment Points

MODEL P10

TROUBLE SHOOTING CHART

SYMPTOMS	REMEDIES OR CAUSES
TRIPPING 1. Automatic Trip Fails.	1. (a) Binding of velocity trip and roller assembly (47). (b) Actuating pawl stuck; part of main cam assembly (46). (c) Automatic trip arm (30) bent and not striking velocity trip and roller (47). (d) Manual trip lever (34) binding. (e) No velocity lead-in eccentric groove at center of record. (f) Foreign matter in record groove or broken record.
2. Manual Trip Fails.	2. (a) Manual trip lever (34); wire spring bent or broken. (b) Velocity trip and roller assembly (47) binding. (c) Actuating pawl stuck.
3. Velocity Trip Fails.	3. (a) Check Service Adjustments paragraphs D. (b) Velocity trip and roller assembly (47) rubbing on main cam gear (45).
4. Last Record Is Not Played.	4. Automatic lock lever failure. Check Service Adjustments, paragraphs C.
PICK-UP INDEXING 1. Pick-up does not start in proper record groove.	1. Check Service Adjustments, paragraphs E.
PICK-UP ARM MOVEMENT 1. Pick-up arm lift too high or too low.	1. Check Service Adjustments, paragraphs F.
RECORD DROP 1. Inconsistent record drop.	1. Check Service Adjustments, paragraphs G.
MOTOR 1. Motor does not shut off automatically.	1. (a) OFF button stuck. (b) Defective switch. (c) Defective switch mechanism.

CAT. NO.	REF.	DESCRIPTION
RMS-181	60	SPRING—Record changer mounting spring
RMT-008		TURNTABLE—Record turntable
RMW-053	14	WHEEL—Turntable drive wheel (78 rpm)
RMW-055	27	DRIVE BUSHING—Motor shaft drive bushing and set screw
RMW-056	16	WHEEL—Turntable drive wheel (33⅓ rpm)

RMG-005	45	GEAR—Main cam drive gear
RMK-003	12	GEAR COUPLING—Drive coupling between idler drive gears
RML-010	48	LEVER—Automatic shut-off lock lever
RML-017	40	ARM—Rocker arm and roller assembly (less record selector shelf and fingers)
RML-018	43	LEVER—Index selector lever
RML-022	34	LEVER—Manual trip lever and wire assembly
RML-024	15	LINK LEVER—Supports one of each turntable drive wheel
RML-025	50	LEVER PLATE—Speed control lever plate with neutral positioning flat index spring
RML-026	28	LEVER—Turntable drive wheel link lever release
RMM-038		COVER—A-C power switch cover
RMM-079	31	DISK AND HUB—Pick-up arm raising disk with set screws
RMM-088	62	RECORD PUSH-OFF SHELF—Plastic record shelf
RMP-008	41	PIN—Rocker arm pivot pin
RMP-009	49	PIN—Pivot pin for automatic shut-off lever
RMS-071	39	SPRING—Pick-up arm raising lever tension spring
RMS-074	44	SPRING—Index rod compression spring
RMS-075	42	SPRING—Rocker arm return spring
RMS-175	17	SPRING—Tension spring on 78 rpm turntable drive wheel
RMS-176	18	SPRING—Tension spring on 33⅓ rpm turntable drive wheel
RMS-177	54	SPRING—Tension spring on speed control shaft toggle
RMS-179		SPRING—Used in mounting pick-up cartridges (19)

MODEL P10 REPLACEMENT PARTS LIST

©John F. Rider

©John F. Rider

GENERAL

This record changer is designed to operate from a power source of 105-125 volts at 60 cycles per second. It is a dual speed type of 33⅓ rpm or 78 rpm for playing the standard records automatically or the "Long Play" records manually.

This changer is similar to the Model P6 except for the addition of the pickup arm with the 1 mil stylus for playing the narrow groove records and the dual-speed motor. A switch has been added to switch to either pickup arm. For detailed information, on automatic operation, trouble shooting, and replacement parts common to both the P6 and the P11, refer to ER-S-P6. Only parts special to the P11 changer are given below.

CONTROLS

1. The CONTROL KNOB turns the power to the motor "ON" in *Manual* or *Auto.* position and will cancel a record being played when rotated to *Rej.*
2. If the SPEED CHANGE KNOB is rotated to *Long Play,* the turntable will rotate at 33⅓ rpm. When rotated to *St'd Play,* the turntable will rotate at 78 rpm. When the record changer is not in use, this knob should be rotated to the center position to relieve pressure from the rubber tired idler wheel.
3. PICKUP ARM SWITCH should be switched to *St'd Play* when playing records of the wide or standard groove. This switch should be switched to *Long Play* when playing 33⅓ rpm "Long Play" records which have the narrow or microgroove type of grooves.
4. 10-INCH RECORD SHELF should be raised to a vertical position when playing 12-inch records or lowered to a horizontal position when playing 10-inch records automatically.
5. HOLD-DOWN ARM should be lowered onto the top record of the stack when playing records automatically.

MANUAL OPERATION

1. Raise the hold-down arm and the 10-inch record support to a vertical position and lower the record onto the turntable over the spindle.
2. Select the proper turntable speed with the SPEED CONTROL KNOB.
3. Set the PICKUP ARM SWITCH to select the proper pickup arm.
4. Rotate the CONTROL KNOB to manual.
5. Place the stylus of the proper pickup arm in the lead-in groove of the record.
6. After the record has been played, lift the pickup arm and place it at its rest position. Rotate the CONTROL KNOB to the "OFF" position to stop the turntable.

AUTOMATIC OPERATION

1. Place up to ten 12-inch or twelve 10-inch records over the spindle resting on the spindle shelf and the 12-inch shelf or the 10-inch shelf. Lower the HOLD DOWN ARM onto the records.
2. Set the PICKUP ARM SWITCH to *St'd Play.*

Note: Only records of the wide or standard groove width which require a 3 mil stylus may be played automatically on this changer.

3. Select the proper speed for the records with the SPEED CONTROL KNOB. Note: Do not intermix records requiring different turntable speeds.
4. Rotate the CONTROL KNOB to *Rej.* and release it. The record changer will automatically play the records. After the last has played, lift the pickup arm and place it on its rest position. Rotate the CONTROL KNOB to "*OFF*" to stop the changer.

OPERATING PRECAUTIONS

Do not use warped records for automatic operation. For warped, odd.size, or home-recorded records, play as for manual operation.

When playing microgroove records, do not allow the St'd Pickup to contact the records as this may damage the record surface.

Do not allow oil or grease to come in contact with the rubber of the idler wheel.

P11 REPLACEMENT PARTS LIST

Cat. No.	Description	Ref. No.
RAC-077	COVER—Terminal cover	113
RBH-011	MOTOR—Two-speed phono-motor (see Fig. 4)	100

MILWAUKEE Record Changer
No. 11200 Series

TO OPERATE MANUALLY

Raise the record balance arm (42) and the 10" record support (38).
Place a record on the turntable and turn the control button to the manual position.
Place the pickup arm at the start of the record and return it to the pickup arm rest at the end of the record.

TO OPERATE AUTOMATICALLY

Place the pickup arm on the pickup arm rest and raise the record balance arm (42).
(The 10" record support (38) must be lowered for 10" records and raised for 12" records.)
Place 12-10" or 10-12" records on the spindle and record support.
Lower the record balance arm (42) and turn the control button to reject and release it. it will automatically return to the automatic position.
To reject an unfinished record turn the control button to reject and release it.
To remove records from the turntable, turn the control button to the OFF position and raise the record balance arm (42) and the 10" record support (38) and lift the records off.

CYCLE OF OPERATION

The following drawings show a complete cycle of operation. Figures 1, 1A, 1B and 1C show the mechanism in the OFF or nonoperating position. The rest of the Figures show the mechanism in various phases of the change cycle.

To start the change cycle turn the control button (126) to the Reject position as shown in Fig. 2. This causes the notched washer (127) to take the position shown in Fig. 2B. And as soon as the control button (126) Fig. 2 is released, the selector lever spring forces the notched washer (127) Fig. 3B, also (126) Fig. 3, into the automatic position. This action of the notched washer causes point A of the selector lever (132) Fig. 2B to move against the ON-OFF switch (125 Fig. 2 B applying voltage to the motor.

Point B of the selector lever (132) Fig. 2B moves away from the lead roller shoulder nut (95) Fig. 2B. Point C of the selector lever (132) pushes against the lead roller dropping lever (78) Fig. 2B causing it to move away from the lead roller shoulder nut (95) Fig. 2B. Thereby, allowing the lead roller (94) Fig. 2A to enter the spiral cam underneath the turntable Fig. 2A.

Fig. 2C shows the lead roller (94) engaged with the spiral cam. This starts the change cycle by the action of the spiral cam forcing the lead roller (94) Fig. 3C and the swing arm (71) Fig. 3B toward the center of the turntable. As the swing arm moves toward the center of the turntable, the cammed end of it (Point D), Fig. 3B forces the adjusting plunger pin (21) Fig. 3C upward raising the pickup arm (14) Fig. 3C from the pickup arm rest (2) Fig. 3C.

As the swing arm (71) Fig. 3B moves farther toward the center of the turntable, the ratchet arm friction springs (82 and 83) Fig. 3B engage the ratchet arm (7) Fig. 3B and swings the pickup arm (14) Fig. 3 away from the turntable (136) Fig. 3 until the ratchet arm (7) Fig. 3B is stopped by coming in contact with the ratchet arm stop bracket (142) Fig. 3B.

©John F. Rider

MODEL 11200, Series

As the swing arm (71) Fig. 3B starts toward the center of the turntable, Point E, on the swing arm (71) Fig. 3B moves away from the ratchet arm lever (64) Fig. 3B allowing it to pivot up due to the tension of the ratchet arm lever spring (69) Fig. 3B so that it will be in a position for Point F of the ratchet arm lever to contact the ratchet arm (7) Fig. 3 B at the proper point for the pickup arm (14) Fig. 3C to set down on the record. If it were not engaged at the proper point, the tension of the ratchet arm friction springs (82 and 83) Fig. 3B would carry the pickup arm past the start of the record.

Another operation that is taking place as the swing arm (71) Fig. 3B moves toward the center of the turntable is that the roller (73) Fig. 3B of the cammed dropping lever (74) Fig. 3B, makes contact with the lever trip bracket (109)Fig. 3B and gradually forces the cammed dropping lever away from the bearing pin shoulder nut (103) Fig. 3C so that as soon as a record is dropped, the lower or return roller (102) Fig. 3C also (102) Fig. 3A is allowed to enter the spiral cam Fig. 3A so that the swing arm (71) Fig. 3B can return to its original position. This will be covered later, as soon as this phase of the change cycle occurs.

Point G of the swing arm (71) Fig. 3B pushes against the roller (117) Fig. 3B of the ejector idler lever (118) Fig. 3B and the adjusting screw (119) Fig. 3B on the ejector idler lever (118) Fig. 3B pushes against the lower push pin (114) Fig. 3B, which in turn pushes against the ejector lever (31) Fig. 3B (a side view of the ejector lever (31) is shown in Fig. 6). The ejector lever (31) Fig. 6A then pushes against the 12" record slide bolt (33) Fig. 6A which pushes the 10" record slide bolt (40) Fig. 6A; causing the 10" record to drop on the turntable.

To play a 12" record, raise the 10" record support (38) Fig. 8, which causes point J on the 10" record support (38) Fig. 8 to engage the change lever ejector (28) Fig. 8A, which pivots and moves the change lever (67) Fig. 1B, toward the rear of the changer base plate. This allows the ratchet arm lever (64) Fig. 1B to pivot more causing the ratchet arm (7) Fig. 1B to hit against point K on the ratchet arm lever (64) Fig. 1B causing the 12" record to land on the turntable, as was the case with Point F for the 10" record.

As mentioned in a previous paragraph, the roller (73) Fig. 3B of the cammed dropping lever (74) Fig. 3B has made contact with the lever trip bracket (109) Fig. 3B and has forced the cammed dropping lever (74) Fig. 3B away from the bearing pin shoulder nut (103) Fig. 3C allowing the lower or return roller (102) Fig. 3A (also 102) Fig. 3C) to enter the spiral cam Fig. 3A and so to return the swing arm (71) Fig. 3B to its original position.

The lead roller (94) Fig. 3A (also 94 Fig. 3C) is then forced out of the spiral cam by a raised portion of the spiral cam Point H Fig. 3A. Through the action of the tension spring (79) Fig. 3B the lead roller dropping lever (78) Fig. 3B is moved into position over the lead roller shoulder nut (95) Fig. 3B thereby keeping the lead roller (94) Fig. 3C also Fig. 3A out of the spiral cam.

As the swing arm (71) starts back to its original position, the ejector mechanism returns to its' original position. The pickup arm is being moved into position to land on the record through the action of the ratchet arm friction springs (82 and 83) Fig. 4B, on the ratchet arm (7) Fig. 4B.

As explained in a previous paragraph, the ratchet arm lever (64) Fig. 4B has been moved up so as to stop the ratchet arm (7) Fig. 4B at the proper position for the pickup arm to land on the record. As the swing arm (71) Fig. 4B nears the end of its' return swing Point I of the swing arm engages

©John F. Rider

the friction brake spring spring (61) Fig. 4B. This insures smooth lowering of the pickup arm and also tends to hold the swing arm (71) Fig. 4B in the same position while a record is being played. As soon as the adjusting plunger pin (21) Fig. 4C starts down the cammed end Point D Fig. 4B of the swing arm (71) Fig. 4B the ratchet arm friction springs (82 and 83) Fig. 4B disengage from the ratchet arm (7) Fig. 4B. Point F of the ratchet arm lever (64) Fig. 4B is forced away from the ratchet arm (7) Fig. 4B by Point E on the swing arm (71) Fig. 4B.

The pickup arm (14) Fig. 4 also Fig. 4C is lowered on the record and then Point H of the spiral cam Fig. 4A forces the lower or return roller (102) Fig. 4A also Fig. 4C out of the spiral cam. Through the action of the tension spring (76) Fig. 4B the cammed dropping lever (74) Fig. 4B also Fig. 4C is moved into position over the bearing pin shoulder nut (103) Fig. 4C thereby keeping the lower or return roller (102) Fig. 4C out of the spiral cam. Thus the pickup arm can continue across the record.

Fig. 5 shows the pickup arm (14) at the end of the record, and Fig. 5A shows how the ratchet arm (7) has also moved to the end of the record and the adjusting screw (11) of the ratchet arm (7) is just at the point of pushing the lead roller dropping lever (78) away from the lead roller shoulder nut (95) so that the lead roller (94) Fig. 5B may enter the spiral cam for another cycle of operation.

TROUBLE SHOOTING CHART

SYMPTOMS	CAUSES	REMEDIES
1-Mechanism continues to cycle	1-Broken or bent selector lever spring (135)	1-Replace if broken 1a-If bent, remove the notched washer (127) and straighten the spring
2-Mechanism jams on return half of cycle	1-A broken or leave dropping lever tension spring (79)	1-Replace if broken 1a-Reset in proper place if loose
3-Mechanism jams on forward	1-A broken or loose cammed dropping lever spring (76)	1-Replace if broken 1a-Reset in proper place if loose
4-Mechanism trips before end	1-Ratchet arm adjusting screen (11) turned too far clockwise	1-Turn adjusting screw (11) counterclockwise until proper point is reached
5-Mechanism does not trip at end of record	1-Ratchet arm adjusting screw (11) turned too far counterclockwise 2-Lead roller compression spring (97) too weak to push lead roller (94) into spiral cam (137 & 138)	1-Turn adjusting screw (11) counterclockwise until proper point is reached 2-Replace compression spring (97)
6-Pickup arm (14) jumps groove	1-The lead roller dropping lever (78) may be bent and is jammed	1-Straighten it out and check to see that it moves freely
7- Pickup arm (14) lands too fast on record	1-Friction broke spring (61) weak or broken	1-Replace spring
8-Pickup arm (14) does not land at start of record	1-Ratchet arm lever spring (69) may be too weak to hold ratchet arm lever (64) in place 2-The ratchet arm clamp screw (8) may be loose	1-Replace spring 2-Disconnect line cord and place control button (126) on automatic. Trip the mechanism and rotate manually noting where pickup arm lands. Loosen clamp screw (8) and holding ratchet arm in place move pickup to start of record and tighten clamp screw (8)

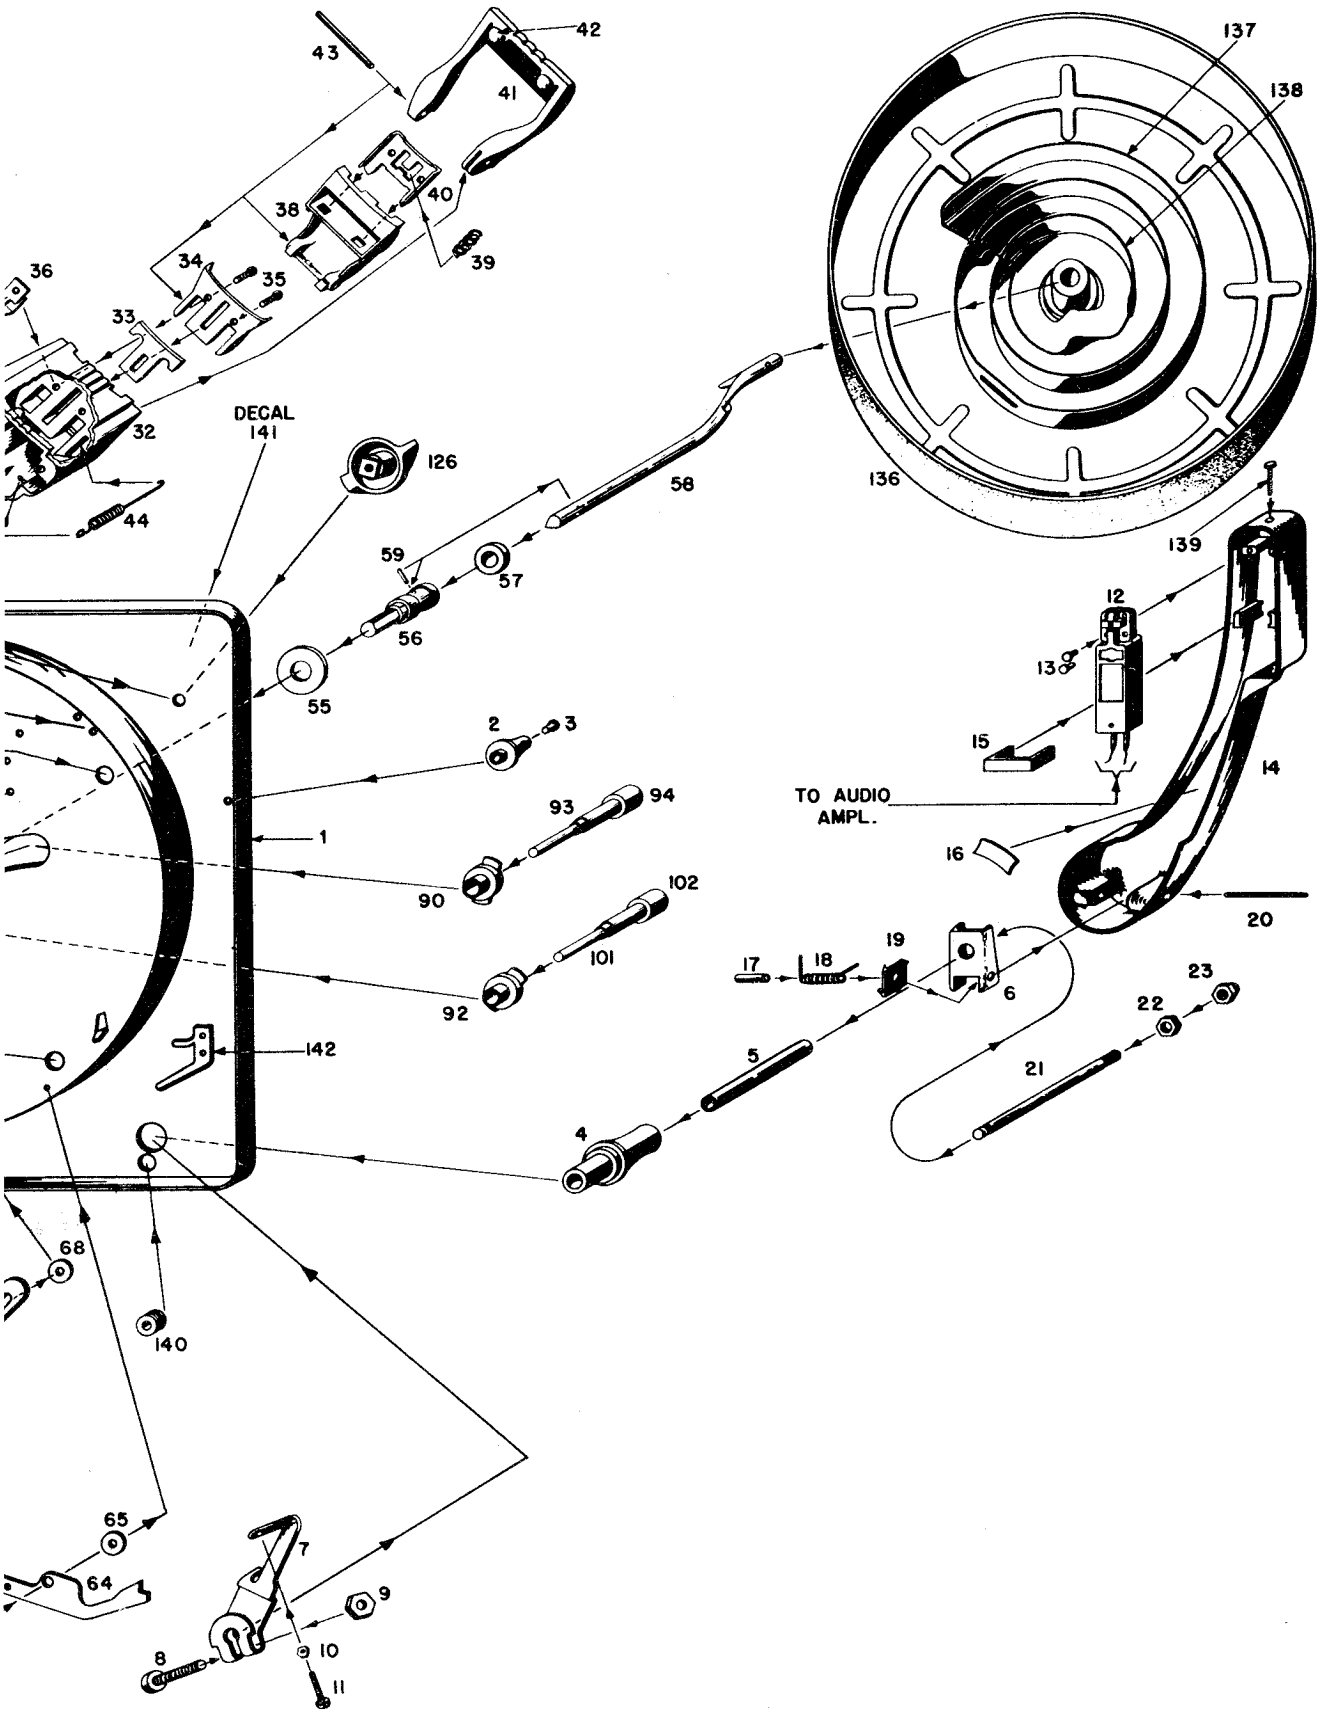
MODEL 11200, Series



TROUBLE SHOOTING SHART (Cont'd)

SYMPTOMS	CAUSES	REMEDIES
9-Pickup arm (14) does not land on record	1-Acorn nut (23) on plunger pin (21) not properly adjusted 2-Shielded lead from crystal pickup may be between pickup arm (14) and acorn nut (23)	1-Loosen jam nut (22) and screw acorn nut (23) farther down on plunger pin (21) 2-Dress shielded head over to one side out of the way
10-Records do not drop	1-The idler lever adjusting screw (119) not adjusted properly 2-The ejector arm extension spring (115) loose or broken 3-The 10" ejector compression spring (39) weak or lost	1-Turn the adjusting screw (119) until the 12" record slide bolt (33) extends slightly beyond the front edge of the 12" record support (34) 2-If loose reconnect, if broken replace 3-Replace spring
11-No sound	1-Audio amplifiers defective 2-Crystal pickup leads shorted 3-Crystal cartridge defective	1-Check with radio reception 2-Check for shorted leads 3-Try new cartridge
12-Distorted sound	1-Audio amplifier defective 2-Defective or worn needle 3-Defective crystal cartridge 4-Worn record	1-Check with radio reception 2-Replace needle 3-Try new cartridge 4-Try new record
13-Wow or motor rumble	1-Worn spots in idler wheel (46) 2-Oil on idler wheel (46) and turntable rim 3-Warped record	1-Replace idler wheel or if worn spots are not too deep try sanding the idler wheel smooth 2-Clean idler wheel and turntable rim
14-Change cycle is too slow or motor overheats	1-Moving parts binding 2-Line voltage incorrect 3-Defective motor winding	1-Locate part and oil lightly 2-Check for correct line voltage 115 to 117 volts 60 cycles 3-Replace motor if defective

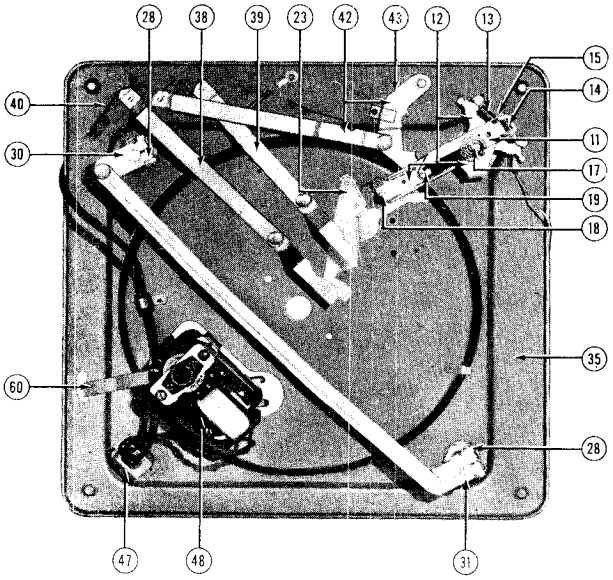
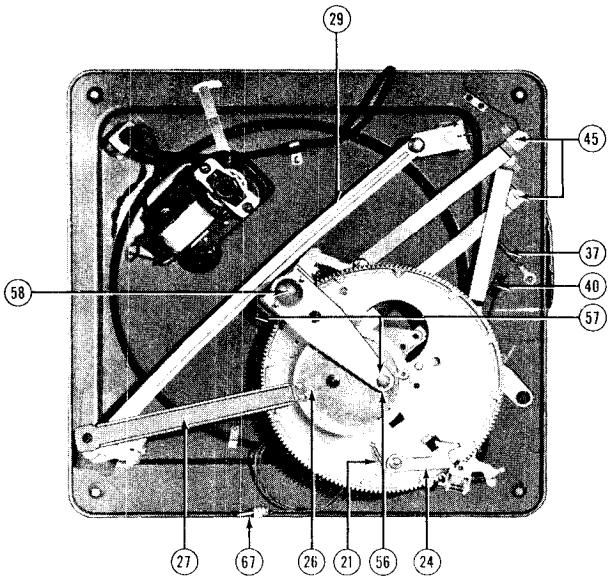
DESCRIPTION OF CYCLE

In order to observe the action of the changer mechanism as it progresses through a complete cycle of operation, disconnect motor plug from power supply so that Turntable can be rotated by hand. Move the front Control Button to the right so that only the word "AUTO" is visible. Then slide the "START-REJECT" Control Button to the left as far as it will go and release it. The operation of all parts of the changer can now be examined as the Turntable is rotated **clockwise.**

FUNCTION	EXPLANATION
SETTING FOR DESIRED RECORD SIZE	1. The position of the "10-12" Control Button determines the size of records that may be played on the changer 2. When this Control Button is in the 12 inch position, the Index Pin (19) is stopped by the front notch on the Index Stop Lever (43). The horizontal motion of the Pick-up Arm (1) is thus stopped. After the Pick-up Arm Lift Pin (17) and Pick-up Arm (1) are lowered, the Pick-up Arm will land in the correct position to start playing a 12 inch record. 3. When the Control Button is in the 10 inch position, the Index Pin (19) is stopped by the rear notch on the Index Stop Lever (43). Since this notch is deeper than the front notch, the Pick-up Arm (1) will be stopped at a point closer to the Center Post. After the Pick-up Arm Lift Pin (17) and Pick-up Arm (1) are lowered, the Pick-up Arm will land in the correct position to start playing a 10 inch record.
SETTING FOR DESIRED NEEDLE	1. Operating the Needle Selector (62) rotates Crystal Cartridge (2) to engage the proper Needle.





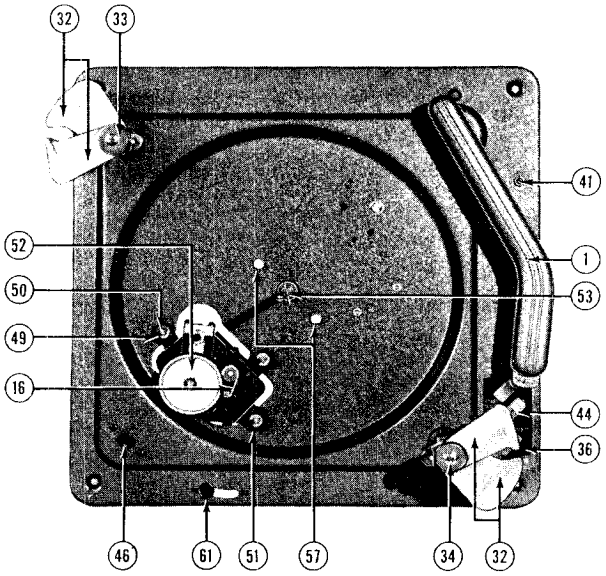
SETTING FOR DESIRED SPEED	1. When the Speed Selector Knob (61) is moved to the left as far as it will go toward the number "78" the motor hub rotates the Idler Wheel (52) which, in turn, engages the inside rim of the Turntable. 2. When the Speed Selector Knob (61) is moved to the right as far as it will go toward the number "33" an auxiliary shaft [connected to the motor hub through Rubber Drive Belt (16)] rotates the Idler Wheel (52). The Idler Wheel engages the inside rim of the Turntable.
STARTING **Operating the "ON-OFF" Switch (46).**	1. Operating this Switch supplies power to Motor (48). 2. Motor (48) operates Idler Wheel (52) to rotate Turntable and Turntable Gear (59). 3. All other parts of mechanism remain at rest until Starting Pawl (24) is released by trip action at end of playing cycle or by operation of the "START-REJECT" Control Button.

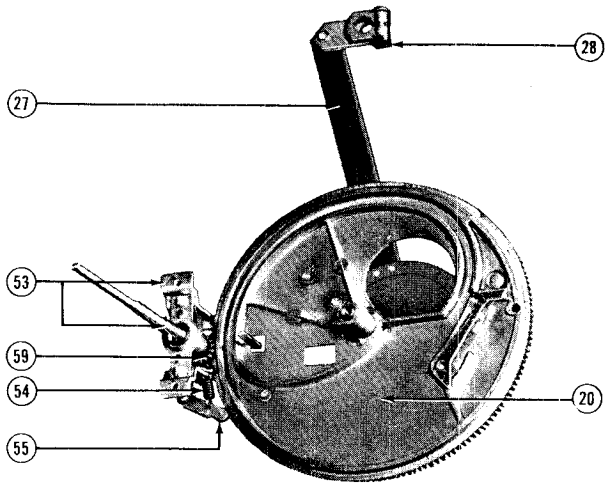
©John F. Rider

MODEL 9000

DESCRIPTION OF CYCLE (Continued)

FUNCTION	EXPLANATION
TRIPPING **To trip mechanism and start change cycle, slide "START-REJECT" Control Button down and to the left as far as it will go and then release it.**	1. Operating the "START-REJECT" Control Button causes the Reject Link (39) to move the Trip Release Assembly (23). This Assembly releases the Starting Pawl (24) and allows the Pawl to engage the Turntable Gear (59) and start the change cycle.
FUNCTION OF THE MAIN CAM (20)	1. The grooves on the upper surface of the Main Cam direct and co-ordinate the motions of the Pick-up Arm Lift Pin (17), which elevates the Pick-up Arm (1) during the change cycle and the Pick-up Arm Follower (18), which moves the Arm horizontally during the change cycle.
DISPLACEMENT OF A RECORD	1. While the Main Cam (20) is turning, the Eccentric (26) turns the Record Support Arms (32) through the action of the Eccentric Arm (27) and Tie Bar (29). 2. During the first half of the change cycle the Record Support Arm Shafts (30 and 31) and Record Support Arms (32) rotate in a clockwise direction. The two lower changer blades eject the bottom record loaded on the changer and the two upper changer blades slide under the remainder of the stack. 3. During the remainder of the cycle, the Record Support Arm Shafts (30 and 31) and Record Support Arms (32) rotate in a counter-clockwise direction. The upper changer blades now slide out from under the stack of records and drop the stack onto the lower changer blades.



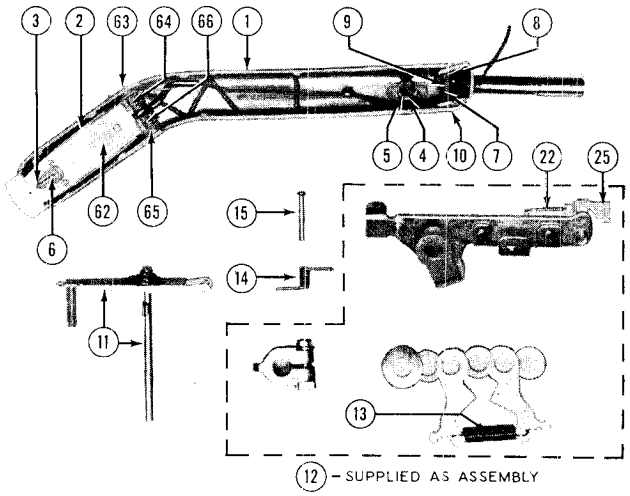


MOVEMENT OF PICK-UP ARM	1. As the Main Cam (20) starts to rotate, the Pick-up Arm Lift Pin (17) raises the Pick-up Arm (1) by riding up the outer ridge of the Main Cam (20). 2. After approximately a quarter turn of the Main Cam (20), the Pick-up Arm Follower (18) enters the groove in the Cam. The groove is cut so as to push the Pick-up Arm Follower (18) and thus the Pick-up Arm (1) to the right. 3. After approximately a three-quarter turn of the Main Cam (20), the groove in the Cam causes the Pick-up Arm Follower (18) and Pick-up Arm (1) to move to the left. 4. Near the end of the cycle, the outer ridge of the Main Cam (20) slopes downward and the Pick-up Arm Lift Pin (17) and Pick-up Arm (1) are lowered.

©John F. Rider

DESCRIPTION OF CYCLE (Continued)

FUNCTION	EXPLANATION
	5. The position at which the Pick-up Arm sets down on a record may be adjusted by means of the Index Screw (41) located on the upper right hand side of the changer base. The Screw acts as an eccentric in changing the position of the Index Stop Lever (43). A complete description of this method of positioning the Arm and another method which will give greater range of adjustment if required may be found in the "Trouble Shooting Chart" under the section entitled "Pick-up Arm (1) sets down at wrong starting point on record". 6. Elevation of the Pick-up Arm is adjusted by turning the Lift Adjusting Screw (5) located on the under side of the Pick-up Arm (1). For complete adjustment details, see section of "Trouble Shooting Chart" entitled "Pick-up Arm elevation is too high or too low during change cycle".
COMPLETION OF MAIN CAM CYCLE	1. After one complete revolution of the Main Cam (20), the notch in the teeth of this Cam will disengage the Main Cam from the Turntable Gear (59). The Cam Stop Roller (55) enters a groove on the side of the Main Cam (20) which serves to locate its rest position. 2. The Starting Pawl (24) contacts and again becomes held by the Trip Release Assembly (23).
ACTION OF TRIP MECHANISM AT END OF RECORD	1. During the playing portion of the cycle the Trip Latch (25) contacts the serrated edge of the Trip Release Assembly (23). While the Pick-up Arm (1) is advancing toward the Center Post (53) the Trip Latch (25) will not move this assembly. When the Needle (3) enters the spiral groove at the end of the record, the motion of the Pick-up Arm away from the Center Post will cause the Trip Latch (25) to operate the Trip Release Assembly (23). The Starting Pawl (24) will be released and will engage the Turntable Gear (59) to start the change cycle.
"MANUAL" CONTROL OF CHANGER	1. When "AUTO-MANUAL" Control Button is moved down and to the left so that the word "MANUAL" is visible, the Starting Pawl (24) is held in such a position as to be unable to engage the Turntable Gear (59) and it is impossible for the changer to cycle automatically. Forward or reverse recordings may now be played by manually placing the Pick-up Arm on the record at the desired starting point.
STOPPING	1. To stop the changer (NOT DURING CHANGE CYCLE), slide the "ON-OFF" Switch (46) to its off position. Power to the Motor (48) will be turned off.



©John F. Rider

MODEL 9000

LUBRICATION

The record changer leaves the factory completely lubricated and under normal conditions this lubrication should be sufficient for approximately one year or 1,000 hours of operation. When operated under extreme conditions of dust or heat, lubrication should be performed as frequently as required.

NOTE: AVOID EXCESSIVE LUBRICATION. Do not permit any oil to get on the rubber tire of the Idler Wheel, on the motor hub, on the Trip Release and Starting Pawl mechanism, or on the drive rim of the Turntable. Any oil on these places should be removed with Carbon Tetrachloride.

A drop of good machine oil once a year on the Center Post Assembly bearings, motor bearings, small cotton oil wick on Main Cam, and frictional surfaces will provide the necessary lubrication.

PARTS LIST

DIAGRAM NO.	PART NO.	DESCRIPTION
1	507452	Pick-up Arm, includes Hinge and Shaft (less Crystal Cartridge, Needles, Needle Selector Assembly and springs)
2	507453	Crystal Cartridge (includes Needles)
3	507454	Standard Needle
	507455	"Long Playing" Needle
4	506849	Spring, Lift Adjusting
5	506850	Screw, Lift Adjusting
6	507456	Set Nut for Needle
7	506851	Spring, Needle Pressure
8	506852	Adjusting Washer
9	506853	Tube, Hinge
10	506854	Pin, Hinge
11	506855	Indexing Assembly
12	507457	Crank Assembly
13	506857	Spring, Extension
14	506858	Spring, Index Latch
15	506859	Pin, Index Latch
16	507552	Rubber Drive Belt for Motor
17	*	Pick-up Arm Lift Pin (part of Item 11)
18	*	Pick-up Arm Follower (part of Item 12)
19	*	Index Pin (part of Item 11)
20	507458	Main Cam Assembly (includes attached levers and springs)
21	507555	Spring, Starting Pawl
22	507459	Spring, Trip Latch
23	507460	Trip Release Assembly
24	*	Starting Pawl (part of Item 20)
25	*	Trip Latch (part of Item 12)
26	*	Eccentric (part of Item 20)
27	506864	Eccentric Arm Assembly
28	506865	Drive Crank Nut
29	506866	Tie Bar Assembly
30	506867	Shaft, Front Record Support Arm
31	506868	Shaft, Rear Record Support Arm
32	506869	Record Support Arm Assembly
33	506870	Plastic Cap, Record Support Arm
34	506871	Cap Screw, Record Support Arm
35	507461	Base Assembly (includes Escutcheon and other riveted parts)
36	506873	Escutcheon
37	506874	Spring, Reject
38	506875	Link, Manual
39	506876	Link, Reject
40	506877	Spring, Control
41	506878	Index Bushing Assembly
42	506879	Index Stop and Link Assembly
43	*	Index Stop Lever (part of Item 42)
44	506881	Control Button
45	506882	Control Insert
46	506845	"On-Off" Switch
47	506883	Switch Cover
48	507462	Motor—115 volt, 60 cycle
49	506884	Fibre Washer for Motor Mounting
50	506885	"C" Washer for Motor Mounting
51	506887	Rubber Grommet for Motor Mounting
52	507542	Idler Wheel (includes fibre washer and retaining clip)
53	507543	Center Post Assembly (includes Cam Stop Spring and Roller, Turntable Cam, and Large Ball Bearing)
54	506891	Spring, Cam Stop
55	*	Cam Stop Roller (part of Item 53)
56	506892	Fibre Washer for Center Post Mounting
57	506893	Screw and Lockwasher for Center Post Mounting
58	506894	Large Ball Bearing (at base of Center Post)
59	*	Turntable Gear (part of Item 53)
60	507544	Speed Selector Lever
61	507545	Knob, Speed Selector Lever
62	507546	Needle Selector Assembly
63	507547	Pin for Mounting Needle Selector
64	507548	Sleeve for Mounting Needle Selector
65	507549	End Spring for Mounting Needle Selector
66	507550	Return Spring for Mounting Needle Selector
67	500966	Plug for Phono Input Cable
	501031	Plug for Phono Motor Cable
	507553	Small Ball Bearing (for Pick-up Arm Shaft mounting)
	507551	Pad, Needle Selector
	506895	Turntable
	506842	Rest Post Bumper
	506896	Screw for Mounting Changer
	506897	Spring for Mounting Changer
	506898	Clip for Mounting Changer

**** Not supplied as replacement part***

©John F. Rider

TROUBLE SHOOTING CHART

SYMPTOM	CAUSE	REMEDY
Turntable fails to start after actuating "ON-OFF" Switch (46).	1. No Power.	Check to determine if there is power at the wall outlet by disconnecting radio power cord and connecting a lamp to same outlet.
	2. Idler Wheel (52) not engaging turntable.	Check to see that pivot lever under Idler Wheel (52) is free. Also be sure that spring which pulls Idler Wheel (52) toward Turntable is hooked to motor frame and has sufficient tension.
	3. Defective "ON-OFF" Switch (46).	Check continuity across switch contacts. Replace switch if necessary.
	4. Defective motor.	Check and replace if necessary.
	5. Broken Rubber Drive Belt (16).	If Speed Selector is in "33" position and Turntable fails to rotate, check condition of Rubber Drive Belt and replace if necessary.
	6. Binding in changer mechanism.	For analysis of fault see symptom entitled "Changer stops while changing a record".
Changer refuses to cycle when "START-REJECT" Control Button is operated.	1. Broken or weak Starting Pawl Spring (21).	If the Starting Pawl Spring (21) is defective, the Starting Pawl (24) will not engage the Turntable Gear (59) when the Trip Release Assembly (23) is operated. Replace this Spring.
	2. Bent Reject Link (39).	Rear end of Reject Link (39) must contact side of Trip Release Assembly (23). Straighten Link.
Changer stops while changing a record.	1. Grease on Idler Wheel (52) or Turntable rim.	Clean with Carbon Tetrachloride.
	2. Idler Wheel (52) not engaging Turntable properly.	Check to see that pivot lever under Idler Wheel (52) moves freely. Also be sure that spring which pulls Idler Wheel (52) toward Turntable is properly engaged and has sufficient tension.
	3. Binding in changer mechanism.	Check for binding at points where Turntable Gear (59) engages Main Cam (20); also at base of Center Post Assembly (53). If Tie Bar (29) is bent and is rubbing against changer base, straighten or replace Tie Bar Assembly (29). Make sure Tie Bar (29) does not rub or jam against frame of Center Post Assembly (53). If this condition occurs, proceed as follows: a. Loosen the bolt and Drive Crank Nut (28) at the end of the Eccentric Arm Assembly (27). b. Rotate the Turntable **clockwise** by hand until the changer cycle is completed. c. Move Tie Bar Assembly (29) [Record Support Arm Shafts (30 and 31) and Record Support Arms (32) will also move] until Tie Bar (29) is approximately 1/32" from the frame of the Center Post Assembly (53). NOTE: There are two positions of the Tie Bar (29) at which it may be placed approximately 1/32" from the frame of the Center Post Assembly (53). Set the Record Support Arms (32) for automatic operation. Then make sure that at the proper separation of the Tie Bar and the frame of the Center Post Assembly, the lower blades of the Record Support Arm Assemblies (32) are nearer the Center Post (53) than the upper blades. d. Retighten the bolt and Drive Crank Nut (28), making sure that the flange of the Nut faces toward the Record Support Arm Shaft (31). e. Operate "START-REJECT" Control Button and rotate the Turntable **clockwise** by hand through the changer cycle. If the adjustment has been properly made, the Tie Bar (29) will no longer come in contact with the frame of the Center Post Assembly (53). Lubricate changer mechanism if necessary; see section entitled "Lubrication".
	4. Low line voltage.	Line voltage should not be less than 105 volts.
	5. Weak Motor (48).	If after checking the above items, the changer continues to stall, it may be assumed that the Motor has low torque and should be replaced.

©John F. Rider

MODEL 9000

TROUBLE SHOOTING CHART (Continued)

SYMPTOM	CAUSE	REMEDY
Changer cycles continuously.	1. Bent arm on Trip Release Assembly (23).	If the Trip Release Assembly (23) becomes bent, the Starting Pawl (24) may not become held by this Assembly at the completion of the Main Cam cycle. Straighten or replace Trip Release Assembly (23).
	2. Bent Starting Pawl (24).	If the portion of the Starting Pawl (24) which contacts the Trip Release Assembly (23) becomes bent, the Starting Pawl may not become held by this Assembly at the completion of the Main Cam cycle. Straighten Starting Pawl (24).
	3. Broken or weak Reject Spring (37).	A defective Reject Spring (37) will not return the "START-REJECT" Control Button to its original position and may keep the Trip Release Assembly (23) from engaging the Starting Pawl (24). Replace this Spring.
Changer fails to cycle after playing a record.	1. Bent or broken Trip Latch (25).	The Trip Latch (25) must contact and exert pressure against the serrated edge of the Trip Release Assembly (23) at the end of a record. Straighten Trip Latch or replace Crank Assembly (12).
	2. Broken or weak Trip Latch Spring (22).	A defective Trip Latch Spring (22) will prevent the Trip Latch (25) from contacting the Trip Release Assembly (23). Replace Spring.
	3. Worn serrated edge of Trip Release Assembly (23).	If the serrated edge of the Trip Release Assembly (23) becomes worn, the Trip Latch (25) will not cause the Trip Release to release the Starting Pawl at the end of a record. Replace Trip Release Assembly (23).
	4. Broken or weak Starting Pawl Spring (21).	If the Starting Pawl Spring (21) is defective, the Starting Pawl (24) will not engage the Turntable, Gear (59) when the Trip Release (23) is operated. Replace this Spring.
	5. No eccentric or Spiral groove at center of record.	The Needle (3) must enter the spiral groove at the center of a record before the Trip Latch (25) will operate the Trip Release Assembly (23). Old records which do not have this groove will prevent automatic operation of the changer.
Record drops on one side only during change cycle OR Both sides of record do not drop simultaneously during cycle.	1. Record Support Arms (32) incorrectly adjusted.	Proceed as follows: a. Make sure that the Record Support Arms (32) are set for automatic operation and the changer has completed its change cycle. b. Loosen the three bolts and Drive Crank Nuts (28) that hold the Tie Bar Assembly (29) and Eccentric Arm Assembly (27) to the Record Support Arm Shafts (30 and 31). c. Move the Tie Bar Assembly (29) until it is approximately 1/32" from the frame of the Center Post Assembly (53). NOTE: There are two positions of the Tie Bar (29) at which it may be placed approximately 1/32" from the frame of the Center Post Assembly (53). Make sure that at the proper separation of the Tie Bar and the frame of the Center Post Assembly the Tie Bar (29) extends closer to the front right hand corner of the changer base than in the other position. d. Then, holding the Tie Bar Assembly (29) in place, rotate Record Support Arms (32) and Record Support Arm Shafts (30 and 31) until lower changer blades are pointing in the general direction of the Center Post (53). e. Place a 10" record on the lower changer blades of the Record Support Arms (32) (as done when stacking records for automatic operation) and adjust Record Support Arms (32) so that the **record covers the same amount of space on the two lower blades.** Also, make sure that the nearest portion of the upper changer blades is approximately 5/8" from the edge of the record. f. Retighten the three bolts and Drive Crank Nuts (28). The flange of the Nuts should face toward the Record Support Arm Shafts (30 and 31). g. Operate "START-REJECT" Control Button and rotate the Turntable **clockwise** by hand through the changer cycle. If trouble is not completely corrected, repeat this adjustment but make slight changes in the positioning of the lower changer blades with respect to the 10" record.

©John F. Rider

TROUBLE SHOOTING CHART (Continued)

SYMPTOM	CAUSE	REMEDY
Record fails to drop off Record Support Arms (32) at correct time during change cycle.	1. Record Support Arms (32) incorrectly adjusted.	For proper adjustment, see previous section of "Trouble Shooting Chart" entitled "Record drops on one side only during change cycle OR Both sides of record do not drop simultaneously during cycle".
	2. Record size not standard.	A standard 10" record has a diameter of 9 7/8" ± 1/32 and a standard 12" record has a diameter of 11 7/8" ± 1/32.
Erratic motion of Pick-up Arm (1) in horizontal direction during change cycle.	1. Broken Pick-up Arm-Follower (18).	The groove in the Main Cam (20) directs the motion of the Pick-up Arm Follower (18) and the Pick-up Arm (1) in the horizontal direction. A broken Pick-up Arm Follower (18) eliminates or adversely affects this motion. Replace Crank Assembly (12).
	2. Loose bolt and nut on Crank Assembly (12).	The nut and bolt on the Crank Assembly (12) clamp the Crank Assembly to the shaft of the Pick-up Arm Assembly (1). If the nut and bolt are loose, horizontal motion between these two assemblies will be transmitted by friction only. Retighten according to section of "Trouble Shooting Chart" entitled "Pick-up Arm (1) sets down at wrong starting point on record".
	3. Weak or broken Extension Spring (13).	This spring is a safety device enabling the Pick-up Arm (1) to be moved horizontally beyond its normal operating range without causing injury to the changer mechanism. However, if the Extension Spring (13) is defective, horizontal motion between the Crank Assembly (12) and the Pick-up Arm Assembly (1) will be transmitted by friction only. Replace spring.
Erratic motion of Pick-up Arm (1) in vertical direction during change cycle.	1. Weak or broken Spring for Index Latch (14).	This spring lowers the Indexing Assembly (11) when the Pick-up Arm Lift Pin (17) enters the depression on the outer ridge of the Main Cam. Replace this spring if it is found to be defective.
	2. Weak or broken conical spring on Indexing Assembly (11).	This spring is also instrumental in obtaining proper vertical motion of the Pick-up Arm (1). If this spring is found to be defective, replace Indexing Assembly (11).
Pick-up Arm Elevation is too high or too low during change cycle.	1. Lift Adjusting Screw (5) improperly adjusted.	When Pick-up Arm elevation is incorrect, proceed as follows: a. Put twelve 10" records on the Turntable. b. Slide "START-REJECT" Control Button to the left as far as it will go and then release it. c. Rotate Turntable **clockwise** by hand until Pick-up Arm (1) and Needle (3) approach the stack of records. d. Adjust the Lift Adjusting Screw (5) so that clearance between Needle and top record is approximately 1/8".
Pick-up Arm (1) sets down at wrong starting point on record.	1. Incorrect adjustment of set-down point.	The position at which the Pick-up Arm (1) sets down on a record may be adjusted by means of the Index Bushing Assembly (41). Proceed as follows: a. Set changer for 12" operation and place a 12" record on the Turntable. b. Slide "START-REJECT" Control Button to the left as far as it will go and then release it. c. Rotate Turntable **clockwise** by hand until Pick-up Arm (1) and Needle (3) start to drop down to record. d. Loosen nut on Index Bushing Assembly (41) and adjust screw of this assembly to drop Pick-up Arm and Needle at desired position on record. This position should place the Needle 5-11/16" from the Center Post (53). e. Retighten nut on Index Bushing Assembly (41). If the Index Bushing Assembly (41) does not provide sufficient range for adjustment, proceed as follows: a. Make sure changer has completed its change cycle. b. Loosen nut and bolt on Crank Assembly (12). c. Move Pick-up Arm Follower (18) toward Center Post Assembly (53) as far as it will go. d. Holding the Pick-up Arm Follower in this position, place Pick-up Arm (1) approximately 3/4" from Center Post (53). e. Tighten nut and bolt on Crank Assembly (12). f. Make final adjustment of set-down point using Index Bushing Assembly (41) as explained above.

©John F. Rider

MODEL 9000

TROUBLE SHOOTING CHART (Continued)

SYMPTOM	CAUSE	REMEDY
	2. Weak or broken spring which operates Index Pin (19).	A defective spring which operates the Index Pin (19) will not engage this Pin with the notches on the Index Stop Lever (43). Replace Indexing Assembly (11).
	3. Defective spring which operates lever on inside surface of Main Cam (20).	The lever located on the inside surface of the Main Cam aids in obtaining the proper set-down point for the Pick-up Arm (1). It guides the Pick-up Arm Follower (18) during the final part of the change cycle. If the spring which operates this lever is defective, the Main Cam Assembly (20) must be replaced.
	4. Broken Pick-up Arm Follower (18), loose bolt and nut on Crank Assembly (12), or weak or broken Extension Spring (13).	See section of "Trouble Shooting Chart" entitled "Erratic motion of Pick-up Arm (1) in horizontal direction during change cycle".
Tripping is possible with Control Button in "Manual" position.	1. Bent Starting Pawl (24).	If the portion of the Starting Pawl (24) which contacts the Manual Link (38) is bent, the Starting Pawl will not be kept from engaging the Turntable Gear (59). Straighten Starting Pawl or replace Main Cam Assembly (20).
	2. Bent Manual Link (38).	Rear end of Manual Link (38) must contact flange on Starting Pawl (24) when changer is set for manual operation. Straighten Link.
Improper "tracking" of Needle with record — Needle slips out of grooves and skips portions of record.	1. Incorrect setting of Needle Selector (62).	Make sure that Needle Selector (62) is in the correct position for playing the type of records on the changer.
	2. Foreign matter in record grooves.	Clean record with record brush or soft camel's hair brush.
	3. Badly worn record.	Examine record for scratches that may have destroyed continuity of grooves.
	4. Badly worn Needle (3).	Examine Needle for worn tip and replace if necessary. To remove and replace a worn or damaged Needle, proceed as follows: a. **If Standard Needle is to be removed,** adjust Needle Selector (62) so that the words "78 ONLY" appear at the top. **If "Long Playing" Needle is to be removed,** adjust Needle Selector (62) so that the words "33 ONLY" appear at the top. b. Loosen Set Nut for Needle (6) located directly below Needle. c. Replacement Needles may be obtained by requesting the following parts: Standard Needle.....Part No. 507454 "Long Playing" Needle.....Part No. 507455 **Do not attempt to use a substitute.** d. Insert Needle so that point extends away from Crystal Cartridge (2) and flat surface of shaft is against Set Nut (6). When tightening Nut make sure that Needle remains parallel to sides of Cartridge and point protrudes approximately 1/8" from lower frame of Needle Selector. To eliminate the possibility of installing the Needles in the wrong sides of the Crystal Cartridge, the shaft of the "Long Playing" Needle is painted red.
	5. Incorrect adjustment of Needle Pressure Spring (7).	The pressure that the Pick-up Arm (1) exerts on a record is controlled by the Needle Pressure Spring (7). Using a Needle Pressure Gauge, the needle pressure should be between 8 and 12 grams. To change needle pressure, proceed as follows: a. To decrease needle pressure, place a screwdriver in a notch of Adjusting Washer (8) and turn Washer by moving screwdriver upward. b. To increase needle pressure, place a screwdriver in a notch of Adjusting Washer (8) and turn Washer by moving screwdriver downward. In making this adjustment it will be necessary to disengage Adjusting Washer (8) from lip on Pick-up Arm Hinge (1).

©John F. Rider

TROUBLE SHOOTING CHART (Continued)

SYMPTOM	CAUSE	REMEDY
Slow Turntable speed.	1. Speed Selector (61) in wrong position.	Make sure that Speed Selector (61) is in the correct position for playing the type of records on the changer.
	2. Grease on Idler Wheel (52) or Turntable rim causing slipping.	Clean surfaces with Carbon Tetrachloride.
	3. Idler Wheel (52) not properly engaging Turntable.	Check to see that pivot lever under Idler Wheel (52) is free. Also be sure that spring which pulls Idler Wheel (52) toward Turntable is properly engaged and has sufficient tension.
	4. Binding of drive parts.	Carefully check Center Post Assembly (53) for binding.
	5. Line voltage too low.	Line voltage should not be less than 105 volts.
	6. Operating temperature too low.	If the changer has been stored in a cold room, the Turntable speed may be slower than normal.
	7. Faulty Motor (48).	If, after checking the above six items Turntable speed is still too slow, then it may be assumed that the Motor is at fault and should be replaced.
Rumble or "wow"	1. Changer not floating freely on its mounting springs.	Be sure the four Base Mounting Screws used for mounting the changer have been screwed down as far as they will go.
	2. Improper motor mounting.	Be sure that Motor (48) is mounted on Rubber Grommets (51).
	3. Worn tire on Idler Wheel (52).	Examine Idler Wheel (52) for flat spots on tire and replace Wheel if defective.
	4. Worn Pad for Needle Selector.	A worn Pad will cause the Needle Selector (62) to rest against the Pick-up Arm (1). This will cause "needle talk-back". Replace Needle Selector Pad.

PROCEDURE FOR REMOVAL AND REPLACEMENT OF MAJOR PARTS

NAME OF ITEM	METHOD OF REMOVING OR REPLACING
Needle (3).	To remove or replace a Needle (3), proceed as follows: a. If **Standard Needle** is to be removed, adjust Needle Selector (62) so that the words "78 ONLY" appear at the top. If **"Long Playing" Needle** is to be removed, adjust Needle Selector (62) so that the words "33 ONLY" appear at the top. b. Loosen Set Nut for Needle (6) located directly below Needle. c. Insert Needle so that point extends away from Crystal Cartridge (2) and flat surface of shaft is against Set Nut (6). When tightening Nut make sure that Needle remains parallel to sides of Cartridge and point protrudes approximately 1/8" from lower frame of Needle Selector.
Crystal Cartridge (2).	Remove the two Needles (3). Remove the two screws (and associated nuts and sleeves) which pass through the Needle Selector Assembly (62) and the Cartridge (2). Crystal Cartridge may now be removed by slipping the "quick disconnect" electrical connectors off the prongs at the rear of the Cartridge (2).
Center Post Assembly (53)	Removal of the Center Post Assembly (53), as well as the remainder of the drive mechanism, may be more easily accomplished if the changer has completed its change cycle. Remove the Turntable by lifting it up from changer base. Then remove the three Screws and Lockwashers (57). To disassemble the Center Post Assembly (53), remove the two screws on this Assembly. When reassembling the Center Post Assembly (53), make sure that the Large Ball Bearing (58) is properly seated in the base of the Assembly. To accomplish this, invert the upper portion of this Assembly and place the Ball Bearing (58) in the hollow at the base of the Center Post. Invert the lower portion of this Assembly and slide it over the Ball Bearing (58) as far as it will go. Insert and tighten the two screws. Then remount the Center Post Assembly (53) onto the changer base using the three Screws and Lockwashers (57). If binding occurs after assembly, a. Disassemble and place one drop of good machine oil in base of Center Post Assembly (53). b. If mechanism still binds, remove Assembly. Remove the two screws on this Assembly, rotate the flange on the upper section of the Assembly 180°, and replace the screws.

©John F. Rider

MODEL 9000

PROCEDURE FOR REMOVAL AND REPLACEMENT OF MAJOR PARTS (Continued)

NAME OF ITEM	METHOD OF REMOVING OR REPLACING
Eccentric Arm Assembly (27) and Tie Bar Assembly (29).	After the Center Post Assembly (53) has been removed, loosen the Drive Crank Nut (28) at one end of the Eccentric Arm Assembly (27) and remove the small screw and washer at the other end. The Eccentric Arm Assembly may then be easily removed. After the Eccentric Arm Assembly (27) has been removed, loosen the two Drive Crank Nuts (28) and slide the Tie Bar Assembly (29) off the two Record Support Arm Shafts (30 and 31). When reassembling, make sure that the flanges on the Drive Crank Nuts (28) face toward the Record Support Arm Shafts (30 and 31).
Main Cam Assembly (20).	After the Eccentric Arm Assembly (27) has been removed, the Main Cam Assembly will easily slide off its shaft.
Record Support Arm Assemblies (32) and Record Support Arm Shaft Assemblies (30 and 31).	After the Eccentric Arm Assembly (27) and Tie Bar Assembly (29) have been removed, remove the Record Support Arm Caps (33). The Record Support Arms (32) and Record Support Arm Shafts (30 and 31) are now disengaged from the Base Assembly (35) and may be easily slipped off.
Pick-up Arm Assembly (1).	The Pick-up Arm Assembly (1) should not be removed from the changer unless it is to be replaced. There are 18 Small Ball Bearings around the top of the Pick-up Arm Shaft and 17 Small Ball Bearings in a circular slot near the bottom of the Pick-up Arm Shaft. These Bearings will fall out of their respective positions unless the changer is in a horizontal position when the Pick-up Arm Shaft is removed and unless removal is accomplished with extreme care. To remove the Pick-up Arm Assembly: a. Make sure changer is in a horizontal position. b. Pull Phono Pick-up Cable to obtain "slack" in cable between Pick-up Arm (1) and changer base.
	c. Loosen the bolt and nut on the Crank Assembly (12) and remove the Pick-up Arm Assembly by **carefully** lifting at its base. When reassembling, the Pick-up Arm Shaft (1) must pass through each part of the Crank Assembly (12), and the hinge at the end of the Pick-up Arm (1) must be as close to the pick-up arm post of the Base Assembly (35) as possible.
Indexing Assembly (11) and Crank Assembly (12).	These two assemblies may be removed by loosening the bolt and nut on the Crank Assembly (12) and sliding these assemblies off the Pick-up Arm Shaft (1). **CAUTION: Separation of these two assemblies is not recommended unless one of the assemblies is to be replaced.** The Indexing Assembly (11) and Crank Assembly (12) may be separated by removing the small "C" washer on the Index Pin (19) and the Spring and Pin for Index Latch (14 and 15). When reassembling, **make sure parts of Crank Assembly are in correct order and position.** Hold hinge at the end of Pick-up Arm (1) tightly against pick-up arm post of Base Assembly (35) to prevent the 35 Small Ball Bearings around the Pick-up Arm Shaft from falling out.

DESCRIPTION OF OPERATIONAL CYCLES

Power for the motor is obtained through the on-off switch mounted on the bridge assembly. This switch is operated manually by the control button with positions OFF-MAN-AUT-REJ. This button is located to the left of the record-shelf assembly, on the top of the Record Changer.

The Record Changer has three speeds, controlled by the Speed Selector located to the right of the record-shelf assembly. The positions of the Speed Selector are ST'D PLAY– 45 –LONG PLAY. These speed changes are brought about by the shift lever, which changes the positions of the idler wheel and pulley with respect to the motor shaft.

The changer mechanism of the Record Changer is brought into action when a small retractable gear segment, mounted on the cam gear, is released, and engages the hub gear of the turntable shaft, causing the cam gear to be driven. While a record is playing, the retractable gear segment is held in the retracted position by the trip-plate retaining wall, which engages the roller of the gear segment. The segment is released either manually, by pushing the OFF-MAN-AUT-REJ control to REJ, or automatically, when the changer tone arm reverses direction as the needle follows the eccentric finish groove of a record. For 45 r.p.m. automatic operation, an additional trip mechanism is brought into play. This trip mechanism is actuated by a trip stop, mounted on the trip receiver. When the needle of the tone arm enters the finish groove of a 45 r.p.m. record, the trip stop engages the trip lever, which releases the hammer; this hammer strikes the trip plate, and pushes it aside. The gear segment is then released, as explained above, for either the standard or long-play operations.

The tone arm of the Record Changer is operated by two link assemblies attached to actuator levers, which are in contact with the cam surfaces of the cam gear. When the cam gear starts rotating, the lower actuator lever is pushed outward first, and the link assembly with the long cord attached to it raises the tone arm off the record. As the cam gear continues to turn, the upper actuator lever is pushed outward, and its link assembly pulls the tone arm out against the rest post. At this instant, a roller on the cam gear makes contact with the push-off actuator (which is connected to the record-shelf assembly through a series of push-off bars), and operates the record-dropping mechanism.

After the record has dropped to the turntable, the cam releases the upper actuator, permitting the tone arm to move inward. As the tone arm moves toward the center of the turntable, the index finger engages one of the selectors, which stops the tone-arm travel at a point just above the start groove of the record. Following this action, the lower actuator, which is engaged with the lower cam surface of the cam gear, starts riding inward, relaxing the long cord and link assembly, allowing the tone arm to set down onto the record.

ADJUSTMENTS

INDEXING OR SET-DOWN

7" Record

Set a 7" record on the turntable, push the OFF-MAN-AUT-REJ control to REJ, and rotate the turntable by hand approximately 4½ turns. The tone-arm needle should be approximately ½" above the record at this point. Loosen the clamp screw on the trip arm slightly (figure 9); then hold the tone arm steady, ⅛" in from the edge of the record, and set the trip arm so that the magnetic index stop, Part No. 76-5497, is in contact with the selector hinge (inside selector), Part No. 56-7494, as shown in figure 1. The index stop should engage the selector hinge by a minimum of ⅛".

Tighten the clamp screw, leaving 1/32" vertical play, or clearance, between the trip arm and the base plate.

10" Record

Make the index adjustment for 7" records first. Check 10" indexing by the same method as that outlined above. With the needle point ½" above the record, and ⅛" in from the outside edge, the index stop should be in contact with the middle selector, Part No. 56-7478, as shown in figure 2.

Ordinarily, the 10" index is satisfactory after the 7" index adjustment is made; if not, bend the selector *slightly* to the right or left, as required, for the proper set-down of the needle.

12" Record

Adjust as given above for 10" records, except that the index stop should contact the outside selector, Part No. 56-7478. If the indexing is incorrect, bend the selector hinge *slightly* to the right or left, as required, for proper set-down.

TRIP ACTION

10" or 12" Standard or Long-Play Records

With a 10" or 12" record on the turntable, the Speed Selector set to either ST'D PLAY or LONG PLAY, and the OFF-MAN-AUT-REJ control in AUT position, place the tone arm in the finish, or eccentric, groove of the record. The trip finger, Part No. 56-7486, now rides over the ratchet of the trip plate, Part No. 76-5252, as shown in figure 3. The trip finger should ride at an angle of 25° to 30° with respect to the ratchet. To obtain the correct angle, adjust the screw on the trip receiver, Part No. 56-7491, as indicated in figure 3. Make certain that the vertical center line of the trip finger coincides with the center line of the ratchet. To obtain this alignment, loosen screw "A" slightly, and screw "B" completely, on the trip receiver, and swing the trip receiver to the right or left, rotating about point "A" until the trip finger is centered over the ratchet; then tighten the screws.

When this adjustment is made, care should be taken to prevent the trip receiver from being pulled in toward the trip arm too far, as this will prevent the trip-arm stop from engaging the selector hinge by a minimum of ⅛". A compromise between these two adjustments should be reached.

The index adjustment will be affected when making the above adjustments. Remember that these three adjustments are interrelated, and that, when any one of them is made, the other two should be rechecked.

7" — 45 R.P.M. Records

Place a 7", 45 r.p.m. record, with adaptor insert, on the turntable. Set the Speed Selector to 45, and the OFF-MAN-AUT-REJ control to AUT position. Set the tone arm on the portion of the record which contains the leadin grooves. The mechanism should trip when the needle reaches a point approximately ⅛" from the last groove (which is concentric). If it trips before reaching this point, bend the trip finger, Part No. 56-7486, away from the trip-arm stop. If it fails to trip when this point is reached, bend in the opposite direction.

The trip-arm stop should engage the trip by a minimum of 1/32" in both the horizontal and vertical planes, as shown in figure 3. This may be adjusted by loosening the trip locking screw, and sliding or raising the trip to the desired position.

The horizontal force required to trip the changer and initiate the change cycle should not exceed 2 grams at any turntable speed.

TONE-ARM HEIGHT AND LIFT

With the changer out of cycle, and the tone arm free, set the arm over the base plate. The needle point should be approximately $\frac{3}{16}$" above the base plate, as shown in figure 4. To adjust the clearance, bend the protruding ear of the swivel post (bending the ear upward increases the clearance, downward decreases the clearance), as shown in figure 5. Now raise the tone arm to its maximum height, and place it against the rest post. There should be a minimum of $\frac{1}{8}$" clearance between the lower edge of the tone arm and the top of the rest-post hook. Adjust the ear on the swivel post until a mean is reached between the correct rest-post clearance and base-plate clearance.

TONE-ARM HORIZONTAL AND VERTICAL TIMING

Before making the vertical and horizontal adjustments, make the tone-arm height and lift adjustments described above.

For the vertical timing, start with the changer out of cycle and the tone arm on the rest post, push the OFF-MAN-AUT-REJ control to REJ, and rotate the turntable approximately $1\frac{1}{2}$ revolutions by hand. At this point, the lower eccentric portion of the cam-and-gear assembly, Part No. 76-3995-2, fully engages the lower (vertical) actuator (the actuator with the cord), Part No. 76-5322. Adjust the wire loop of the lower link, Part No. 56-7023, figure 6, by squeezing or opening the loop so that the safety spring is expanded approximately $\frac{1}{32}$". With this adjustment, the ear of the tone-arm swivel post makes firm contact with the lower end of the cutout on the tone-arm pivot assembly.

For the horizontal timing, start as given in the above paragraph. At the same point, $1\frac{1}{2}$ revolutions from the start of the cycle, the upper eccentric portion of the cam gear fully engages the upper (horizontal) actuator, Part No. 76-5323. Adjust the wire loop of the upper link, Part No. 76-7023, with the short cord, figure 6, by squeezing or opening the loop so that the safety spring is expanded approximately $\frac{1}{32}$". With this adjustment, the tone arm should be snug against the rest post, but not so tight as to cause undue slapping as the arm returns to the rest post during cycling.

RECORD SHELF

Set the record shelf to the 10" position, with the changer out of cycle. Loosen the two hex-head drive screws that hold the record-shelf assembly to the changer base plate just sufficiently to allow movement of the record-shelf stanchion. Place the Philco record-shelf gauge, Part No. 45-1672, over the spindle and onto the record shelf, as shown in figure 7. Move the record-shelf assembly away from the spindle until the large, curved part of the gauge drops even with the record-shelf lips. Now push the record shelf and gauge lightly against the spindle, taking out all play toward the spindle; keep the lips of the record shelf in even contact with the edge of the gauge. Tighten the two hex-head screws.

PUSH-OFF

With the changer out of cycle, push the OFF-MAN-AUT-REJ control to REJ, and rotate the turntable 2 revolutions by hand. At this point, the push-off actuator, Part No. 56-4588, is in its most forward position, in contact with the roller on the cam gear. Loosen the push-off-bar locking screw (indicated in figure 3) slightly (just sufficiently to allow adjustment), and squeeze the push-off ears toward each other until the slide plate on the record shelf extends between $\frac{1}{64}$" and $\frac{1}{32}$" beyond the lips of the shelf. Tighten the hex-head push-off-bar screw.

NEEDLE PRESSURE

Use the Philco gram scale, Part No. 45-9531. Calibrate the scale to zero by holding it upright for vertical measurement, and setting the pointer to the center line of the scale. The center is the "0" point, and each small division on either side of "0" is equal to one gram.

After the scale has been calibrated to zero, hold the scale perpendicularly to the tone-arm head, and support the tone arm by placing the standard-play needle in the hole at the end of the gram-scale arm, as shown in figure 8. By lifting the gram scale carefully, raise the tone arm approximately $\frac{1}{2}$", and note the reading. Then lower the tone-arm, and note the reading. The average of these two readings is the needle pressure, which should be between 7 and 9 grams. The pressure is adjustable by bending the ear at the rear of the tone arm to which the tone-arm spring is anchored, as shown in figure 9. Bending the ear so as to stretch the spring decreases the needle pressure; bending so as to relax the spring increases the needle pressure. If the needle pressure is out of tolerance, make the above adjustments gradually, and recheck after each change, as a small movement gives a rather large variation in needle pressure.

When making this adjustment, be careful not to bend or distort the bracket. If this bracket is deformed, the needle pressure on the last record of a stack will differ from the needle pressure on the first record. When the proper needle pressure is attained, the upper edge of the ear should be parallel to the rear, lower edge of the tone-arm shell. If the bracket was bent while adjusting the ear, gently pry down or push up the bracket (applying even pressure on both sides) until the ear and tone-arm shell are in proper relationship.

VERTICAL FRICTION

To measure the vertical friction, take two gram-scale readings as explained above under **NEEDLE PRESSURE**. One-half of the difference between the two readings is the vertical friction, which should not exceed 1.5 grams.

HORIZONTAL FRICTION

Calibrate the gram scale by laying it flat, face-up. Set the pointer to zero (center mark).

Place a counterweight on top of the rear end of the tone arm, with the changer out of cycle; move the counterweight until the tone arm is balanced horizontally, and the needle point clears the turntable. Hold the gram scale face-up, place its pointer against the side of the pickup, and slowly move the gram scale so as to push the tone-arm horizontally with the pointer, as shown in figure 10. Note the reading of the gram scale while moving the tone arm throughout its entire travel (outside the trip range). At no time should the horizontal friction (the force required to move the tone arm) exceed $1\frac{1}{2}$ grams, nor be less than $\frac{3}{4}$ of a gram.

Note: Whenever any repairs or replacements are performed, all adjustments should be checked, and any necessary adjustments made. When making adjustments, check the lubrication at all points indicated in the LUBRICATION section, and lubricate where necessary, after cleaning off old and excess grease with a soft brush and carbon tetrachloride.

LUBRICATION

When the Record Changer is brought in for service, it should be well cleaned with a fine brush and carbon tetrachloride. Remove the needle guard and clean out accumulated dust with a fine brush. Remove all dirt and old grease and oil. When applying new grease and oil, use it sparingly. Lubrication points are shown in figures 11 and 12. It may be necessary to remove some parts and assemblies in order to properly lubricate them. For example, the cam gear and actuator levers should be removed to lubricate the cam-gear spindle and the actuator stud. The lubrication points that cannot be reached without some degree of disassembly are indicated in the following list with an asterisk, and are also indicated in the breakdown views of their respective assemblies.

LUBRICANTS

Oil—S.A.E. 20
Grease—Texaco Motor Cup Grease (unless otherwise specified)

PARTS NOT TO BE LUBRICATED

The following parts should not be lubricated at any time:
Trip receivers
Trip fingers
Selector assembly (except specific points indicated)
Ratchet portion of trip plate
Trip-latch assembly
Idler tire
Drive belt
Drive-pulley shaft

PARTS TO BE GREASED

Record-Shelf Assembly

Top of push-off saddle
Each of four cast lugs on 10" shelf where pin is inserted and where hold-down pivots*
Loops of hold-down springs where hooked to 10" hold-down and 7" record shelf*
Points of contact of record shelves where push-off blades ride*
Control button fulcrum points*

Bridge Assembly

Three dimples and two upturned ears
End and detent notches of control slider

Cam Gear

Between roller and gear surface
Gear teeth and two lateral cam surfaces
Upper cam surface where selector hinge rides*

Main Assembly

Push-off bar where it connects to its actuator
Push-off actuator where its dimples slide on base plate
Speed Selector ears where they slide on base plate
Speed Selector cam slot, detent surfaces, and pivot point
Selector hinge where ears slide on base plate
Turntable shaft at upper outside bearing *only**
Detent assembly; to roller stud, ear, and sliding guide surfaces
Trip actuator, to three guide surfaces and ear operating reset lever
Actuator spindle*
Horizontal actuator bushing, outside*
Vertical actuator bushing where trip reset arm rides

Tone Arm

Point of shaft and where it rotates in tone-arm stanchion

Motor Assembly

Cam surface of idler-wheel lifter
Detent surfaces
Guide slots of shifter plate
Extension of idler shaft in contact with lower shifter plate

PARTS TO BE OILED

Tone-arm pivot pin*
Trip-plate bushing (inside)*
Spindle; where spindle slides in hole in the bridge, and where it engages the upper bearing of turntable
Cam-gear spindle*
Roller on gear segment

Motor Assembly

Idler support shaft
Idler shaft
Slider bar; four points
Two shift roller pins
Under pivot bushing of shifter plate*
Pulley shaft (remove pulley)*

CAUTION: When lubricating the motor, remove the rubber belt and idler wheel. When lubrication is completed, be sure the motor shaft and pulley are free from oil and grease. Failure to observe this precaution may result in slippage.

GRAPHITE

Powdered graphite should be applied to the ear of the selector plate in the brass shifter bushing.

PETROLEUM JELLY (or DOW CORNING "DC-4")

Apply to the contacts of the cartridge contact plate, and to the dimple of the cartridge retaining spring.

SERVICE NOTE: After long usage, the push-off bar may develop squeaks while cycling. If this is encountered, the following points should be greased sparingly.

Both ends of return spring
Fulcrum of push-off rod
Point of contact between push-off bar and hanger
Where hanger pivots in fulcrum plate
Where push-off rod rides in push-off bar

UNEVEN TURNTABLE SPEED (WOWS)

Uneven turntable speed may be caused by the following conditions.

1. Dirt under and around the idler-wheel assembly.
2. Idler-wheel spring loose or missing.
3. Flat spot on idler-wheel tire or on turntable.
4. Loose or worn pulley belt.
5. Oil or grease on idler-wheel tire, pulley, or drive shaft.

©John F. Rider

REPLACEMENT OF PARTS AND ASSEMBLIES

The following procedures are recommended for the correct removal of parts and assemblies. The parts should be replaced by reversing the order of removal. Adjustments should be made according to the directions given in the ADJUSTMENTS section of the manual.

1. Crystal

Grasp crystal with fingernails. With the other hand, hold tone arm and apply slight pressure on switch lever. Pull down and to the outside. Replace by holding crystal contacts toward spindle, and pushing upward until firmly seated.

2. Needle

Remove crystal (see paragraph 1). Gently lift out with prying motion, using fingernail or knife point. When replacing needle, align key of needle shaft with keyway in chuck of cartridge, then push needle into cartridge.

3. Spindle

Remove cotter pin from lower end, and pull spindle out. The turntable may now be lifted off.

NOTE: When replacing the turntable, position the speed-control button midway between LONG-PLAY and 45. Hold the idler wheel back toward the center while positioning the speed control until the idler stays retracted. Then replace turntable. This method will *prevent damage* to the *idler-wheel tire.*

4. Tone-Arm Assembly

a. Place changer in MAN position.
b. Unsolder the four tone-arm leads from terminal panel.
c. Remove vertical actuator safety spring from long cord
d. Loosen trip-arm clamp screw
e. Lift out tone arm. Figure 13 shows tone-arm assembly

NOTE: When the tone arm is replaced, be sure to maintain $\frac{1}{32}$" vertical play between the trip arm and the fiber washer.

To insure proper tone-arm damping, be sure that the tone-arm damper is firmly seated in its proper position. Also, the lead washer under the adjusting screw of the trip receiver should never be replaced with a substitute; if it is necessary to replace it, use lead washer, Part No. 8W51958.

5. Trip-Arm Assembly

a. Loosen clamp screw.
b. Raise tone arm sufficiently to clear trip arm.
c. Remove trip arm, and disengage link spring. Figure 14 shows trip-arm and trip-receiver assemblies.

NOTE: When reassembling, maintain $\frac{1}{32}$" vertical play.

6. Motor Assembly

a. Remove spindle and turntable (see paragraph 3).
b. Unsolder motor lead from switch on bridge assembly.
c. Remove ground wire from terminal panel.
d. Remove the three hex-head screws, washers, and spacers from motor frame.
e. Slide jaws of speed-shift lever free of brass spacer and ear of speed-change actuator plate.
f. Lift motor out. Figures 15 and 16 show motor assemblies.

7. Speed-Change Assembly

a. Remove "E" washer and washer from actuator shaft.
b. Remove "E" washer and detent spring from selector-lever shaft
c. Lift off trip actuator.
d. Remove lower "E" washer from selector shaft.
e. Rotate selector lever until ears clear cutouts of base plate, and brass spacer comes free from motor shift lever.
f. Lift selector lever upward and off.
g. Disengage link from control button. Figure 17 shows speed-change assembly.

8. Tone-Arm-Actuator Levers

a. Remove "E" washer from actuator shaft; lift trip actuator off, and push to one side.
b. Remove long spring from reset lever, and lift off.
c. Remove small "E" washer from actuator shaft (above main plate), and remove inner actuator shaft.
d. Disengage link from vertical actuator.
e. Remove spacer, and swing horizontal actuator away from cam gear; slip off from actuator stud, and disengage link. Figure 17 shows actuator assembly.

9. Push-Off Actuator

a. Remove tone-arm actuators (see paragraph 8)
b. Remove return spring from push-off bar.
c. Disengage push-off bar from its actuator.
d. Rotate actuator until its ears clear cutouts in base plate. Lift off. See figure 17.

10. Bridge Assembly

a. Remove mounting plate and hammer-actuator springs.
b. Remove "E" washer, curved washer, and spacer from cam-gear shaft.
c. Lift hammer, hammer bushing, spacer, mounting plate and trip-latch assembly, and mounting-plate bushing from shaft.
d. Remove hex-head screw holding spindle spring and bridge to turntable-bearing bracket.
e. Lift bridge off, and disengage control link from slider control bar. See figure 18.

11. Cam-Gear Assembly

a. Remove bridge (see paragraph 10)
b. Remove "E" washer, and lift off trip plate
c. Remove "E" washer and spacer.
d. Slide cam gear from spindle. Figure 18 shows cam-gear assembly.

12. Selector Assembly

a. Remove cam-gear assembly (see paragraph 11).
b. Remove hex-head screws holding selector bracket.
c. Remove index lever, index-lever spring, and selector-hinge spring.
d. Lift out entire assembly. Figure 19 shows selector assembly.

13. Push-Off and Shelf Assembly

a. Remove push-off return spring, push-off bar, and hanger.
b. Remove selector-link bar from selector lever, then disengage from control button.
c. Remove the two hex-head screws holding stanchion.
d. While lifting assembly free of base plate, rotate, and disengage control link.
e. Remove the three speed nuts holding fulcrum plate.
f. Slide control-button shaft from fulcrum plate, and remove plate and control buttons.
g. Remove spring ring, spring-retaining washer, and heavy spring.

CAUTION: Use due care—the heavy spring may fly out.

h. Remove shelf and push-off assembly from stanchion. Figure 20 shows record shelf and push-off assemblies.

14. Push-Off Blades

a. Remove the two Phillips-head screws from bottom of 10"-12" record shelf, and the one Phillips-head screw from the top. Lift off cover.
b. The 10"-12" push-off blade, the push-off rod, and the 10"-12" hold-down and springs may now be removed.
c. Remove the two small Phillips-head screws from top of 7" cover. Remove cover.
d. The hold-down spring, 7" hold-down, ball bearing and push-off spring, push-off blade, and push-off return spring may now be removed.

Trav-ler Record Changer Model A

OPERATION OF RECORD CHANGER

For 10" records the long side of the record shelf (11) must be turned counterclockwise (Fig. 6) so that it points toward the spindle (47).

For 12" records, the short side of the record shelf (11) must be turned counterclockwise so that it points toward the spindle (47).

In either case, always turn the record shelf counterclockwise until a click is heard. This will be the 10"-12" index lever (9) engaging one of two slots on the 10"-12" index cam. (12). This insures correct positioning of the mechanism during cycling or playing.

Lift the record holddown plate (20) Fig. 6 to the rear of the record shelf (11)(if it is not already there) and place two or three records on the spindle (47) and record shelf (11). Return the record holddown plate (20) so that it rests on the records holding them in place.

Turn the control knob (29) to the Reject position and hold momentarily. Release the control knob (29) and it will return to the ON position for automatic operation.

If the mechanism is working properly more records may be added.

This changer was designed to play automatically 12 - 10" or 10 - 12" standard records not mixed, and to operate on 115-117 volts 60 cycles.

CYCLE OF OPERATION

Drawings A through 5 show Trav-ler Model A Record Changer progressing through a complete cycle of operation.

Fig. A shows the bottom view of the Record Changer with the drive wheel and belt in place. Fig. B shows the bottom view of the Record Changer with the drive wheel and belt removed and the main cam (40) in place. All parts visible from the bottom of the Record Changer are labeled in these 2 drawings.

If Figs. 1 through 5, the drive wheel (41) and main cam (40) have been omitted for sake of clarity and to show operation of otherwise hidden parts. The main cam, however, has been shown in these drawings as a dotted line to illustrate its position.

Only those parts are labeled in Figs. 1 - 5B which are operative or referred to in that particular phase of cycle. Figs. 1, 1A, and 1B illustrate the parts of the Record Changer in the OFF or normal position.

To start the change cycle, turn the control knob (29) to the Reject position as shown in Fig. 2A. Release the control knob and it will automatically return to the ON position as shown in Fig. 3A.

This causes the reject arm actuating lever (26 Fig. 2) to move to the left, causing the reject arm (35 fig. 2) to pivot and push the ON -

© John F. Rider

MODEL A

OFF switch (22 Fig. 2) to the ON position. And at the same time point A of the reject arm (25 Fig. 2) pushes against the release arm (35 Fig. 2) releases its hold on the cam pawl (39 Fig 2C) allowing it to drop down and engage the raised portions of the drive wheel (41 Fig. 2C). The drive wheel is driven by the drive belt (42) and drive pulley (46 Fig. A).

This section starts turning the main cam (40 Fig. B). The pickup arm lift (56 Fig. 3B) which normally rests in the depression (point C) in the top of the main cam (40 Fig. 3C) is forced out of the depression and rides around the flat surface of the cam for the duration of the change cycle. At the same time, the pickup arm lift (56) forces the pickup arm (62 Fig. 3B) upward. And the cam follower (14, point D, Fig. 3) in following the inside contour (E Fig. 3C) of the main cam moves the pickup (62 Fig. 3A) away from the turntable (54 Fig. 3A) so that a record will be free to drop. (Assuming start of new cycle.)

As soon as point F of the main cam (40 Fig. 3C) moves against the ejector roller (15 Fig. 3) the roller is forced away from the main cam and the roller shaft (15) see exploded view) in turn forces the ejector plate (16) Fig. 3A and 6 forward and pushes a record off the record shelf (11 Fig. 4A).

As the main cam (40 Fig. 3) continues to turn, the tension of the ejector spring (31 Fig. 3) forces the ejector roller (15) to follow the outside contour of the main cam (40 Fig. 4). This allows the ejector plate (16 Fig. 4A) to return to its normal position.

Near the end of the change cycle as the cam follower (14, point D, Fig. 4) reaches point G of the inside contour of the main cam (40 Fig. 4C), the pickup arm starts moving toward the turntable (54 Fig. 4A), and when it is directly over the starting point of the record, the main cam (40 Fig. 4C) moves until the depression, C, in the main cam, is directly under the pickup arm lift (56 Fig. 4B), which causes the pickup arm (62 Fig. 4B) to lower onto the record.

As the main cam (40 Fig. 4) ends its' revolution, the cam pawl (39 Fig. 4D) comes in contact with point B on the release arm (35 Fig. 4) and is lifted up from contact with the drive wheel (41 Fig. A also Fig. 4D) and thereby stopping the main cam in its original position.

The pickup arm is now free to move across the record.

Fig. 5 shows how the pickup trip arm (13) has followed the pickup arm (62 Fig. 5A) as it moved across the record. The pickup arm is at the end of the record and the serrated end of the pickup trip arm has moved against the release arm tension bracket (33 Fig. 5). (Also see 33 on exploded view). The backward and forward movement caused by the grooves at the end of the record forces the release arm tension bracket (33 Fig. 5) to pivot, and the pivot point applies pressure to the release arm (35 Fig. 5) forcing it away from the cam pawl (39 Fig. 2C) allowing the cam pawl to drop and engage the main drive wheel (41 Fig. 2C), thereby starting another change cycle.

SYMPTOMS	CAUSES	REMEDIES
1. Changer continues to cycle	1. Release arm spring (37) weak or lost 2. Reject Arm (25) binding 3. Release arm (35) bent 4. Actuating lever shaft (27) binding	1. Replace Spring 2. Oil lightly at pivot pin 3. Straighten until parallel with changer base plate 4. Remove control knob and oil shaft lightly
2. Mechanism does not trip at end of record	1. Pickup trip arm (13) is bend downwards	1. Straighten trip arm until parallel with changer base plate
3. Pickup arm moves a short way in on record then jumps a groove	1. Pickup trip arm (13) is bent upwards	1. Straighten trip arm until parallel with base plate
4. Wow or motor rumble	1. Worn spots in idler wheel (6) 2. Oil on idler sheel (6) and turntable rim 3. Warped record	1. Replace idler wheel or if spots are too deep try sanding the wheel smooth 2. Clean idler wheel and turntable rim
5. Change cycle is too slow or motor overheats	1. Moving parts binding 2. Line voltage incorrect 3. Defective motor winding 4. Drive belt slipping	1. Locate part and oil lightly 2. 115-117 Volts 60 cycles 3. Replace motor 4. Clean belt, pulley and drive wheel if oily. Replace belt if not oily
6. Pickup arm lands too far in on record or	1. Ball detent is not in detent slot Fig. 7	1. Hold the pickup arm part (55) stationary and move the pickup arm until the ball detent Fig 7 engages the ball detent slot
7. Pickup arm does not lower enough to reach the record	1. The pickup arm lift (56) is bent upwards	1. Bend the pickup arm lift (56) down slightly and try the changer each time until the proper angle is obtained
8. Turntable will not start	1. A break in the line cord 2. Defective power plug 3. Defective switch 4. No voltage at power outlet 5. Burned out motor	1. Replace 2. Replace 3. Replace 4. Check fuse box 5. Replace
9. Distorted sound	1. Audio Amplifier defective 2. Word needle 3. Defective crystal cartridge 4. Worn record	1. Check with radio reception or check audio amplifier 2. Replace needle 3. Try new cartridge 4. Check with new record
10. No Sound	1. Defective crystal cartridge 2. Loose connection between crystal and audio amplifier 3. Defective Audio Amplifier	1. Replace 2. Make continuity and short check 3. Make conventional voltage, resistance and tube check

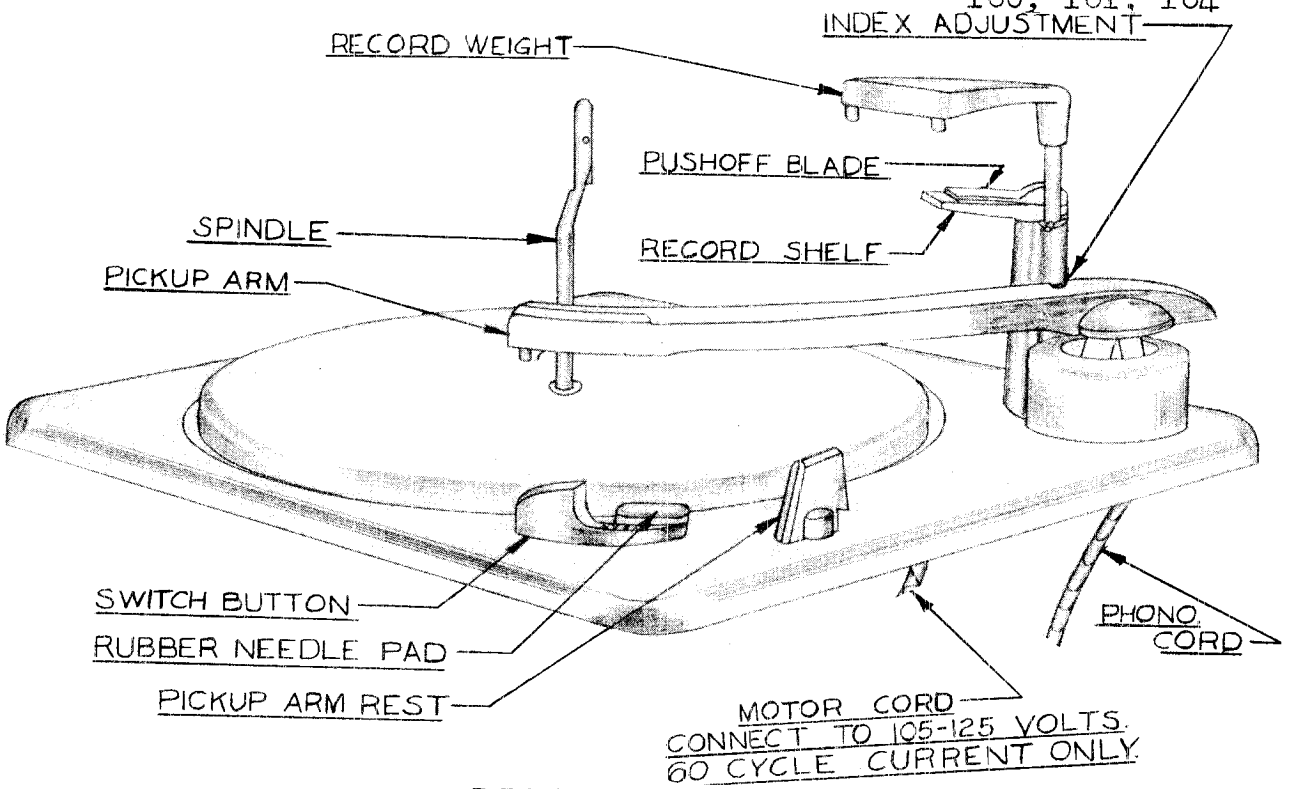
MODELS 133-6, 146, 160, 161, 164



DESCRIPTION

The Webster-Chicago Model 146 is a single post, spring-cushioned spindle, automatic record changer. Simple in design and operation, it provides manual or automatic playing of a 1" stack of 10" or 12" records with a minimum of waiting time between records during automatic operation. When set for automatic operation, Model 146 returns the pickup arm to the rest position after the last record, although the motor continues to revolve until attended.

Model 146 features the exclusive Webster-Chicago Velocity Trip mechanism. The pickup arm is not actuated by "lead-in" springs and there is a minimum of lateral pressure. The arm travels freely in either direction. This lack of lateral pressure or inertia add immeasurably to the life of records and is considered to be as important as extra light vertical pressure, which in some instances would result in poor tracking at extremely low or high frequencies. This free floating arm permits "home recordings" or "inside out" records up to 12" size to be played manually.

Model 146 will change warped or rough-edged records, at the same time assuring maximum protection to the finest discs.

©John F. Rider

MODELS 133-6, 146, 160, 161, 164

OPERATION

MOTOR

Connect the motor cord to a source of 105-115 volt 60 cycle current only. If it is desired to operate the changer on 50 cycle current, a special motor pulley (Part No. 17X412-11) must be used in place of the one supplied with the changer in order to drive the turntable at the required speed of 78 R.P.M.

Do not under any circumstances connect the motor to a source of direct current or alternating current of any other frequencies.

PICKUP

The high impedance crystal cartridge supplied may be of the fixed permanent point or removable needle type. If it is the latter, use a needle which is not more than $1\frac{1}{16}$ inches long for most satisfactory results.

Some desirable qualities of a good needle are faithful reproduction, low surface scratch or hiss, long wearing qualities, minimum record wear and rugged construction.

The Webster-Chicago Nylon Needles are particularly adaptable for use with your Webster-Chicago "146" Do not use single play or cactus needles for automatic operation. Such needles require frequent replacement or sharpening and are not designed to play a full stack of records.

OPERATION — AUTOMATIC

1. Turn the Record Shelf forward or back for ten or twelve inch records.
2. With the record ballast weight lifted and turned forward out of position, place up to a 1" stack of 10" or 12" records on the spindle so that the bottom record rests on the step of the spindle and on the Record Shelf.
3. Turn the record ballast weight and lower it until it rests on the top record.
4. Move the control knob from the STOP position (nearest the pickup arm rest) to the START-REJECT position (farthest from the pickup arm rest) and release. The control will then drop back into the automatic playing position and the mechanism will continue to operate automatically until the last record is completed. The pickup arm will then return to the "rest" position and the motor will continue to revolve until the control knob is returned to the STOP position.
5. To reject any record while playing in the automatic position, move the control knob momentarily to the START-REJECT position and release.

NOTE: The mechanism may be turned off at any time or during any portion of the change cycle by moving the control knob to the STOP position.

The pickup arm may be moved horizontally at any time without damage to the mechanism. However, the pickup arm cannot be returned to the pickup arm rest until the change cycle has been completed.

After the last record has been played, the entire stack may be removed from the turntable at one time. The simplest procedure is as follows:

a. Place the pickup arm on the pickup arm rest.
b. Lift and turn the record ballast weight out of position.
c. Place the fingers of both hands under opposite edges of the bottom record.
d. Do not apply pressure to the top record. (Keep your thumbs free.)
e. Lift the stack of records straight up following the contours of the spindle. This permits the stack of records to follow the curve of the spindle without binding and greatly facilitates the removal of the stack.

OPERATION — MANUAL

1. Turn the Record Shelf to the TWELVE inch position (this is not essential but permits more clearance in loading and unloading records.)
2. Place a record on the turntable.
3. Move the control knob from the STOP position to the AUTOMATIC position, then toward the spindle to the MANUAL position, as indicated by the arrow on the control knob.

   No harm will result if the knob is accidentally moved to the START-REJECT position. If a twelve inch record is on the turntable, the arm will automatically index to the edge of the record. If a ten inch record is on the turntable, the needle will be set down gently on the rubber pad and the arm may be moved to the edge of the record.
4. Place the needle gently on the edge of the record. Particular care should be exercised if your pickup has a sapphire point needle. Although the sapphire is very hard and long wearing, it is extremely brittle and may be fractured or chipped if dropped on the record
5. To stop the mechanism at any time, move the control knob to the STOP position.

©John F. Rider

MODELS 133-6, 146, 160, 161, 164

SERVICE INFORMATION

All units are accurately adjusted, lubricated and tested at the factory. However, service repairs and adjustments sometimes become necessary. This bulletin should be studied carefully before making any adjustments or replacing parts.

The functions and most probable misadjustments of the main assemblies are as follows (reference numbers refer to the exploded views

THE AUTOMATIC TRIP FAILS TO FUNCTION

The Main Cam Assembly (32) and Actuating Gear (31) are the heart of the record changer. The Main Cam Assembly drives the mechanism associated with the action of the Pickup Arm (7) and the Record Selector assemblies. It, in turn, is driven by the gear train (28, 29, 30) and the Turntable which is rim driven by the phonograph motor.

The Main Cam Assembly and Actuating Gear is put in motion or "tripped" by means of the "automatic" trip or by the manually operated "reject" trip. When the movement of the Pickup Arm toward the spindle is greater than 1/8" in 1/2 revolution of the turntable, the Automatic Trip Arm (35) trips the Velocity Trip and Roller Assembly (33). This releases the Actuating Pawl on the Main Cam Assembly (32), allowing it to engage the Main Cam Actuating Gear (31) and driving it through the change cycle. The pressure from the Automatic Trip Arm required to actuate the trip mechanism is negligible.

The Automatic Trip Arm follows the movement of the Pickup Arm through a weighted friction clutch (34). This clutch must be kept free of oil and grease. If the clutch does not cause the Automatic Trip Arm to trip the mechanism, clean the clutch parts with carbon tetrachloride. This clutch should operate the trip mechanism without placing undue drag on the movement of the pickup arm.

Also check for:

1. Velocity Trip and Roller Assembly (32) binding.
2. Slight burr on end of the Actuating Pawl or on the underside of the hook end of the Velocity Trip and Roller Assembly.
3. Actuating Pawl stuck (part of Main Cam Assembly (32) engaged by the hook end of the Velocity Trip and Roller Assembly (33).
4. Automatic Trip Arm (35) bent and not hitting the Velocity Trip and Roller Assembly (33).
5. Automatic Trip Arm (35) fails to touch the Velocity Trip and Roller Assembly.
6. Velocity Trip and Roller Assembly (33) rubbing on the underside of the Main Cam Actuating Gear (31).
7. No velocity lead-in groove or eccentric groove in the center of record.

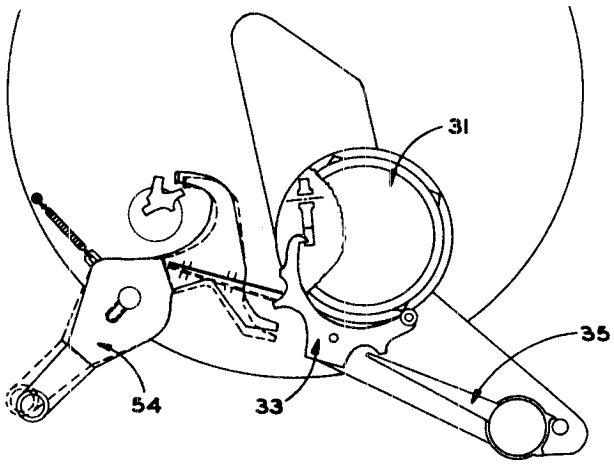


Fig. 1

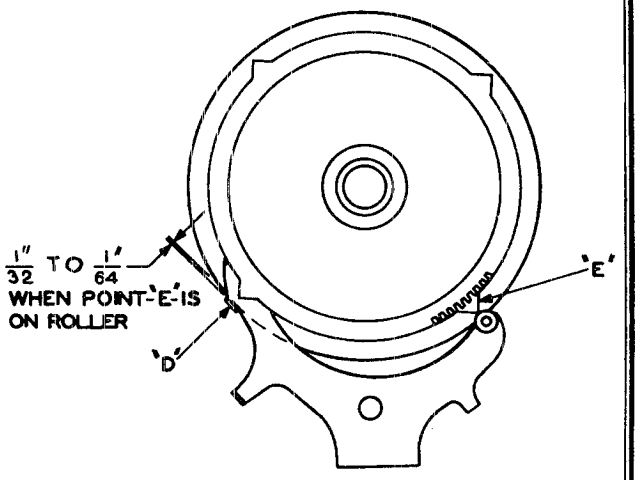

ADJUST IF NECESSARY BY BENDING AT POINT "D"

Fig. 2

©John F. Rider

MODELS 133-6, 146, 160, 161, 164

8. Foreign matter in record groove.
9. Badly worn record.
10. Badly bent or worn needle.

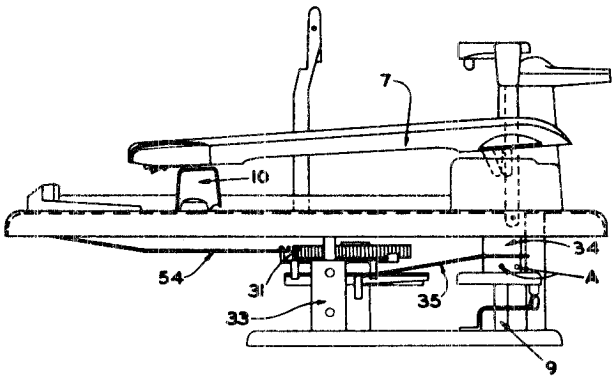

Fig. 3

IF THE "REJECT" TRIP FAILS TO FUNCTION

When the control knob is moved to the extreme START-REJECT position, the hair spring of the Reject Trip Lever Arm (54) actuates the Velocity Trip and Arm Assembly, putting the change mechanism in cycle. See Fig. 1.

Check for:

1. "Reject" trip hair spring of Lever 54 bent or broken.
2. Velocity Trip and Roller Assembly (33) binding.
3. Actuating Pawl stuck (part of Main Cam Assembly 32).

IF THE MECHANISM CONTINUES TO CYCLE

At the completion of the change cycle, the Actuating Pawl is disengaged from the Main Cam Assembly Actuating Gear by the hook end of the Velocity Trip and Roller Assembly, which has been returned to its normal position by the reset points on the Main Cam Drive Gear, Fig. 2.

If the clearance between the lip on the Velocity Trip Lever and the edge of the Main Cam is too small, it will prevent the hooked end of the Velocity Trip Lever from engaging the trigger. Adjust the clearance between the lip ("D" of Fig. 2) on the Velocity Trip Lever and the Main Cam to be within $\frac{1}{32}$" and $\frac{1}{64}$" when the roller is contacting the point of one of the reset points on the Actuating Gear

Also check for:

1. Velocity Trip and Roller Assembly (33) rubbing on Main Cam Actuating Gear (31).
2. Manual Trip Lever (54) binding.
3. "Disengage Roller" broken on Velocity Trip and Roller Assembly (33).

PICKUP ARM LIFT TOO HIGH OR TOO LOW

The vertical movement of the pickup arm is controlled by the angle of the pickup arm raising lever (37 and Fig. 4). The needle should approach the top record of a full stack of 10" records on the turntable with approximately $\frac{1}{16}$" clearance.

To adjust:

1. Put a full stack of 10" records ON THE TURNTABLE.
2. Trip the "Start-Reject" control and rotate the turntable clockwise until the needle clears the top record of the stack by about $\frac{1}{16}$"
3. Be sure the notch in the pickup arm raising disc engages the pickup arm raising lever.
4. If the needle does not clear the top record or if it raises too high, adjust by bending the pickup arm raising lever (37) at points X and Y as indicated in Fig. 4.

CAUTION: All adjusting bends should be made slowly, using slight but firm, easy pressure.

Be sure the set screws in the Pickup Arm Raising Disc (36) are not loose and are properly positioned in the alignment holes as explained in the paragraph on Needle Setdown Indexing.

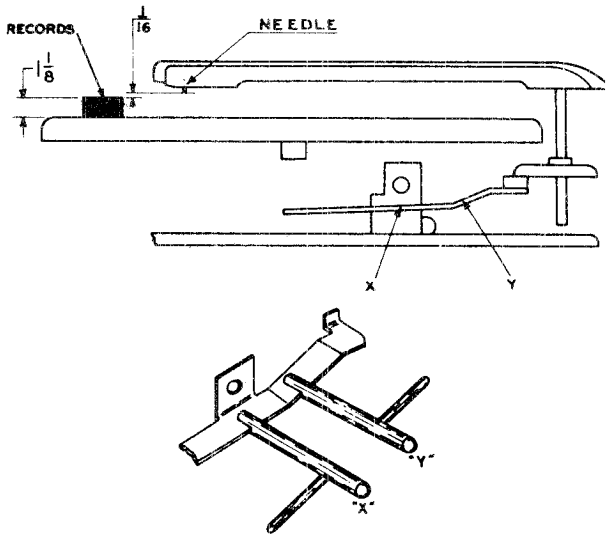

Fig. 4

©John F. Rider

NEEDLE SET DOWN INDEXING INCORRECT

The horizontal movement of the pickup arm (7) is controlled by the eccentric excursion of the Pickup Arm Raising Lever (37) moving the Pickup Arm Raising Disc (36) when actuated by the Main Cam Assembly (32). The eccentric screw (part of 8). accessible through the top of the pickup arm (7), should take care of any normal position adjustment. Turn this screw clockwise to index the needle in toward the spindle and counter-clockwise to index the needle out away from the spindle.

Should further adjustment be necessary, proceed as follows:

1. Set the eccentric screw, just mentioned, to a middle position.
2. Set the Record Shelf (4) to the 10" position.
3. Operate the mechanism by revolving the turntable manually until the needle drops to within $\frac{1}{8}$" of a ten inch record on the turntable.
4. Be sure the notch in the Pickup Arm Raising Disc (36) engages the Pickup Arm Raising Lever (37).
5. The No. 8 Bristol set screws "A" of the Pickup Arm Raising Disc (36, Fig. 3) have pointed ends which fit into off center holes in the Pickup Arm Pivot (9). Alternately loosen one screw and tighten the other until the needle rests above the record lead-in groove at the desired point. Be sure that both set screws are tight when this adjustment is completed.
6. Complete the change cycle of the mechanism and place the pickup arm on the Pickup Arm Rest (10). The tongue of the Pickup Arm Raising Disc (36) should now rest against the post which supports the sub plate assembly. If the pickup arm does not rest in the proper position on the pickup arm rest, bend the tongue closer to or away from this post until the pickup arm is correctly positioned.

   REMEMBER: Always slight but firm, easy bends!
7. Turn the Record Shelf to 12" and check the needle drop on a twelve inch record. Make any additional adjustments with the eccentric screw mentioned previously.

PICKUP ARM DROPS OFF REST

The upturned end of the Pickup Arm Pivot Shaft Bracket (Fig. 3) prevents the Pickup Arm from falling off the Pickup Arm Rest. There should be $\frac{1}{64}$" clearance between the tongue of the Pickup Arm Raising Disc (36) and the bottom of the groove formed by the Bracket and the Base Plate Post. Bend the Bracket end up or down to secure proper positioning of the Disc tongue and the Pivot bracket. Be careful to bend the end only or the Bracket will bind on the Pickup Arm Pivot Shaft. The Bracket should not be too high or the Disc tongue will rub on it when the needle approaches the edge of a 12" record, causing "glide in" on the first few grooves of the record.

ERRATIC INDEXING

Indexing in either the 10" or the 12" position is controlled through the presence or absence of pressure from the Compression Spring (45), on the Pickup Arm Raising Lever bracket, forcing the stud to travel the inside edge or the outside edge of the groove in the bottom of the Main Cam. The compression on this spring is changed as the Record Shelf is changed from the 10" to the 12" position. Improper adjustment of the spring tension will result in erratic indexing.

In the 12" position, the spring should be just free. In the 10" position the compression of the spring holds the stud of the Pickup Arm Raising Lever against the outside edge of the groove. If the compression tension needs adjustment:

1. Turn the Record Shelf (4) to the 12" position.
2. Trip the Reject control and rotate the Turntable clockwise until the push off Blade reaches its farthest forward position. At this point the cam follower will be at the highest point on the Main Cam ("A" of Fig. 5).
3. Loosen the lock bolts of (41) and (42).
4. Be sure that the Record Shelf is held in the extreme 12" position while adjusting the Record Shelf and Push-off Blade fingers.
5. At the same time, push the Push-off Blade forward as far as possible and push the Push-off Blade and Record Shelf Assembly downward tight against the Housing (6).
6. Position the Record Shelf finger and the Toggle Assembly (41) so the 12" finger of the Push-off

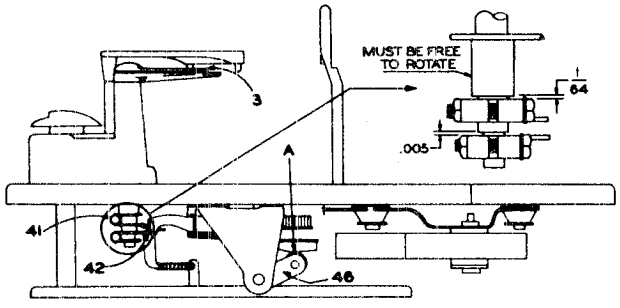

Fig. 5

©John F. Rider

MODELS 133-6, 146, 160, 161, 164

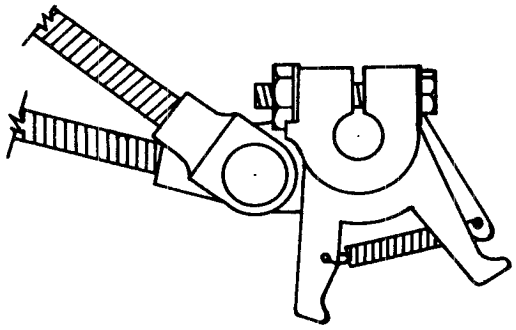

Fig. 6

Blade finger (42) looks like Fig. 6. A visual spacing of approximately 1/64 between the rounded edge of the toggle assembly and the Push-off Blade finger when viewed directly from the bottom of the record changer is required. See Fig. 6. Since these two parts lie on different planes, this adjustment must be made by observation only.

7. While holding the Push-off Blade and Record Shelf Assembly tight against the Housing (6), push the Index Toggle Assembly (41) against the spacer (40) and tighten the lock bolt.
8. Tighten the Push-off Blade bracket lock bolt, leaving approximately 1/64" clearance between the shoulder of the Record Shelf shaft and the Push-off Blade finger bracket (42).

RECORD FAILS TO DROP

The record must leave the spindle step just prior to or at least by the time it leaves the record shelf. If the spindle is too far from the record shelf, the record will hang up on the spindle step and fail to drop.

To adjust:

Press down on the edge of the turntable nearest the Record Shelf to secure proper spacing. DO NOT bend the spindle itself. Also be sure a standard record is used when aking this adjustment. A standard 10" record has a diameter of 9 7/8" ± 1/32". A standard 12" record measures 11 7/8" ± 1/32" in diameter.

If the changer still fails to drop records, put the mechanism in cycle and watch the movement of the Push-off Blade. If it fails to protrude beyond the edge of the Record Shelf when at its greatest forward position, adjust the Push-off Blade finger position:

1. Turn the record Shelf (4) to the 12" position.
2. Trip the Reject control and rotate the Turntable until the Push-off Cam Follower reaches the highest point on the Main Cam ("A" of Fig. 5).
3. Loosen the Push-off Blade finger (42) clamp bolt.
4. Push the Push-off Blade forward as far as possible and hold the Push-off Blade and Record Shelf assembly downward tight against the housing (6).
5. Tighten the Push-off Blade finger clamp bolt (42), leaving 1/64" vertical clearance between the shoulder of the Record Shelf shaft and the Push-off Blade finger (42).

CHANGE CYCLE STARTS BEFORE END OF RECORD

If the Trip Assembly chatters while the changer is running or if the changer cycles before the entire record is played, there is probably insufficient clearance between the hook end of the Velocity Trip and Roller Assembly and the actuating gear. This clearance should be adjusted to be within 1/32" to 1/64" by bending the lever at point "C" as shown in Fig. 7.

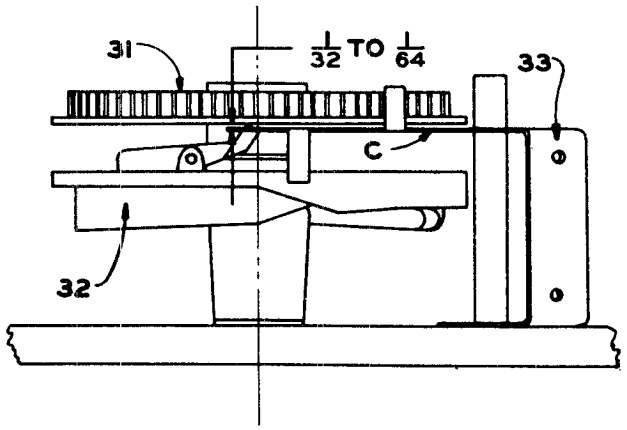

Fig. 7

LAST RECORD REPEATS

The weight of the records on the Spindle keeps the Automatic Shut Off Lock Lever (59) from dropping and engaging the Pickup Arm Raising Disc. The dropping of the last record releases the Automatic Shut Off Lock Lever, permitting it to drop and prevent the Pickup Arm Raising Disc from moving the Arm onto the record when the change cycle starts.

©John F. Rider

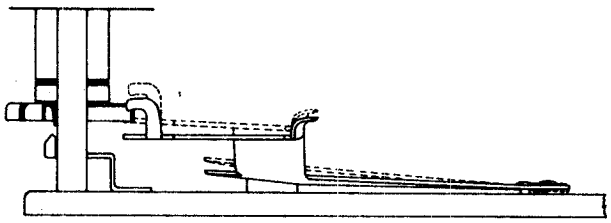

Fig. 8

If the last record continues to play:

1. Check the Spindle to be sure that it moves up and down freely.
2. With no records on the Spindle, and with the mechanism at rest, the hook of the Automatic Shut Off Lock Lever (59) should clear the top of the Pickup Arm Raising Disc by 1/32". Adjust, if necessary, by bending the Automatic Shut Off Lock Lever slightly.

REPLACEMENT OF PARTS

TO REPLACE PICKUP CARTRIDGE

A Pickup cartridge can be most easily replaced by first removing the Pickup Arm.

1. Hold the Pickup Arm firmly with left hand.
2. Remove the spring from between the pins of the hinge bracket.
3. Using a tool such as a screwdriver, press in on one of the blue steel Pickup Arm hinge brackets while lifting up on the arm. This will release the Pickup Arm Hinge pin.
4. Repeat on the other pickup arm bracket.
5. The Pickup Arm, when released from the hinge brackets, may then be turned over and laid on the turntable for easy access to the cartridge.

TO REPLACE THE PICKUP ARM

The Pickup Arm may be replaced in its bracket as follows:

1. Hook the roller on the rear of the hinge assembly under the Pickup Arm lift stop, inside the Housing (6).
2. Using a pair of long nose pliers, place the pickup arm hinge brackets, one at a time, over the pins in the Pickup Arm Pivot Shaft (9) bracket.

The retaining spring need not be replaced unless the unit is to be re-shipped.

In performing this operation, be sure that the pickup cord lies outside of the hinge and does not become wedged in the bracket.

LUBRICATION

Model 146 Record Changers leave the factory completely oiled and lubricated. Under normal conditions this should be sufficient for approximately one year or 1,000 hours of operation. When operated under extreme conditions of dust or heat, this operation should be performed more frequently as required.

Do not permit any oil or grease to get on the rubber Idler Drive Wheel or the Motor Sleeve, on Turntable Drive Rim or on the Automatic Trip Arm clutch. Any oil or grease on these points should be removed using Carbon Tetrachloride.

The recommended lubricants and points of lubrication are as follows:

A — No. 10 OIL (Apply With Small Oil Can or Medicine Dropper)

1. Motor Bearings. Saturate top and bottom felts.
2. Pickup Arm Shaft. Drop one drop each to bottom bearing point, bracket hole through Main Base Plate.
3. Ball Bearing Assembly.
4. Idler Wheel Felt.

B — A NON FLUID LUBRICANT (Apply With Small Brush)

1. Idler Wheel Link.
2. Turntable Shaft Stud.
3. Pickup Arm Hinge Pins.
4. Knife edge of Pickup Arm Raising Lever.
5. Main Cam Bearing. (It is necessary to remove the sub-plate assembly to lubricate this bearing.)
6. Teeth of Main Cam Actuating Gear.
7. Track of Main Cam Gear.
8. Teeth of Large and Small idler gears.
9. Raising lever Bracket bearing surfaces.

AVOID EXCESSIVE LUBRICATION

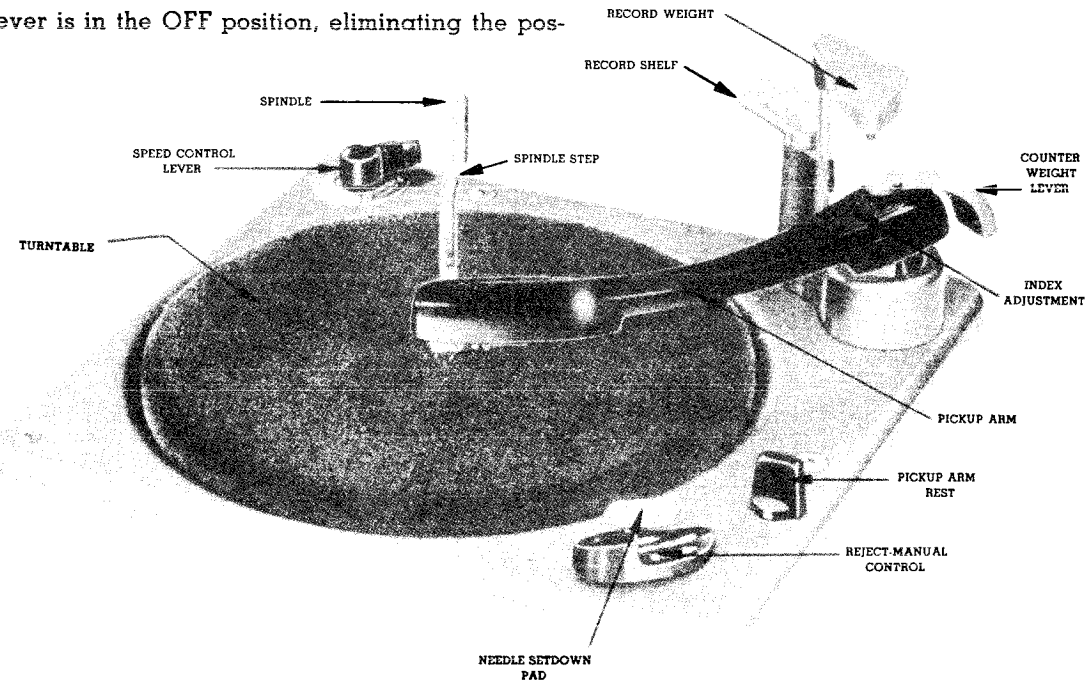
DESCRIPTION

The Webster-Chicago Model 246 is a dual speed, single post, spring cushioned spindle automatic record changer. Simple in design and operation, it provides automatic or manual playing of up to a 1" stack of 10" or 12" standard 78 R.P.M. or microgroove 33⅓ R.P.M. records.

Model 246 returns the pickup arm to the rest position after playing the last record, although the motor continues to revolve until the "33⅓ — OFF — 78" Speed Control Lever is moved to the OFF position. This is especially important when playing microgroove records for it eliminates the necessity of manually lifting the pickup arm or setting it down on the easily scratched microgrooves. The idler wheels are also pulled away from the motor shaft when the Speed Control Lever is in the OFF position, eliminating the possibility of a flat spot developing on the rubber wheels with consequent "wow"

Model 246 also features the exclusive Webster-Chicago velocity trip mechanism. The pickup arm is not actuated by "lead-in" springs and there is a minimum of lateral pressure. The arm travels freely in either direction. This lack of lateral pressure or inertia adds immeasurably to the life of records and is considered to be as important as extra-light vertical pressure, which in some instances would result in poor tracking at extremely low or high frequencies. The free floating arm permits "home recordings" or "inside out" records up to 12" size to be played manually.

Model 246 will change warped or rough edged records, at the same time assuring maximum protection to the finest discs.



OPERATION

PICKUP

The special pickup cartridge supplied has a replaceable tandem point needle. A unique connection between the cartridge and the needle weight counterbalance automatically lowers the proper point into playing position when the counterbalance is adjusted for light or normal needle pressure. When the counterbalance weight is turned back, the needle pressure is the 7 grams required for proper playing of the microgroove records. When it is turned forward to the side of the pickup arm the normal weight for standard 78 R.P.M. records is at the needle point.

The voltage output is normally lower when playing microgroove records. The volume control of the radio or amplifier must be turned up further when they are played.

Any 33⅓ R.P.M. records other than microgroove should be played with the standard needle and standard needle weight.

MOTOR

Connect the motor cord to a source of 105-120 volt, 60 cycle current only. If it is desired to operate the changer on 50 cycle current, special motor shaft bushings must be used in order to drive the turntable at the required speed of 78 R.P.M. or 33⅓ R.P.M.

Do not under any circumstances connect the motor to a source of direct current (DC) or alternating current of any other frequencies.

SPEED CONTROL ADJUSTMENTS

1. Move the Speed Control Lever to either "33⅓ or 78" as required for microgroove or standard records.

   Moving the Speed Control Lever also turns the motor power on.

2. Move the needle pressure counterbalance weight back for 7 gram needle pressure and the .001" tip radius needle point required by microgroove records Move the weight lever forward for normal pressure and the .003" tip radius needle point required by the usual 78 R.P.M. records.

The Red or White dots on the Pickup Arm and the Speed Control Knob should match. The proper needle point will then be in position for the record speed selected.

FOR AUTOMATIC RECORD CHANGE

1. Turn the Record Shelf forward or back for ten or twelve-inch records. Do not turn this shelf while a record is changing or the mechanism is in cycle.
2. With the record ballast weight lifted and turned forward out of position, place up to a 1" stack of 12" or 10" records on the spindle so that the bottom record rests on the step of the spindle and on the Record Shelf.
3. Turn the record ballast weight and lower it until it rests on the top record.
4. Move the "Manual-Reject" Control toward you, to the "Reject" position, and release it. The Control will then drop back into the automatic playing position and the records will be changed automatically until the last record is completed. The pickup arm will then return to the "Rest" position and the motor will continue to revolve until the Speed Control is turned to the OFF position.
5. To reject any record while playing in the automatic position, move the "Manual-Reject" Control to the REJECT position and release.

The pickup arm may be moved horizontally at any time without damage to the mechanism. However, after the last record is completed or while the mechanism is in cycle the pickup arm cannot be returned to the pickup arm rest until the change cycle has been completed.

After the last record has been played, the entire stack may be removed from the turntable at one time. The simplest procedure is as follows:

a. Place the pickup arm on the pickup arm rest.

b. Lift and turn the record ballast weight out of position.

c. Place the fingers of both hands under opposite edges of the bottom record.

d. Do not apply pressure to the top record. (Keep your thumbs free.)

e. Lift the stack of records straight up following the contours of the spindle. This permits the stack of records to follow the curve of the spindle without binding and greatly facilitates the removal of the stack.

FOR "MANUAL" RECORD CHANGE

CAUTION: We recommend that microgroove records never be played with the control in the "Manual" position. The microgrooves are easily scratched and the automatic rest position of the pickup arm plus the use of the "Reject" position of the control knob make manual playing unnecessary. However, manual operation when playing standard 78 R.P.M. records is often desirable.

1. Place a record on the turntable.
2. Move the "Manual-Reject" Control Knob toward the spindle to the "Manual" position, as indicated by the arrow on the Control Knob. No harm will result if the knob is accidentally moved to the "Reject" position. If a twelve-inch record is on the turntable, the arm will automatically index to the edge of the record. If a ten-inch record is on the turntable, the needle will be set down gently on the rubber pad and the arm may be moved to the edge of the record.
3. Place the needle gently on the edge of the record.
4. To stop the mechanism at any time move the Speed Control Lever to the OFF position.

MODEL 246

SERVICE INFORMATION

All units are accurately adjusted, lubricated and tested at the factory. However, service repairs and adjustments sometimes become necessary. This bulletin should be studied carefully before making any adjustments or replacing parts.

The functions and most probable misadjustments of the main assemblies are as follows (reference numbers refer to the exploded views

THE AUTOMATIC TRIP FAILS TO FUNCTION

The Main Cam Assembly (32) and Actuating Gear (31) are the heart of the record changer. The Main Cam Assembly drives the mechanism associated with the action of the Pickup Arm (7) and the Record Selector assemblies. It, in turn, is driven by the gear train (28, 29, 30) and the Turntable which is rim driven by the phonograph motor.

The Main Cam Assembly and Actuating Gear is put in motion or "tripped" by means of the "automatic" trip or by the manually operated "reject" trip. When the movement of the Pickup Arm toward the spindle is greater than 1/8" in 1/2 revolution of the turntable, the Automatic Trip Arm (35) trips the Velocity Trip and Roller Assembly (33). This releases the Actuating Pawl on the Main Cam Assembly (32), allowing it to engage the Main Cam Actuating Gear (31) and driving it through the change cycle. The pressure from the Automatic Trip Arm required to actuate the trip mechanism is negligible.

The Automatic Trip Arm follows the movement of the Pickup Arm through a weighted friction clutch (34). This clutch must be kept free of oil and grease. If the clutch does not cause the Automatic Trip Arm to trip the mechanism, clean the clutch parts with carbon tetrachloride. This clutch should operate the trip mechanism without placing undue drag on the movement of the pickup arm.

Also check for:

1. Velocity Trip and Roller Assembly (32) binding.
2. Slight burr on end of the Actuating Pawl or on the underside of the hook end of the Velocity Trip and Roller Assembly.
3. Actuating Pawl stuck (part of Main Cam Assembly (32) engaged by the hook end of the Velocity Trip and Roller Assembly (33).
4. Automatic Trip Arm (35) bent and not hitting the Velocity Trip and Roller Assembly (33).
5. Automatic Trip Arm (35) fails to touch the Velocity Trip and Roller Assembly.
6. Velocity Trip and Roller Assembly (33) rubbing on the underside of the Main Cam Actuating Gear (31).
7. No velocity lead-in groove or eccentric groove in the center of record.

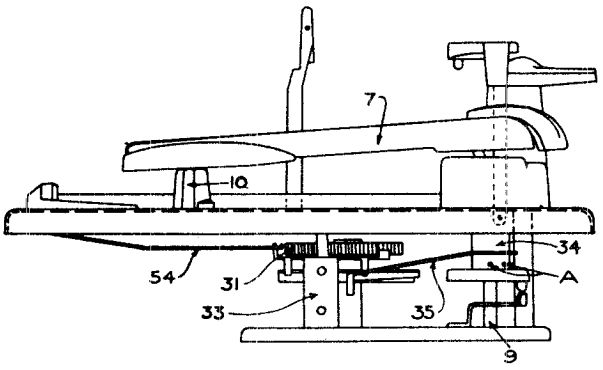

Fig. 1

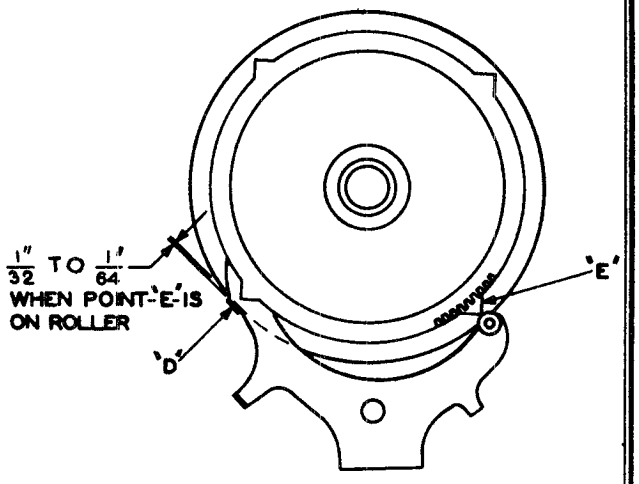

ADJUST IF NECESSARY BY BENDING AT POINT "D".

Fig. 2

©John F. Rider

8. Foreign matter in record groove.
9. Badly worn record.
10. Badly bent or worn needle.

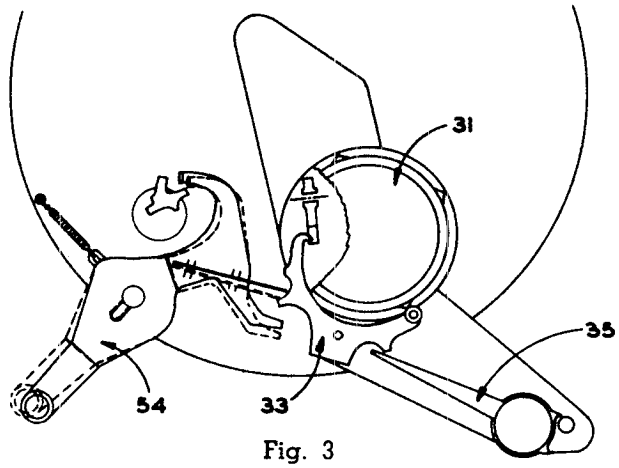

Fig. 3

IF THE "REJECT" TRIP FAILS TO FUNCTION

When the control knob is moved to the extreme START-REJECT position, the hair spring of the Reject Trip Lever Arm (54) actuates the Velocity Trip and Arm Assembly, putting the change mechanism in cycle. See Fig. 3.

Check for:

1. "Reject" trip hair spring of Lever 54 bent or broken.
2. Velocity Trip and Roller Assembly (33) binding.
3. Actuating Pawl (32) stuck (part of Main Cam Assembly).

IF THE MECHANISM CONTINUES TO CYCLE

At the completion of the change cycle, the Actuating Pawl is disengaged from the Main Cam Assembly Actuating Gear by the hook end of the Velocity Trip and Roller Assembly, which has been returned to its normal position by the reset points on the Main Cam Drive Gear, Fig. 2.

If the clearance between the lip on the Velocity Trip Lever and the edge of the Main Cam is too small, it will prevent the hooked end of the Velocity Trip Lever from engaging the trigger. Adjust the clearance between the lip ("D" of Fig. 2) on the Velocity Trip Lever and the Main Cam to be within $\frac{1}{32}$" and $\frac{1}{64}$" when the roller is contacting the point of one of the reset points on the Actuating Gear.

Also check for:

1. Velocity Trip and Roller Assembly (33) rubbing on Main Cam Actuating Gear (31).
2. Manual Trip Lever (54) binding.
3. "Disengage Roller" broken on Velocity Trip and Roller Assembly (33).

PICKUP ARM LIFT TOO HIGH OR TOO LOW

The vertical movement of the pickup arm is controlled by the angle of the pickup arm raising lever (37 and Fig. 4). The needle should approach the top record of a full 1" stack of records on the turntable with approximately $\frac{1}{16}$" clearance.

To adjust:

1. Put a full 1" stack of records ON THE TURNTABLE.
2. Trip the "Start-Reject" control and rotate the turntable clockwise until the needle clears the top record of the stack by about $\frac{1}{16}$"
3. Be sure the notch in the pickup arm raising disc engages the pickup arm raising lever.
4. If the needle does not clear the top record or if it raises too high, adjust by holding the pickup arm raising lever (37) at point X and bending at Y as indicated in Fig. 4.

CAUTION: All adjusting bends should be made slowly, using slight but firm, easy pressure.

Be sure the set screws in the Pickup Arm Raising Disc (36) are not loose and are properly positioned in the alignment holes as explained in the paragraph on Needle Setdown Indexing.

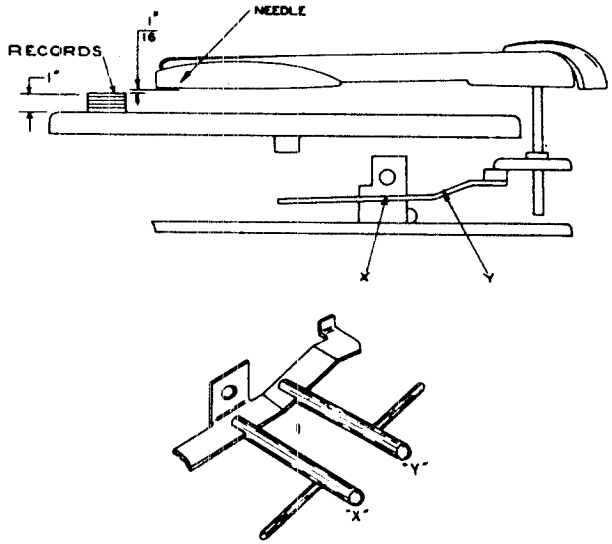

Fig. 4

©John F. Rider

MODEL 246

NEEDLE SET DOWN INDEXING INCORRECT

The horizontal movement of the pickup arm (7) is controlled by the eccentric excursion of the Pickup Arm Raising Lever (37) moving the Pickup Arm Raising Disc (36) when actuated by the Main Cam Assembly (32). The eccentric screw (part of 8) accessible through the top of the pickup arm (7), should take care of any normal position adjustment. Turn this screw clockwise to index the needle in toward the spindle and counter-clockwise to index the needle out away from the spindle.

Should further adjustment be necessary, proceed as follows:

1. Set the eccentric screw, just mentioned, to a middle position.
2. Set the Record Shelf (4) to the 10" position.
3. Operate the mechanism by revolving the turntable manually until the needle drops to within 1/8" of a ten inch record on the turntable.
4. Be sure the notch in the Pickup Arm Raising Disc (36) engages the Pickup Arm Raising Lever (37).
5. The No. 8 Bristol set screws "A" of the Pickup Arm Raising Disc (36, Fig. 1) have pointed ends which fit into off center holes in the Pickup Arm Pivot (9). Alternately loosen one screw and tighten the other until the needle rests above the record lead-in groove at the desired point. Be sure that both set screws are tight when this adjustment is completed.
6. Complete the change cycle of the mechanism and place the pickup arm on the Pickup Arm Rest (10). The tongue of the Pickup Arm Raising Disc (36) should now rest against the post which supports the sub plate assembly. If the pickup arm does not rest in the proper position on the pickup arm rest, bend the tongue closer to or away from this post until the pickup arm is correctly positioned.

   REMEMBER: Always slight but firm, easy bends!
7. Turn the Record Shelf to 12" and check the needle drop on a twelve inch record. Make any additional adjustments with the eccentric screw mentioned previously.

PICKUP ARM DROPS OFF REST

The upturned end of the Pickup Arm Pivot Shaft Bracket (Fig. 3) prevents the Pickup Arm from falling off the Pickup Arm Rest. There should be 1/64" clearance between the tongue of the Pickup Arm Raising Disc (36) and the bottom of the groove formed by the Bracket and the Base Plate Post. Bend the Bracket end up or down to secure proper positioning of the Disc tongue and the Pivot bracket. Be careful to bend the end only or the Bracket will bind on the Pickup Arm Pivot Shaft. The Bracket should not be too high or the Disc tongue will rub on it when the needle approaches the edge of a 12" record, causing "glide in" on the first few grooves of the record.

ERRATIC INDEXING

Indexing in either the 10" or the 12" position is controlled through the presence or absence of pressure from the Compression Spring (45), on the Pickup Arm Raising Lever bracket, forcing the stud to travel the inside edge or the outside edge of the groove in the bottom of the Main Cam. The compression on this spring is changed as the Record Shelf is changed from the 10" to the 12" position. Improper adjustment of the spring tension will result in erratic indexing.

In the 12" position, the spring should be just free. In the 10" position the compression of the spring holds the stud of the Pickup Arm Raising Lever against the outside edge of the groove. If the compression tension needs adjustment:

1. Turn the Record Shelf (4) to the 12" position.
2. Trip the Reject control and rotate the Turntable clockwise until the push off Blade reaches its farthest forward position. At this point the cam follower will be at the highest point on the Main Cam ("A" of Fig. 5).
3. Loosen the lock bolts of (41) and (42).
4. Be sure that the Record Shelf is held in the extreme 12" position while adjusting the Record Shelf and Push-off Blade fingers.
5. At the same time, push the Push-off Blade forward as far as possible and push the Push-off Blade and Record Shelf Assembly downward tight against the Housing (6).
6. Position the Record Shelf finger and the Toggle Assembly (41) so the 12" finger of the Push-off

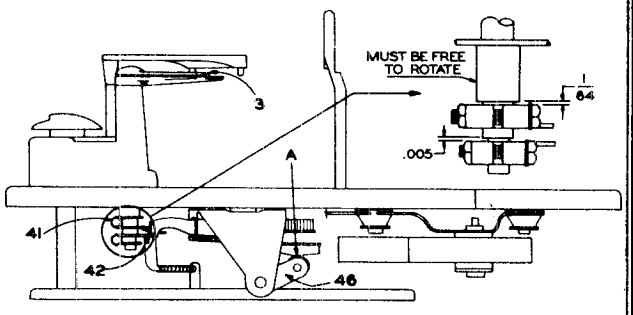

Fig. 5

©John F. Rider

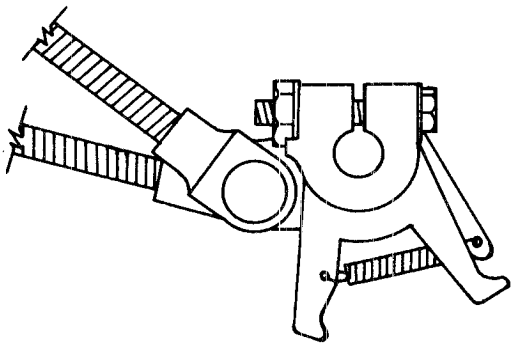

Fig. 6

Blade finger (42) looks like Fig. 6. A visual spacing of approximately 1/64" between the rounded edge of the toggle assembly and the Push-off Blade finger when viewed directly from the bottom of the record changer is required. See Fig. 6. Since these two parts lie on different planes, this adjustment must be made by observation only.

7 While holding the Push-off Blade and Record Shelf Assembly tight against the Housing (6), push the Index Toggle Assembly (41) against the spacer (40) and tighten the lock bolt.

8. Tighten the Push-off Blade bracket lock bolt, leaving approximately 1/64" clearance between the shoulder of the Record Shelf shaft and the Push-off Blade finger bracket (42).

RECORD FAILS TO DROP

The record must leave the spindle step just prior to or at least by the time it leaves the record shelf. If the spindle is too far from the record shelf, the record will hang up on the spindle step and fail to drop.

To adjust:

Press down on the edge of the turntable nearest the Record Shelf to secure proper spacing. DO NOT bend the spindle itself. Also be sure a standard record is used when aking this adjustment. A standard 10" record has a diameter of 9 7/8" ± 1/32". A standard 12" record measures 11 7/8" ± 1/32" in diameter.

If the changer still fails to drop records, put the mechanism in cycle and watch the movement of the Push-off Blade. If it fails to protrude beyond the edge of the Record Shelf when at its greatest forward position, adjust the Push-off Blade finger position:

1. Turn the record Shelf (4) to the 12" position.
2. Trip the Reject control and rotate the Turntable until the Push-off Cam Follower reaches the highest point on the Main Cam ("A" of Fig. 5).
3. Loosen the Push-off Blade finger (42) clamp bolt.
4. Push the Push-off Blade forward as far as possible and hold the Push-off Blade and Record Shelf assembly downward tight against the housing (6).
5. Tighten the Push-off Blade finger clamp bolt (42), leaving 1/64" vertical clearance between the shoulder of the Record Shelf shaft and the Push-off Blade finger (42).

CHANGE CYCLE STARTS BEFORE END OF RECORD

If the Trip Assembly chatters while the changer is running or if the changer cycles before the entire record is played, there is probably insufficient clearance between the hook end of the Velocity Trip and Roller Assembly and the actuating gear. This clearance should be adjusted to be within 1/32" to 1/64" by bending the lever at point "C" as shown in Fig. 7.

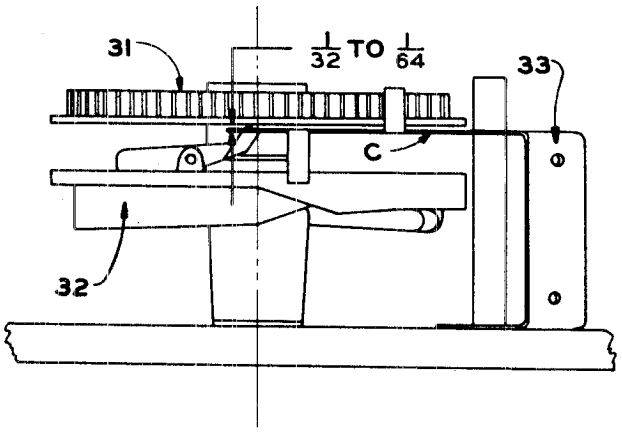

Fig. 7

LAST RECORD REPEATS

The weight of the records on the Spindle keeps the Automatic Shut Off Lock Lever (59) from dropping and engaging the Pickup Arm Raising Disc. The dropping of the last record releases the Automatic Shut Off Lock Lever, permitting it to engage the Pickup Arm Raising Disc and prevent the Pickup Arm from moving onto the record. The Pickup Arm then comes to rest on the Rest Button.

©John F. Rider

MODEL 246

If the last record continues to play:

1. Check the Spindle to be sure that it moves up and down freely.
2. With no records on the Spindle, and with the mechanism at rest, the hook "D" of the Automatic Shut Off Lock Lever (59) should clear the top of the Pickup Arm Raising Disc by 1/32" Adjust, if necessary, by bending the Automatic Shut Off Lock Lever slightly.

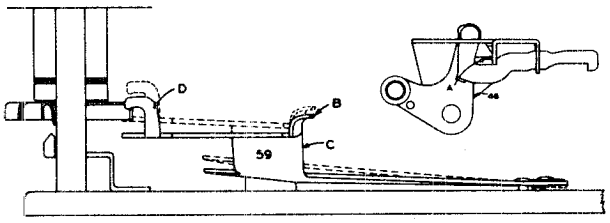

Fig. 8

LAST RECORD WILL NOT PLAY

As explained above, the weight of records on the spindle prevents the Automatic Lock Lever (59) from dropping. As the Cam Lever and Bracket assembly (46) moves forward to engage the Push-off Blade Actuating Lever (42), Fig. 5, point A of the Cam Lever (46), Fig. 8, should also move forward under point B of the Automatic Shut Off Lock Lever (59) to make certain it does not drop until the last record has dropped to the turntable and the Pickup Arm is in position to play. If point A does not engage point B, the Lock Lever (59) will drop to engage the Pickup Arm Raising Disc (36) and the Pickup Arm will return to the rest position without playing the last record.

To adjust, bend B so they engage properly. It may be necessary to bend (46) at point C, then readjust point D so it engages the Pickup Arm Raising Disc (36) correctly.

78 R.P.M. AT BOTH SPEED SETTINGS

The 78 R.P.M. bushing on the motor shaft should be low enough to clear the 33⅓ R.P.M. idler wheel. If it is too high:

1. Loosen the bushing set screw, using a No. 8 Bristol wrench.
2. Lower the bushing until it just clears the idler wheel.
3. Tighten the set screw.

SLOW SPEED

1. Idler wheel (23) or (74) may be cocked at an angle. Bend the mounting bracket (25).
2. Too strong tension on Idler Link Tension Spring (26) or (85). Stretch spring slightly.
3. Lip of Idler Wheel Link (25) may be binding in mounting hole. Carefully bend out the lip so the Idler Wheel rides more firmly on the rim of the Turntable.

MOTOR DOES NOT TURN ON

The top switch leaf of the AC switch (60) may be bent, preventing contact when the Speed Control Lever is moved to 33⅓ or 78. Bend the Switch leaf by means of a small screw driver inserted through the small opening in the plastic protecting cover or bend the switch mounting bracket.

STALLS DURING CHANGE CYCLE

Too weak tension on Idler Link Spring (26) or (85). Tighten spring as required.

ERRATIC SPEED ("WOW")

Remove any dirt or excess flocking from the inside rim of the turntable. Check the rubber drive wheel for a flat spot or "out of round".

The idler wheel links (25) should be loose on the shoulder rivets but not sloppy. If too loose, erratic speed will result.

1. Remove the motor.
2. Carefully stake the shoulder rivet move securely to insure smooth operation.
3. Idler wheel cocked at an angle. This may have been caused by forcing the Turntable onto the spindle and bearing (18) with the Speed Control Lever in either the "33⅓" or "78" position. Remove the Turntable and carefully bend the idler wheel (23 or 74) so the idler wheel link stud (part of 84) is perpendicular. Always have the Speed Control at OFF when putting on the Turntable.

©John F. Rider

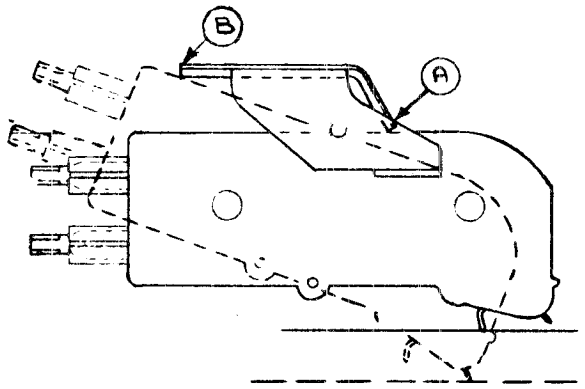

Fig. 9

NEEDLE JUMPS GROOVES ON 33⅓ R.P.M.

Check the needle pressure, using a Clarkstan needle pressure gauge. Pressure should be between 7 grams and 9 grams.

To increase the pressure, use a heavy wire or small steel rod to turn the spring shaft (63).

BOTH NEEDLE POINTS TOUCH AT ONCE

1. Needle point is bent. Replace needle.
2. Needle mounting bracket "fingers" improperly bent. See Fig. 9.

REPLACEMENT OF PARTS

TO REPLACE THE NEEDLE

1. Loosen the needle set screw, using a small screw driver.
2. Remove the needle.
3. Insert new needle with the flat side of the needle shank facing the needle set screw. Be sure the needle shank is all the way in to the bottom of the needle hole.
4. Tighten the set screw. The needle point should be parallel to the sides of the needle slot and evenly spaced between the walls of the slot.

TO REPLACE THE CARTRIDGE

1. Remove the two set screws, one on each side of the cartridge.
2. Lift the cartridge from the pickup arm mounting studs and remove the Tilt Spring from its mounting hole.
3. Insert the Tilt Spring in the new cartridge.
4. Seat the cartridge on the mounting studs, insert and tighten the two set screws.

The holes in the cartridge bracket are elongated. Position the cartridge so it fits solidly against the back finger of the mounting bracket when the needle weight counterbalance lever is in the "forward" or microgroove position and solidly against the front finger of the bracket when the counterbalance lever is in the "back" or 78 R.P.M. position.

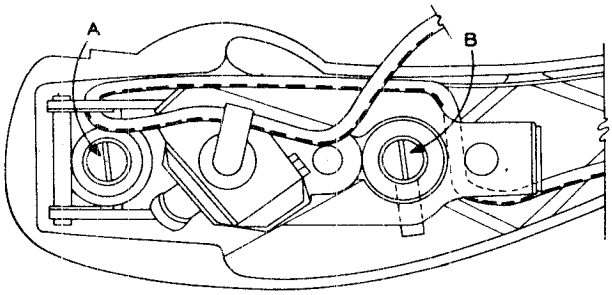

Fig. 10

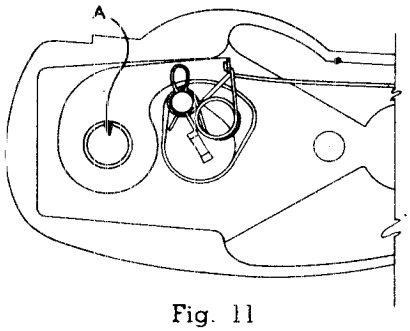

Fig. 11

TO REPLACE THE PICKUP ARM

CAUTION: Closely observe the original placement of the pickup cord and replace it in the same position. (See Fig. 10.) **Do Not** push hard on the needle end of the cartridge. Bending the mounting bracket will cause improper tracking or even cause both needle points to touch the record at once.

1. Remove mounting screws from mounting studs A and B, Fig. 10.
2. Gently remove hinge assembly from the mounting studs.
3. Remove tension spring anchor from mounting stud A. (See Fig. 11.)
4. Loosen No. 8 Bristol set screw and remove needle pressure counterbalance arm.
5. Remove the tilt control Lever. Do not disassemble the springs from this lever.
6. Remove the pickup cord and tilt spring brackets.
7. Remove the cartridge mounting screws and the cartridge.

Reassemble the parts to the new pickup arm in reverse order. Read the paragraph regarding replacement of the cartridge.

©John F. Rider

MODEL 246

LUBRICATION

Model 246 Record Changers leave the factory completely oiled and lubricated. Under normal conditions this should be sufficient for approximately one year or 1,000 hours of operation. When operated under extreme conditions of dust or heat, this operation should be performed more frequently as required.

Do not permit any oil or grease to get on the rubber Idler Drive Wheel or the Motor Sleeve, on Turntable Drive Rim or on the Automatic Trip Arm clutch. Any oil or grease on these points should be removed using Carbon Tetrachloride. *The recommended lubricants and points of lubrication are as follows:*

A — No. 10 OIL (Apply With Small Oil Can or Medicine Dropper)

1. Motor Bearings. Saturate top and bottom felts.
2. Pickup Arm Shaft. Drop one drop each to bottom bearing point, bracket hole through Main Base Plate.
3. Ball Bearing Assembly.
4. Idler Wheel Felt.

B — A NON FLUID LUBRICANT (Apply With Small Brush)

1. Idler Wheel Link.
2. Turntable Shaft Stud.
3. Pickup Arm Hinge Pins.
4. Knife edge of Pickup Arm Raising Lever.
5. Main Cam Bearing. (It is necessary to remove the sub-plate assembly to lubricate this bearing.)
6. Teeth of Main Cam Actuating Gear.
7. Track of Main Cam Gear.
8. Teeth of Large and Small idler gears.
9. Raising lever Bracket bearing surfaces.

AVOID EXCESSIVE LUBRICATION

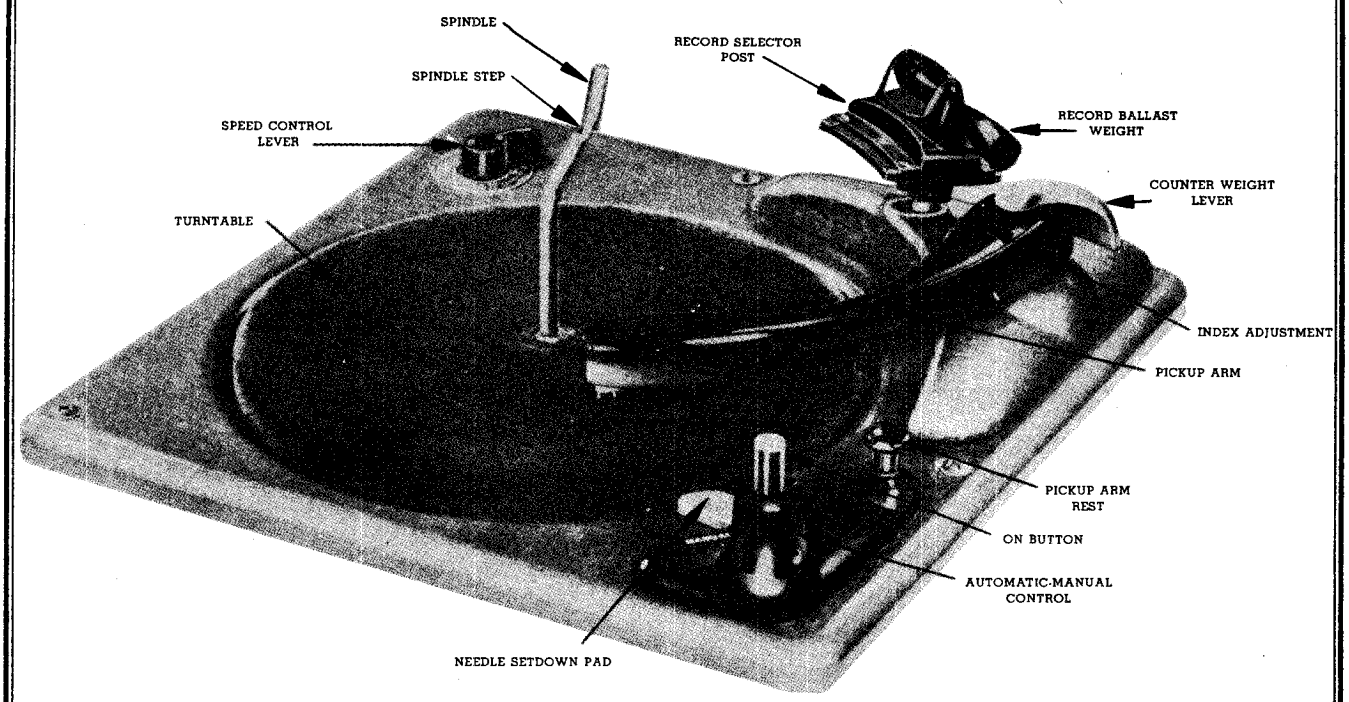
MODELS 256, 256-1



DESCRIPTION

The Webster-Chicago Model 256 is a dual speed, single post, spring cushioned spindle, automatic record changer. Simple in design and operation, it provides automatic or manual playing of up to a 1" stack of 10" or 12" standard 78 R.P.M. or microgroove 33⅓ R.P.M. records.

Model 256 returns the pickup arm to the rest position after playing the last record, although the motor continues to revolve until the "33⅓ OFF — 78" Speed Control Lever is moved to the OFF position. This is especially important when playing the microgroove records for it eliminates the necessity of manually lifting the pickup arm or setting it down on the easily scratched microgrooves. The idler wheels are also pulled away from the motor shaft when the Speed Control Lever is in the OFF position, eliminating the possibility of a flat spot developing on the rubber wheels with consequent wow.

Model 256 also features the exclusive Webster-Chicago velocity trip mechanism. The pickup arm is not actuated by "lead-in" springs and there is a minimum of lateral pressure. The arm travels freely in either direction. This lack of lateral pressure or inertia adds immeasurably to the life of records and is considered to be as important as extra-light vertical pressure, which in some instances would result in poor tracking at extremely low or high frequencies. The free floating arm permits "home recordings" or "inside out" records up to 12" size to be played manually.

Model 256 will change warped or rough edged records, at the same time assuring maximum protection to the finest discs.

OPERATION

PICKUP

The special pickup cartridge supplied has a replaceable tandem point needle. A unique connection between the cartridge and the needle weight counterbalance automatically lowers the proper point into playing position when the counterbalance is adjusted for light or normal needle pressure. When the counterbalance weight is turned back, the needle pressure is the 7 grams required for proper playing of the microgroove records. When it is turned forward to the side of the pickup arm the normal weight for standard 78 R.P.M. records is at the needle point.

The voltage output is normally lower when playing microgroove records. The volume control of the radio or amplifier must be turned up further when they are played.

Any 33⅓ R.P.M. records other than microgroove should be played with the standard needle and standard needle weight.

©John F. Rider

MODELS 256, 256-1

MOTOR

Connect the motor cord to a source of 105-120 volt, 60 cycle current only. If it is desired to operate the changer on 50 cycle current, special motor shaft bushings must be used in order to drive the turntable at the required speed of 78 R.P.M. or 33⅓ R.P.M.

Do not under any circumstances connect the motor to a source of direct current (DC) or alternating current of any other frequencies.

SPEED CONTROL ADJUSTMENTS

1. Move the Speed Control Lever to either "33⅓" or "78" as required for microgroove or standard records.

   Moving the Speed Control Lever also turns the motor power on.

2. Move the needle pressure counterbalance weight back for 7 gram needle pressure and the .001" tip radius needle point required by microgroove records. Move the weight lever forward for normal pressure and the .003" tip radius needle point required by the usual 78 R.P.M. records.

The Red or White dots on the Pickup Arm and the Speed Control Knob should match. The proper needle point will then be in position for the record speed selected.

FOR AUTOMATIC RECORD CHANGE

1. Turn the Record Selector Post to "10" or "12" for ten or twelve inch records. The Record Selector Post is pivoted and turns in a counterclockwise direction to the 10" position and clockwise to the 12" position as indicated by the arrows. Do not use the Ballast Weight as a handle to turn the post. Turn by grasping the head of the Record Selector Post with the thumb and forefingers.
2. Turn the Selector Switch (sleeve of ON button) to AUTOMATIC.
3. With the Record Ballast Weight turned back, place up to a 1" stack of 12" or 10" records on the spindle so that the bottom record rests on the step of the spindle and the shelf of the Record Selector Post.
4. Turn the Record Ballast Weight forward to rest on the top record.
5. Press the ON button.

   To reject any record while playing in the AUTOMATIC position, press the ON button.

6. After the last record has been played, the entire stack may be removed from the turntable at one time. The simplest procedure is as follows:
   a. Turn the Record Ballast Weight back out of position.
   b. Place the fingers of both hands under opposite edges of the bottom record.
   c. Do *not* apply pressure to the top record. (Keep your thumbs free.)
   d. Lift the stack of records straight up following the contours of the spindle. This permits the stack of records to follow the curve of the spindle without binding and greatly facilitates the removal of the stack.

FOR "MANUAL" RECORD CHANGE

CAUTION: We recommend that microgroove records never be played with the control in the "Manual" position. The microgrooves are easily scratched and the automatic rest position of the pickup arm plus the use of the "Reject" position of the control knob make manual playing unnecessary. However, manual operation when playing standard 78 R.P.M. records is often desirable.

1. Place a record on the turntable.
2. Turn the Record Selector Post to the "12" position. (This is not essential but permits more clearance in loading and unloading records.)
3. Turn the Selector Switch (sleeve of ON button) to MANUAL.
4. Place a record on the turntable. It may facilitate this operation if the record is placed over the spindle at an angle, with one edge of the record held below the level of the Record Selector Post Shelf. Records may be removed in the same manner.
5. Press the ON button.
6. Place the needle gently on the edge of the record. Do not lift the pickup arm too high as this will cause it to catch in the Automatic Stop Lock position.
7. To stop the mechanism at any time, turn the Speed Control to the "OFF" position.

©John F. Rider

SERVICE INFORMATION AND ADJUSTMENTS

All units are accurately adjusted, lubricated and tested at the factory. However service repairs and adjustments sometimes become necessary. This bulletin should be studied carefully before making any adjustments or replacing parts.

The functions and most probable misadjustments of the main assemblies are as follows (reference numbers refer to the exploded view

THE AUTOMATIC TRIP FAILS TO FUNCTION

The Main Cam Assembly (38) and Actuating Gear (36) are the heart of the record changer. The Main Cam Assembly drives the mechanisms associated with the action of the Pickup Arm (5) and the Record Selector assemblies. It, in turn, is driven by the gear train (29, 30, 31) and the Turntable which is rim driven by the phonograph motor.

The Main Cam Assembly and Actuating Gear is put in motion or "tripped" by means of the "automatic" trip or by the manually operated "reject" trip. When the movement of the Pickup Arm toward the spindle is greater than ⅛" in ½ revolution of the Turntable, the Automatic Trip Arm (33) trips the Velocity Trip and Roller Assembly (37). This releases the Actuating Pawl on the Main Cam Assembly (38), allowing it to engage the Main Cam Actuating Gear (36) and driving it through the change cycle. The pressure from the Automatic Trip Arm required to actuate the trip mechanism is negligible.

The Automatic Trip Arm (33) follows the movement of the Pickup Arm through a weighted friction clutch (32). This clutch must be kept free of oil and grease. Should it become necessary, clean the clutch parts with carbon tetrachloride. This clutch should operate the trip mechanism without placing undue drag on the movement of the pickup arm.

Also check for:

1. Velocity Trip and Roller Assembly binding.
2. Slight burr on end of the actuating pawl or on the underside of the Velocity Trip hook.
3. Actuating Pawl stuck (part of Main Cam Assembly (38) engaged by the hook end of the Velocity Trip and Roller Assembly (37).
4. Automatic Trip Arm (33) bent and not hitting the Velocity Trip and Roller Assembly (37).
5. Automatic Trip Arm (33) fails to touch the Velocity Trip and Roller Assembly.
6. Velocity Trip and Roller Assembly (37) rubbing on the underside of the Main Cam Actuating Gear (36).
7. No velocity lead-in groove or eccentric groove in the center of record.
8. Foreign matter in record groove.
9. Badly worn record.
10. Badly bent or worn needle.

IF THE "REJECT" TRIP FAILS TO FUNCTION

When the "On" button is pressed, the hair spring of the "reject" trip lever arm (65), actuates the Velocity Trip and Arm Assembly, putting the change mechanism in cycle.

Check for:

1. "Reject" trip hair spring of Lever (65) bent or broken.
2. Velocity Trip and Roller Assembly (37) binding.
3. Actuating Pawl (part of Main Cam Assembly 38) stuck.

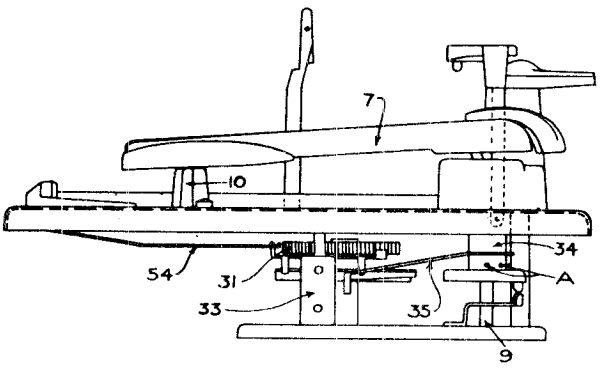


Fig. 1

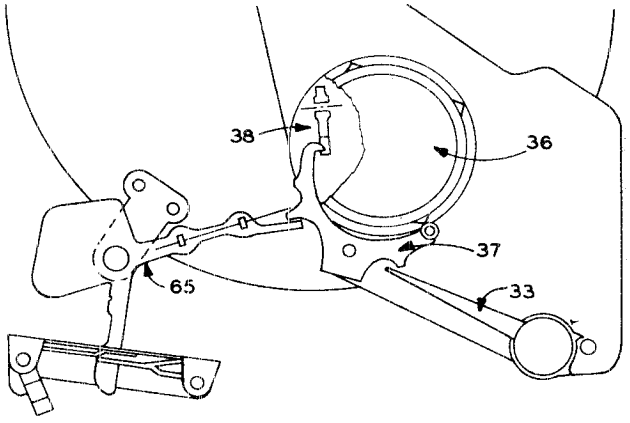

Fig. 2

©John F. Rider

MODELS 256, 256-1

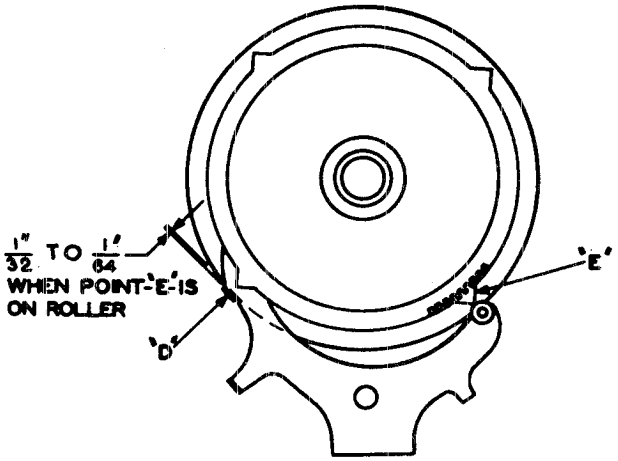
IF THE MECHANISM CONTINUES TO CYCLE

At the completion of the change cycle, the Actuating Pawl is disengaged from the Main Cam Assembly Actuating Gear (36) by the hook end of the Velocity Trip and Roller Assembly (37) which has been returned to its normal position by the reset points on the Main Cam Drive Gear (Fig. 3). This hook should be adjusted for about 1/64" clearance from the bottom of the Main Cam Drive Gear (36), Fig. 1. Greater clearance may permit the pawl to bounce past the hook and re-engage, causing the mechanism to continue to cycle.

If the clearance between the lip on the Velocity Trip Lever and the edge of the Main Cam is too small, it will prevent the hook end of the Velocity Trip Lever from engaging the trigger. Adjust the clearance between the lip (D, Figs. 3 and 5) on the Velocity Trip Lever of the Main Cam to be within 1/64" when the roller is contacting the point of one of the protrusions on the Actuating Gear.

Also check for:

1. Velocity Trip and Roller Assembly (37) rubbing on Main Cam Actuating Gear (36).
2. Manual Trip Lever (65) binding.
3. "Disengage Roller" broken on Velocity Trip and Roller Assembly (37).



ADJUST IF NECESSARY BY BENDING AT POINT "D".

Fig. 3

PICKUP ARM LIFT TOO HIGH OR TOO LOW

The vertical movement of the pickup arm is controlled by the angle of the Pickup Arm Raising Lever (40), Fig. 4. The needle should approach the top record of a full stack of 10" records on the turntable with approximately 1/8" clearance.

To adjust:

1. Put a full stack of 10" records ON THE TURNTABLE.
2. Press the "On" button and rotate the Turntable clockwise until the needle clears the top record of the stack by about 1/8".
3. Be sure the notch in the Pickup Arm raising disc (34) engages the pickup arm raising lever (40).
4. If the needle does not clear the top record or if it raises too high, adjust by bending the pickup arm raising lever at the point indicated in Fig. 4.

CAUTION: All adjusting bends should be made slowly, using slight but firm, easy pressure.

Be sure the set screws (A of Fig. 1) of the pickup arm raising disc are not loose and are properly positioned in the alignment holes as explained in the paragraph on Needle Setdown Indexing.

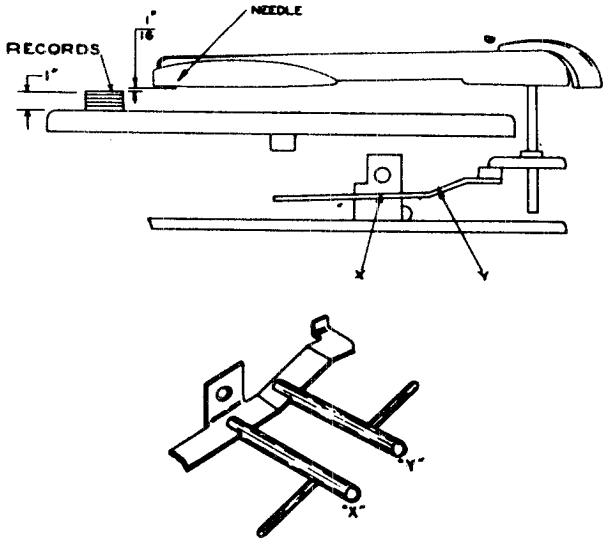


Fig. 4

NEEDLE SET DOWN INDEXING INCORRECT

The horizontal movement of the pickup arm (5) is controlled by the eccentric excursion of the Pickup Arm Raising Lever (40) moving the Pickup Arm Raising Disc (34) when actuated by the Main Cam Assembly (38). The eccentric screw (part of 6), accessible through the top of the pickup arm (5), should take care of any normal position adjustment. Turn this screw clockwise to index the needle in toward the spindle and counter-clockwise to index the needle out away from the spindle.

Should further adjustment be necessary, proceed as follows:

1. Set the eccentric screw, just mentioned, to a middle position.
2. Set the Record Selector Post (42) to the 10" position.
3. Operate the mechanism by revolving the Turntable manually until the needle drops to within 1/8" of a 10" record on the turntable.
4. Be sure the notch in the Pickup Arm Raising Disc (34) engages the Pickup Arm Raising Lever (40).

©John F. Rider

5. With a No. 8 Bristol wrench in each of the set screws of the Pickup Arm Raising Disc (35) as indicated in A, Fig. 1, alternately loosen one screw and tighten the other until the needle rests above the record lead-in groove at the desired point.
6. Complete the change cycle of the mechanism and position the Pickup Arm on the rest button (10). If necessary, bend the tongue of the Pickup Arm Raising Disc closer to or away from the Base Plate Post until the Pickup Arm is correctly seated on the rest button when the tongue is touching the Base Plate Post.

NOTE: All adjusting bends should be slight but firm, easy bends.

CHANGE CYCLE STARTS BEFORE END OF RECORD

If the trip assembly chatters while the changer is running, or if the changer cycles before the entire record is played, there is probably insufficient clearance between the hook end of the Velocity Trip and Roller Assembly (37) and the Actuating Gear (36). This clearance should be adjusted to be within 1/32" to 1/64" by bending the lever at point "C" shown in Fig. 5.

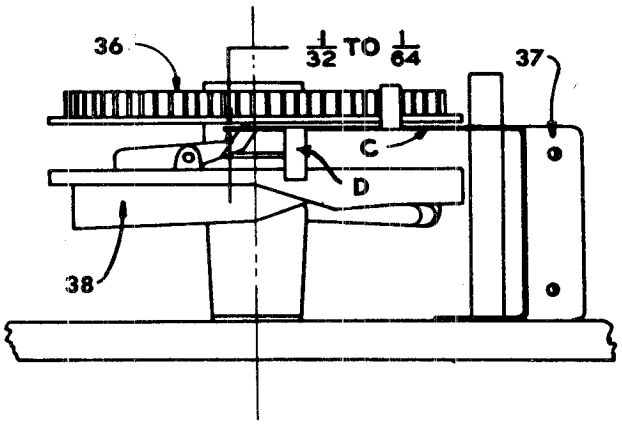

Fig. 5

MORE THAN ONE RECORD IS DROPPED DURING A CHANGE CYCLE

The floating latch at the top of the Record Spindle is so spaced that only one record at a time can slide between the heel of the latch and the step of the spindle. The hole in the latch is elongated so that the latch can slip into the spindle recess when records are being removed.

If more than one record is dropped at a time, it will be found to be due to:

1. Foreign matter in spindle recess causing the latch to stick.
2. Exceptionally thin records.

RECORD DROPS ON PICKUP ARM

As the change cycle is started, the first motion of the inclined outer bottom surface of the Main Cam (38) causes the Record Selector Post (42) to move toward the Spindle about 3/32 inch. This position is maintained until the Pickup Arm has made its full outward lateral excursion at which time the Record Selector Post again moves toward the spindle, causing the bottom record to drop into playing position.

If the Record Selector Post (42) has been bent back, away from the Record Spindle, it is possible for a standard record to rest on the spindle step with its edge just over the edge of the Record Selector Post shelf. Then as the change cycle is started, the record is pushed off the spindle by the initial movement of the Record Selector Post, so that it drops on the Pickup Arm.

To correct this condition, the Rocker Arm Assembly must be adjusted so that the Record Selector Post is brought nearer to the spindle. This adjustment is made in the following manner:

1. With the mechanism at rest, remove the Turntable and replace the Record Spindle. Set the Record Selector Post to the position for playing 12-inch records and place a 12-inch record on the Record Spindle.
2. Insert a short screwdriver through the motorboard opening into the screw slot as shown at "A" in Fig. 6. Clockwise rotation of the screw will increase the distance between the Record Spindle and the Record Selector Post; counterclockwise rotation will decrease it.

It is recommended that the distance between the edge of the record and the step of the Record Selector Post be held to just over 1/32 of an inch so that records with rough or sharply beveled edges will not catch on the outer edge of the Record Selector Post.

CAUTION: Be certain that a standard size record is used in making this adjustment. A standard 10" record measures 9 7/8" ± 1/32" diameter. A standard 12" record measures 11 7/8" ± 1/32" diameter.

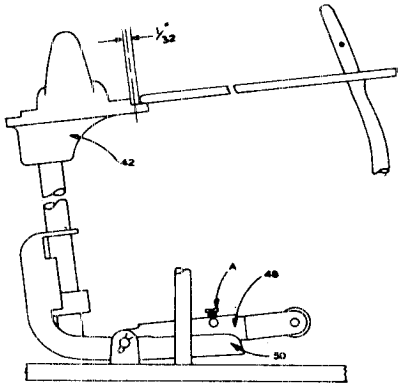

Fig. 6

©John F. Rider

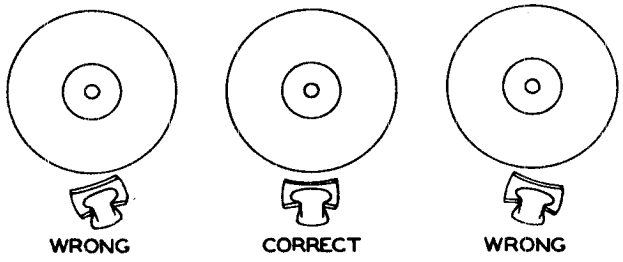
MODELS 256, 256-1

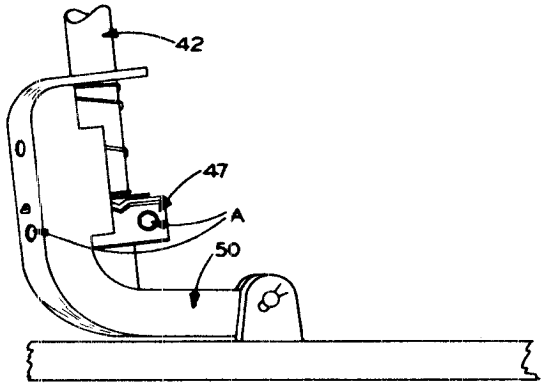
PUSH OFF POST ANGLE INCORRECT

The Record Selector Post should be adjusted so that the curve of the shelf matches the curve of the record. See Fig. 7.

To adjust this angle:

1. Turn the Record Selector Post to the "10" position.
2. Place a ten-inch record on the Spindle in the normal position for automatic playing.
3. With a No. 8 Bristol wrench in each of the set screws (point A, Fig. 7), alternately loosen one and tighten the other until the Record Selector post angle is correct. Be sure that both set screws are tight at the completion of this adjustment.





ERRATIC INDEXING

Indexing in the 10" or the 12" position is controlled through the presence or absence of pressure from the Compression Spring (47A) on the Pickup Arm Raising Lever (40). The compression on this spring is changed as the Record Selector Post (42) is changed to the 10" or 12" position. Improper adjustment of the spring tension will result in erratic indexing. In the 12" position, the spring should be just free. In the 10" position, the compression of the spring holds the stud of the Pickup Arm Raising Lever (40) against the outside edge of the groove, forcing the stud to travel the inside edge or the outside edge of the groove in the bottom of the Main Cam (38).

To adjust:

Bend the slotted arm (part of 40) for proper tension and smooth clearance of the spring guide arm (47).

GLIDE IN ON 12" RECORDS

1. Check tension of compression spring (47A) as explained above. Spring should be free in 12" position.
2. Remove any cause of friction in Index Lever (47).
3. Tongue of Pickup Arm Raising Disc (34) should not touch beveled edge of pickup arm pivot shaft bracket (35) when the needle is on the edge of a 12" record. Bend the end of the bracket if necessary.

LAST RECORD DOES NOT PLAY

The weight of the records on the Spindle keeps the Automatic Shut Off Lock Lever (44) from dropping and engaging the Pickup Arm Raising Disc (38), thus permitting the mechanism to continue to cycle.

The Push Off Post (50) moves forward slightly at the beginning of each change cycle. The bracket "B" on this post is then underneath the elevated hook "A" on the Automatic Shut Off Lock Lever (44). This forward movement takes place before the last record drops so the change cycle should continue. However the dropping of the last record releases the Automatic Shut Off Lock Lever, permitting it to drop and shut off the mechanism when the change cycle starts after the last record.

If the last record does not play:

1. Bend the elevated hook "A", Fig. 8 forward so that it will overlap the Push Off Post bracket "H" about $\frac{1}{32}$" with a record on the spindle.

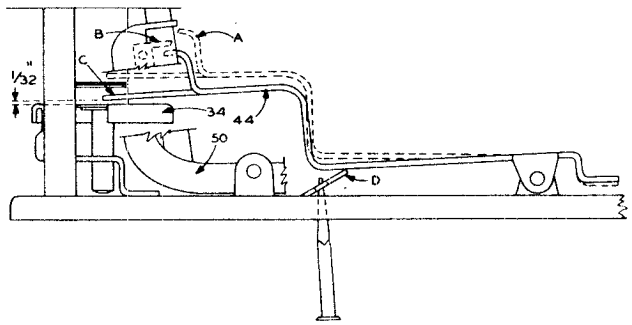


Fig. 8

LAST RECORD CONTINUES TO PLAY

1. Check the record spindle to be sure that it moves up and down freely.
2. With no records on the spindle, check the Automatic Shut Off Lock Lever (44). The lower hook end of this arm ("C") should catch the Pickup Arm Raising Disc (34) at the beginning of the cycle to prevent travel of the Pickup Arm, causing it to drop on the OFF button. With no records on the Spindle and with the mechanism at rest, this hook should clear the top of the Pickup Arm Raising Disc by $\frac{1}{32}$". Adjust, if necessary, by inserting a screw driver in the hole in the bottom base plate and bending

©John F. Rider

lip "D". Never attempt to move the Pickup Arm Raising Disc up or down.

3. The elevated hook "A" on the Automatic Shut Off Lock Lever will sometimes lock with the bracket "B" on the Record Selector Post (50) if the drop of the record is delayed. More clearance can be obtained by bending the elevated hook "A" away from the bracket.

78 R.P.M. AT BOTH SPEED SETTINGS

The 78 R.P.M. bushing on the motor shaft should be low enough to clear the 33⅓ R.P.M. idler wheel. If it is too high:

1. Loosen the bushing set screw, using a No. 8 Bristol wrench.
2. Lower the bushing until it just clears the idler wheel.
3. Tighten the set screw.

SLOW SPEED

1. Idler wheel (24) or (91) may be cocked at an angle. Bend the mounting bracket (26).
2. Too strong tension on Idler Link Tension Spring (27) or (90). Stretch spring slightly.
3. Lip of Idler Wheel Link (26) may be binding in mounting hole. Carefully bend out the lip so the Idler Wheel rides more firmly on the rim of the Turntable.

MOTOR DOES NOT TURN ON

The top switch leaf of the AC switch (61) may be bent, preventing contact when the Speed Control Lever is moved to 33⅓ or 78. Bend the Switch Leaf by means of a small screw driver inserted through the small opening in the plastic protecting cover or bend the switch mounting bracket.

STALLS DURING CHANGE CYCLE

Too weak tension on Idler Link Spring (25 or (90). Tighten spring as required.

ERRATIC SPEED ("WOW")

Remove any dirt or excess flocking from the inside rim of the turntable. Check the rubber drive wheel for a flat spot or "out of round".

The idler wheel links (26) should be loose on the shoulder rivets but not sloppy. If too loose, erratic speed will result.

1. Remove the motor.
2. Carefully stake the shoulder rivet more securely to insure smooth operation.
3. Idler wheel cocked at an angle.

BOTH NEEDLE POINTS TOUCH AT ONCE

1. Needle point is bent. Replace needle.
2. Needle mounting bracket "fingers" improperly bent. See Fig. 9.

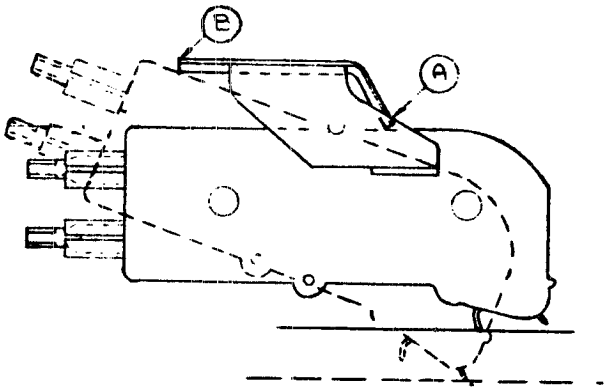

Fig. 9

REPLACEMENT OF PARTS

TO REPLACE THE NEEDLE

1. Loosen the needle set screw, using a small screw driver.
2. Remove the needle.
3. Insert the new needle with the flat side of the needle toward the set screw. Be sure the needle shank is all the way in to the bottom of the needle hole.
4. Tighten the set screw. The needle point should be parallel to the sides of the needle slot and evenly spaced between the walls of the slot.

TO REPLACE THE PICKUP ARM

CAUTION: Closely observe the original placement of the pickup cord and replace it in the same position. (See Fig. 10). *Do not* push hard on the needle end of the cartridge. Bending the mounting bracket will cause improper tracking or even cause both needle points to touch the record at once.

1. Remove mounting screws from mounting studs A and B, Fig. 10.
2. Gently remove hinge assembly from the mounting studs.

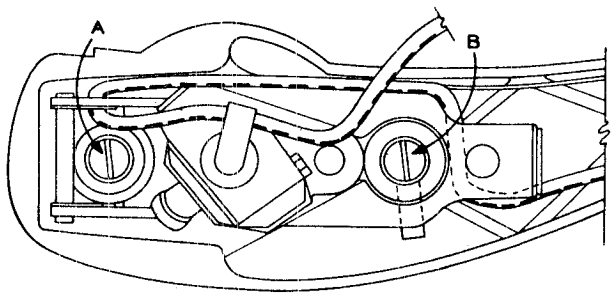

Fig. 10

©John F. Rider

MODELS 256, 256-1

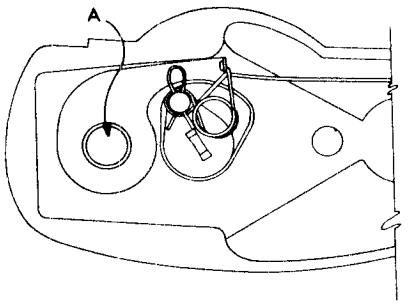

Fig. 11

3. Remove tension spring anchor from mounting stud A. (See Fig. 11.)
4. Loosen No. 8 Bristol set screw and remove needle pressure counterbalance arm.
5. Remove the tilt control lever. Do not disassemble the springs from this lever.
6. Remove the pickup cord and tilt spring brackets.
7. Remove the cartridge mounting screws and the cartridge.

Reassemble the parts to the new pickup arm in reverse order. Read the paragraph regarding cartridge replacement.

TO REPLACE THE CARTRIDGE

1. Remove the two set screws, one on each side of the cartridge.
2. Lift the cartridge from the pickup arm mounting studs and remove the Tilt Spring from its mounting hole.
3. Insert the Tilt Spring in the new cartridge
4. Seat the cartridge on the mounting studs, insert and tighten the two set screws.

The holes in the cartridge bracket are elongated. Position the cartridge so it fits solidly against the back finger of the mounting bracket when the needle weight counterbalance lever is in the "forward" or 78 R.P.M. position and solidly against the front finger of the bracket when the counterbalance lever is in the "back" or micro-groove position.

REPLACE PICKUP ARM BRACKET AND SHAFT ASSEMBLY

1. Loosen Bristol screws in Pickup Arm Raising Disc.
2. Remove Disc and Clutch parts by sliding them off the bottom of the Pickup Arm Shaft and pull shaft out of changer from above.

To replace, reverse the procedure and adjust the Pickup Arm Raising Disc for proper operation.

REPLACE RECORD POST AND ROCKER ARM ASSEMBLY

1. Remove the Pickup Arm Assembly.
2. Remove the four nuts under the main plate which hold the Crescent Assembly.
3. Unhook the Rocker Arm Return Spring.
4. Remove the Rocker Arm Pivot Pin.
5. Lift out the Record Selector Post, Rocker Arm and Crescent Assembly as a unit.
6. In replacing the Rocker Arm Assembly, note paragraph "Replacing the Sub-Plate Assembly."

LUBRICATION

Model 256 Record Changers leave the factory completely oiled and lubricated. Under normal conditions this should be sufficient for approximately one year or 1,000 hours of operation. When operated under extreme conditions of dust or heat, this operation should be performed more frequently as required.

Do not permit any oil or grease to get on the rubber Idler Drive Wheel or the Motor Sleeve, on Turntable Drive Rim or on the Automatic Trip Arm clutch. Any oil or grease on these points should be removed using Carbon Tetrachloride.

The recommended lubricants and points of lubrication are as follows:

A — No. 10 OIL (Apply With Small Oil Can or Medicine Dropper)

1. Motor Bearings. Saturate top and bottom felts.
2. Pickup Arm Shaft. Drop one drop each to bottom bearing point, bracket hole through Main Base Plate.
3. Ball Bearing Assembly.
4. Idler Wheel Felt.

B — A Non Fluid Lubricant (Apply With Small Brush)

1. Idler Wheel Link.
2. Turntable Shaft Stud.
3. Pickup Arm Hinge Pins.
4. Knife edge of Pickup Arm Raising Lever.
5. Main Cam Bearing. (It is necessary to remove the sub-plate assembly to lubricate this bearing.)
6. Teeth of Main Cam Actuating Gear.
7. Track of Main Cam Gear.
8. Teeth of Large and Small idler gears.
9. Raising lever Bracket bearing surfaces.

AVOID EXCESSIVE LUBRICATION

PARTS LIST

Illustration No.	*Part No.*	*Description*
1	49P074	Record Stabilizer Weight
2	46P126	Tension Spring — Record Weight
3	45P464	Spring Retaining Bracket
4	49X029	Record Selector Post
5	49X068	Pickup Arm — less cartridge and hardware
6	21X283	Pickup Arm Mounting Hinge
7	11X385	Pickup Shaft Assembly
8	45P350	Crescent Plate
9	49P111	Reject Button
10	49P112	Pickup Arm Rest
11	11X139	"Automatic-Manual" Control
12	24P022	Needle Pad
13	49P027	Escutcheon
14	25P333	Lock Washer
15	11X133	Spindle
16	50P204	Spindle Retaining Clip
17	11X289	Turntable
18	25P269	Bearing Race Washer
19	11X058	Bearing Race Assembly
20	41P414	Turntable Bearing
21	26P687	Bearing Nut
22	25P030	Felt Washer
23	50P125	Retaining Clip
24	11X366	Idler Wheel — 78 R.P.M.
25	25P046	Fibre Washer
26	11X375	Link Assembly
27	46P179	Link Tension Spring — 78 R.P.M.
70	39P044	Speed Control Knob
71	41P632	Shaft Bushing
72	78P410	Dial
73	45P757	Toggle Bracket
74	25P345	Lock Washer
75	26P276	Hex Nut
76	50P216	Retainer for 11X381
77	11X381	Two Speed Shaft Assembly
78	46P175	Tension Spring
79	11X386	Pickup Counterbalance Assembly
80	11X429	Counterbalance Weight Lever and Set Screw
81	11X405	Crank Lever Assembly
82	50P125	Spring Clip
83	46P176	Crank Lever Spring
84	45P700	Crank Lever Spring Retainer
85	46P180	Cartridge Tilt Spring
86		Cartridge and Bracket Assembly
87	26P474	Cartridge Mounting Screw
88	20X1244	Pickup Cord Assembly — Internal
89	20X1247	Pickup Cord Assembly — External
90	46P134	Link Tension Spring — 33⅓ R.P.M.
91	11X368	Idler Wheel — 33⅓ R.P.M.
